ISS On-Orbit Status 12/31/07

New Year’s Eve... 16 times for the Expedition 16 crew of CDR Peggy Whitson (m), FE-1 Yuri Malenchenko (l) and FE-2 Dan Tani (r) while counting down to 2008!

All ISS systems continue to function nominally, except those noted previously or below.

Crew off-duty day. Underway: Week 11 of Increment 16.

Peggy and Dan began the day with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the experiment’s session file on the HRF-1 laptop for downlink. [To monitor the crewmembers’ sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

The CDR continued her support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) facility. [Today, Whitson activated the MSG, closed the vacuum vent, checked for acceptable humidity levels, and opened the SPU-10 (Sample Processing Unit #10) water valve to initiate unattended vacuum preparation. Later, in Step 2, she reset MSG, closed the water valve, again]
checked for acceptable humidity levels in the sample chamber, then opened the vent &
vacuum valves to initiate the required vacuum draw on the sample chamber. CSLM-2
examines the kinetics of competitive particle growth within a liquid matrix. During this
process, small particles shrink by losing atoms to larger particles, causing the larger
particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the
mechanisms and rates of coarsening that govern the manufacture with metals from turbine
blades to dental amalgam fillings.]

Peggy also checked the MELFI (Minus Eighty Degree Laboratory Freezer for ISS) to see
whether its current N\textsubscript{2} (nitrogen) pressure is in acceptable range.

FE-2 Tani performed the daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3)
science payload, running by itself in Node-2 since 12/13 (briefly interrupted for EVA-13
photo support). The status check, conducted on the last image taken by the DCS 760
digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify
proper image focus and camera alignment. [The SSC (Station Support Computer) is
taking photography of the phase separation occurring in the BCAT Sample 3, with the
photo flash going off every half hour.]

Dan also worked on the OpsLAN (Operations Local Area Network), disconnecting the IBM
760XD laptop from the OCA router assembly and stowing it away for use as a future
Russian spare.

The CDR ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA
(Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the
CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The
CGBA incubator is controlled from the ground, with automatic video downlinked to Earth.
ANITA continues to collect data every six seconds and downlinks the data daily to the
ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS
cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants.
The experiment is testing the accuracy and reliability of this technology as a potential next-
generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is
a cooperative investigation with ESA.]

FE-1 Malenchenko dumped application software log files from the Russian BVS (Onboard
Computer System) RS3 laptop to a CD-ROM disk for subsequent downlink to the ground.

Whitson & Tani assembled and configured new equipment from the ACS (Atmosphere
Control System) modification kit for installation in the Regenerative ECLSS (Environment
Control & Life Support System). [In support of the activities, the ground temporarily
deactivated the LAB1PD1 rack smoke detector.]

Malenchenko completed of the routine servicing of the SOZh system (Russian ECLSS) in
the SM (Service Module). [Regular daily SOZh maintenance consists, among else, of
checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers
and replacement of EDV-SV waste water and EDV-U urine containers.]
With the Elektron oxygen (O₂) generator turned off since 12/28, Yuri performed a 1-hour O₂ repress of the cabin atmosphere from Progress M-62/27P storage tankage. [The Elektron will remain powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]

The crew worked out in their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:40am EST, Peggy & Dan supported an interactive PAO interview event on ABC-TV’s “Good Morning America” (David Muir), via Ku- and S-band.

CEO photo targets uplinked for today again were Polar Mesospheric Clouds — (PMC - also known as noctilucent clouds) over selected ground sites (12 minutes for each). (Southern spring is the season for relatively uncommon polar mesospheric clouds to form very high over Antarctica. PMC are being studied as part of the International Polar Year [IPY] investigation of climate change in high latitudes. PMC form in the stratosphere and higher, i.e. well above the lowest layer of the atmosphere [troposphere, or weather layer, characterized by clouds, and an orange tinge produced by brushfire smoke, smog, etc.]. The AIM satellite (Aeronomy of Ice in the Atmosphere) has recently been launched to investigate how PMC form and why they are apparently becoming thicker and brighter. ISS/CEO imagery will complement images from AIM and from the ground. The collaborating IPY scientist is excited to receive any images ISS may acquire. Collaborating Swedish scientists are now working at a base in Antarctica (73S 13 W) for PMC observation.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 8:09am EST [= epoch]):
- Mean altitude -- 335.5 km
- Apogee height -- 336.7 km
- Perigee height -- 334.3 km
- Period -- 91.24 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001773
Solar Beta Angle -- -65.6 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 75 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52191

**Significant Events Ahead (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):**

TBD -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.
TBD -- STS-122/Atlantis/1E docking
TBD -- STS-122/Atlantis/1E undocking
01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [Check it out at http://usspace50.com]
02/06/08 -- Progress M-62/27P undocking & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking (DC1)
02/22/08 -- NET: ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/06/08 -- ATV-1 Demo Day 1
03/12/08 -- ATV-1 Demo Day 2
03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08 -- NET: ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- ISS 10 Years
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- Constellation’s Ares I-X Launch
05/??/09 -- Six-person crew on ISS  (following Soyuz 18S-2 docking)

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/30/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani. New Year’s Eve’s Eve! Ahead: Week 11 of Increment 16.

Peggy Whitson and Dan Tani began the day with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the experiment’s session file on the HRF-1 laptop for downlink. [To monitor the crewmembers’ sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

The crew performed the regular weekly three-hour task of thorough station cleaning. ["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

Continuing his troubleshooting of the Russian SKV2 air conditioner, FE-1 Malenchenko finished cleaning the condensate line that pulls condensate from the SKV-2 air conditioner by means of the NOK-2 condensate evacuation pump. [On 12/28, Yuri had found a “rubbery, jelly-like” substance inside the inlet line of which he at that time removed as much as he could. The remainder of the pipe was cleaned today. The NOK-2 pump was to be permanently installed once the condensate & inlet line cleaning is complete. These activities are in support of SKV-2 troubleshooting that began after SKV-2 and the SRVK condensate processing]
unit in the RS (Russian Segment) shut down on 12/23 (last Sunday). SRVK and SKV-2 both remain operational, but are currently deactivated. SKV-1 has been inoperable for some time.]

Afterwards Malenchenko terminated the test compression of the Progress Rodnik BV1 & BV2 water tank bladders, to check for leak tightness, and tore down the pumping equipment for stowage.  [Each of the spherical Rodnik tanks BV1 & BV2 consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane and is leak-tested before water transfer and the subsequent reception of liquid waste for disposal.]

With the Elektron oxygen (O2) generator turned off since 12/28, Yuri was scheduled today to perform a 1.5-hour O2 repress of the cabin atmosphere from Progress M-62/27P storage tankage, upon TsUP Go.  [The Elektron will remain powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]

FE-2 Tani performed the daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment.  [The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]

CDR Whitson continued her support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox), today transferring the data for SPU-13 (Sample Processing Unit 13) from the ECU (Electronics Control Unit) to the MSG Laptop, then removing SPU-13 from the WV (Work Volume) and reinstalling SPU-10 for double-checking its humidity. MSG will then be powered down.  [If humidity level checks out correctly at 99%, that will be the end of CSLM-2 operations.]

Malenchenko also completed of the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.  [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]
After Houston Flight Controllers deactivated the CDRA (Carbon Dioxide Removal Assembly) late yesterday (~5:00pm EST) when Dan Tani’s work with the SPHERES experiment was finished, and cooling was no longer required, Peggy Whitson today disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper to the CDRA (LAB1D6) rack.

The crew worked out in their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exerciser (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Working from his discretionary “time permitting” task list, the FE-1 also completed another radiation data monitoring & logging session for flow & dose power data with the Matryoshka-R radiation payload and its LULIN-5 electronics box.

[Accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel.]

Led by Yuri Malenchenko, at ~5:00am EST the crew donned their flight suits and supported three formal live PAO TV downlinks with greetings and congratulations to special Russian educational events, viz. --

1. Moscow Region Scientists on Russia’s annual Science Day [Russian Science Day is celebrated annually on February 8. “...the crew of the International Space Station is extending their heartfelt greetings to extraordinary scientists, engineers, and designers of the Moscow Region and wishes them a Happy Russian Science Day.”];

2. Participants of a Scientific Conference dedicated to the 50th Anniversary of the Space Era [“...these days when humankind enters the second half century of the Space Era having celebrated its 50th anniversary, you are gathered to once again remember and honor the individuals who made it possible for humanity to break into space and open it for further exploration. By a quirk of history, many of these trailblazers were men and women in uniform. While not forgetting about defending the Motherland, these people, still hot from the battles of the Great Patriotic War, channeled their thoughts and deeds to purely peaceful objectives. One of such tasks had literally cosmic proportions… Long live the Union of Space Force Veterans!”]; andke

objectives of the Readings: “To stimulate trainees for in-depth study of the achievements of cosmonautics, to scout and provide support for gifted students, to promote innovative aerospace educational programs using Earth images from space, and to provide career guidance to a younger generation.”]

The crewmembers each had a “New Year’s Eve’s Eve” PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop), Yuri at ~4:00am, Peggy at ~12:40pm, and Dan at ~2:55pm.

CEO photo targets uplinked for today again were Polar Mesospheric Clouds — (PMC - also known as noctilucent clouds) over selected ground sites (12 minutes for each). (Southern spring is the season for relatively uncommon polar mesospheric clouds to form very high over Antarctica. PMC are being studied as part of the International Polar Year [IPY] investigation of climate change in high latitudes. PMC form in the stratosphere and higher, i.e. well above the lowest layer of the atmosphere [troposphere, or weather layer, characterized by clouds, and an orange tinge produced by brushfire smoke, smog, etc.]. The AIM satellite (Aeronomy of Ice in the Atmosphere) has recently been launched to investigate how PMC form and why they are apparently becoming thicker and brighter. ISS/CEO imagery will complement images from AIM and from the ground. The collaborating IPY scientist is excited to receive any images ISS may acquire. Collaborating Swedish scientists are now working at a base in Antarctica (73S 13 W) for PMC observation.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 9:01am EST [= epoch]):
Mean altitude -- 335.6 km
Apogee height -- 336.7 km
Perigee height -- 334.4 km
Period -- 91.24 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0001721
Solar Beta Angle -- -69.5 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 88 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52176

**Significant Events Ahead** *(all dates Eastern Standard, some changes possible. NET = Not Earlier Than):*

TBD -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.
TBD -- STS-122/Atlantis/1E docking
TBD -- STS-122/Atlantis/1E undocking

01/31/08 -- **Explorer-1 50 Years** *(1st U.S. Satellite on Redstone rocket)* [Check it out at http://usspace50.com]

11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation’s Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)

Note: The daily ISS On-Orbit Status reports can also be found at [http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
ISS On-Orbit Status 12/29/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work.

Whitson and Tani began the day with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the experiment’s session file on the HRF-1 laptop for downlink. [To monitor the crewmembers’ sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

Preparatory to potable water transfer from Progress M-62/27P to the Service Module (SM), FE-1 Malenchenko set up pumping equipment and initiated the compression of the Progress Rodnik BV1 tank bladder, monitoring air flow to check for leak tightness (hermeticity). Later, the FE-1 switched the compressor to the second tank, BV2, for the bladder check. [Each of the spherical Rodnik tanks BV1 & BV2 consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane and is leak-tested before water transfer and the subsequent reception of liquid waste for disposal.]

Yuri Malenchenko later worked on the Russian SOTR Thermal Control System, performing connection tests on the jumper cables installed yesterday between the KMTK Triple Channel Matrix Commutator switch and the PUVN Cabin Air Heater Control Panel, and activating the 1N1 & 2N1 pumps of the two active external thermal control systems (KOKh1, KOKh2) of the SM.

After a brief familiarization review of reference material, FE-2 Dan Tani conducted
another session with the payload SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), which he had selected for today’s Voluntary Weekend Science program. In support of this interesting experiment, the ground yesterday activated CDRA (Carbon Dioxide Removal Assembly) and will turn it off later today (~5:00pm EST). [Today’s session concentrated on the ability of a single crewperson to deploy three satellites with the assistance of a “Position Hold” mode. Due to the different air flows introduced with the addition of Node-2, the former operational environment has changed, making 3-satellite deployments more challenging. The SPHERES experiment is a test bed for the development and testing of formation flying and other multi-spacecraft control algorithms. SPHERES, done first by FE-1 Jeff Williams on Expedition 13, serves to mature autonomous satellite formation flight, rendezvous and docking algorithms in a long duration, microgravity environment. Dan set up the Work Area, dimmed GLAs (General Luminaire Assemblies), programmed & deployed three gas-propelled satellites (orange, red, blue), with five beacons, and used two PD-100 camcorders for video capture. Per applicable Flight Rule, SPHERES operations have no CO₂ (Carbon Dioxide) output constraints if the CDRA (CO₂ Removal Assembly) is operating in dual-bed or single-bed mode. Should CDRA not work properly, ECLSS (Environmental Control & Life Support System) engineers will assess the ppCO₂ flight rule requirement. The experiment run was time-critical since Ku-band is required for real-time video downlink.]

