Subject: Well Completion Report (WCR) for NASA White Sands Test Facility (WSTF) 300-002-GSV

NASA submitted the *Response to Disapproval of the 300 Area Abbreviated Drilling Work Plan* on July 14, 2021, which was approved by NMED on May 2, 2023. Field activities to install the first of two multiport soil vapor and groundwater monitoring (MSVGM) wells (300-002-GSV) commenced on April 9, 2024. NASA subsequently submitted a *Request for Extension of Time for Submittal of Three Well Completion Reports (WCRs) for NASA WSTF Wells 300-001-GSV, 300-002-GSV, and 400-001-GW* on April 18, 2024. In accordance with the NMED-approved Work Plan, NASA requested the WCR for well 300-002-GW be provided to NMED 180 days following equipment mobilization to the 300 Area and no later than October 4, 2024. NMED approved the request on May 6, 2024.

The 300-002-GSV borehole was completed to a total depth of 250 feet (ft) below ground surface (bgs) on April 22, 2024. This depth is greater than the depth anticipated in the drilling work plan, and incorporated a supplemental bedrock matrix diffusion investigation that was described in the Expanded Scope Proposed for the 300 Area Supplemental Abbreviated Drilling Work Plan submitted to NMED on September 13, 2023. The expanded scope was approved by NMED on November 1, 2023. The matrix diffusion study is described, and the results presented in Appendix E of the WCR.

The initial set of soil vapor samples from well 300-002-GSV was shipped on September 9, 2024. However, the analytical laboratory determined that the soil vapor samples did not meet final canister pressure requirements. Replacement soil vapor samples must be collected following reconfiguration of the soil vapor connectors in the wellhead by the drilling subcontractor. The soil vapor results required to complete Appendix G will be provided immediately following connector replacement, soil vapor re-sampling, and the receipt and processing of laboratory analytical data.

This submittal includes a printed WCR for 300-002-GSV up to Appendix C as Enclosure 1, and a CD-ROM with an electronic copy of the entire WCR as Enclosure 2.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

If you have any questions or comments concerning this submittal, please contact Antonette Doherty of my staff at 575-202-5406.

1.0 Introduction and Purpose

The National Aeronautics and Space Administration (NASA) Johnson Space Center (JSC) White Sands Test Facility (WSTF) has supported testing of space flight equipment and hazardous materials from 1964 to the present. The facility contains five closed hazardous waste management units (HWMUs) that are under post-closure care (PCC). They are located within the 200, 300, 400, and 600 Areas. PCC requirements are specified by the WSTF Resource Conservation and Recovery Act (RCRA) Permit (Permit) issued by the New Mexico Environment Department (NMED, 2023a). The Permit requires that historical releases of hazardous waste or hazardous constituents from the former HWMUs be investigated to determine if continuing sources of contamination are present.

A groundwater contamination plume consisting of n-nitrosodimethylamine (NDMA), trichloroethene, tetrachloroethene, and Freons®[1] has been identified at WSTF. To characterize and monitor the horizontal and vertical extent of contamination, a monitoring well network consisting of single zone (referred to as conventional) and multi-zone (referred to as multiport) wells has been established. In the contaminant source areas, in addition to groundwater monitoring wells, soil vapor wells are used to monitor and evaluate the vadose zone. NASA utilizes multiport soil vapor monitoring (MSVM) wells to monitor the vadose zone and multiport soil vapor and groundwater monitoring (MSVGM) wells to monitor both the vadose zone and the underlying groundwater. Combined groundwater and soil vapor wells are defined by the acronym GSV in the well descriptor.

The 300 Area at WSTF is used for testing altitude propulsion systems. Facilities at this location include altitude chambers, engine test stands, and former wastewater treatment facilities. Between 1964 and 1985, several areas of the eastern impoundments were used to treat hazardous wastes derived from space hardware testing activities. These areas were later reinforced with a 4 to 6-inch (in.) structural caps (gunite liners). The discharge of wastes to the impoundments ceased by November 8, 1985. Based on the results of early investigations, NASA closed the impoundments in accordance with a closure plan approved by NMED. Closure activities consisted of constructing an erosion-resistant, low permeability cap over the impoundment areas and diversions to prevent accumulation of surface water drainage. Closure construction began in November 1988 and was completed in June 1989 (NASA, 1989). NMED approved the closure on November 1, 1989 (NMED, 1989).

Two MSVGM wells were recently added to the existing well network to monitor groundwater and soil vapor within each of the two closure areas located adjacent to the main 300 Area testing facility. The data collected from the MSVGM wells installed provide groundwater and soil vapor monitoring for WSTF contaminants of potential concern (COPC) as well as groundwater elevation data and other hydrogeological parameters.

This Well Completion Report (WCR; report) provides a summary of field activities associated with the drilling and installation of WSTF groundwater and soil vapor monitoring well 300-002-GSV, located within the southwestern closure pond. Under the supervision of the WSTF Environmental Contactor, Navarro Research and Engineering Inc. (Navarro), multiple subcontractors performed activities in relation to this project: drilling activities were performed by Yellow Jacket Drilling Services (YJD), matrix diffusion sample collections and preparation by Sanborn Head and Associates (Sanborn Head), and matrix diffusion laboratory services by Pace Environmental (Pace). Initial drilling activities were conducted between April 9, 2024 and April 22, 2024. Geophysical logging was completed on April 24, 2024. Additional reaming of the borehole was performed in accordance with the well completion protocol presented in the NMED-approved 300 Area Supplemental Abbreviated Drilling Work Plan (ADWP;

[1] Freon is a registered trademark of The Chemours Company CF, LLC.

NASA, 2021b, p 3; NMED, 2023b) between April 24 and May 3, 2024. Well construction began on May 4, 2024 and was completed on May 7, 2024. Final well development was performed on June 26 and June 27, 2024.

2.0 Location and Description

2.1 Facility

WSTF, located in Doña Ana County, New Mexico, lies 18 miles (mi) northeast of Las Cruces, New Mexico and 65 mi north of El Paso, Texas (Figure 2.1). WSTF was constructed in 1964 at a remote location adjacent to the San Andres Mountains (SAM). The land occupied by WSTF is owned by the Department of the Army and is used by NASA under a land use agreement with the Army (Department of Defense, 1982). Access to the site is provided by a paved road that intersects U.S. Highway 70, 1 mi west of Organ, New Mexico and leads 6 mi north to the test areas.

WSTF's primary activities in support of the United States space program are:

1. Development, qualification, refurbishment, and testing of spacecraft propulsion systems, subsystems, and ground support equipment.
2. Investigation of flight hardware anomalies.
3. Testing of materials and components.
4. Performance of hazard and failure analyses.

Following the completion of construction of WSTF in 1964, many wastes were historically managed in hazardous waste management units, including surface impoundments, within the WSTF industrial area. These hazardous waste management units contributed to groundwater contamination. As a result of the groundwater contamination, NASA operates a network of groundwater monitoring wells throughout the site.

2.2 300-002-GSV Well Location

The location of the 300 Area relative to other WSTF areas is shown in Figure 2.2 and the location of well 300-002-GSV relative to other infrastructure in the 300 Area is shown in Figure 2.3. MSVGM well 300-002-GSV was installed within the southwestern closure pond located southwest of the main 300 Area testing facility and immediately adjacent to the primary ephemeral drainage in the area referred to as the 300/400 Area Arroyo.

3.0 Regulatory Timeline

NASA submitted the *300 Area Supplemental Abbreviated Drilling Work Plan* on May 30, 2019 (NASA, 2019). NMED received and reviewed the report and issued a disapproval on March 19, 2021 (NMED, 2021a) directing NASA to address all comments and provide a revised report by July 30, 2021. NASA submitted the *Response to Disapproval of the 300 Area Abbreviated Drilling Work Plan* on July 14, 2021 (NASA, 2021b). NMED approved the *300 Area Supplemental Abbreviated Drilling Work Plan* on May 2, 2023 (NMED, 2023b).

NASA subsequently submitted a *Request for Extension of Time for Submittal of Three Well Completion Reports (WCRs) for NASA WSTF Wells 300-001-GSV, 300-002-GSV, and 400-001-GW* on April 18, 2024 (NASA, 2024a). In accordance with the NMED-approved work plan, NASA requested the WCR for well 300-002-GW be provided to NMED 180 days following equipment mobilization to the 300 Area (April 9, 2024) no later than October 4, 2024. NMED approved this request on May 6, 2024 (NMED, 2024a).

4.0 Drilling of Well 300-002-GSV

The approved New Mexico Office of the State Engineer (NMOSE) Permit for drilling well 300-002-GSV is provided in Appendix A. Drilling at the well 300-002-GSV location (Figure 2.3) began on April 9, 2024, and the borehole was completed to a total depth of 250 feet (ft) below ground surface (bgs) on April 22, 2024. This total depth incorporated additional matrix diffusion work performed at this location that was described in the *Expanded Scope Proposed for the 300 Area Supplemental Abbreviated Drilling Work Plan* submitted to NMED on September 13, 2023 (NASA, 2023a). The expanded scope, approved by NMED on November 1, 2023 (NMED, 2023d), consisted of a bedrock matrix diffusion study. The matrix diffusion study is described, and the results presented within this WCR. There were no issues or problems encountered during drilling activities.

4.1 Drilling Methods Utilized

YJD of Rancho Cucamonga, California was subcontracted to perform drilling services at WSTF for the 300-002-GSV location. The borehole was drilled in accordance with the NMED-approved ADWP using the rotary sonic method of drilling through the alluvium section and air rotary with coring after contacting bedrock. These drilling methods have been used successfully to install many source area monitoring wells at WSTF. The diameter of the cased sonic borehole in the upper alluvial section was 6 in. to a depth of approximately 80 ft bgs. A cemented conglomerate unit was observed at approximately 67 ft bgs. Coring in the borehole commenced at 80 ft bgs within the cemented conglomerate and then continued to the total depth of the borehole at 250 ft bgs. The cored borehole was installed using HQ-sized tooling, which resulted in a 3 3/4-in. diameter borehole, with 2.5-in. diameter cores collected in 5-ft length core barrels. Following geophysical logging and the selection of the groundwater screened zone, the upper borehole was reamed to a diameter of 9-in. and depth of 165 ft bgs to accommodate emplacement of MSVGM well 300-002-GSV and annular materials. The total amount of water used during drilling at the 300-002-GSV location was approximately 14,000 gallons (Table 4.1).

