

Demonstration of Autonomous Rendezvous Technology (DART)

Case Study Transcript

**Welcome to the DART
Case Study**

The NASA DART project history provides a rich learning experience for anyone involved in aerospace program or project management. The Case explores a wide range of challenges, and issues relevant to the planning, formulation, design, test, and operation of a complex space system.

While the Case discusses technical aspects of DART's guidance navigation and control system it also examines the way in which the DART project was managed and the environment in which it was conducted. One will find lessons for senior management, program, and project managers as well as integrated process team leads and people in the process.