Later, Dan conducted the visual microbial (bacterial & fungal) “T+5 Day” analysis of surface samples which he collected on 12/24 with the SSK (Surface Sampling Kit) at specific locations near air diffusers. [The sampling analysis is performed once per month for the first three months, and once every three months thereafter. Bacterial and fungal air samples are taken at two locations in each module. The colony growth on the sampling slides is analyzed after five days of incubation in four Petri dishes. For onboard visual analysis of media slides from SSK (Surface Sampling Kit), MCDs (microbial capture devices) from WMK (Water Monitoring Kit), coliform detection bags from MWAK (Microbial Water Analysis Kit), and Petri dishes from the MAS (Microbial Air Sampler) kit, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]

CDR Whitson continued her support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) by terminating vacuum venting on SPU-13 (Sample Processing Unit 13), powering up the ECU (Electronics Control Unit) and started experiment operations by initiating sample heating.

In Node-2, FE-2 Tani worked on the BCAT-3 (Binary Colloidal Alloy Test-3) science
payload (running since 12/13), today mixing Sample 3 again (since the previous run probably was corrupted) and monitoring the start of the next 2-week run.  *Dan also took detailed documentary photos of the setup to show the exact angles and locations of the flash, camera, and sample module for ground scientists to better understand the lighting in the images and also for upcoming crew training sessions and procedures.  An SSC (Station Support Computer) laptop is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.*

With SAMS (Space Acceleration Measurement System), used to monitor last night’s 27P thruster firing tests, currently no longer required, Peggy configured the ER1 (EXPRESS Rack 1) by disconnecting its MTL (Moderate Temperature Loop) cooling jumper QDs (quick disconnects) to the nearby LAB1O2 UIP (Utility Interface Panel, “Z-panel”).

The FE-1 continued the current round of periodic preventive maintenance of cabin ventilation systems in the RS (Russian Segment), today cleaning “Group A” fan grilles in the SM.

Malenchenko also completed of the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.  *Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.*

Later, Yuri conducted the daily 20-min. IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Malenchenko also performed an update on the “Sigma” BNO (Ballistic Navigation Program) software on two Russian laptops, RSK1 & EGE-2 (in DOS), essentially updating ballistic service files for the new calendar year 2008 ahead, to prevent slowdown of the application (which computes real-time position of the ISS over the ground).

The crew worked out in their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate
Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from his discretionary “time permitting” task list, the FE-1 also performed the periodic collection & deletion of readings on the MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/display of the RBO-3-2 Matryoshka-R antroph-amorphous (human torso) "phantoms" located inside the station for sophisticated radiation studies, collecting radiation measurements every 15 minutes around the clock.

Led by Yuri Malenchenko, the crew supported two formal live PAO TV exchange sessions with visitors at TsUP-Moscow, viz. --

(1) At ~11:55pm EST (last night), with a gathering of top officials of FKA/Roskosmos (Anatoly Perminov), RSC-Energia (Vitaly Lopota), TsNIIMASH (Nikolai Anfimov) GCTC (Vasily Tsibliev), IBMP (Anatoly Grigorievich), Moscow Mayor’s Office (Lyudmila Shvetsova), Vologda Region Governor’s Office (Nicolai Vinogradov), Interagency State Commission (Valery Grin), and – last not least – Father Frost; and

(2) At ~2:45am, a Press Conference with mass media representatives (Channel One TV, NTV Channel, Zvezda TV Channel, Russia Today TV Channel, ITAR-TASS Russian Information & Telegraph Agency, INTERFAX Information Agency, RIA Novosti Information-Analytical Agency, Kaliningradskaya Pravda Newspaper, and others).

Elektron Deactivation: The FE-1 and TsUP specialists yesterday performed a planned deactivation of the Elektron. As part of the deactivation process the Elektron was purged with N₂ (nitrogen). The FE-1 had to swap the RS Laptop 1 with Laptop 2 to complete the purge successfully. The Elektron will remain powered down until 1/9/08. During this time, the station will be periodically repressurized with oxygen from Progress 27P.

Crew Provisions Audit: CDR Whitson yesterday completed a portion of the Increment 16 Crew Provisions Audit, going by an uplinked work sheet. The audit was performed to update onboard crew provision quantities for IMS accuracy and resupply planning. Some of the items audited included miscellaneous workout equipment and crew hygiene and clothing items.

Weekly Science Update (Expedition Sixteen -- Week 10)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): In progress.
ANITA: Completed.

**BCAT (Binary Colloidal Alloy Test):** BCAT-3 has had a very successful week. Dan has successfully set up BCAT-3 on the ceiling seat tracks and handrails in Node-2 after seeing that he did not need to use the MWA surface to mount and run the experiment. He may have remembered seeing a future setup option during BCAT-4 training, which was designed to not monopolize the often needed MWA surface, while allowing BCAT to be able to be run, uninterrupted, for far longer periods of time. Researchers are particularly grateful for Dan's continued willingness to tweak the setup, interactively, as they receive images automatically from EarthKAM. After several rounds of minor tweaks, the photos are now as good as any seen from the MWA-based setups. "This is great news as we are trying to get the similar alternate setup into the system for the future BCAT-4 runs."

**CARDIOCOG-2:** Completed.

**CCIIS (Cardiovascular & Cerebrovascular Control on Return from ISS):** Reserve.

**CFE (Capillary Flow Experiment):** Reserve.

**CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus):** In progress.

**CGBA-2 (Commercial Generic Bioprocessing Apparatus):** Complete.

**CSLM-2 (Coarsening in Solid-Liquid Mixtures 2):** 1.) SPU-11 (10.17 hour soak) - It appears that the quench did not occur as intended. The data was downloaded and analyzed and the normal quick cool down did not occur. It is possible that we may be able to get good data from SPU-11 (10.17 hour soak); we won't know until we look at the samples. 2.) SPU-10 (4 hour soak planned) - The temperature and humidity (99%) indicated a dew point of 18.8ºC which is above the max of 16ºC required to permit us to connect to the VES. Possible causes: A) Failed humidity sensor in the SPU, or B) Failed circuit in the ECU that reads the humidity sensor, or C) Water system malfunction allowing the water to enter the chamber prematurely. 3.) SPU-13 (1.6 hour soak planned) is currently being evacuated which means that the humidity (30%) and temp (22C) was good to allow connecting to the VES. Once SPU-13 is completed we may go back and install SPU-10 again. This will allow us to re-check the humidity, but it is likely that the humidity sensor in this SPU has failed and thus is giving a maxed out reading."

**EarthKAM (Earth Knowledge Acquired by Middle School Students):** Complete.

**EPO (Educational Payload Operations):** Reserve.
**ETD (Eye Tracking Device):** In progress.

**Integrated Immune:** In progress.

**KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators:** Completed.

**LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):** Complete.

**MISSE (Materials ISS Experiment):** Ongoing.

**MTR-2 (Russian radiation measurements):** Passive dosimeters measurements in DC1 “Pirs”.

**MULTIGEN-1:** MULTIGEN-1 samples will be downloaded on STS-122 (1E).

**MSG-SAME (Microgravity Science Glovebox):** Complete.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION/REPOSITORY:** "Peggy did a great job completing the FD60 Nutrition/Repository run. Blood operations were completed in record time”.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** Ongoing.

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** Peggy completed the Actiwatch download(initialization activity off the task list. The ground will downlink those files soon and send them to the PI. “We appreciate the additional sleep logging. Peggy is going above and beyond the requirements, and the PI greatly appreciates it. We will still add sleep logging to Peggy’s task list during weeks she will be sleep shifting.” Dan completed his second week of sleep logging. “We still need to capture eleven days of sleep logging to fulfill the requirement. We will make sure these are on Dan’s task list. We appreciate Dan’s participation”.

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** In progress. To be conducted tomorrow (12/2).

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** In progress.
TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observation): On-going.

CEO photo targets uplinked for today again were Polar Mesospheric Clouds — PMC, Antarctica (IPY-PMC radar research station active. GMTs for this and PMC opportunities, uplinked, have been chosen for closeness to the Antarctic PMC radar research site at 73S 13W. Radar is switched on during ISS passes at the GMTs uplinked. But the crew was to feel free to look south during any night awake pass), Hyderabad, India (this enormous urban area has an estimated 6.1 million people. It is India’s sixth largest metro area. ISS had a nadir pass: the crew was to shoot city margins), and Khartoum, Sudan (looking right for this city, which lies on both sides of the Nile, at the confluence of the White and Blue Niles (the visual cue from ISS).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:49am EST [= epoch]):
Mean altitude -- 335.6 km
Apogee height -- 336.7 km
Perigee height -- 334.6 km
Period -- 91.25 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0001506
Solar Beta Angle -- -72.6 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 58 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52160

Significant Events Ahead (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
TBD -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.
TBD -- STS-122/Atlantis/1E docking
TBD -- STS-122/Atlantis/1E undocking
01/31/08 -- Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket) [Check it out at http://usspace50.com]
02/06/08 -- Progress M-62/27P undocking & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking (DC1)
02/22/08 -- NET: ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/22/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/06/08 -- ATV-1 Demo Day 1
03/12/08 -- ATV-1 Demo Day 2
03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08 -- NET: ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- Constellation’s Ares I-X Launch
05/??/09 -- Six-person crew on ISS (following Soyuz 18S-2 docking)

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson and FE-2 Tani began the day with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the experiment’s session file on the HRF-1 laptop for downlink. [To monitor the crewmembers’ sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

Upon wakeup, FE-1 Yuri Malenchenko terminated his fifth MBI-12 SONOKARD experiment session, started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. [SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

As part of his standard fitness evaluation, Malenchenko also undertook the Russian MO-5 MedOps protocol of Cardiovascular Evaluation during Graded Exercises on the VELO cycle ergometer, with CDR Whitson assisting as CMO (Crew Medical Officer). [The 50-min assessment, supported by ground specialist tagup via VHF (~3:55am EST) and telemetry monitoring, uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph...
cuff wired to the cycle ergometer's instrumentation panels. For the graded exercise, the subject works the pedals after a prescribed program at load settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]

After Peggy Whitson prepared the auditory test equipment, she, Malenchenko & FE-2 Tani took the periodic (monthly) O-OHA (On-Orbit Hearing Assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was the second session for the three crewmembers. [The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]

Whitson and Tani set up and activated the OUM-PFE (Oxygen Uptake Measurement - Periodic Fitness Evaluation) equipment at the HRF-2 (Human Research Facility 2) rack for another session, requiring a CEVIS cycle ergometer workout. Both crewmembers then completed the evaluation protocol, wearing HRMs (Heart Rate Monitors), with each one in turn acting as subject and operator, obtaining measurements on each other during the workout. [The equipment includes the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). In a change to previous procedures, the calibration of the DPFM (Differential Pressure Flowmeter) was done manually for the first time. Later, Peggy and Dan updated the evaluation protocol, deactivated & stowed the gear, and powered down the OUM-PFE laptop. Purpose of OUM-PFE is to measure aerobic capacity during exercise within 14 days after arrival on ISS, and once monthly during routine PFEs. The data allows exercise physiologists & flight doctors to assess the crew’s health & fitness and to provide data for modifying & updating crew-specific exercise regimes. PFE-OUM is a collaborative effort between NASA and ESA (European Space Agency).]

Yuri Malenchenko worked on the Russian SOTR Thermal Control System, rerouting and connecting jumpers between the KMTK Triple Channel Matrix Commutator switch and the PUVN Cabin Air Heater Control Panel, to ensure continued thermal
control loop operation in case of loss of communication between the Terminal & Central Computers.

Later, the FE-1 performed the periodic communication check and time synchronization between the BSPN payload server and the ISS “Wiener” power laptop, using the RSC-E “PingMaster” program, used for network checkouts.

In the Lab, Dr. Whitson serviced the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) by terminating the overnight vacuum draw on the SPU10 (Sample Processing Unit 11), opening the vent and vacuum valves for a six-hour vacuum draw on the work chamber, and setting up final operations tomorrow by installing SPU13 and initiating a last vacuum draw on it. [CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]

Continuing the current round of periodic preventive maintenance of ventilation systems in the RS (Russian Segment), Dan Tani spent half an hour in the DC1 (Docking Compartment) to replace the PF1 & PF2 air filter cartridges with fresh units.