4.2 Sampling During Drilling

Grab samples of soil and bedrock cuttings were collected and examined by qualified geologists as they were extruded from sonic core barrels. Samples in the vadose zone were collected on 10 ft intervals. Representative samples of the interval were placed in chip trays for subsequent detailed characterization using a binocular microscope. Soil descriptions were completed in accordance with ASTM D2488-17, “Standard Practice for Description and Identification of Soils.” Within the indurated lithologies toward the base of the cemented conglomerate and the underlying bedrock lithologies, continuous core samples were collected on 5-ft intervals. Lithologic descriptions are documented on the lithologic log included in (Appendix B). Analytical samples were collected from the core barrel at 10 ft, 40 ft, and 80 ft for analysis (Section 8.1). No groundwater samples were collected during drilling activities.

4.3 Lithology Description

Alluvium in the vadose zone below the 300 Area closure cells consists of Quaternary to Tertiary intercalated fan, interfan valley, and erosion surface veneer deposits derived from the SAM adjacent to and east of the WSTF industrial areas. The heterogeneous alluvial soil lithologies in the vadose zone typically have measured porosities between 20 to 40 percent and consist primarily of unconsolidated to moderately cemented, poorly sorted, pebble to boulder conglomerate with interbedded lenticular sandy gravels, and sandy silts.

Drilling operations at 300-002-GSV encountered alluvium for the first 67 ft. The alluvium primarily consisted of a sequence of silty to sandy gravels deposited in a sequence of stacked alluvial fans. Gravel

clasts ranged from 2 mm to greater than 4-in. diameter. Beneath the unconsolidated alluvium, a layer of cemented conglomerate composed of strongly indurated alluvium (lithified primarily with calcite cement) was present. Andesite bedrock was encountered at 82 ft (Appendix B).

The underlying andesitic bedrock consisted of greenish black aphanitic andesite with irregular dispersed calcite veinlets. Veinlets ranged from reddish brown to bluish grey in color and were generally less than 1 mm in thickness. At 215 ft, Limestone was encountered. The limestone unit is micritic with a deep purple to black color. A shale horizon was encountered within the limestone between 213 and 215 ft bgs. Rhyolite was intercepted at approximately 234 ft. The rhyolitic lithology is younger in age than the andesite and limestone units and may represent a sill.

4.4 Matrix Diffusion Evaluation

Sanborn Head and Pace performed the matrix diffusion evaluation under the supervision of the WSTF Environmental Contractor (Navarro) to support a program of rock core sampling within the 300-002-GSV borehole. The work was performed between April 17 and April 22, 2024 to assess potential distribution of chlorinated volatile organic compounds (VOCs) and semi volatile organic compounds (SVOCs) within the bedrock matrix below the 300 Area closures.

The CORE Discrete Fracture Network Approach ($CORE^{DFN}$) bedrock VOC sampling approach is a comprehensive fractured rock sampling method developed by Dr. Beth Parker and Dr. Gorecki at the University of Guelph and University of Waterloo, respectively. This method has been previously applied to bedrock within the WSTF 200 Area (NASA, 2015, pp 22-28). The $CORE^{DFN}$ method includes detailed logging of bedrock core including fractures, field preparation and crushing of bedrock samples to increase the surface area of the sample, field preservation of crushed samples in methanol, and laboratory extraction and analysis of the samples. The unconsolidated portion of the 300-002-GSV borehole was cased to 86 ft bgs to stabilize the borehole for coring operations. Rock was cored over the interval between 86 to 250 ft bgs.

4.5 Geophysical Logging

Geophysical logging was conducted at 300-002-GSV by Jet West Geophysical Services, LLC on April 23 and 24, 2024. Downhole geophysical logs included 16-in. resistivity, 64-in. resistivity, single point resistance, gamma, temperature, heat pulse flowmeter, and 3-arm caliper. The logger's total depth recorded was 252 ft bgs. The geophysical logs (Appendix C) were used in conjunction with the lithologic log (Appendix B) to confirm changes in lithology, identify the bedrock contact, and to evaluate borehole integrity depths favorable for the placement of the well screen. Final placement of the well screen also required evaluation of the location of the potentiometric surface, hydraulic conditions within the aquifer, and a review of adjacent monitoring wells in the vicinity of the 300 Area closure (Figure 2.3).

5.0 Well Construction

5.1 Planned Well Design

In the NMED-approved ADWP (NASA, 2021, pp 5-6), MSVGM well 300-002-GSV was proposed as a single groundwater monitoring zone in conjunction with four soil vapor ports to monitor vapor in the alluvial and bedrock portion of the vadose zone. The 300-002-GSV Well Completion Diagram (WCD; Figure 5.1) was designed accordingly, considering information acquired from lithological logs, geophysical logs (most significantly caliper, heat pulse flow, gamma, neutron, and resistivity), aquifer conditions (unconfined), and adjacent monitoring wells in the area.

The screened interval was placed from 140 to 155 ft bgs below the current static water level at approximately 117 ft bgs. The screen extended over 15-ft in order to account for the limited number of producing fractures identified within the lithologic and geophysical logs. Four soil vapor ports to monitor the vertical delineation of soil vapor in the vadose zone were placed at 10, 40, 80, and 100 ft bgs. Casing was cut to 2.45 ft above ground surface. Specific details of the well's construction are illustrated in the WCD (Figure 5.1).

5.2 Well Completion Casing

MSVGM well 300-002-GSV well casing installation was performed on May 4, 2024. Casing materials comprised conventional 4-in. nominal Schedule 80 polyvinyl chloride (PVC) flush joint casing with one 15 ft x 0.020-in. slotted screen with a 5-ft sump and a PVC end cap installed to a total well depth of 160 ft. The screen was set from 140 to 155 ft bgs (Figure 5.1). Steel centralizers were installed on the casing above and below the screened interval, and at 50 ft intervals along the length of the casing to prevent the casing and screen from contacting the borehole walls and ensure a uniform thickness of the annular materials.

Soil vapor ports comprising 5/8-in. diameter x 12-in. length stainless steel screened implants were set at 10, 40, 80 and 100 ft bgs. Soil vapor ports were connected to the surface using ¼-in. diameter, Type 304 stainless steel tubing secured to the outside of the PVC casing using stainless steel hose clamps every 5 ft between the port location and the surface. Each vapor port at surface was affixed with an aluminum tag engraved with port identification, and a quick-connect fitting to facilitate soil vapor sampling.

5.3 Annular Materials Installation

Annular materials installation for 300-002-GSV began May 5, 2024 and was completed May 7, 2024 (Figure 5.1). Annular completion materials were installed as follows:

- 2 x 50 lbs bags of bentonite pellets to backfill the borehole from 160-165 ft bgs and to provide a lower seal
- 1 x 50 lbs bag of 20/40 sand from 158-160 ft bgs
- 14 x 50 lbs bags of 10/20 sand from 137-158 ft bgs
- 1 x 50 lbs bag of 20/40 sand from 135-137 ft bgs
- 4.5 x 50 lbs bags of bentonite chips (3/8") from 103-135 ft bgs
- 2 x 50 lbs bags of 20/40 sand from 97.5-103 ft bgs
- 4.5 x 50 lbs buckets of bentonite pellets from 82.5-97.5 ft bgs
- 3 x 50 lbs bags 20/40 sand from 77.5-82.5 ft bgs
- 3.5 x 50 lbs buckets of bentonite pellets from 67.5-77.5 ft bgs
- 6 x 50 lbs bags of cement from 55-67.5 ft bgs
- 8 x 50 lbs bags of bentonite pellets from 42.5-55 ft bgs
- 6 x 50 lbs bags of 20/40 sand from 37.5-42.5 ft bgs
- 9 x 50 lbs bags of bentonite chips (3/8") 27.5-37.5 ft bgs
- 3 x 50 lbs bags of cement from 22.5-27.5 ft bgs
- 8 x 50 lbs bags of bentonite chips (3/8") from 12.5-22.5 ft bgs
- 6 x 50 lbs bags of 20/40 sand from 7.5-12.5 ft bgs
- 8 x 50 lbs bags of bentonite pellets from 1-7.5 ft bgs
- 3 x 50 lbs bags Portland neat cement for top surface seal at 0-1 ft bgs

Completion materials were emplaced using a pneumatic diaphragm pump. All materials were installed using a 2-in. outer diameter tremie pipe maintained at a level approximately 10 to 20 ft above the top of

annular materials in the well. No water was added except that for mixing of the bentonite grout and neat cement. The bentonite grout was mixed by YJD per standard with the ratio of 5% bentonite added by weight and 8.5 gallons of non-chlorinated water per 94-pound sack of Portland cement used. Dry cement and bentonite were added to non-chlorinated water in a 55-gallon drum and mixed thoroughly with a mixing paddle attached to a power drill for a smooth and uniform consistency. The neat Portland cement was mixed by YJD per standard with a ratio of 6 gallons of water per 94-pound sack of Portland cement used. Cumulative water usage is shown in Table 4.1.

6.0 Hydraulic Conditions

The initial groundwater level was identified within the 300-002-GSV borehole during drilling at approximately 83 ft bgs on April 18, 2024. The groundwater level was subsequently measured in the borehole at 103 ft bgs after the borehole stabilized overnight on April 19, 2024. During geophysical logging performed on April 23, 2024, groundwater was reported at a depth of 114 ft bgs. Prior to development activities on June 25, 2024, the static water level and total depth of well 300-002-GSV were measured at 114.2 and 160.0 ft below the top of casing, respectively. Following development and prior to the initial groundwater sampling event on August 15, 2024, the static water level was measured at 116.74 ft below top of casing (113.74 ft bgs). Based on the overall decline in water level over the period of borehole and well installation, coupled with information from the lithologic log, geophysical logs, and adjacent wells, the aquifer is defined as unconfined.

7.0 Well Development

YJD performed the development of well 300-002-GSV on June 25, 2024 (Table 7.1). The well casing was bailed and swabbed to remove mud from the well casing and develop the well in preparation for sampling. During development activities, WSTF Environmental Contractor personnel monitored discharged development water for parameters including pH, specific conductivity, temperature, and turbidity. Well development is considered complete when measured water quality parameters are relatively stable (vary less than 10%) and turbidity is below 5 nephelometric turbidity units (NTUs).

