SERVIR

Connecting space . . .

. . . to village.
SERVIR builds the capacity of developing countries to manage environmental issues in sustainable and innovative ways.
People in developing countries rely on their natural environment for food, water, and shelter.
Climate variability and poor management of natural resources affect the livelihood of these people and their communities.
SERVIR translates satellite data into useful information about the environment, climate, water, agriculture, bio-diversity, and natural disasters.
SERVIR streamlines access to this information and develops state-of-the-art geospatial tools for governments, NGOs, universities, and the public.
These tools support informed policy decisions that benefit communities and the planet as a whole.