The FE-2 also filled out the regular FFQ (Food Frequency Questionnaire), his 8th, on the MEC. [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. At TsUP/Moscow, food specialists are currently preparing the Russian food “menu” for delivery by Progress M-63/28P next February. 28P will carry “bonus food” for Peggy and Yuri, plus about 15 kg of fresh food items (apples, grapefruit, oranges, lemons, garlic) in two containers.]

Peggy connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper to the LAB1D6 rack, to support the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly) at ~12:30pm in support of tomorrow’s SPHERES experiment by Dan. [The experiment’s floating “satellite” spheres use CO2 gas as propellant.]

The CDR also replaced procedures pages in Russian ODF (Operation Data File) books with new updates delivered on Progress 27P. [Changes involve the books on SOZh Life Support, Medical Ops 1, 2 & 3, Technical Experiments, Medical
Experiments 1 & 2, and Progress M-62/27P Transfer Ops.]

Peggy and Dan had almost four hours set aside between them to finish unloading the 27P resupply ship, transferring its cargo to the ISS and updating the IMS (Inventory Management System) accordingly.

Yuri completed of the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module). [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Later, Malenchenko also conducted the daily 20-min. IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The CDR performed the daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. [The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]

The crew worked out in their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR/OUM, FE-2/OUM), TVIS treadmill (FE-1), RED (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1/MO-5).

Afterwards, Tani copied the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

For the thruster test firing later tonight, the CDR verified proper closure of the protective shutters on the Lab science window, to remain closed until two orbits after returning to US Momentum Management control.

At ~3:25am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.
At ~4:30am, Yuri linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~2:55pm, the crew is scheduled for their seventh weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. [S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].

At ~3:40pm, Dan Tani will have a PFC (Private Family Conference), via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop).

27P Dynamic Thruster Testing: To verify proper integration of the Progress 27P cargo ship’s propulsion system (used for reboosts & debris avoidance maneuvers) into the RS MCS (Motion Control System), Russian ground controllers will conduct the standard firing tests of the Progress DPO (Approach & Attitude Control) thrusters later tonight, at 7:05pm (Manifold 1) with three firings of 10 sec duration each, and at 8:41pm (Manifold 2) for a second set of three 10-sec firings. ISS attitude control will be handed over to the RS MCS at 6:20pm and returned to USOS (US Segment) CMG Momentum Management at 9:10pm.

GNC MDM Software Patch Update: An attempt yesterday by ground controllers at MCC-Houston to upload a software patch to the GNC MDMs (Guidance, Navigation & Control Multiplexer/Demultiplexers) was unsuccessful when the backup & prime GNC MDMs could not be synchronized. This morning, the backup MDM was returned to its nominal (pre-patch) configuration by reloading its original software without the patch. Engineers are assessing when to reattempt the patch load. Activation of the software patch, designed to allow for limiting CMG (Control Moment Gyroscope) gimbal rate acceleration to help protect the CMGs, is not planned until after Flight 1E.

Russian SKV Air Conditioner Update: Yesterday the FE-1 removed the NOK-2 condensate evacuation pump that pulls condensate from the SKV-2 air conditioner. Finding a “rubbery, jelly-like” substance inside the inlet line, Yuri removed as much of it as he could, and TsUP specialists directed him to clean the remainder of the line in an upcoming maintenance session. The FE-1 temporarily installed the replacement NOK-2 and will permanently install it once condensate & inlet line cleaning is complete. [These activities are in support of SKV-2 troubleshooting that began after SKV-2 and the SRVK condensate processing unit in the RS shut down on 12/23 (last Sunday). SRVK and SKV-2 both remain operational, but are currently deactivated. SKV-1 has been inoperable for some time.]

CEO photo targets uplinked for today again were Yangtze River Delta (patchy overcast, so the crew may have seen some or all of this very large river delta at
nadir and right), Shanghai, China (patchy overcast, so the crew may have been able to see some or all of this city at nadir and right), Polar Mesospheric Clouds — PMC, Antarctica, (looking right), Lahore, Pakistan (Lahore is on the short list of Asian cities for research. The crew was to shoot city margins on this nadir pass), Delhi, India (looking right for this large city, which can be difficult to detect, on the banks of the large Yamuna River, which is the main visual cue from ISS), Santorini volcanic complex, Mediterranean (scattered cloud forecast. The crew should have seen some of the islands in this group, well left of track), and South Tibesti Megafans, Chad (looking right for a general view of a wide plain covered with darker lines [immediately at the foot of the dark rocks of the Tibesti Mountains]. The dark lines are river courses of an ancient megafan [inland delta] created when the Sahara was much wetter several thousand years ago. New research shows that many features of this pattern are replicated by river-like features seen on Mars. ISS/CEO imagery is far more detailed than anything available of this remote region of the Sahara).

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);  
http://earthobservatory.nasa.gov/  
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:42am EST [= epoch]):
Mean altitude -- 335.7 km  
Apogee height -- 336.9 km  
Perigee height -- 334.5 km  
Period -- 91.25 min.  
Inclination (to Equator) -- 51.63 deg  
Eccentricity -- 0.0001723  
Solar Beta Angle -- -74.6 deg (magnitude decreasing)  
Orbits per 24-hr. day -- 15.78  
Mean altitude loss in the last 24 hours -- 66 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 52144

Significant Events Ahead (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
12/28/07 – Thruster Test Firing (~7:05pm)  
TBD -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.  
TBD -- STS-122/Atlantis/1E docking  
TBD -- STS-122/Atlantis/1E undocking  
01/31/08 -- Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket) [Check it
out at http://usspace50.com]

02/06/08 -- Progress M-62/27P undocking & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking (DC1)
02/22/08 – NET: ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)

03/06/08 -- ATV-1 Demo Day 1
03/12/08 -- ATV-1 Demo Day 2
03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08 -- NET: ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- NASA 50 Years
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- ISS 10 Years
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- Constellation’s Ares I-X Launch
05/??/09 -- Six-person crew on ISS (following Soyuz 18S-2 docking)

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/27/07

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson and FE-2 Tani started the day with their daily reading of SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) data accumulated during the night, for logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for downlink. [To monitor the crewmembers’ sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

Also upon wake-up, FE-2 Tani started Part 3 (of 5) of the periodic acoustic measurement protocol by recording post-sleep data of the crew-worn acoustic dosimeters, later deploying the dosimeters statically in the Service Module (SM) (Panel 404 near SM air conditioner, SM Central Post, & Vozdukh) for the duration of the day, then recording measurements this afternoon (~4:10pm EST) and stowing the instruments (Parts 4 & 5). [Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]

Before breakfast & first exercise, Whitson, Malenchenko and Tani completed a full session with the Russian crew health monitoring program's medical assessment MO-9/Biochemical Urinalysis. Afterwards, the FE-1 closed out and stowed the Urolux hardware. [MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).]
At ~5:30am, the FE-2 again activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. Later (~12:30pm), the MPC was powered off again.

In the Lab, after inspecting, activating and configuring the MSG (Microgravity Science Glovebox) facility, Dr. Whitson initiated another series of vacuum draws on the sample chamber containing SPU-10 (Sample Processing Unit #10), by opening the vent and vacuum valves, for subsequent CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment ops tomorrow and the exchange with SPU-13 on 12/29. 

[CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]

Later, the CDR broke out and set up the PFE-OUM (PFE-Oxygen Uptake Measurement) equipment on the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). Data collection on herself and Dan, taking turns, is scheduled tomorrow.  

[The Periodic Fitness Evaluation with Oxygen Uptake Measurement experiment, using the CEVIS ergometer for workout, demonstrates the capability of crewmembers to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during long-duration space flight.]

Working in the newly arrived 27P cargo ship (TKG), the FE-1 installed the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry measurement system, along with its ROM unit (read-only memory, TA765B), a 1-hr. job. The LKT was subsequently switched on by the ground to complete the basic configuration.

Yuri completed the electronic integration of 27P into the ISS by installing the standard US-21 matching unit, another 1-hr. task. A dynamic thruster test of the installation is scheduled tomorrow evening (7:05pm-8:41pm EST).  

[The US-21 matching unit connects the SM with the Progress motion control and DPO thrusters systems, so that they can be commanded by the SM computer system (BVS). After bolting the box down, Yuri hooked up its the telemetry (TM) connector to the BITS2-
12 onboard TM system on Go from TsUP, after Moscow had inhibited data output to the VD-SU control system mode, powered off the BITS and deactivated the Elektron and the SKV-1 air conditioner. These systems were subsequently turned back on.

The CDR and FE-2 had almost two hours scheduled between them to unload the 27P resupply ship, transfer its cargo to the ISS and update the IMS accordingly.

Using the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System), the FE-1 took the periodic readings of potentially harmful contaminants in the SM. The hardware was then returned to initial stowage. [The CMS uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip.]

The CDR conducted the daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. [The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]

Peggy also removed the equipment used yesterday for downlinking TV imagery of the Progress docking via Ku-band and disconnected the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable at the Lab RWS (Robotics Work Station) which was required for video coverage of the docking from the SSRMS (Space Station Remote Manipulator System) cameras.

Dan Tani booted up the ER2 RIC (EXPRESS Rack 2/Rack Interface Controller) laptop, then installed a new software load (Release 5) on it in two parts.

Performing the periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), the FE-1 removed the PCMCIA memory card #940 from the AST spectrometer’s slot and copied the accumulated data, also from a previous card, #937, to the RSK1 laptop for subsequent downlinking via OCA. PCMCIA card 941 was then inserted to continue AST ops.

Peggy conducted the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout, today on all four units, then picked a new prime instrument and returned the backup units & sampling pump to their
original locations.  [The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Peggy changed out the batteries on the units, then zero-calibrated the instruments (to eliminate drift in the combustion sensors). Following zero calibration, the backup units was stowed in the Node (next to the sampling pump), while the prime unit’s datalogger function was turned on to collect data at the SM Central Post as a spot check. After one hour, the datalogger was deactivated, with the prime CSA-CP remaining on for continuous passive sampling.]

The CDR also took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA -Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary.  [Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]

Peggy Whitson conducted the weekly 10-min. CWC audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card (16-0018K), to be updated with today’s data, lists 26 CWCs; ~983 liters total) for the four types of water identified on board: technical water (735.4 l, for Elektron, flushing, hygiene), potable water (221.3 l), condensate water (0 l), waste/EMU dump and other (26.6 l). Two CWCs (#1004 & #1081, ~89 l) with potable water are off limits due to the Wautersia bacteria found in sample analysis, the source of which is still not understood. Impact of losing this potable CWC is negligible since there are sufficient drinking water supplies onboard. Also currently not to be used are nine CWCs with technical water (~389 l).]

In the SM, Dan set up the video equipment for filming the subsequent workouts of all three crewmembers on the TVIS (Treadmill with Vibration Isolation & Stabilization), for biomechanical evaluation and assessment of the hardware status by ground engineers. Afterwards, he transferred the footage to VTR (Video Tape Recorder) for subsequent downlink to the ground, then dismantled and stowed the video equipment.  [Preparations included the removal of the treadmill’s “skirt” to show TVIS motion within the floor “pit” in the SM along with the crewmember's feet striking the belt.]

The crew conducted their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).
Afterwards, Whitson copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Yuri took care of the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Later, Malenchenko also completed the daily 20-min. IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~5:02am, the FE-1 powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 5:07am, a ham radio exchange with students at High School No. 15 in the city of Korolev near Moscow (home of RSC-Energia, TsNIIMASh, and TsUP). Questions to the crew were uplinked beforehand. [“What contaminations, and where, do you see in the ocean, on land and in the atmosphere?”; “What do US astronauts do onboard ISS as part of the school educational program?”; “How did you celebrate Christmas and how are you going to celebrate the New Year?”; “What presents did you get for the holidays with the arrival of the cargo vehicle?”; “We wish you a happy flight, interesting experiments, effective educational programs, and, of course, a soft landing. Happy New Year to all of you!”]

At ~10:15am, the crew conducted a press conference with Moscow’s TV Channel Russia Today, speaking from the SM decked out with New Year decorations and wearing “Father Frost” caps. [Russia Today is the first English-language news channel to present the Russian point of view on events happening in Russia and around the globe, on the air 24/7 with a potential of millions of viewers via 10 satellites and also 24 hours a day on the Internet. “How many times can you celebrate the New Year on orbit? How many times will your clock strike 12? What is this related to? How many times are you going to celebrate?”; “Is this going to be your first New Year in space? What are your feelings and thoughts in connection with that? Do you feel excited, committed?”; “Do cosmonauts have their own traditions when they celebrate?”; “How did you prepare for the New Year? “Who takes care of that? How was all of this delivered there?”; “How about the New Year traditions? How do you drink champagne? And, generally
speaking, how do you do orbital celebrations?”; “On the New Year, do you feel some special nostalgia? What earthly fun will you be missing on this New Year night?”; ”Are weekends any different from work days in space? What do you do? What kind of entertainment do you have?”; “Do you have a New Year wish? If wished on orbit is it going to come true sooner?”; “What kind of present would you like to get this New Year?”; “When you get back to Earth are you going to celebrate the New Year all over again with your families?”]