The well was bailed with a decontaminated 2-in. steel bailer initially, then switched to a decontaminated low-flow submersible pump for efficiency as the well was recharging relatively quickly compared to other wells screened in fractured bedrock within this area. The sustainable pumping rate during development activities was approximately 2.5 gallons per minute (gpm). During development, levels of pH varied from 7.20 to 7.47, temperature varied from 24.2 to 25.8 degrees Celsius (°C), and specific conductivity varied from 1,159 to 1,185 microsiemens per centimeter (µS/cm).

A total of 500 gallons were removed during well development. Groundwater quality parameters stabilized with the final results: pH = 7.3; temperature = 25.1 °C; and specific conductivity = 1,184 µS/cm. The final turbidity was reported at 2.96 NTU.

8.0 Sampling

8.1 Soil Sampling

Soil samples were collected from the 300-002-GSV borehole from three locations in the alluvial vadose zone at 10, 40, 80 ft bgs as specified in the 300 Area ADWP (NASA, 2021, pp 5-6) between April 8 and April 9, 2024. The subsurface soil borings were drilled and sampled by YJD under WSTF Environmental Department supervision. Soil sampling locations were selected to provide soil analytical data to determine whether there are VOCs or SVOCs present in the vadose zone below the southwest cell of the 300 Area closure. The soil sample locations were selected to provide vertical delineation of the vadose zone and

approximate the location of soil vapor sample ports subsequently installed in MSVGM well 300-002-GSV. Sufficient soil sample recovery volume was reported from the 5-ft core barrels used to collect the samples at all three locations.

Soil samples were field screened within the core barrels using a photoionization detector (PID) and observed for visual indicators of saturation or staining. There were no PID or visual indications of potential contamination, and the field geologist selected samples based on the lithology for analysis.

Soil chemical samples from the 300-002-GSV borehole were analyzed for the list of COPC and their analytical methods provided in the NMED-approved 300 Area ADWP (NASA, 2021, pp 18-21). Standardized analytical methods were used to analyze for the COPC that were determined based on the historic site activities and known results from previous soil borings installed in the 300 Area. Chemical analytical results for soil samples included VOC (SW-846 8260B), SVOC (SW-846-8270D), Total metals (SW-846-6010C), cyanide (SW-846 Method 9012), perchlorate (Environmental Protection Agency [EPA] Method 6850), polychlorinated biphenyls (SW-846 8082), NDMA (EPA Method 607), hydrazines (SW-846 Method 8315), dioxins/furans (SW-846 Method 8290A), hexavalent chromium (SW-846 Method 7196A), Nitrate/Nitrite (SW-846 9056A), and per- and polyfluoroalkyl substances (PFAS; EPA Method 1633). There were no data quality exceptions that negatively impacted analytical data quality or project objectives. The soil analytical results and chain of custody (CoC) forms are provided in Appendix D.

8.2 Matrix Diffusion Sampling

A total of 341.0 linear feet of rock was cored from two boreholes installed at the same time in the area. These consisted of borehole 300-002-GSV installed in the 300 Area closure southwest cell described in this WCR, and nearby borehole 300-001-GSV in the northeast cell (Figure 2.3). The total recovery from the two boreholes was 291.40 ft, and a total of 147 rock samples were collected for VOC and SVOC analysis. In addition, 8 field duplicate (FD) samples, and 8 matrix spike and matrix spike duplicate (MS/MSD) sample pair (2 samples), 10 equipment blank (EB) samples, 3 method blank (MB) samples, and 6 trip blank (TB) samples were collected for VOC and SVOC analysis.

Sixteen intact core samples were collected and were sent for physical property analyses in accordance with CORE^{DFN} procedure. Extraction and VOC and SVOC analyses of the rock core samples were conducted by the Pace analytical laboratory in Green Bay, WI. Physical properties samples were analyzed at WSP Canada Inc. in Mississauga, Ontario between April and June 2024. Results of physical property analyses for bulk density, porosity, water content, and organic carbon content were used in conjunction with the VOC data for the calculation of rock porewater concentrations.

Following sample retrieval from the borehole, the core was transferred from the liners to a PVC tray lined with aluminum foil. The core was logged, and samples were collected by a Sanborn Head scientist. Sample locations were selected for paired VOC and SVOC analysis based on fracture distributions and lithology with a target frequency of approximately one sample every 1.5 to 2.0 ft. Following sampling and wrapping, the samples were delivered to the sample processing area. Samples were individually unwrapped and placed in a stainless steel trimming cell. The outer portion of the sample was removed with a hammer and chisel. The remaining subsample was then placed in a stainless steel cell and crushed using a hydraulic press. For VOC samples, the crushed subsample was then transferred to a pre-labeled and pre-weighed 40 milliliters (mL) volatile organic analysis (VOA) vial containing 15 mL of purge-and-trap grade methanol. Purge-and-trap grade methanol is a high-grade methanol used for gas chromatography/mass spectrometry VOC analysis. For SVOC samples, the crushed subsample was transferred to a pre-labeled and pre-weighed unpreserved 40 mL amber VOA. Each sample was labeled with its sample identifier and submitted to Pace's laboratory in Green Bay, WI for analysis (see

description of method below). Samples were kept on ice in coolers on-site by Sanborn Head until being shipped to the Green Bay Pace laboratory on ice by Sanborn Head and analyzed for VOCs and SVOCs.

Specific to the 300-002-GSV borehole, CORE^{DFN} sampling activities were performed between April 17 and April 22, 2024. A total of 72 VOC/SVOC samples, 4 VOC/SVOC duplicates, 4 MS/MSD samples, and 8 physical property samples were collected and processed from the interval between 86 ft bgs and 247.5 ft bgs. The analytical laboratory (Pace) noted that small detections of methylene chloride were reported in a sequence of samples between 165 and 242 ft bgs. These detections are flagged to indicate that the results are lower than the reporting limit but above the detection limit and questionable. Methylene chloride can be a laboratory contaminant. A description of the CORE^{DFN} drilling and core collection, VOC and SVOC sample collection and processing, physical property sample collection, laboratory analysis and VOC extraction, and analytical results is provided within the Data Report for Rock Core Sampling and Analysis (Appendix E).

8.3 Groundwater Sampling

An initial set of groundwater samples for laboratory chemical analysis was collected and managed in accordance with the NMED-approved WSTF Groundwater Monitoring Plan (NASA, 2023b; NMED, 2023e) on August 15, 2024 from MSVGM well 300-002-GSV. Water quality field parameters (temperature; specific conductivity; pH; and turbidity) were monitored during the purging process prior to sampling to ensure sufficient purging had been performed and demonstrate that all groundwater within the well and gravel pack surrounding the screened zone had been removed. Groundwater characterization samples were collected for the analysis of VOCs by the current revision of SW-846 Method 8260D, SVOCs by the current revision of SW-846 Method 8270C, NDMA by Modified EPA Method 607M, and a variety of metals by the most effective laboratory-selected analytical method. The groundwater analytical results and CoC forms are provided in Appendix F.

8.4 Soil Vapor Sampling

Following well development and sampling system installation, an initial set of soil vapor samples was collected on September 9, 2024 from each of the four soil vapor sampling ports in MSVGM well 300-002-GSV located at 10, 40, 80, and 100 ft bgs (Figure 5.1). All four soil vapor ports (300-002-GSV-10, 300-002-GSV-40, 300-002-GSV-80, and 300-002-GSV-100) were located above the potentiometric surface in the well located at depth of approximately 117 ft bgs and were not blocked.

Soil vapor sampling was performed in accordance with established WSTF procedures. The soil vapor sampling began with the shallowest port and continued sequentially until the deepest port had been sampled. The sampling ports and stainless steel tubing were purged of entrained soil vapor with a non-dedicated surface vacuum pump to evacuate stagnant air below the sample collection fitting. Each port was purged for a minimum of five minutes per zone to evacuate at least three volumes of the ¼-in. tubing and soil vapor implant. Carbon dioxide, oxygen, and methane indicator parameters were monitored during purging to ensure stabilization prior to sampling and recorded in a field logbook.

Soil vapor samples were collected in 1-liter stainless steel canisters. The initial pressure for all canisters verified by the analytical laboratory is -14.3 pounds per square inch (PSI). The final canister pressure was noted in the field logbook and CoC form. Soil vapor samples were shipped to the contracted analytical laboratory in California for VOC analysis using EPA Method TO-15. The soil vapor analytical results and CoC forms are provided in Appendix G.

8.5 Survey

During surface completion of the wells, a brass cap was permanently installed in the northwest corner of the cement well pad. The cap was installed to serve as a survey point to represent the location of the well. The location and elevation of well 300-002-GSV was surveyed by experienced NASA WSTF GPS personnel. The New Mexico State Plane Central Zone North American Datum 83 coordinate system in U.S. survey feet above mean sea level (amsl) were utilized for the field survey and input into project documentation. The lithologic log and well completion diagram contained in Appendix B and Figure 5.1, respectively, include the survey data.

The top of the inner and outer well casing and the brass cap elevation and coordinates at ground surface will be re-surveyed for confirmation. Following confirmation, the brass cap will be inscribed with the permanent well name and its surveyed ground surface elevation.

9.0 Investigation Work Plan Deviations – Well Construction

The following are deviations from the NMED-approved 300 Area ADWP (NASA, 2021) for the installation of well 300-002-GSV dated July 14, 2021.

- In the **Well Completion** section, it was stated that Colorado Silica sand (10/20 mesh) will be emplaced in the bottom of the boring using a tremie pipe to approximately 2 1/2 ft above the deepest soil vapor monitoring zone, covering the screen emplacement of the groundwater monitoring well and lowermost soil vapor sampling port. The soil vapor port was placed at 100 ft rather than 120 ft, to obtain representative samples and limit the sampling zone, a bentonite seal was placed between the groundwater screen and lower soil vapor port.

- In the **Well Completion** section, it was stated that Colorado Silica sand (10/20 mesh) will be emplaced in the bottom of the boring using a tremie pipe to approximately 2 1/2 ft above the deepest soil vapor monitoring zone, covering the screen emplacement of the groundwater monitoring well and lowermost soil vapor sampling port. A 2-ft zone of Colorado Silica sand (20/40 mesh) was emplaced above and below the 10/20 mesh Colorado Silica sand covering the screened zone.

- In the **Groundwater Sampling** section, it was stated that Hexavalent Chromium would be analyzed. A sample for Hexavalent Chromium was not collected during the initial sampling event.

