White Fans: A New Model?

2% of the Gas can be converted back to frost.

Adiabatic Cooling

Credit: Ron Miller, Arizona State University
Early Morning

Sun is low on the horizon so little heating of the substrate occurs.
Mid Morning

Sun is higher in the sky. Sunlight shines through the CO2 ice, heating the underlying substrate.
As the sunlight heats the underlying substrate, the CO₂ slab ice starts to sublime from the bottom, thus building up pressure and causing the ice slab to levitate.
Mid Morning

Sunlight continues to heat the underlying substrate, until the pressure breaks through the CO$_2$ slab ice, causing a jet of gas to expand and cool. This cooling causes some of the gas to recondense back into frost.
Winds blow the recondensed frost downwind, where some of the frost settles to the surface, forming bright fans.
Late Morning

As the sun rises higher in the sky, the gas under the ice picks up speed, until the gas scoops up dust with it. The dust is carried out the vent.
Mid-Day

When the sun is highest in the sky, the gas under the ice is at full speed. Dust and gas spew from the vent. The dust is blown downwind and settles on the ice slab, forming a dark fan.
Early Afternoon

This process continues through early afternoon.
By mid-afternoon, the sun has sunk low enough there the substrate begins to cool and the gas pressure decreases to the point that the dust can no longer be scooped up and shot out of the vent. Adiabatic Cooling continues – forming more white fans.
By late afternoon, the sun has sunk low enough that the substrate has cooled back to CO$_2$ frost temperatures and the gas pressure under the ice slab has returned to atmospheric levels. The whole venting process has stopped.
Late Afternoon

At the end of the day, all we have left are the fans.
Summary

• Bright fans
  – are CO$_2$ frost which forms due to adiabatic cooling.
  – are seen at many vents in mid-spring.

• Dark fans
  – form when jets are under highest pressure.
  – must cover up white fans.

• Variable wind speeds/directions of fans suggest dark fans form during mid-day.