At ~1:05pm, the crew conducted their standard weekly teleconference with the JSC Astronaut Office (Kent Rominger), via Private S-band S/G-2 (space-to-ground).

At ~2:00pm, Dan Tani has a PFC (Private Family Conference) scheduled, via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop).

CEO photo targets uplinked for today again were **Urumqi, China** (looking right at the foot of the Tien Shan range for China’s western oil boom city), **Eastern Tien Shan Range** (ISS passed over one of central Asia’s ice capped ranges. Shooting white ice caps and glacier tongues at nadir and left. Ice caps are being drilled for cores that reveal information on climate change, and particularly because of the information they store on past environments--often tens of thousands of years of data on snow fall amount, blowing dust deposition as an indication of dryness, and atmospheric composition from air bubbles in the ice. This kind of data is being lost in many cases due to rapid melting. Continental ice caps in interior Asia have received far less attention than other low-latitude ice caps), **Florida Coastal Everglades** (50% cloud cover predicted, so there is a chance the crew may see some or all of the target: looking right to obtain a mapping swath), and **Tunis, Tunisia** (looking nadir and a touch right at the head of the big bay. Only scattered cloud predicted).

CEO photography can be viewed and studied at the websites:
[http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
[http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/)
[http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** (as of this morning, 8:20am EST [= epoch]):
Mean altitude -- 335.8 km
Apogee height -- 336.9 km
Perigee height -- 334.6 km
Period -- 91.25 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001738
Solar Beta Angle -- -74.8 deg (magnitude peaking)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 185 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52128

**Significant Events Ahead** *(all dates Eastern Standard, some changes possible. NET = Not Earlier Than):*
12/29/07 – Thruster Test Firing (tomorrow’s reboost was cancelled)
01/10/08 -- NET: STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.
01/12/08 -- NET: STS-122/Atlantis/1E docking
01/21/08 -- NET: STS-122/Atlantis/1E undocking
01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [Check it out at http://usspace50.com]
02/06/08 -- Progress M-62/27P undocking & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking (DC1)
02/22/08 -- NET: ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/06/08 -- ATV-1 Demo Day 1
03/12/08 -- ATV-1 Demo Day 2
03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGP nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGP nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08 -- NET: ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation’s Ares I-X Launch**

05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)

ISS On-Orbit Status 12/26/07

All ISS systems continue to function nominally, except those noted previously or below.

**Yest kasaniye!** Progress M-62 (27P), approaching from below the station, docked nominally at the DC1 Docking Compartment nadir port at 3:14am EST, with automatic AO-VKA orientation antenna retraction, followed by docking probe retraction and hook closure (“sborka”) at 3:23am after motion damp-out, while the ISS was in free drift. [Launched 12/23 (2:12am EST), the 27P resupply drone delivered about 2.5 tons of cargo for the ISS crews, including propellants for the Russian thrusters, fresh water, oxygen, food, spare parts, repair gear, life support and science experiment hardware. For the docking, ISS attitude control authority was handed over to Russian MCS (Motion Control System) thrusters at 11:48pm and returned to US Momentum Management at 5:06am. Starting with TV camera activation at ~2:37am (range ~8 km), the KURS TV camera display data overlay failed to show through docking despite attempts by the crew to activate the numerical display. The docking took place nominally, without violation of any joint flight rules, since Malenchenko and Whitson had all numerical data on a laptop before them. Telemetry was also available in TsUP-Moscow.]

In preparation for the docking, FE-2 Dan Tani set up the IWIS (Internal Wireless Instrumentation System) equipment for measuring structural dynamics disturbances (accelerations/vibrations) during docking. [RSUs (Remote Sensing Units) were connected to power outlets in Lab, Node-1, SM (Service Module) and FGB, with data transmitted to the Lab NCU (Network Control Unit) from the RS via cable, not wireless (due to previous experience with lack of RF signal strength). Later, the IWIS was powered down and the RS units removed and stowed.]

Earlier today, FE-1 Malenchenko and CDR Whitson had completed final preparations for Progress arrival, including turning off amateur (ham) radio equipment in the ISS to prevent any interference with Progress/KURS radio traffic, and activation of the SSC6 (Station Support Computer 6) A31p laptop in the
FGB for handling the video transmission from the Russian segment (RS) via the Ku-band assets in the USOS. [The A31p used for the routing from the SM is located in the FGB since available cables are not long enough to extend to the Node. The video signal is fed from there via coaxial cable to the SSC Operations LAN (local area network) and from there into the Ku-band system for subsequent conversion from the Russian SECAM format to the American NTSC format on the ground. The newly set up VSW (Video Streaming Workstation) failed to convert and/or downlink analog video of the docking to MCC-Houston and thence to TsUP-Moscow. A second video stream, a digital MPEG (Moving Pictures Expert Group 2) transmission originating in the RS by the Russian/ESA encoder, passed without problem via the ISS JSL (Joint Station LAN) through Ku-band to both MCCs. ]

Malenchenko and Whitson then monitored the docking process from the TORU (teleoperated approach & docking system) station in the SM, in “hot standby” mode, and took photography of the Progress approach and linkup.

After the docking, the FE-1 shut off TORU and began reconfiguring the STTS telephone/telegraph subsystem to normal ops. [The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM’s outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]

The crew then conducted the standard one-hour leak checks of the docking vestibule and fuel/oxidizer transfer line interface between Progress and DC1. During leak checking and initial clamp installation, Russian thrusters were inhibited (as they were during docking).

After opening the two hatches, Yuri and Peggy first installed the QD (quick disconnect) screw clamps (BZV) of the docking & internal transfer mechanism (SSVP) to rigidize the coupling, and the FE-1 removed the PkhO/DC1 (SU) hatch cover, reinstalled the IP-1 airflow sensor and assembled the ventilation/heating air duct.

Next, Malenchenko performed the standard air sampling inside the Progress with the Russian AK-1M air sampler, then deactivated the cargo ship. At the same time, the CDR also collected samples with a GSC (Grab Sample Container) at the center of 27P.
Peggy and Yuri then began Progress unloading and cargo transfer to the ISS, accompanied by IMS (Inventory Management System) logging. Malenchenko’s first priority for the transfer was the new Japanese (JAXA) 3DPC-J (3D Photon Crystals) experiment, which Yuri set up in the SM. [3DPC hardware had been removed by Valery Tokarev on 3/23/06 as part of closing out JAXA’s 3D-PCGF Growth Facility and was inadvertently returned to Earth. 3DPC studies the production of 3D photonic crystals, from UV LEDs, through self-organization and ordering of colloid nanoparticles in an electrolyte solution with subsequent fixation in an elastic gel matrix.]

CDR Whitson and FE-2 Tani had started the day with their daily reading of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) data accumulated during the night, for logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for downlink. [To monitor the crewmembers’ sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

The FE-2 conducted his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. [The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]

Dan Tani performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling CWC (Contingency Water Container) #1062 with the collected water slated for processing, and putting aside two water samples in bags (1 sample bag, 1 purge bag) for return to Earth. [Estimated offload time before termination (leaving ~6 kg in the tank): ~40 min. Dan There is currently continued attention on water sampling after the discovery of some contaminated CWCs. The identified contaminant, a common soil bacterium ( unicellular organism) called Wautersia after Belgian microbiologist Georges Wauters, is no more critical than what is found often in faucet water on the ground or in farm soil. Wautersia lives off hydrogen & carbon dioxide, oxidizing H₂ and producing gaseous oxyhydrogen as energy for itself. Since it can turn sugar into a synthetic biodegradable fuel, it was seen for a short while as a promising long-term solution to the petroleum dependency, until it became clear that this “solution” would require gigantic amounts of expensive sugar.]
Dan Tani worked on the RED (Resistive Exercise Device), replacing two canister pulley cables (done after every 53,515 cycles, based on life cycle testing results & safety controls), afterwards concluding with the standard Flexpac canister load calibration as required after cable replacements. (Last time done: 11/1). [In addition to the cords, the FE-2 also replaced the aft (right canister’s) spiral pulley and a few of the bottom cover fasteners. Cables are replaced periodically after ground analysis shows cable life has expired. Dan’s on-orbit calibration of the Schwinn RED cans re-established the relationship of specific load settings with a specific number of pulls per setting, followed by recording of the load values measured with a calibration tool and steel handles from the on-orbit calibration kit.]

The crewmembers completed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill with vibration isolation (CDR, FE-1), and RED (CDR, FE-2).

Afterwards, Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Yuri took care of the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Peggy Whitson readied the PZE MO-9 equipment for another Russian “Urolux” biochemical urine testing, scheduled tomorrow for all three crewmembers. [MO-9 is conducted regularly every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for US crewmembers for IMG (Integrated Medical Group) PHS evaluation as part of the “PFE w/o Blood Labs” exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. The data are then entered in the Medical Equipment Computer (MEC)’s special IFEP (In-Flight Examination Program) software.]

Later today, before sleep time, Dan Tani will ready the equipment for the periodic acoustic measurement protocol by deploying crew-worn acoustic dosimeters to the station residents, to be carried overnight with a microphone on the shirt collar. (Last time done: 9/11). [Tomorrow, after about 15 hours of measurements, dosimeter data will be downloaded and the hardware power-cycled for another data take. At
that point, the crew will deploy the dosimeters statically in the station for the
duration of the day, record measurements tomorrow noon and stow the
instruments. Acoustic data must be taken twice per Increment, each time for the
duration of the 16-hour crew workday.]

The FE-2 has two PFCs (Private Family Conference) scheduled, via S-band/audio
and Ku-band/MS-NetMeeting application (which displays the uplinked ground video
on the SSC-10 laptop), one with Clay Anderson at ~1:20pm, the other with his
family at ~2:55pm.

**Weekend Voluntary Science:** For the voluntary “Saturday Science” program on
12/29, Dan was offered, for his acceptance, a session with the SPHERES
(Synchronized Position Hold, Engage, Reorient, Experimental Satellites)
experiment, flying two & three satellites and testing various deployment conditions
aimed at operations improvement.

CEO photo targets uplinked for today again were **Polar Mesospheric Clouds**
(PMC — also known as noctilucent clouds) over selected ground sites (12 minutes
for each). Also suggested for Dan Tani were a series of night photographs of city
lights. *(Use of the footprint of city lights as a proxy for population size and density
[in different cultures/economies] is proving out as a workable method of observing
population change through time).*

CEO photography can be viewed and studied at the websites:

Note: The daily ISS On-Orbit Status reports can also be found at
[http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
All ISS systems continue to function nominally, except those noted previously or below. *Off-duty day for the crew.*

**Merry Christmas!**

Progress M-62/27P is continuing its 3-day flight to the ISS for docking tomorrow morning (12/26) at ~3:25am EST at the DC1 nadir port. All onboard tests (TV, KURS, TORU) and the DV3 burn on Orbit 33, during RGS (Russian ground site) passes were nominal. *(See Timeline, below).*

Before breakfast, FE-2 Dan Tani and CDR Peggy Whitson completed their daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for downlink. *To monitor the crewmembers’ sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.*

FE-1 Malenchenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated at ~2:45pm EST. *(Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.)*

Yuri also performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *(Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U*
The crewmembers completed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill with vibration isolation (CDR, FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~1:00pm, Dan Tani had a PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop).

At ~11:30am, CDT Whitson conducted a teleconference with the Houston Flight Control Team (FCT).

**ASN-M Testing**: TsUP-Moscow began with tests of the ASN-M Satellite Navigation System over six orbits, without crew involvement.  
**ASN-M is required for ATV (Automated Transfer Vehicle) “Jules Verne” prox ops next year.**

**Timeline for 27P Approach & Docking** (all times EST):
- ISS mnvr to dock attitude: 12:50am – 1:40am (-XVV –YLV)
- Range = 9km - VHF activation/TORU command link: 2:36am
- Range = 8km – Progress TV activation: 2:37am
- Flyaround mode start: 2:54am
- Stationkeeping start: 3:03am
- RGS AOS: 3:15am
- Final Approach start: 3:17am
- 27P Docking at DC1 nadir port: 3:25am
- RGS LOS: 3:37am
- Progress hooks closed: 3:46am

CEO photo targets uplinked for today again were Polar Mesospheric Clouds (PMC — also known as noctilucent clouds) over selected ground sites (12 minutes for each). Also suggested for Dan Tani were a series of night photographs of city lights.  **(Use of the footprint of city lights as a proxy for population size and density [in different cultures/economies] is proving out as a workable method of observing population change through time).**

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/24/07

All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 10 of Increment 16. Merry Christmas and Great Holidays to everyone!