10.0 Investigation-Derived Waste Management, Characterization, and Disposal

Waste characterization as indicated in the 300 Area ADWP was conducted in accordance with Section 4.3.10 (Collection and Management of Investigation-Derived Waste) of the RCRA Permit (NMED, 2023a, pp 59). All waste was properly managed and disposed of in accordance with NASA procedures and state and federal regulations. The waste streams that were generated during drilling and installation of MSVGM well 300-002-GSV included:

- **Drill cuttings.** Unsaturated drill cuttings are defined as soil cuttings or rock fragments generated from the vadose zone that have not come into contact with groundwater. Unsaturated cuttings are characterized as non-hazardous solid waste. Saturated drill cuttings are defined as soil cuttings or rock fragments generated from below the water table that may have come into contact with potentially contaminated groundwater. This environmental media potentially contains listed hazardous waste constituents from the WSTF groundwater plume and was initially characterized as hazardous waste.

- **Drilling fluids.** Non-chlorinated water was introduced into the circulated material during rotary sonic drilling, as necessary. Drilling fluid generated above the water table was characterized as non-hazardous solid waste. Drilling fluid generated below the water table potentially contain listed hazardous waste constituents that are present in the WSTF groundwater plume and was characterized initially as hazardous waste.

- **Groundwater.** Groundwater produced from within the WSTF groundwater plume during well drilling and development was characterized as environmental media containing listed hazardous waste with the F001 and F002 hazardous waste codes.

- **Decontamination fluids.** Decontamination fluids such as water and soap solutions used to wash and decontaminate equipment generated during drilling above the water table were characterized as non-hazardous solid waste. Decontamination fluids generated by cleaning equipment that has contacted potentially contaminated soil, cuttings, or fluids generated when drilling below the water table were characterized as hazardous waste.

- **Contact waste.** Contact waste, or debris, such as used disposable sampling equipment, personal protective equipment, plastic sheeting, and other debris generated during drilling above the water table was non-hazardous solid waste. Contact debris contaminated with soil, cuttings, or fluids that were generated when drilling below the water table were characterized as hazardous waste.

- **Petroleum Contaminated Debris.** Debris such as rags and plastic sheeting contaminated with petroleum products during routine drilling equipment maintenance and operation. The petroleum contaminated debris and environmental media was be characterized as hazardous waste with the D018 hazardous waste code.

Historical data from groundwater monitoring at the proposed location of well 300-002-GSV indicate that environmental media unearthed from zones containing regional groundwater during drilling operations may contain hazardous constituents at concentrations exceeding regulatory limits. The contaminants of concern include VOCs such as trichloroethene, tetrachloroethene, trichlorofluoromethane, dichlorofluoromethane, 1,1,2-trichloro- l,2,2-trifluoroethane, and semi-volatile VOCs such as NDMA. For this reason, generated waste that encountered groundwater during drilling operations were initially labeled as hazardous waste with EPA waste codes F001 and F002 following the application of the EPA's "contained-in" policy (EPA, 1998). This waste stream was then managed in a central accumulation area in accordance with state (20.4.1.300 NMAC) and federal (40 CFR 262.17) regulations. Any free-standing water was decanted from this waste stream and transferred to the Mid-plume Interception and Treatment System for treatment and discharge in accordance with Discharge Permit (DP)-1255 (NMED, 2023c).

Samples of environmental media (i.e., drilling mud and cuttings) from below the water table were sent for chemical analysis to investigate the concentrations of contaminants of concern and determine if the media did contain listed hazardous waste or exhibit characteristics of a hazardous waste. On July 11, 2024, NASA submitted a *Request for a 'No Longer Contained-in' Determination for Drilling Mud and Cuttings Associated with the Expanded Scope Proposed for the 300 Area Supplemental Abbreviated Drilling Work Plan (ADWP)* (NASA, 2024b). On July 24, 2024, NASA received NMED approval for the "No Longer Contained-In" Determination (NMED, 2024b), and all environmental media previously labeled as hazardous waste was changed to solid waste and is to be shipped off-site and disposed of in a permitted RCRA treatment, storage, and disposal facility, along with environmental media generated from above the water table.

Dec. 20, 2023

NASA WHITE SANDS TEST FACILITY
TIMOTHY J. DAVIS
PO BOX 20
LAS CRUCES, NM 88004

Greetings:

Your approved copy of the above numbered permit to drill a well for non-consumptive purposes is enclosed. You must obtain an additional permit if you intend to use the water. It is your responsibility to provide the contracted well driller with a copy of the permit that must be made available during well drilling activities.

Carefully review the attached conditions of approval for all specific permit requirements.

* If use of this well is temporary in nature and the well will be plugged at the end of the well usage, the OSE must initially approve of the plugging. If plugging approval is not conditioned in this permit, the applicant must submit a Plugging Plan of Operations for approval prior to the well being plugged. The Plugging Record must be properly completed and submitted to the OSE within 30 days of the well plugging.
* If the final intended purpose and condition requires a well ID tag and meter installation, the applicant must immediately send a completed meter report form to this office.
* The well record and log must be submitted within 30 days of the completion of the well or if the attempt was a dry hole.
* This permit expires and will be cancelled if no well is drilled and/or a well log is not received by the date set forth in the conditions of approval.

Appropriate forms can be downloaded from the OSE website www.ose.state.nm.us.

Sincerely,

Cheryl Thacker
Water Resource Manager

WR-07 APPLICATION FOR PERMIT TO DRILL

A WELL WITH NO WATER RIGHT

(check applicable box):

For fees, see State Engineer website: http://www.ose.state.nm.us/

RECEIVED
DEC 19 2023
STATE ENGINEER OFFICE
LAS CRUCES, NM

Purpose:	☐ Pollution Control And/Or Recovery	☐ Ground Source Heat Pump
☐ Exploratory Well*(Pump test)	☐ Construction Site/Public Works Dewatering	☐ Other(Describe):
☒ Monitoring Well	☐ Mine Dewatering	

A separate permit will be required to apply water to beneficial use regardless if use is consumptive or nonconsumptive.

*New Mexico Environment Department-Drinking Water Bureau (NMED-DWB) will be notified if a proposed exploratory well is used for public water supply.

☐ Temporary Request - Requested Start Date: Requested End Date:

Plugging Plan of Operations Submitted? ☐ Yes ☐ No

NOTE: If more well locations need to be described, complete form WR-08 (Attachment 1 – POD Descriptions)
Additional well descriptions are attached: ☐ Yes ☒ No **If yes, how many**

Other description relating well to common landmarks, streets, or other:

Refer to enclosed map

Well is on land owned by: Department of Defense (White Sands Missile Range)

Well Information: NOTE: If more than one (1) well needs to be described, provide attachment. **Attached?** ☒ Yes ☐ No
If yes, how many Three

Approximate depth of well (feet):	Outside diameter of well casing (inches):
Driller Name:	Driller License Number:

3. ADDITIONAL STATEMENTS OR EXPLANATIONS

Two (2) monitoring wells (300-001-SVG and 300-002-SVG) are required to evaluate groundwater conditions in the vicinity of the former 300 Area Hazardous Waste Management Unit (Closure). The wells will be installed into a poorly fractured andesite bedrock aquifer and are anticipated to yield < 1 gallon per minute (gpm) each based on information from nearby monitoring wells. The duration of monitoring is dependent in part on the requirements of the New Mexico Environment Department (NMED).

One (1) monitoring well (400-001-GW) is required to evaluate groundwater conditions in the vicinity of the former 400 Area Hazardous Waste Management Unit (Closure). The well will be installed into a poorly fractured andesite bedrock aquifer and is anticipated to yield < 1 gallon per minute (gpm) based on information from nearby monitoring wells. The duration of monitoring is dependent in part on the requirements of the NMED.

4. SPECIFIC REQUIREMENTS: The applicant must include the following, as applicable to each well type. Please check the appropriate boxes, to indicate the information has been included and/or attached to this application:

Exploratory:	**Pollution Control and/or Recovery:**	**Construction De-Watering:**	**Mine De-Watering:**
Is proposed well a future public water supply well? ☐ Yes ☒ NO If Yes, an application must be filed with NMED-DWB, concurrently. ☐ Include a description of the requested pump test if applicable.	☐ Include a plan for pollution control/recovery, that includes the following: ☐ A description of the need for the pollution control or recovery operation. ☐ The estimated maximum period of time for completion of the operation. ☐ The annual diversion amount. ☐ The annual consumptive use amount. ☐ The maximum amount of water to be diverted and injected for the duration of the operation. ☐ The method and place of discharge. ☐ The method of measurement of water produced and discharged. ☐ The source of water to be injected. ☐ The method of measurement of water injected. ☐ The characteristics of the aquifer. ☐ The method of determining the resulting annual consumptive use of water and depletion from any related stream system. ☐ Proof of any permit required from the New Mexico Environment Department. ☐ An access agreement if the applicant is not the owner of the land on which the pollution plume control or recovery well is to be located.	☐ Include a description of the proposed dewatering operation, ☐ The estimated duration of the operation, ☐ The maximum amount of water to be diverted, ☐ A description of the need for the dewatering operation, and, ☐ A description of how the diverted water will be disposed of.	☐ Include a plan for pollution control/recovery, that includes the following: ☐ A description of the need for mine dewatering. ☐ The estimated maximum period of time for completion of the operation. ☐ The source(s) of the water to be diverted. ☐ The geohydrologic characteristics of the aquifer(s). ☐ The maximum amount of water to be diverted per annum. ☐ The maximum amount of water to be diverted for the duration of the operation. ☐ The quality of the water. ☐ The method of measurement of water diverted. ☐ The recharge of water to the aquifer. ☐ Description of the estimated area of hydrologic effect of the project. ☐ The method and place of discharge. ☐ An estimation of the effects on surface water rights and underground water rights from the mine dewatering project. ☐ A description of the methods employed to estimate effects on surface water rights and underground water rights. ☐ Information on existing wells, rivers, springs, and wetlands within the area of hydrologic effect.
Monitoring ☒ The reason and duration of the monitoring is required.		**Ground Source Heat Pump:** ☐ Include a description of the geothermal heat exchange project, ☐ The number of boreholes for the completed project and required depths. ☐ The time frame for constructing the geothermal heat exchange project, and, ☐ The duration of the project. ☐ Preliminary surveys, design data, and additional information shall be included to provide all essential facts relating to the request.

FOR OSE INTERNAL USE Application for Permit, Form WR-07 Version 07/12/22

File No.: LRG-16197	Trn No.: 754302

NEW MEXICO STATE ENGINEER OFFICE
PERMIT TO EXPLORE

SPECIFIC CONDITIONS OF APPROVAL

17-4 No water shall be appropriated and beneficially used under this permit.

17-7 The Permittee shall utilize the highest and best technology available to ensure conservation of water to the maximum extent practical.

17-B The well shall be drilled by a driller licensed in the State of New Mexico in accordance with 72-12-12 NMSA 1978. A licensed driller shall not be required for the construction of a well driven without the use of a drill rig, provided that the casing shall not exceed two and three-eighths (2 3/8) inches outside diameter.

17-C The well driller must file the well record with the State Engineer and the applicant within 30 days after the well is drilled or driven. It is the well owner's responsibility to ensure that the well driller files the well record.
The well driller may obtain the well record form from any District Office or the Office of the State Engineer website.

17-Q The State Engineer retains jurisdiction over this permit.

17-R Pursuant to section 72-8-1 NMSA 1978, the permittee shall allow the State Engineer and OSE representatives entry upon private property for the performance of their respective duties, including access to the ditch or acequia to measure flow and also to the well for meter reading and water level measurement.

LOG The Point of Diversion LRG 16197 POD16 must be completed and the Well Log filed on or before 12/19/2024.

NEW MEXICO STATE ENGINEER OFFICE
PERMIT TO EXPLORE

SPECIFIC CONDITIONS OF APPROVAL (Continued)

LOG The Point of Diversion LRG 16197 POD17 must be completed and the Well Log filed on or before 12/19/2024.

LOG The Point of Diversion LRG 16197 POD18 must be completed and the Well Log filed on or before 12/19/2024.

ACTION OF STATE ENGINEER

Notice of Intention Rcvd: Date Rcvd. Corrected:
Formal Application Rcvd: 12/19/2023 Pub. of Notice Ordered:

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 11ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. The report may include analytes that are not currently accreditable by some state agencies or accrediting bodies. This analytical report must be reproduced in its entirety.

Dear Orange Coast Analtyical,

Enclosed are the results of analyses for samples received 4/24/24 with the Chain-of-Custody document. The samples were received in good condition, at 3.5 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
%REC	Percent Recovery
Dil	Dilution
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Project Name: Nasa White Sands Test Facility
Project #: 23EEHWMU.0007

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 5.1ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Comments:

An EDD has been sent along with this report and has been reviewed for completeness.

Data Qualifier Definitions

Qualifier

L1 = The associated blank spike recovery was above laboratory acceptance limits.

TP0422242	8260B	1,1-Dichloropropene	LCS/LCSD	
TP0422242	8260B	n-Propylbenzene	LCS	

L2 = The associated blank spike recovery was below laboratory acceptance limits.

TP0422242	8260B	Bromomethane	LCS/LCSD	Compound co-elutes with methanol from extraction resulting in reduced recoveries.
TP0422242	8260B	Chloroethane	LCS/LCSD	Compound co-elutes with methanol from extraction resulting in reduced recoveries.

M1 = Matrix spike recovery was high, the associated blank spike recovery was acceptable.

AZ14434-001	8260B	Tetrachloroethene	MS/MSD	Dechlorination of pentachloroethane in QC spike into tetrachloroethene due to sample matrix suspected.

M2 = Matrix spike recovery was low, the associated blank spike recovery was acceptable.

AZ14434-001	8260B	Pentachloroethane	MS/MSD	Dechlorination of pentachloroethane in QC spike into tetrachloroethene due to sample matrix suspected.
AZ14434-001	8260B	Vinyl acetate	MS/MSD	

M7 = Matrix spike recovery was low. Data reported per ADEQ policy 0154.000. Matrix interference was confirmed.

AZ14434-001	8260B	Bromomethane	MSD	Compound co-elutes with methanol from extraction resulting in reduced recoveries.
AZ14434-001	8260B	Chloroethane	MS/MSD	Compound co-elutes with methanol from extraction resulting in reduced recoveries.

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

WSTF CHAIN OF CUSTODY RECORD – OCA

Date 4/17/2024

AZ14434

Laboratory: Orange Coast Analytical (Alliance TG) PO#23EC043B

Address shipping questions to:
☐ Lori Minnick, 575-524-5119
☐ Other

Send sample receipt confirmation and analytical reports to:
☒ Kyle Williams, jerry.k.williams@nasa.gov
☒ Stephanie Portillo, stephanie.portillo@nasa.gov

Analytical Requirements

Special Instructions

Return coolers and reusable packaging materials within 14 days as required in statement of work to:

Return Address:

NASA WSTF Environmental Department
12600 NASA Road; Bldg. 120
Las Cruces, NM 88012
Attn: Lori Minnick

Sample Receipt Report

Laboratory Reference: **NRE AZ14434** Logged in by TT

Received:	04/18/24 10:00	Company Name:	Navarro Research and Engineeri
Project Name:	Nasa White Sands Test Facility	Project Manager:	Mr. Kyle Williams
Project #:	23EEHWMU.0007	COC:	Complete

Sample Quantity

4 Soil

Container Quantity

8 VOA - 10mL MeOH

Transportation Containers

Transportation Case ID	Method of Shipment	Shipping Container	Ice	Temperature	Custody Seal
TC-AZ14434-1	FEDEX	Cooler	Wet	5.4+(-0.3)=5.1ºC	Intact-Signed

Login Preservation Checks

Container #	Preservative	pH	Chlorine	Head Space	Conductivity	Preservation Note
All containers	None	NC	NC	NA	NC	

Receipt Hold Times

All samples received within hold time.

Container Conditions

Container #	Container Condition	Container Label	Custody Seals
All containers	Good	Complete	None

Inappropriate Containers

All samples received in appropriate containers.

Inappropriate Chemical Preservation

All samples received with appropriate chemical preservation.

Inappropriate Temperature Preservation

All samples received with appropriate temperature preservation.

4-Bromofluorobenzene	460-00-4		117	50-130
Dibromofluoromethane	1868-53-7		108	65-130
Toluene-d8	2037-26-5		111	59-130

All values presented with any preparation, dilution, or unit conversions taken into account.

[1] = Complete new form for each batch of samples. Multiple dilutions may be included in the same batch as long as they run during same shift.

[2] = Use this section to indicate dilutions made on extracts. Use comment section if more space is needed.

[3] = EDF => dilution factor (extraction based). DF = Dilution factor (post extraction)

[4] = Waters at full are the arbitrary VOA volume (~42mL). Water spikes and dilutions are performed on 40mL final volume.

[4] = As reported. Post spike means it's 10 µg/mL at the instrument.

RE: 23EC043B

Dear Jerry Williams:

Order No.: 24041390

Summit Environmental Technologies, Inc. received 4 sample(s) on 4/18/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Salwa A. Najjar

Project Manager

Case Narrative

WO#: **24041390**
Date: **5/3/2024**

CLIENT: Navarro Research & Engineering Inc.
Project: 23EC043B

WorkOrder Narrative:
24041390: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence Sample Notes:
24041390-001A Anions_S(9056): Sample and Sample Duplicate exhibited high RPD for Nitrogen, Nitrate due to detections < PQL.

24041390-001A Mtl-ICP_S(6010D): Corresponding MS/MSD exhibited low recoveries and high RPD possibly due to spiking error. LCS-74731 demonstrates control.

24041390-001A through 004A SVOC-MSTR_S(8270E): CCV demonstrated high recoveries for several analytes, indicating possible high bias. Sample was ND for these analytes.

24041390-001A through 004A DX-Full_S(8290): LCS-74842 exhibited high recoveries for several

analytes. Sample is ND for these analytes.;
TEQ was calculated based on the compounds detected plus the 1/2 of PQL of non-detected compounds.

Analyses	Result	RL	Qual	Units	DF	Date Analyzed
ANIONS ANALYSIS BY IC (SW-846: 9056)				**SW9056A**		Analyst: **TAL**
Nitrate	ND	1.00	m	mg/Kg	10	4/19/2024 3:04:00 PM
Nitrite	ND	1.00		mg/Kg	10	4/19/2024 3:04:00 PM

Qualifiers:

B	Analyte detected in the associated Method Blank	E	Value above quantitation range
H	Holding times for preparation or analysis exceeded	M	Manual Integration used to determine area response
ND	Not Detected	PL	Permit Limit
R	RPD outside accepted recovery limits	RL	Reporting Detection Limit
W	Sample container temperature is out of limit as specified at testcode

Qualifiers and Acronyms

WO#: **24041390**
Date: **5/3/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

WSTF CHAIN OF CUSTODY RECORD – SUMMIT

Date 4/17/2024

24041390

Laboratory: Summit (Alliance TG) PO#23EC043B

Address shipping questions to:

☐ Lori Minnick, 575-524-5119

☐ Other _____, 575-524-_____

Send sample receipt confirmation and analytical reports to:

☒ Kyle Williams, jerry.k.williams@nasa.gov

☒ Stephanie Portillo, stephanie.portillo@nasa.gov

Special Instructions

Return coolers and reusable packaging materials within 14 days as required in statement of work to:

Return Address:

NASA WSTF Environmental Department
12600 NASA Road; Bldg. 120
Las Cruces, NM 88012
Attn: Lori Minnick

NARRATIVE

(M607-939)

CLIENT:	**Navarro Research and Engineering Inc.**
SwRI PROJECT #:	**26040.09.001**
BATCH #:	**M607-939**
TASK ORDERS:	**240418-7**
REPORT DATE:	**04/30/2024**

NARRATIVE FOR NDMA/DMN/BROMACIL ANALYSIS

1. Samples were extracted with dichloromethane (DCM) and analyzed by GC/MS in selective ion monitoring mode for N-Nitrosodimethylamine (NDMA), N-Nitrodimethylamine (DMN) and Bromacil according to the modified Method 607.

2. All soil samples were extracted within 14 days of collection date and were analyzed within 28 days from extraction date.

3. The sample reporting limit is 0.33 ppb (ng/g; µg/kg) for 30 gram Soxhlet extraction of soil samples. All targets were quantified within the calibration curve range 0.33 - 167 ng/g.

4. Laboratory control sample (LCS) and matrix spike samples (if any) were spiked at 16.7 ppb, then extracted and analyzed. Recovery of NDMA exceeded the limit 110% but the method recovery criteria was established for aqueous matrix so it should be considered advisory. Recoveries of DMN and Bromacil met their respective criteria of 30-150% for DMN, and 40-190% for Bromacil.