Progress M-62/27P is continuing its 3-day flight to the ISS for docking Wednesday morning (12/26) at ~3:25am EST at the DC1 nadir port. All onboard tests (TV, KURS, TORU), performed today during RGS (Russian ground site) passes, were without issues. (See picture below).

Before breakfast, FE-2 Dan Tani and CDR Peggy Whitson completed their daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for downlink. [To monitor the crewmembers’ sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

FE-1 performed troubleshooting on one (A1) of the two redundant BSV-M (Frequency & Time Synchronization System, i.e., Master Clock) units in the Service Module (SM). [After a software update on the Russian BSPN payload server on 11/8, ground analysis of the BSPN log file on 11/12 discovered a failure of channel 2 of the BSPN CAN interface. Since BSV-M A1 is needed for nominal operation with the payload server, Malenchenko today switched connections of CAN channel 1 to BSV-M A2 before a new BSV-MA1 unit is delivered next February on Progress 28P.]

Later, Malenchenko performed the periodic communication check and time synchronization between the BSPN payload server and the ISS “Wiener” power laptop, using the RSC-E “PingMaster” program, used for network checkouts.

Yuri also serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~4:15pm EST.
Regeneration of bed #2 follows tomorrow.  [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]

CDR Whitson conducted the third and final session of the LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System)/Phase 2 operations, sampling four of the sites that were identified in the CHeCS SSK (Crew Health Care Systems/Surface Sampler Kit) procedure also scheduled for today.  [The goal is to compare LOCAD results with the SSK colony growth results.  LOCAD uses small, thumb-sized “microfluidic” cartridges that are read by the experiment reader.  The cartridges contain dried extract of horseshoe crab blood cells and colorless dye.  In the presence of the bacteria, the dried extract reacts strongly to turn the dye a green color.  Therefore, the more green dye, the more microorganisms there are in the original sample.  The handheld device tests this new analysis technology by sampling for the presence of gram negative bacteria in the sample in about 15 minutes, showing the results on a display screen.  Background:  Lab-on-a-Chip technology has an ever-expanding range of applications in the biotech industry.  Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics.  The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection.  With expanded testing on ISS, began by Sunita Williams in March/April this year, this compact technology has broad potential applications in space exploration--from monitoring environmental conditions to monitoring crew health.  The current study should prepare for long-duration exploration by demonstrating a system that enables the crew to perform biochemical analysis in space without having to return samples to Earth.]

During Peggy’s LOCAD activities, FE-2 Tani collected SSK microbiological surface samples at specific locations near air diffusers and later also sampled the cabin atmosphere by collecting air samples with the MAS (Microbial Air Sampler) kit at mid-module.  [Bacterial and fungal air samples are usually taken at two locations in the module being checked.  The colony growth on the MAS sampling slides is analyzed after five days of incubation in four Petri dishes.  For onboard visual analysis of media slides from SSK (Surface Sampling Kit), the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]

Whitson and Malenchenko each performed the CHeCS CMO (Crew Medical Officer) onboard training drill, a (generally) monthly 30-min. video & audio refresher course, taken individually, to hone the CMO’s acuity in emergency medical operations.  [The proficiency drill focuses on re-familiarization with skills and techniques required in procedures related to medical issues arising on board and concludes with a self-assessment questionnaire.  The HMS (Health Maintenance Systems) hardware, which includes ACLS (Advanced Cardio Life Support) equipment, may be used in contingency situations where crew life is at risk.  To maintain proficiency, crewmembers spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS CBT (computer-based training) and the ACLS CBT.]

Yuri and Peggy also conducted a one-hour refresher teleconference on the upcoming
Progress 27P docking using the TORU manual backup control system in the event of a failure of the automated KURS system.

Dan Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. [The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]

Working on the SM’s SOZh (Environment Control & Life Support System) plumbing system, the FE-1 removed & replaced the life-expired gas-liquid mixture filter (FGS) in the powered-down condensate water processor (SRVK-2M), discarding the old unit.

Starting a new round of periodic preventive maintenance of RS (Russian Segment) ventilation systems, the FE-2 worked in the FGB (Funktsionalnyi-Grusovoi Blok) to clean the vent screens of specific interior closeout panels (116, 231, 316 & 431), then moved on to do the detachable VT7 fan screens 1, 2 & 3 of the three SOTR (Thermal Control System) gas-liquid heat exchangers (GZhT4) and finished by cleaning the TsV1 fan grille.

FE-1 Malenchenko unstowed and set up the electric equipment for the upcoming operation of the new Russian/Japanese (JAXA) experiment 3DPC-J (3D Photon Crystals), with its main unit to be delivered on 27P. The experiment is scheduled for 12/26. [3DPC hardware was removed by Valery Tokarev on 3/23/06 as part of closing out JAXA’s 3D-PCGF Growth Facility and was inadvertently returned to Earth. 3DPC studies the production of 3D photonic crystals, from UV LEDs, through self-organization and ordering of colloid nanoparticles in an electrolyte solution with subsequent fixation in an elastic gel matrix.]

Yuri also configured the onboard Russian TV system with its conversion to Ku-band in support of an extended (10:00am-1:00pm) ground-controlled multicast downlink operation in digital packets to MCC-H and then on to TsUP-Moscow via the COL-CC (Columbus Control Center) in Oberpfaffenhofen, as a test for the Progress 27P docking on 12/26 morning.

The CDR relocated the TEPC (Tissue Equivalent Proportional Counter), the primary radiation measurement tool in the ISS, to Node-2. [Peggy also swapped out the power/data cable and wrapped the new cable with a layer of Kapton tape, to prevent the creation of debris if the cable’s mesh sheathing starts to degrade, as seen on the current cable.]

With the Vozdukh CO2 removal system running in automated mode, the FE-1 performed the periodic (monthly) functional closure test of its spare emergency vacuum valves (AVK), in the spare parts kit. Afterwards, Malenchenko switched the Vozdukh back to manual mode 5 via the on-board computer system. [The AVKs are critical because
CDR Whitson ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]

Peggy conducted a maintenance inspection on the CEVIS (Cycle Ergometer with Vibration Isolation) and took video imagery of damaged isolators for ground inspection.

The FE-2 configured the video equipment in the SM for filming Peggy’s and his own subsequent workout on the RED resistive exerciser, for biomechanical assessment of the hardware status by ground engineers. [The footage from the two sessions was then to be transferred from camcorder to VTR (Video Tape Recorder) for subsequent downlink to the ground when Ku-band is available.]

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill with vibration isolation (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Peggy performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Working from his “time permitting” discretionary task list, the FE-1 later handled the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).
At ~3:50pm EST, Dan Tani is scheduled for a PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

CEO photo targets uplinked for today again were Polar Mesospheric Clouds (PMC — also known as noctilucent clouds) over selected ground sites (12 minutes for each). (Southern spring is the season for relatively uncommon polar mesospheric clouds to form very high over Antarctica. PMC are being studied as part of the International Polar Year [IPY] investigation of climate change in high latitudes. PMC form in the stratosphere and higher, i.e. well above the lowest layer of the atmosphere [troposphere, or weather layer, characterized by clouds, and an orange tinge produced by brushfire smoke, smog, etc.]. The AIM satellite (Aeronomy of Ice in the Atmosphere) has just been launched to investigate how PMC form and why they are apparently becoming thicker and brighter. ISS/CEO imagery will complement images from AIM and from the ground. The collaborating IPY scientist is excited to receive any images ISS may acquire. Collaborating Swedish scientists have arrived at a base in Antarctica (73S 13 W) for PMC observation.)

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov; http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 7:14am EST [= epoch]):
Mean altitude -- 336.1 km
Apogee height -- 336.9 km
Perigee height -- 335.2 km
Period -- 91.25 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001208
Solar Beta Angle -- -66.4 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 95 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52080

**Significant Events Ahead** (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
12/26/07 -- Progress M-62/27P docking (DC1); ~3:25am
12/30/07 -- ISS Reboost (phasing)

04/15/09 -- Constellation’s Ares I-X Launch
05/??/09 -- Six-person crew on ISS (following Soyuz 18S-2 docking)

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 12/23/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani. Ahead: Week 10 of Increment 16.

With the usual dependability, Progress M-62/27P launched nominally this morning at Baikonur at 2:12am EST. Orbit insertion and 3rd stage separation were nominal at ~2:21:30am. Critical antennae and solar array deployments took place without issue. Docking is scheduled on Wednesday, 12/26 (~3:25am EST). Congrats, Baikonur!

Before breakfast, FE-2 Dan Tani and CDR Peggy Whitson completed their daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for downlink. [To monitor the crewmembers’ sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

Upon wakeup, Dr. Whitson also performed the last sampling of her 3rd session with the NASA/JSC experiment NUTRITION w/Repository, collecting a final urine sample for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. Peggy’s next NUTRITION w/Repository activity will be her FD120 (Flight Day 120) session. [The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R
+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.

Today Dan Tani was the subject for the Braslet experiment (SDTO/Station Development Test Objective), holding still for his second ultrasound scanning session by Peggy as operator (for which Dan had to abstain from caffeine 12 hrs prior to the scan session, heavy meals 4 hrs before and any food at all 2 hrs prior to the scan, plus no exercise 2 hours before and no liquids 30 mins before). [The SDTO-17011 “Validation of On-Orbit Methodology for the Assessment of Cardiac Function and Changes in the Circulating Volume Using Ultrasound and Braslet-M Occlusion Cuffs (Braslet)” is a collaborative effort between NASA and the Russian FSA (Federal Space Agency), with the goal to establish a valid ultrasound methodology for assessing a number of aspects of central and peripheral hemodynamics and cardiovascular function, specifically in rapid changes in intravascular circulating volume. Braslet uses Braslet-M occlusion cuffs, i.e., the Russian-made operational countermeasure already pre-calibrated and available onboard for each ISS crewmember. Braslet employs multiple modes of ultrasound imaging and measurements, in combination with short-term application of Braslet-M occlusive cuffs and cardiopulmonary maneuvers (Valsalva, Mueller) to demonstrate and to evaluate the degree of changes in the circulating volume on orbit. This will be accomplished by performing echocardiographic examinations in multiple modes (including Tissue Doppler mode), ultrasound measurements of lower extremity venous and arterial vascular responses to Braslet-M device under nominal conditions and also during cardiopulmonary Mueller and Valsalva maneuvers. Identical measurements will be repeated without Braslet-M, with Braslet-M applied, and immediately after releasing the occlusion device.]

The FE-2 performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. [The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]

FE-1 Malenchenko conducted regular service on the Vozdukh CO₂ (Carbon Dioxide) removal system, first switching it via on-board computer system to automatic control mode and later back to manual mode 5.

Afterwards, Yuri Malenchenko completed the daily routine maintenance of the Service Module (SM)’s SOZh environment control & life support system, with the regular replacements in its toilet system (ASU), plus the periodic checkout/
verification of IP-1 airflow sensors in the various Russian Segment hatchways, including the SM-to-DC1 (22P) tunnel, and the FGB-to-Node and FGB-to-Soyuz passageways. [Regular daily SOZh maintenance includes checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill with vibration isolation (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

The FE-2, who is mourning the loss of his mother, was scheduled for two PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), one at ~10:45am EST and the other at ~5:30pm.

Working off his “time permitting” discretionary task list, Yuri conducted his fourth run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 still camera with 80-200 mm Nikkor zoom lens to record high production zones and associated oceanic phenomena (cloud pattern, hydrodynamics) in the target areas of Pacific and Atlantic Ocean. [Uplinked target zones were the coastal area of Brazil, Gibraltar and the northern waters of Mediterranean Sea in the Atlantic Ocean, and coral islands and atolls of Oceania and the California Bay in the Pacific Ocean.]

A second job item on the FE-1’s discretionary list for today was another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D1X digital camera with SIGMA 300-800mm telephoto lens. [Targets today were contamination areas in the Vistula River in Poland and in the Pacific Ocean. KPT-3 photography has been a frequent earth observing experiment for ECON.]