5. N-Nitroso-di-n-propylamine-d14 (surrogate) was spiked into every sample before extraction at 0.50 µg/mL in extract. The surrogate recoveries for all samples were within method recovery criteria of 40-160%.

6. Laboratory process blanks (PB) and LCS using sodium sulfate as matrix were extracted and analyzed with every extraction batch.

7. A "J" value was reported if the associated value was below reporting limit.

8. All analyte concentrations are expressed in ng/g (ppb). Sample calculation:

$$\text{Concentration (ng/g; µg/kg)} = \frac{C\left(\frac{\mu g}{mL}\right) \times FV\ (mL) \times DF}{Wsamp(kg)}$$

where:
- C = result of GC/MS analysis in µg/mL
- FV = final volume of sample in mL
- W_{samp} = sample weight in kg
- DF = dilution factor, if any

1.0 INTRODUCTION

Sanborn Head & Associates, Inc. (Sanborn Head) was retained by Pace Analytical (Pace) and Navarro Research and Engineering, Inc. (Navarro) to support a program of rock core sampling at the NASA White Sands Test Facility in Las Cruces, New Mexico (Site). The purpose of this work was to assess the distribution of chlorinated volatile organic compounds (VOCs) and semi volatile organic compounds (SVOCs) within the bedrock matrix. Sampling was conducted during drilling of two core holes between the dates of April 17 and May 18, 2024.

The Core^{DFN} bedrock VOC sampling approach is a comprehensive VOC sampling method developed by Dr. Beth Parker, and Dr. Gorecki at the University of Guelph and University of Waterloo, respectively. This method has been previously applied at the Site. The Core^{DFN} method generally includes detailed logging of bedrock core including fractures, field preparation and crushing of bedrock samples to increase the surface area of the sample, field preservation of crushed samples in methanol, and laboratory extraction and analysis of the samples. This method was developed to improve quantification of VOCs in the bedrock matrix and pore water.

The unconsolidated portion of the core holes were cased to 75 and 86 feet below ground surface (ft bgs) at 300-001-GSV and 300-002-GSV, respectively. A total of 341.0 linear feet of rock was cored from 300-001-GSV and 300-002-GSV, with a total recovery of 291.40 feet. A total of 147 rock samples were collected for VOC and SVOC analysis. In addition, 8 field duplicate (FD) samples, and 8 matrix spike and matrix spike duplicate (MS/MSD) sample pair (2 samples), 10 equipment blank (EB) samples, 3 methanol blank (MB) samples, and 6 trip blank (TB) samples were also collected for VOC and SVOC analysis. Sixteen intact core samples were collected, and were sent for physical property analyses, in accordance with CORE^{DFN} procedure. Extraction and VOC and SVOC analyses of the rock core samples were conducted by the Pace Analytical (Pace) laboratory in Green Bay, Wisconsin. Physical properties samples were analyzed at WSP Canada Inc. (WSP) in Mississauga, Ontario between April and June of 2024.

Results of physical property analyses for bulk density, porosity, water content, and organic carbon content were used in conjunction with the VOC data for the calculation of rock porewater concentrations, as presented in this report. A full description of the methods used for the estimation of porewater concentrations is contained in Section 4.1.

2.0 FIELD SAMPLING COLLECTION METHODS

The following is a summary of the field methods used for drilling, rock sample collection and processing during the field program. The sampling was undertaken by two Sanborn Head Scientists working in collaboration with one Navarro geologist who logged the core and directed drilling operations from April 17 to May 18, 2024.

2.1 Drilling and Core Collection

The drilling was conducted by Yellow Jacket Drilling Services of Rancho Cucamonga, California. Coring was conducted using HQ size tooling. HQ size core barrels generate 5-foot long by 2.5-inch diameter cores. A triple-tube core barrel (HQ3) was utilized to minimize disturbance to the core. In HQ3 tooling, core samples are retained within a second inner stainless-steel tube, split

lengthwise (liners), within the core barrel. The liners are extruded from the outer core barrel after each core run using water pressure. This method was used as it limits the disturbance and mechanical breaks of the core samples and provides cores that better reflect the *in-situ* fracture distribution. Table 1 summarizes the drilling progression and the number of samples collected.

2.2 VOC and SVOC Sample Collection and Processing

Following retrieval, the core was transferred from the liners to a poly vinyl chloride (PVC) tray lined with aluminum foil. The PVC tray was placed on a table, where the core was logged, and samples were collected by a Sanborn Head scientist. Two PVC trays were utilized and decontaminated after each use; the aluminum foil was disposed between runs. Sample locations were selected for paired VOC and SVOC analysis based on fracture distributions and lithology with a target frequency of approximately one sample every 1.5 to 2.0 feet. Prior to sampling, the core was photographed with labels indicating the Site name, core hole name, run number, depth of the top and bottom of the run, and rock quality designation (RQD). Samples were collected both from fractured surfaces and from the intervening unfractured rock matrix. Samples approximately 0.1 feet thick were broken from the core using a hammer and chisel at the selected sample depths. The samples were then wrapped in aluminum foil and given a unique field ID. Following sampling and wrapping, the samples were delivered to the sample processing area. Details on sample depths, collection times, position relative to fractures, and other relevant information were recorded in the Sanborn Head electronic logs. After completion of geologic logging by Navarro and sample collection by Sanborn Head, the remainder of the core was placed in core boxes on-site.

Once samples arrived at the processing area, samples were individually unwrapped and placed in a stainless-steel trimming cell. The outer portion of the sample (that had been exposed to drill tooling and fluids) was removed with a hammer and chisel. The remaining subsample was then placed in a stainless-steel cell and crushed using a hydraulic press at a pressure of approximately 6,000 psi. For VOC samples, the crushed subsample was then transferred to a pre-labeled and pre-weighed 40 mL VOA vial containing 15 mL of purge-and-trap grade methanol. Purge-and-trap grade methanol is a high-grade methanol used for Gas chromatography/Mass spectrometry (GS/MS) VOC analysis. For SVOC samples, the crushed subsample was transferred to a pre-labeled and pre-weighed unpreserved 40 mL amber VOA.

Trimming cells, crushing cells, chisels, and all other equipment associated with sample processing were decontaminated between each subsample. Sanborn Head provided 6 sets of trimming cells, crushing cells, and chisels enabling staff to process all samples from a given run before starting the five-step decontamination process. The five-step decontamination process involves: (1) full immersion in detergent (Alconox™) wash with scrubbing to remove sediment, (2) full immersion and rinse in distilled or spring water, (3) spray rinse with clean high-performance liquid chromatography (HPLC) grade methanol, (4) spray rinse with clean distilled or spring water to remove any traces of methanol, and (5) drying with clean/disposable towels before next use.

Sample vials were prepared by Pace at their Green Bay, Wisconsin laboratory and sent to the Site. Vials were labeled and weighed after the addition of 15 mL of purge-and-trap grade

methanol, and again after the addition of crushed rock. Calibration of the balance was checked daily. Sample vial IDs were cross-referenced with the field ID, which in turn references a sample depth. Sample depths were used to generate sample IDs which are unique to each sample depth and drilling location. Each sample was labeled with its sample ID and submitted to Pace's laboratory in Green Bay, Wisconsin for analysis (see description of method, below). Samples were kept on ice in coolers on Site by Sanborn Head until being shipped to the Green Bay Pace laboratory on ice by Sanborn Head and analyzed for VOCs and SVOCs.

In total, 147 samples were collected for VOC and SVOC analysis from 291.40 ft of rock retrieved from the two core holes. During sample packing one soil sample vial broke (VOC-0175: 300-001-GSV-230.05-VOC_20240518); therefore, analysis of this sample could not be completed. Eight FDs were collected by crushing additional mass of selected field samples. Eight MS/MSD sample pairs were collected by crushing additional mass of selected field samples. Nine TBs were sent within the coolers shipped to Pace to determine possible cross contamination within the coolers during shipment.

2.3 Physical Property Sample Collection

Sixteen 0.5-0.6 ft long intact samples were collected from the rock cores and were sent for analysis of physical properties (porosity, bulk density, water content, specific gravity, and total organic carbon (TOC). Physical property samples were not collected until after VOC sample collection was completed for each applicable run. Details about lithology, grain size, sample depth interval, and other relevant information were recorded on field forms. Samples were wrapped first with parafilm, then foil, and then sealed in a plastic bag with a vacuum sealer to limit moisture loss. Each sample was shipped on ice under Chain of Custody to WSP for analysis by Sanborn Head.

WSP analyzed the porosity and bulk density via Method ASTM D7263; water content via Methods ASTM D2216 and ASTM D4318; specific gravity via Method ASTM D854; and TOC via the Walkley and Black method. A summary of the samples collected for these physical property analyses are presented in Table 2 and the results of these analyses are presented in Table 3. The physical property sample analytical reports are found in Appendix B.

3.0 LABORATORY ANALYSIS AND VOC EXTRACTION

Sample extraction and analysis was performed at Pace laboratory in Green Bay, Wisconsin. Samples were extracted into methanol for analysis by microwave assisted extraction (MAE) of VOCs and SVOCs from rock samples. The methanol extracts were analyzed for VOCs with GC/MS for 24 target VOCs: 1,1,1-trichloroethane, 1,1,2-trichlorotrifluoroethane, 1,1-dichloroethene, 1,2-dichloroethene, 2-butanone (MEK), 2-hexanone, 2-propanol, acetone, benzene, bromodichloromethane, bromoform, chlorobenzene, chloroform, chloromethane, dibromochloromethane, dichlorofluoromethane, m&p-xylene, methylene chloride, methyl-tert-butyl ether, tetrachloroethene, toluene, trans-1,2-dichloroethene, trichloroethene, and trichlorofluoromethane. The unpreserved vials were analyzed for SVOCs with EPA Method 8270E for five target SVOCs: 1,4-dioxane, bis(2-ethylhexyl) phthalate, di-n-butylphthalate, n-nitrodimethylamine, and n-nitrosodimethylamine.

Pace's laboratory report is presented in Appendix A.

4.0 RESULTS

The following sections provide the results of the rock core chemical analyses and a discussion of the method of estimation of porewater concentration and VOC mass estimated from that data.

4.1 Rock Core VOC Results and Porewater Estimates

A summary of core sample depths is provided in Table 1. VOC and SVOC concentrations from laboratory analysis of bedrock are provided in Table 4. Estimates of porewater concentrations are provided in Table 5 for those samples where analytes were detected above laboratory reporting limits. The estimated porewater calculations were not completed for the SVOC samples as no detections were reported in the samples.

The concentrations of the analytes extracted into methanol (C_{MEOH}) were measured using GC/MS methods as µg/L in methanol. The concentrations of analytes in the bulk rock (C_t) sample were then calculated by Pace using the analysis of the methanol extract (C_{MEOH}) µg, mass of crushed rock in sample (M_{rock}) in g and volume of methanol (V_{MEOH}) in mL as follows:

$$C_t = \frac{C_{MeOH} \times V_{MeOH}}{M_{rock}}$$

This calculation reflects total VOC mass present in dissolved, sorbed, and immiscible phases.

Sample limits of detection (LDs) can be calculated for each sample from the above equation by setting the C_{MEOH} to the respective values for each analyte. For samples where the analyte was analyzed for, but was not detected above the limit of quantitation, the results are flagged with a "ND." Samples flagged with a "J" designation indicate the analyte was detected but is below the limit of quantitation but above the LD, the concentration is estimated.

The bulk rock VOC concentrations (C_t) are converted to matrix pore water concentrations (C_w) in µg/L of pore water utilizing the wet rock bulk density in grams per cubic centimeter (g/cm^3 - $P_{b(wet)}$); the dry rock bulk density ($P_{b(dry)}$) in g/cm^3; matrix porosity, a unitless factor (Ø); and the soil-water partitioning coefficient (K_d) in mL/g as shown below:

$$C_w = \frac{C_t P_{b(wet)}}{K_d P_{b[dry]} + \emptyset}$$

This equation assumes that the matrix porosity (i.e., primary porosity) is 100% saturated with water and that the VOC mass occurs in only the dissolved and sorbed phases (i.e., no NAPL is present). Pore water concentrations that approach or exceed aqueous solubility limits for given compounds may indicate the presence of DNAPL (Feenstra et al, 1991).

The partitioning coefficient (K_d) is based on the assumption that sorption is rapid, reversible, and that there is no variation with concentration. This coefficient is calculated using the organic carbon partitioning coefficient (K_{oc}) in mL/g for each compound, obtained from the literature (e.g., Pankow and Cherry, 1996) or other sources, and fraction of organic carbon (f_{oc}) in % obtained through physical property analysis using the following equation:

$$K_d = K_{oc} f_{oc}$$

This coefficient assumes that sorption is entirely dependent upon solid phase organic carbon in the rock matrix, based on the fact that the VOCs of interest have relatively low molecular weights (Schwarzenbach et al. 1993).

Physical property tests were conducted by WSP. Full laboratory reports for these analyses are provided in Appendix B. These results are summarized in Table 3. Physical properties samples were representative of the major rock types encountered on the Site (andesite, rhyolite, breccia, limestone, and conglomerate). The values for porosity (Ø) bulk density (ρ_b), and fraction of organic carbon (f_{oc}) used to estimate matrix porewater concentrations are based on the closest physical property sample collected, taking into consideration, and pairing the VOC sample with the physical property sample that was most representative, by depth and lithology, and applied to the VOC sample. The selection of physical properties has a direct correlation to the predicted porewater concentrations. As such, Navarro evaluated the appropriateness of the physical samples selected for these calculations based on its understanding of the geologic conditions at the Site. As necessary, Sanborn Head adjusted the porewater concentration calculations.

Table A lists the (K_{oc}) values used to calculate matrix porewater concentrations, and the source for these values for those compounds that were detected.

Table A: Organic Carbon Partitioning Coefficients

Volatile Organic Compound	Koc Value (mL/g)	Reference
1,1,2-Trichlorotrifluoroethane	372	http://www.epa.gov/chemfact/s_freon.txt
Benzene	59	Pankow and Cherry (1996)
Chlorobenzene	330	Pankow and Cherry (1996)
Methylene Chloride	25	http://epa.gov/chemfact/s_dcm.txt (1994)
Toluene	182	http://www.epa.gov/superfund/health/conmedia/soil/pdfs/appd_k.pdf
Trichlorofluoromethane	159	Pankow and Cherry (1996)

VOC concentrations in rock (as ug/kg) are shown in Table 4. Estimated pore water concentrations (as µg/L) for each sample for which a compound was detected are shown in Table 5. These concentrations were calculated using the porosity (Ø), bulk density (P_b), and (f_{oc}) calculated from the total organic carbon as reported by WSP. Sanborn Head, using the physical property groupings/zones established by Navarro, calculated porewater concentrations for each VOC sample for each analyte that was detected above laboratory reporting limits.

4.2 Figures

Concentrations of benzene and trichlorofluoromethane in µg/kg, along with other information are presented in the logs for borehole 300-001-GSV (Figure 1) and borehole 300-002-GSV (Figure 2).

4.3 Results from Field Blanks and Duplicates

EBs were collected at the beginning and end of the field effort and at a minimum frequency of 1 EB for every core hole. To collect EBs for VOCs, Kim-wipes® (or other disposable delicate task wipes) were removed from a pre-prepped and pre-labeled vial containing 15 mL of purge-and-trap grade methanol then used to wipe the inside of decontaminated crushing cells and other equipment that had come in contact with subsamples. Kim-wipes® were then placed back into the pre-labeled vials they were taken from. To collect EBs for SVOCs, laboratory provided deionized water was poured over decontaminated crushing cells and other equipment that had come in contact with the subsamples. The water was collected in a pre-labeled 100mL bottle and shipped for SVOC analysis.

Field blank results, including EBs, MBs and TBs are provided with the analytical report in Appendix A, and summarized in Table 6. No analytes were detected above laboratory quantitation limits in any of the blanks, EBs or TBs. One trip blank, TB-01_20240422 had an estimated value (analyte was detected below the quantitation limit, but above the detection limit) for methylene chloride (a common laboratory contaminant). This result was compared with all samples associated with the cooler of samples shipped with this trip blank. None of the samples associated with the shipment had any detection of methylene chloride and therefore no cross-contamination sourced from Site samples is likely for this analyte.

Comparisons for the field duplicate samples are provided in Table 7. Relative percent difference (RPD) is calculated by taking the absolute difference of the two values, dividing by the average of the two values and multiplying by 100. The target RPD for solid samples is less than 50% RPD for field duplicate samples. Field duplicates test and reflect the repeatability of the entire sample processing, extraction, and analytical procedures, and thus are expected to show more variability than laboratory duplicates. This dataset had one sample / FD pair where the calculated RPD was greater than the 50% value that is typically used for solid samples; therefore, the sample result was an estimated “J” flagged value.

Notes:

1. Samples submitted to WSP Canada, Inc. for physical parameter testing (porosity via Method ASTM D7263, water content via Methods ASTM D2216 and ASTM D4318; bulk density via Method ASTM D7263, specific gravity via Method ASTM D854 and TOC via Walkley and Black).

2. Sample results are the average of the two results reported, when applicable.

3. Porosity and Specific Gravity are unitless designated by (-).

TABLE 4

TABLE 4
Total VOC Concentrations in Rock Core Samples

Samples (1)			Comments/Observations (2)			VOC Analytical Results µg/kg (3)																								
Sample ID	Top Depth (ft bgs)	Bottom Depth (ft bgs)	Sample Lithology (2a)	Sample Type (2b)	Position Relative to Feature (2c)	1,1,1-Trichloroethane	1,1,2-Trichlorotrifluoroethane	1,1-Dichloroethene	1,2-Dichloroethane	2-Butanone (MEK)	2-Hexanone	2-Propanol	Acetone	Benzene	Bromodichloromethane	Bromoform	Chlorobenzene	Chloroform	Chloromethane	Dibromochloromethane	Dichlorofluoromethane	m&p-Xylene	Methylene Chloride	Methyl-tert-butyl ether	Tetrachloroethene	Toluene	trans-1,2-Dichloroethene	Trichloroethene	Trichlorofluoromethane

Notes:
1. This table presents data recorded in conducting field sampling and laboratory analysis of rock core samples. The samd & Associates, Inc. (Sanborn Head) personnel and analyzed by Pace Analytical where they were extracted and analyzed for the listed target Volatile Organic Compounds (VOCs) and Semi Volatile Organic COmpounds (SVOCs). Refer to the Sanborn Head report text and tables for additional details regarding sampling, sample preparation, extraction, and analysis.

2. The Comments/Observations section includes general notes regarding the sample characteristics, field classified lithanborn Head standard protocols as explained further below.
   a) Lithology reflects Sanborn Head and Navarro personnel classification of the sample at the time of collection.
   b) Sample type differentiates between feature surface (e.g. including a fracture face) ; or a matrix sample = somence in 2c)
   c) Position relative to feature indicates the position of the sample relative to observed features (e.g. fractures) inf
      "Between Fracture"= between closely spaced fractures;
      "Above Fracture"=above fracture surface;
      "Below Fracture"=below fracture surface;
      "f#" = sample distance in tenths of feet from fracture surface;
      "NA" = not applicable.
3. The laboratory results for VOCs and SVOCs in rock are expressed in units of micrograms per kilogram (µg/kg) of rock compounds included.
   "<" indicates that the analyte was analyzed for, but was not detected above the indicated quantitation limit
   "J" indicates the analyte was detected below the quantitation limit, but above the detection limit, and the concent

Notes

1. This table presents data recorded in conducting field sampling and laboratory analysis of rock core samples from coring locations: 300-001-GSV and 300-002-GSV. The samples were collected, processed and preserved in the field by Sanborn Head & Associates, Inc. (Sanborn Head) personnel and analyzed in Pace Analytical's laboratory where they were extracted and analyzed for the listed target Volatile Organic Compounds (VOCs) and Semi Volatile Organic Compounds (SVOCs) using methods developed by the University of Guelph. Refer to the Sanborn Head report text and tables for additional details regarding sampling, sample preparation, extraction, and analysis.