CEO photo targets uplinked for today were Polar Mesospheric Clouds (PMC — also known as noctilucent clouds) over selected ground sites (12 minutes for each). (Southern spring is the season for relatively uncommon polar mesospheric clouds to form very high over Antarctica. PMC are being studied as part of the International Polar Year [IPY] investigation of climate change in high latitudes. PMC form in the stratosphere and higher, i.e. well above the lowest layer of the atmosphere [troposphere, or weather layer, characterized by clouds, and an orange
tinge produced by brushfire smoke, smog, etc.]. The AIM satellite (Aeronomy of Ice in the Atmosphere) has just been launched to investigate how PMC form and why they are apparently becoming thicker and brighter. ISS/CEO imagery will complement images from AIM and from the ground. The collaborating IPY scientist is excited to receive any images ISS may acquire. Collaborating Swedish scientists have arrived at a base in Antarctica (73S 13 W) for PMC observation.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 8:27am EST [= epoch]):
Mean altitude -- 336.1 km
Apogee height -- 337.0 km
Perigee height -- 335.3 km
Period -- 91.26 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001214
Solar Beta Angle -- -62.0 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 128 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52065

Significant Events Ahead (all dates Eastern Standard, some changes possible.

ISS On-Orbit Status 12/22/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work. Happy 46th Birthday, Yuri Ivanovich!

Last night, Progress M-61/26P successfully undocked from the ISS at 10:59pm EST (hook opening command: 10:57pm). The separation appeared smooth with no vibrations noted. Downlinked video from the cargo vehicle showed that the docking ring surface was nominal. The first separation burn was performed at 11:03pm and a second separation burn followed at 11:09pm. The spacecraft initially moved aft of the station, then forward, overtaking the ISS on a lower (faster) orbit. 26P will remain in orbit in free flight for 3-4 weeks, continuing to phase out in front of the ISS (about 40 km per orbit) as part of a Russian Earth observation experiment.

After the undocking, FE-1 Yuri Malenchenko manually closed the PEV (Pressure Equalization Valve) between the DC1 and its docking port vestibule.

Before breakfast, FE-2 Dan Tani and CDR Peggy Whitson (who now has joined in this activity) completed their daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

Also before breakfast, Dr. Whitson completed the last day (FD 60) of her 3rd session with the NASA/JSC experiment NUTRITION w/Repository. Today she conducted the 24-hour urine collections starting with the first void early in the
morning and continuing through tomorrow morning. The samples were stored in the MELFI (Minus-Eighty Laboratory Freezer for ISS) and the sampling kit was then stowed away.  

[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

The crew performed the regular weekly three-hour task of thorough station cleaning.  

["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

The CDR conducted her first self-scanning session for the Braslet experiment (SDTO/Station Development Test Objective), leading off with a video review and followed by the actual ultrasound scanning activity on herself (for which she had to abstain from caffeine 12 hrs prior to the scan session, heavy meals 4 hrs before and any food at all 2 hrs prior to the scan, plus no exercise 2 hours before and no liquids 30 mins before).  

[The SDTO-17011 “Validation of On-Orbit Methodology for the Assessment of Cardiac Function and Changes in the Circulating Volume Using Ultrasound and Braslet-M Occlusion Cuffs (Braslet)” is a collaborative effort between NASA and the Russian FSA (Federal Space Agency), with the goal to establish a valid ultrasound methodology for assessing a number of aspects of central and peripheral hemodynamics and cardiovascular function, specifically in rapid changes in intravascular circulating volume. Braslet uses Braslet-M occlusion cuffs, i.e., the Russian-made operational countermeasure already pre-calibrated and available onboard for each ISS crewmember. Braslet employs multiple modes of ultrasound imaging and measurements, in combination with short-term application of Braslet-M occlusive cuffs and cardiopulmonary maneuvers (Valsalva, Mueller) to demonstrate and to evaluate the degree of changes in the circulating volume on orbit. This will be accomplished by performing echocardiographic examinations in multiple modes (including Tissue Doppler mode), ultrasound measurements of lower extremity venous and arterial vascular responses to Braslet-M device under nominal conditions and also during cardiopulmonary Mueller and Valsalva maneuvers. Identical measurements will be repeated without Braslet-M, with Braslet-M applied, and immediately after releasing the occlusion device.]
For FE-2 Tani, it was time again for his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. [The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]

In the Lab, Peggy continued her support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) facility, terminating SPU-11 (Sample Processing Unit #11) processing, transferring its data to the MLC (MSG Laptop Computer) and verifying them, then removing SPU-11, installing a new SPU (#10), and finally turning the payload off. Later, the MSG was also powered off. [CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]

Working briefly on the EXPRESS Rack 1 (ER1) laptop computer, Whitson modify its “crash recovery” parameter, changing the location of the memory dump analysis file to make downlinking more efficient.

Malenchenko performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the FE-2 will transfer the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:20am EST, Yuri Malenchenko, born today 46 years ago in the Ukraine, participated in a Telebridge radio hook-up with friends and family at an event in the
Ukrainian city of Kiev via RGS (Russian Groundsites).

The FE-1 and FE-2 each were scheduled for a PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Yuri at ~5:305am, Dan at ~3:05pm.

From his voluntary task list, Yuri conducted another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera with 800 mm focal length lenses to take pictures of catastrophic events for subsequent downlink via BSR-TM. [Uplinked target zones for today were slopes and ravine terrain to the south of Voronezh, the Alps, the Allaline and other glaciers near arc-shaped water reservoir dams, Poland’s Vistula river showing 20-km long contamination spreading on 12/17 towards the Baltic Sea, and the Huascaran volcano in Peru.]

Electron Activation Update: Yesterday, when Yuri assisted the ground in activation the Elektron oxygen generator in the standard 32 amp mode, the system came on in 11 amps mode. A recently (11/27) installed electronic interference filter (to prevent RFI with the ATV/Automated Transfer Vehicle) felt hot to Yuri’s touch, who, on ground advice, turned off the Elektron, removed the filter and reconnected the cables. The electrolysis machine was then successfully reactivated in 32 amp mode and is now operating nominally at 24 amps.

Progress Launch Preps: At Baikonur, Kazakhstan, final preparations continue for the launch of the Progress M-62/27P cargo vehicle tomorrow morning at 2:12am EST.

Weekly Science Update (Expedition Sixteen -- Week 9)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): In progress.

ANITA: Completed.

BCAT (Binary Colloidal Alloy Test): There will be a reboost on 12/29 ands thruster firings on 12/30, both of which could significantly impact the quality of BCAT science. The ground team feels that it’s not likely that they will get two runs before the Shuttle docking, so they are going to remix sample 3 on 12/31 after the thruster firings and run sample 3 for ~14 days.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.
CFE (Capillary Flow Experiment): Reserve.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): CSLM-2 SPU-11 has completed vacuum vent cycles 1 through 4. SPU-11 (10 hr heat soak) started processing on 12/21 at ~11:00am EST.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: FE-1 Malenchenko has retrieved the telemetry data of the two KUBIK devices. The data is related to the 16S/15S Soyuz mission Biology Program and has been downlinked to ground.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: MULTIGEN-1 samples will be downloaded on STS-122 (1E).

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):
Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): Peggy and Dan’s next Sleep Actiwatch Download/Initialization session will be placed on the task list from 12/26/07-1/2/08. The Actiwatches will stop taking data on 1/3/08.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress. To be conducted tomorrow (12/2).

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observation): On-going.

CEO photo targets uplinked for today were Polar Mesospheric Clouds over Antarctica (PMC — also known as noctilucent clouds). Southern spring is the season for relatively uncommon polar mesospheric clouds to form very high over Antarctica. PMC are being studied as part of the International Polar Year [IPY] investigation of climate change in high latitudes. PMC form in the stratosphere and higher, i.e. well above the lowest layer of the atmosphere [troposphere, or weather layer, characterized by clouds, and an orange tinge produced by brushfire smoke, smog, etc.]. The AIM satellite (Aeronomy of Ice in the Atmosphere) has just been launched to investigate how PMC form and why they are apparently becoming thicker and brighter. ISS/CEO imagery will complement images from AIM and from the ground. The collaborating IPY scientist is excited to receive any images ISS may acquire. Collaborating Swedish scientists have arrived at a base in Antarctica (73S 13 W) for PMC observation.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:13am EST [= epoch]):
Mean altitude -- 336.3 km
Apogee height -- 337.0 km
Perigee height -- 335.5 km
Period -- 91.26 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001097
Solar Beta Angle -- -57.5 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 66 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52049

**Significant Events Ahead** (all dates Eastern Standard, some changes possible.
NET = Not Earlier Than):
12/23/07 -- Progress M-62/27P launch; ~2:12am

05/??/09 -- Six-person crew on ISS (following Soyuz 18S-2 docking)

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/21/07

All ISS systems continue to function nominally, except those noted previously or below.

After wakeup and before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for downlink.  [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

Having passed the Day 60 mark in her flight, Dr. Peggy Whitson began her third session with the NASA/JSC experiment NUTRITION w/Repository, for which she had to forego exercising and food intake for eight hours. Today’s protocol consisted of two blood draws (for Serum & Heparin). Later, the CDR set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning and continue through Sunday morning.  [Acting as operator, Dan Tani as performed phlebotomy on Peggy Whitson, i.e., drawing blood samples (from an arm vein) which was first allowed to coagulate in the Repository, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. Background: NUTRITION is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight; this includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing inflight samples and an additional postflight sample. Furthermore, additional measurements are included]
for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.

FE-2 Tani conducted his second session of the LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System)/Phase 2 experiment, completing another LOCAD exploratory survey by taking single swab samples from five more surface sites in the station. In Phase 2, no media sides have to be prepared. LOCAD uses small, thumb-sized “microfluidic” cartridges that are read by the experiment reader. The cartridges contain dried extract of horseshoe crab blood cells and colorless dye. In the presence of the bacteria, the dried extract reacts strongly to turn the dye a green color. Therefore, the more green dye, the more microorganisms there are in the original sample. The handheld device tests this new analysis technology by sampling for the presence of gram negative bacteria in the sample in about 15 minutes, showing the results on a display screen.

Background: Lab-on-a-Chip technology has an ever-expanding range of applications in the biotech industry. Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics. The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection. With expanded testing on ISS, began by Sunita Williams in March/April this year, this compact technology has broad potential applications in space exploration--from monitoring environmental conditions to monitoring crew health. The current study should prepare for long-duration exploration by demonstrating a system that enables the crew to perform biochemical analysis in space without having to return samples to Earth.

Afterwards, the FE-2 performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off
every half hour. Today Dan received ground feedback that “the photos are looking really good now!”

In the Lab, the CDR continued crew support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) facility, terminating the final (fourth) vacuum draw on the SPU11 (Sample Processing Unit 11) and initiating sample processing on SPU11, to be finished prior to Progress 26P undocking tonight to avoid vibration disturbances on the processing. [CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]

Working in the Airlock (A/L) on more post-EVA cleanup tasks, Peggy Whitson set up and started the periodic scrubbing process on the EMUs’ (Extravehicular Mobility Units) cooling water loops, by initiating its ionic and particulate matter filtration (using a 3-micron filter) on suits #3006 & #3018. The cooling loops were then reconfigured and the EMU water processing kit disassembled and stowed. [Purpose of the scrubbing, including iodination of the LCVGs (Liquid Cooling & Ventilation Garments) for biocidal maintenance, is the elimination of any biomass and particulate matter that may have accumulated in the loops.]

The CDR also terminated the regeneration of METOX (Metal Oxide) canisters #0020 & #0021 in the Airlock (A/L) bakeout oven. [METOX CO₂ absorption cans, rather than LiOH (Lithium Hydroxide) filters, were used on 12/19 both in the A/L for the Campout and in the two EMUs for the spacewalk.]

Afterwards, Peggy checked out the U.S. Sound Level Meter (SLM) instrument and then used it to conduct the periodic noise level measurements program in the station interior for a 2-hr acoustic survey, including transfer of the recorded data to the MEC (Medical Equipment Computer). [The acoustic level may have been somewhat impacted by the fans running in the A/L for the EMU iodination procedure. A total of 48 acoustic measurements are obtained at 13 locations in the Lab (including in the TESS {Temporary Sleep Station} with door closed), four locations in Node-1, three locations in the A/L, six locations in Node-2, 11 locations in the SM, three locations in the DC1 Docking Compartment, and 4 locations in the FGB. The survey also includes four crew preference locations taken at their perceived loudest locations in the station. The SLM gives instantaneous noise levels and their frequency spectra, which are transferred to the MEC laptop via an RS232 cable and later downlinked with regular CHeCS (Crew Health Care Systems) data dump or via OCA.]
For tonight’s operation of SAMS (Space Acceleration Measurement System), Tani configured the ER1 (EXPRESS Rack 1) by connecting its MTL (Moderate Temperature Loop) cooling jumper QDs (quick disconnects) to the nearby LAB1O2 UIP (Utility Interface Panel, “Z-panel”). Later, Dan will also verify proper functioning of the SAMS laptop in ER4.  [Background: Progress 26P undocking tonight will be monitored with three instrumentation systems measuring vibrational dynamics of ISS structural elements during the undocking: SDMS (Structural Dynamic Measurement System), SAMS, and MAMS (Microgravity Acceleration Measurement System). The ground-controlled SDMS can store only 10 minutes of data and has no permanent memory. Thus, the goal is to acquire at least 2 min of data prior to undocking and 3 min after, with data downlink within 24 hours after the data collection. MAMS and SAMS should be up and running 2 hours before the undocking to ensure data collection during the actual event.]