2. The Comments/Interpretation section include general notes regarding the sample characteristics, field classified lithology, position relative to fracturing, and type of fracturing according to Sanborn Head standard protocols as explained further below.
   a) Lithology reflects Sanborn Head and Navarro personnel classification of the sample at the time of collection.
   b) Sample type differentiates between surface, lithology change or matrix some distance away from the nearest fracture or other feature (see "f#" reference in 2c).
   c) Position relative to feature indicates the position of the sample relative to observed features (e.g. fractures) inferred to reflect insitu features with the following legend:
      Above Feature = sampled above and inclusive of feature;
      Below Feature = sampled below and inclusive of feature;
      "f#" = sampled distance in tenths of feet from fracture surface;
      "NA" = not applicable.
   d) Physical Property Sample designates which physical property sample was used as part of the estimated porewater concentration calculations.

3. The Estimated Pore Water Concentration in micrograms per liter (ug/L) represents an estimate of the equivalent matrix porewater concentrations (Cw) computed based on the laboratory determined total mass concentration (µg/kg of wet rock), as outlined in the report text, using estimated or measured parameters including rock wet bulk density (g/cm3) as received in the field, matrix porosity, and matrix retardation factor (R). This simplified partitioning analysis assumes the rock matrix porosity was fully saturated with water, and that mass occurs at equilibrium in the dissolved and sorbed phase. Refer to the Pace report text for additional details.

4. Estimated Porewater concentrations have been calculated for select VOCs. These calculations were not completed for SVOCs as there were no detections observed in any of the samples. The values are rounded to two significant figures. Please refer to the analytical report text and appendices for information regarding detection and quantitation limits. The second column for each compound denotes quality assurance flags that have been carried through from the µg/kg analytical results including:
   "<" indicates that the analyte was analyzed for, but was not detected above the indicated quantitation limit.
   "J" indicates the analyte was detected below the quantitation limit, but above the detection limit, and the concentration is estimated.
   See Laboratory Analytical Report for further explanation.

RE: Project: WHITE SANDS 6119.00.020
Pace Project No.: 40277226

Dear Jessica Bulova:

Enclosed are the analytical results for sample(s) received by the laboratory on April 23, 2024. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Green Bay

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tod Noltemeyer

PROJECT NARRATIVE

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40277226

Method: **EPA 8270E**
Description: 8270E MSSV FULL LIST MICROWAVE
Client: Sanborn, Head & Associates
Date: May 06, 2024

General Information:
75 samples were analyzed for EPA 8270E by Pace Analytical Services Green Bay. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3546 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

QC Batch: 472660

CH: The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.

PROJECT NARRATIVE

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40277226

Method: **EPA 8270E**
Description: 8270E MSSV FULL LIST MICROWAVE
Client: Sanborn, Head & Associates
Date: May 06, 2024

QC Batch: 472882

L2: Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
- LCS (Lab ID: 2708621)
  - N-Nitrodimethylamine

R1: RPD value was outside control limits.
- LCSD (Lab ID: 2708622)
  - N-Nitrosodimethylamine

QC Batch: 473062

L2: Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
- LCSD (Lab ID: 2709274)
  - N-Nitrodimethylamine

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 472917

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 40277353002

M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- MS (Lab ID: 2708855)
  - N-Nitrodimethylamine

R1: RPD value was outside control limits.
- MSD (Lab ID: 2708856)
  - N-Nitrodimethylamine

Additional Comments:

Batch Comments:

The LCS and DUPLICATE failed for N-Nitrodimethylamine. There are insufficient data points for laboratory generated limits so default limits were used. There was insufficient sample amount to re-extract and re-analyze.
- QC Batch: 472883

The LCSD failed for N-Nitrodimethylamine. There are insufficient data points for laboratory generated limits so default limits were used. There was an insufficient sample amount to re-extract and re-analyze.
- QC Batch: 473158

PROJECT NARRATIVE

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40277226

Method: **EPA 8270E**
Description: 8270E MSSV Low Volume
Client: Sanborn, Head & Associates
Date: May 06, 2024

General Information:
5 samples were analyzed for EPA 8270E by Pace Analytical Services Green Bay. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3510 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 472533

A matrix spike/matrix spike duplicate was not performed due to insufficient sample volume.

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40277226

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

BATCH QUALIFIERS

Batch: 472597

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

Batch: 472883

[1] The LCS and DUPLICATE failed for N-Nitrodimethylamine. There are insufficient data points for laboratory generated limits so default limits were used. There was insufficient sample amount to re-extract and re-analyze.

Batch: 473158

[1] The LCSD failed for N-Nitrodimethylamine. There are insufficient data points for laboratory generated limits so default limits were used. There was an insufficient sample amount to re-extract and re-analyze.

ANALYTE QUALIFIERS

CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
R1	RPD value was outside control limits.
S0	Surrogate recovery outside laboratory control limits.

RE: Project: WHITE SANDS 6119.00.020
Pace Project No.: 40277236

Dear Jessica Bulova:

Enclosed are the analytical results for sample(s) received by the laboratory on April 23, 2024. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

Some analyses were subcontracted outside of the Pace Network. The test report from the external subcontractor is attached to this report in its entirety.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Green Bay

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tod Noltemeyer

PROJECT NARRATIVE

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40277236

Method: **EPA 8260**
Description: 8260 MSV Med Level MAE
Client: Sanborn, Head & Associates
Date: May 10, 2024

General Information:
84 samples were analyzed for EPA 8260 by Pace Analytical Services Green Bay. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3546 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

QC Batch: 472531

v1: The continuing calibration verification was above the method acceptance limit. Any detection for the analyte in the associated samples may have a high bias.

PROJECT NARRATIVE

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40277236

Method: **EPA 8260**
Description: 8260 MSV Med Level MAE
Client: Sanborn, Head & Associates
Date: May 10, 2024

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

QC Batch: 472531

L2: Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
- LCS (Lab ID: 2706292)
  - Chloromethane

QC Batch: 472541

L2: Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
- LCS (Lab ID: 2706327)
  - Chloromethane

QC Batch: 472668

L2: Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
- LCS (Lab ID: 2707097)
  - Chloroform

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 472531

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 40277236025

M0: Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
- MS (Lab ID: 2706293)
  - Chloromethane
- MSD (Lab ID: 2706294)
  - Chloromethane

QC Batch: 472541

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 40277236046

M0: Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
- MS (Lab ID: 2706328)
  - Chloromethane
- MSD (Lab ID: 2706329)
  - Chloromethane

QUALIFIERS

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40277236

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
R1	RPD value was outside control limits.
v1	The continuing calibration verification was above the method acceptance limit. Any detection for the analyte in the associated samples may have a high bias.
v2	The continuing calibration verification was below the method acceptance limit. The analyte was not detected in the associated samples and the sensitivity of the instrument was verified with a reporting limit check standard.

RE: Project: 6119.00.020
Pace Project No.: 40278528

Dear Jessica Bulova:

Enclosed are the analytical results for sample(s) received by the laboratory on May 21, 2024. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Green Bay

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tod Noltemeyer

PROJECT NARRATIVE

Project: 6119.00.020
Pace Project No.: 40278528

Method: **EPA 8260**
Description: 8260 MSV Med Level MAE
Client: Sanborn, Head & Associates
Date: May 30, 2024

General Information:
88 samples were analyzed for EPA 8260 by Pace Analytical Services Green Bay. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3546 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

QC Batch: 475115

v1: The continuing calibration verification was above the method acceptance limit. Any detection for the analyte in the associated samples may have a high bias.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

QC Batch: 475000

L2: Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.

- LCS (Lab ID: 2720563)
  - Chloromethane

QC Batch: 475089

L2: Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.

- LCS (Lab ID: 2721015)
  - Chloromethane

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

PROJECT NARRATIVE

Project: 6119.00.020
Pace Project No.: 40278528

Method: **EPA 8260**
Description: 8260 MSV Med Level MAE
Client: Sanborn, Head & Associates
Date: May 30, 2024

QC Batch: 475000

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 40278528019

M0: Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

- MS (Lab ID: 2720564)
  - Chloromethane
- MSD (Lab ID: 2720565)
  - Chloromethane

QC Batch: 475089

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 40278528039

M0: Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

- MS (Lab ID: 2721016)
  - Chloromethane
- MSD (Lab ID: 2721017)
  - Chloromethane

QC Batch: 475242

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 40278528079

M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

- MSD (Lab ID: 2721931)
  - Trichloroethene

QUALIFIERS

Project: 6119.00.020
Pace Project No.: 40278528

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
v1	The continuing calibration verification was above the method acceptance limit. Any detection for the analyte in the associated samples may have a high bias.

RE: Project: WHITE SANDS 6119.00.020
Pace Project No.: 40278540

Dear Jessica Bulova:

Enclosed are the analytical results for sample(s) received by the laboratory on May 21, 2024. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Green Bay

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tod Noltemeyer

PROJECT NARRATIVE

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40278540

Method: **EPA 8270E**
Description: 8270E MSSV FULL LIST MICROWAVE
Client: Sanborn, Head & Associates
Date: June 05, 2024

General Information:
79 samples were analyzed for EPA 8270E by Pace Analytical Services Green Bay. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3546 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

QC Batch: 475338

CH: The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.

PROJECT NARRATIVE

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40278540

Method: **EPA 8270E**
Description: 8270E MSSV FULL LIST MICROWAVE
Client: Sanborn, Head & Associates
Date: June 05, 2024

QC Batch: 475611

CH: The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
- MSD (Lab ID: 2724023)
  - 2,4,6-Tribromophenol (S)

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 475483

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 40278671004

M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- MS (Lab ID: 2723303)
  - N-Nitrodimethylamine
- MSD (Lab ID: 2723304)
  - N-Nitrodimethylamine

QC Batch: 475755

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 40278540078

M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- MS (Lab ID: 2724600)
  - N-Nitrodimethylamine
- MSD (Lab ID: 2724601)
  - N-Nitrodimethylamine

PROJECT NARRATIVE

Project: WHITE SANDS 6119.00.020
Pace Project No.: 40278540

Method: **EPA 8270E**
Description: 8270E MSSV Low Volume
Client: Sanborn, Head & Associates
Date: June 05, 2024

General Information:
5 samples were analyzed for EPA 8270E by Pace Analytical Services Green Bay. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

H3: Sample was received or analysis requested beyond the recognized method holding time.
- EB-06 (Lab ID: 40278540080)

Sample Preparation:
The samples were prepared in accordance with EPA 3510 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

QC Batch: 475007

L1: Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results may be biased high.
- LCS (Lab ID: 2720610)
  - N-Nitrosodimethylamine
- LCSD (Lab ID: 2720611)
  - N-Nitrosodimethylamine

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 475007

A matrix spike/matrix spike duplicate was not performed due to insufficient sample volume.