Returning to the ITCS (Internal Thermal Control System) panels later today, the FE-2 will demate and take down the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack, after the CDRA (Carbon Dioxide Removal Assembly) failed yesterday due to a warm slug of water resulting from an unexpected transition of LTL to single LT. [Since CO₂ levels during METOX remained acceptable level, CDRA did not have to be reactivated.]

Unstowing the two HRDs (High Rate Dosimeters) from the Passive Dosimetry Kit, Dan Tani replaced their batteries with fresh ones, as is done once a year to ensure the units are ready to be used in a contingency situation.  [Purpose of the handheld HRDs is to measure & record high rate radiation data, i.e., dose (in Gy) and dose rate (in Gy/hr or cGy/hr), and relay to MCC-H during a contingency event. The instruments measure absorbed dose, also known as total ionizing dose (TID), a measure of the energy deposited in a medium by ionizing radiation. Since it is equal to the energy deposited per unit mass of medium, it the unit Joule/kg, which is given the special name “gray” (Gy).]

The FE-2 also filled out the regular FFQ (Food Frequency Questionnaire), his 7th, on the MEC. [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. At TsUP/Moscow, food specialists are currently preparing the Russian food “menu” for delivery by Progress M-63/28P next February. 28P will carry “bonus food” for Peggy and Yuri, plus about 15 kg of fresh food items (apples, grapefruit, oranges, lemons, garlic) in two containers.]
CDR Whitson unstowed and assembled the HRF (Human Research Facility) ultrasound hardware for Day 1 of the Braslet experiment (SDTO/Station Development Test Objective). [The SDTO-17011 “Validation of On-Orbit Methodology for the Assessment of Cardiac Function and Changes in the Circulating Volume Using Ultrasound and Braslet-M Occlusion Cuffs (Braslet)” is a collaborative effort between NASA and the Russian FSA (Federal Space Agency), with the goal to establish a valid ultrasound methodology for assessing a number of aspects of central and peripheral hemodynamics and cardiovascular function, specifically in rapid changes in intravascular circulating volume. Braslet uses Braslet-M occlusion cuffs, i.e., the Russian-made operational countermeasure already pre-calibrated and available onboard for each ISS crewmember. Braslet employs multiple modes of ultrasound imaging and measurements, in combination with short-term application of Braslet-M occlusive cuffs and cardiopulmonary maneuvers (Valsalva, Mueller) to demonstrate and to evaluate the degree of changes in the circulating volume on orbit. This will be accomplished by performing echocardiographic examinations in multiple modes (including Tissue Doppler mode), ultrasound measurements of lower extremity venous and arterial vascular responses to Braslet-M device under nominal conditions and also during cardiopulmonary Mueller and Valsalva maneuvers. Identical measurements will be repeated without Braslet-M, with Braslet-M applied, and immediately after releasing the occlusion device.]

Yuri and Peggy completed preparations for Progress M-61/26P undocking tonight on its own free-flyer mission (~10:59pm). [The FE-1 and CDR finished trash loading and reported completion to the ground for the final Go from TsUP/Moscow, followed by cargo ship activation, tearing down the ventilation air duct, removing the threaded BZV QD (quick disconnect) screw clamps screw clamps of the SSVP docking & internal transfer system, and closing hatches between 26P and the transfer tunnel (PrK) to the DC1 after taking video of the mating surfaces/seals. They then conducted the one-hour vestibule leak check and downlinked the video imagery of the SM/Progress hatch interface. Russian MCS/thrusters were temporarily inhibited during the clamp removal due to loads constraints.]

Before sleeptime tonight, Dan will verify closure of the protective Lab science window shutter and power down the onboard amateur/ham radio equipment to prevent RF interference with the departing Progress.

Using the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System), Malenchenko took readings of potentially harmful contaminants in the SM. The hardware was then returned to initial stowage. [The CMS uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement
With Progress 26P’s oxygen (O₂) stores depleted yesterday, Yuri today supported the ground’s reactivation of the Elektron O₂ generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. [During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

Malenchenko performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Later, Yuri also will conduct the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~3:20am EST, Yuri linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations. [Issues discussed included number of PCMCIA memory cards used for KUBIK experiment data, number of discarded urine transfer hoses & adapters, and confirmation that a large number of trashed items have been stowed in Progress M-61/26P which are not yet showing in the IMS log.]

At ~3:40pm, the crew is scheduled for their conducted their seventh weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. [S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].

The CDR and FE-2 each were scheduled for their weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Dan at ~8:05am, Peggy at ~2:45pm.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the FE-2 will transfer the exercise data file to the MEC laptop for
downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

**Progress Launch Preps:** At Baikonur, Kazakhstan, preparations continue for the launch of the Progress M-62/27P cargo vehicle on 12/23 (2:12am EST). At 4:00am Moscow time (8:00pm EST last night), the Soyuz-U launch vehicle was rolled out from the Integration Building to the launch pad and installed on the pad. L-2 days activities have been started (see picture below).

CEO photo targets uplinked for today were **Polar Mesospheric Clouds** (*PMC — also known as noctilucent clouds*). *Southern spring is the season for relatively uncommon polar mesospheric clouds to form very high over Antarctica. PMC are being studied as part of the International Polar Year [IPY] investigation of climate change in high latitudes. PMC form in the stratosphere and higher, i.e. well above the lowest layer of the atmosphere [troposphere, or weather layer, characterized by clouds, and an orange tinge produced by brushfire smoke, smog, etc.]. The AIM satellite (Aeronomy of Ice in the Atmosphere) has just been launched to investigate how PMC form and why they are apparently becoming thicker and brighter. ISS/CEO imagery will complement images from AIM and from the ground. The collaborating IPY scientist is excited to receive any images ISS may acquire. Collaborating Swedish scientists have arrived at a base in Antarctica (73S 13 W) for PMC observation.**

CEO photography can be viewed and studied at the websites:

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

*Progress M-62/27P on Soyuz-U on launch pad (12/21/07)*
ISS On-Orbit Status 12/20/07

All ISS systems continue to function nominally, except those noted previously or below.

After wakeup and before breakfast, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink.  [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

In preparation for the arrival of Progress M-62/27P on 12/26 (~3:25am EST), FE-1 Malenchenko and CDR Whitson successfully conducted the standard 3-hr. training course on the TORU teleoperated control system.  [The drill involved a review of procedures and docking/math model data, UHF/S-band tagup with a ground instructor, and onboard training on a special TORU simulation program with video on laptop computer TP2. Flown on the simulator were all phases of rendezvous, flyaround, final approach and docking, plus off-nominal situations like no comm in the SM-to-27P or 27P-to-SM channels, loss of TV feed, display format hang-up on the SM's Simvol-TS screen, and docking failure of TORU before capture. During Kurs-controlled rendezvous, the TORU is in “hot standby” mode, and it would allow Malenchenko to perform necessary guidance functions manually from the SM via two hand controllers in the event of a failure of the "Kurs" automated rendezvous and docking (AR&D) of the Progress. Should the docking attempt fail, the cargo ship’s motions would be controlled by the crewmember from a console by viewing the approach to the ISS on the Simvol-TS screen as seen by the Klest-M television camera mounted on the Progress, followed by stationkeeping at 30m. Final approach should then be initiated not earlier than 3:16am (local “night”) to ensure RGS coverage, important for situational awareness, although remote TORU control]
from the ground is not available at this point. Nominal docking will be inside RGS (Russian ground site) coverage.]

To complete preparations for Progress M-61/26P undocking tomorrow night, to go on its own free-flyer mission (~10:59pm), FE-1 Malenchenko installed the StM Docking Mechanism between Progress and the DC1. [StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]

Afterwards, Malenchenko performed the usual dismantling & removal of electronic US-21 matching unit equipment from the cargo ship, to be recycled on another flight. [After deactivating the US-21 matching unit and SKV-1 dehumidifier and disconnecting the cables of the BITS 2-12 onboard telemetry measurement system, with its VD-SU monitoring mode turned off, the crew unbolted and removed the Progress’ US-21 in its container box. US-21, with its associated commutator gear, provides the electronic interface between the Service Module (SM) and the Progress for SM computer control of Progress propulsion. When a Progress is undocked and jettisoned, the valuable electronics are retained, to be recycled on a future vehicle. Tomorrow's final steps for the undocking will include completion of trash loading, activation of the cargo ship and tearing down the ventilation air duct, removing the threaded quick-disconnect (QD) screw clamps of the SSVP the docking & internal transfer system, closing hatches between 26P and the transfer tunnel (PrK) to the DC1 after taking video of the mating surfaces/seals, conducting the vestibule leak check, and downlinking video imagery of the SM/Progress hatch interface.]

FE-2 Dan Tani and CDR Peggy Whitson conducted their first session of the LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System)/Phase 2 experiment, starting off with a teleconference with the Project Scientist at POIC (Payload Operations & Integration Center/Huntsville). After setting up the payload equipment, the CDR completed today’s LOCAD exploratory survey activities, taking single swab samples from five different sites in the station. Five more swab samplings will be conducted tomorrow. In Phase 2, no media sides will have to be prepared. [LOCAD uses small, thumb-sized “microfluidic” cartridges that are read by the experiment reader. The cartridges contain dried extract of horseshoe crab blood cells and colorless dye. In the presence of the bacteria, the dried extract reacts strongly to turn the dye a green color. Therefore, the more green dye, the more microorganisms there are in the original sample. The handheld device tests this new analysis technology by sampling for the presence of gram negative
bacteria in the sample in about 15 minutes, showing the results on a display screen. Lab-on-a-Chip technology has an ever-expanding range of applications in the biotech industry. Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics. The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection. With expanded testing on ISS, began by Sunita Williams in March/April this year, this compact technology has broad potential applications in space exploration—from monitoring environmental conditions to monitoring crew health. The current study should prepare for long-duration exploration by demonstrating a system that enables the crew to perform biochemical analysis in space without having to return samples to Earth.

In the Lab, Tani also continued his servicing of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment on its third ground-controlled session. [In Step 1, the FE-2 configured the MSG (Microgravity Science Glovebox) facility, closed the vacuum vent, checked for acceptable humidity levels, and opened the SPU-11 (Sample Processing Unit #13) water valve to initiate unattended vacuum preparation. Later, in Step 2, he reset MSG, closed the water valve, again checked for acceptable humidity levels in the sample chamber, then opened the vent & vacuum valves to initiate the required vacuum draw on the sample chamber. CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]

During the afternoon, the crew performed a repeat of the previous end-to-end test of analog & digital video transmission & downlinking from the Russian Segment (RS) from the MPEG-2 (Moving Pictures Expert Group 2) encoder via U.S. OpsLAN and Ku-band in “streaming video” packets, after previous attempts had yielded results unacceptable for ATV1 “Jules Verne” docking. For the testing, Tani set up the necessary cabling and three SSC (Station Support Computer) laptops (#4, #6, #9) for viewing and recording MPEG2 stream on the LAN (Local Area Network). [Afterwards the FE-2 shut down SSC-4 and SSC-6, leaving the SSC-9 A31p powered for downloading its files via OCA.]

In Node-2, where the BCAT-3 (Binary Colloidal Alloy Test-3) science payload is running by itself since 12/13 (with a brief picture taking interruption for EVA-13 support), the FE-2 performed his daily status check on the A31p laptop controlling the EarthKAM digital still camera, verifying on the last image taken that image focus and alignment remain in check. [The SSC (Station Support Computer) is taking
photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour for the next few days.]

The FE-1 was scheduled to perform another one-hour O₂ (oxygen) refresh of the cabin atmosphere from Progress M-61/26P storage tank, to utilize its gas stores prior to its jettisoning on 12/22.

Whitson ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with the European Space Agency.]

Peggy also took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA - Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary.  [Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. CSA-CP sensors (and readings) employed in the SM were #1051 (21.7%) & #1044 (21.8%); in Node-1 #1058 (20.9%); and in Node-2 #1058 (20.9%). O₂ sensor checks used #1042 (21%), #1063 (21.8%), #1052 (21.8%), #1041 (21.7%). CDMK CO₂ level in Lab and SM was ~0.20%.]  

Peggy and Dan completed their second run with the MedOps WinSCAT (Spaceflight Cognitive Assessment Tool) experiment by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment.  [WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR’s, crewmembers or flight surgeons request.]

In the Joint Airlock, the CDR and FE-2 performed more post-EVA cleanup, recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir) #1024 and CWC (Contingency Water Container) #1059, then reconnecting the
LTAs (Lower Torso Assemblies) to the EMUs and capping the UIA (Umbilical Interface Assembly).

Tani also terminated the overnight regeneration of METOX (Metal Oxide) canisters #0017 & #0019 in the A/L bakeout oven and initiated the process on canisters #0020 & #0021. [METOX CO₂ absorption cans, rather than LiOH (Lithium Hydroxide) filters, were used yesterday both in the Airlock for the Campout and in the two EMUs for the spacewalk.]

Afterwards, Dan started discharging two EMU batteries, #2063 & #2077, used during EVA-13. [The full maintenance discharge is handled automatically by an SSC laptop equipped with a special DOS application.]

Peggy Whitson conducted the weekly 10-min. CWC audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card (16-0018K), to be updated with today’s data, lists 26 CWCs; ~983 liters total) for the four types of water identified on board: technical water (735.4 l, for Elektron, flushing, hygiene), potable water (221.3 l), condensate water (0 l), waste/EMU dump and other (26.6 l). Two CWCs (#1004 & #1081, ~89 l) with potable water are off limits due to the Wautersia bacteria found in sample analysis, the source of which is still not understood. Impact of losing this potable CWC is negligible since there are sufficient drinking water supplies onboard. Also currently not to be used are nine CWCs with technical water (~389 l).]

Peggy unstowed and set up the NUTRITION with Repository hardware for the blood draw and urine collection part of her third session with this experiment, beginning tomorrow with a combination blood draw (Serum & Heparin), requiring Dr. Whitson to forego exercising & food intake for eight hours, i.e., starting tonight. Urine sample collection begins tomorrow morning and continues for 24h, i.e., through Tuesday morning. [The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing in-flight samples (plus an additional postflight sample), made possible by the MELFI (Minus Eighty Degree Celsius Laboratory Freezer for ISS). Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status & nutrient requirements.]

At ~3:15am EST, Yuri Malenchenko had a PMC (Private Medical Conference) via S-band/audio to discuss his exercise regimen.
The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the CDR copied the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

FE-2 Tani conducted the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Working from his discretionary “time permitting” task list, Yuri Malenchenko completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The relocation of the MT (Mobile Transporter) from WS7 (Worksight 7) to WS4, postponed on 12/14 due to a possible obstruction by MLI (Multi-Layered Insulation) on the NTA (Nitrogen Tank Assembly), was performed at 10:55am-12:55pm, with the Russian MCS (Motion Control System)/thrusters temporarily inhibited due to loads constraints. [Analysis of the NTA insulation had shown that there was sufficient clearance for the roll-over which has the purpose to provide added protection of the TUS (Trailing Umbilical System) from MMOD (Micrometeoroid/Orbital Debris) between now and Flight STSA-122/1E. MT will be translated back to WS7 about three days before 1E arrival.]

**MBSU Health Flag:** MBSU (Main Bus Switching Unit) 2 is showing a new health flag in a data dump conducted yesterday, indicating an anomaly in one of its firmware blocks. Two other health flags were discovered earlier in different blocks. Exact impacts are unknown until further analysis. All MBSU telemetry appears nominal.

**Progress Launch Preps:** At Baikonur, Kazakhstan, the Progress M-62/27P orbital module was integrated today with the Soyuz-U launch vehicle in the Processing Facility (see picture, below).

**Sad Note:** Early this morning it was announced at the MMT (Mission Management
Team) meeting that Flight Engineer Dan Tani’s mother Rose died late yesterday during a car crash. Dan was informed in a private phone call. This is the first time an orbiting NASA Astronaut loses a close kin. We all feel truly sorry for your loss, Dan!

CEO photo targets uplinked for today were Greater Khartoum, Sudan (Khartoum and Omdurman, cities at the confluence of the White and Blue Niles, were at nadir and a touch left. The margins of these cities are of greatest interest. Omdurman on the west bank is more earth-colored than Khartoum and thus less easily visible), Sahara dust (Dynamic event. Conditions have set in for an extended dust event in the central Sahara, north of Lake Chad, in one of the planet’s prime dust-generating basins. Dust particles from this basin are now known to reach the Americas several times per year. Looking right for oblique views of the dust plumes and trying to shoot the edges of the dust mass), Tunis, Tunisia (looking right for this historic port city which lies at the head of a major bay, the crew’s main visual cue), and Mount Vesuvius, Italy (Vesuvius is one of the so-called “Decade Volcanoes”. The Decade Volcanoes project focuses on a small number of active volcanoes worldwide in order to encourage a range of research and public-awareness activities, all aimed at improving understanding of volcanoes and the hazards associated with them).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:30am EST [= epoch]):
Mean altitude -- 336.5 km
Apogee height -- 337.1 km
Perigee height -- 335.9 km
Period -- 91.26 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000907
Solar Beta Angle -- -47.8 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 176 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52017

Significant Events Ahead (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
12/21/07 -- Progress M-61/26P undocking (DC1) ~10:59pm (to continue free-flying mission)
12/22/07 -- Yuri Malenchenko’s Birthday
12/23/07 -- Progress M-62/27P launch; ~2:12am
12/26/07 -- Progress M-62/27P docking (DC1); ~3:25am
01/10/08 – NET: STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.
01/12/08 -- NET: STS-122/Atlantis/1E docking
01/21/08 -- NET: STS-122/Atlantis/1E undocking
01/31/08 -- Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket) [Check it out at http://usspace50.com]
02/06/08 -- Progress M-62/27P undocking & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking (DC1)
02/14/08 -- NET: ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/06/08 -- NET: ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08 -- NET: ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- NASA 50 Years
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation’s Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

![Progress M-62/27P on Soyuz-U in Processing Facility (12/20/07)](image)
All ISS systems continue to function nominally, except those noted previously or below.

>>> Today at ~5:30am EST, the ISS, specifically its FGB module, completed 52,000 orbits of the Earth, having covered a distance of 2.2 billion kilometers (1.37 billion st.miles) in 3316 days. The 19,300 kg (42,600 lbs) Zarya (“Dawn”) was launched on a Russian/Khrunichev Proton from Baikonur over nine years ago (11/20/1998) as the first element of the multi-national space station.<<<

After wakeup and before breakfast, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

For the subsequent METOX (Metal Oxide) CO₂ absorption canister regeneration, the FE-2 connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper to the LAB1D6 rack, to support the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), and Houston lowered the temperature setpoint to the regular 9.4 degC. [CDRA activation was performed from 4:30-5:30am.]

As part of post-EVA cleanup activities, FE-1 Yuri Malenchenko recorded the “Pille” radiation readings from the EMU-worn (plus one background) “Pille-MKS” dosimeters in a log table for subsequent downlink to the ground.

Other cleanup activities performed by Dan Tani during the day were –
Disconnecting the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cables at the Lab RWS (Robotics Work Stations), used during the EVA for SSRMS (Space Station Remote Manipulator System) video coverage,
- Powering down the no-longer-needed A31p PCS (Portable Computer System) laptop in the Airlock (A/L), and
- Initiating and monitoring regeneration of METOX canisters #0017 & #0019 in the A/L bakeout oven.

At ~8:25am EST, the three crewmembers wrapped up post-EVA activities by discussing the spacewalk in the usual post-EVA debriefing conference with the ground via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplink on the SSC-10 laptop).

In the Lab, after inspecting, activating and configuring the MSG (Microgravity Science Glovebox) facility, CDR Peggy Whitson initiated another series of vacuum draws on the sample chamber containing SPU-11 (Sample Processing Unit #11), by opening the vent and vacuum valves, for subsequent CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment ops on its third run, to be controlled by the ground for the next 36 hrs (until 12/22). [CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]

In Node-2, the FE-2 restored the BCAT-3 (Binary Colloidal Alloy Test-3) science payload in the MWA WSA (Maintenance Work Area/Work Surface Area) to nominal operation by setting up Sample 3 and reinstalling the DCS-760 digital still camera, run by an A31p SSC (Station Support Computer) with EarthKAM software for automatically taking flash photography of the sample every two hours over the next several days. Dan checked on correct focus and flash settings, taking manual photos for ground analysis. [The EarthKAM DCS 760 had been temporarily removed on 12/16 for being used for yesterday’s EVA.]

FE-1 Malenchenko took the periodic readings of cabin air components with the IK0501 GA (gas analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System in the Service Module (SM). [IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed.]

The FE-1 performed a one-hour O₂ (oxygen) refresh of the cabin atmosphere from
Progress M-61/26P storage tank, to utilize its gas stores prior to its jettisoning on 12/22.

Also in preparation for 26P undocking, Malenchenko worked an hour in the cargo ship to dismantle and remove the LKT local temperature sensor commutator/switch (TA251MB) of the BITS2-12 onboard telemetry system, along with its PZU-1M ROM (read-only memory) unit, stowing the avionics items on ISS for reuse in a future vehicle.

Yuri and Peggy had two hours each set aside for finishing up stowing discarded equipment and trash in the 26P cargo ship-turned-trash can while keeping track of movements in the IMS (Inventory Management System).

Malenchenko installed and configured the thermostat-controlled science coolers KUBIK-1 & KUBIK-2 in the SM and transferred their stored data via data cable and PCMCIA card to the RSE1 laptop for subsequent downlink to the ground over the BSR-TM payload channel. The KUBIK refrigerators were then deactivated, removed and put back in stowage in the FGB.

Dan Tani today performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Working from his discretionary “time permitting” task list, Yuri Malenchenko conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the FE-2 copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~1:25pm EST, Peggy Whitson and Dan Tani supported two PAO TV interviews of 6 minutes each, one with CBS News (Bill Harwood), the other with ABC News (Victor Ratner). Afterwards, the CDR downlinked a TV message to MCC-H for
taping on the occasion of NASA’s upcoming Day of Remembrance, to be broadcast on NASA TV and used at other NASA occasions marking those solemn days. [NASA’s Day of Remembrance, the final Thursday in January (this time 1/31/08), commemorates and honors the fallen heroes of Apollo 1, Challenger and Columbia and all of those who have given their lives in the cause of exploration and discovery. In their memory, flags across the agency will fly at half-staff.]

**KURS Tests:** After the two pre-docking tests for Progress M-62/27P of the KURS automated rendezvous & docking system on 12/14 & 12/16, two additional tests are being performed today and tomorrow to confirm positive test results. [Test results for the previously (12/13) failed KURS String 2 subset were nominal, but only after an extended warm-up time for the system (1.5 hrs instead of nominal 30 min). Today’s and tomorrow’s testing should provide more assurance of adequate functioning for the docking on 12/26 (~3:25am).]

**MT Translation:** Relocation of the MT (Mobile Transporter) from WS7 (Worksite 7) to WS4, postponed on 12/14 due to a possible obstruction by MLI (Multi-Layered Insulation) on the NTA (Nitrogen Tank Assembly), will take place tomorrow (12/20) at ~10:55am-12:55pm. [Analysis of the NTA insulation showed that there is sufficient clearance for the roll-over which is intended to provide added protection of the TUS (Trailing Umbilical System) from MMOD (Micrometeoroid/Orbital Debris) between now and Flight STSA-122/1E.]

**MPEG-2 Testing:** The recent end-to-end testing of analog & digital video transmission & downlinking from the Russian Segment (RS) via the MPEG-2 (Moving Pictures Expert Group 2) encoder and Ku-band in “streaming video” packets over the U.S. OpsLAN has to date yielded results that are unacceptable for ATV1 “Jules Verne” docking. To obtain more data, a repeat of the end-to-end test is planned for tomorrow (~2:00pm) with some modifications, preparatory to using the video linkup during the Progress 26P undocking on 12/21 (Friday).

**Power Management Update:** Yesterday after the EVA-13, DLA-1 (Drive Lock Assembly 1) of the Stbd SARJ (Solar Alpha Rotary Joint) was re-engaged, moded to Directed Position and moved to safe parking at 45 deg. Between 1:37-2:07pm EST, with the SPS (Secondary Power System) temporarily powered down, ground commanding then transferred power loads on the 1A channel to the 4A channel via the MBSUs (Main Bus Switching Units) by means of the SPCH (Seamless Power Channel Handover) technique. This was necessitated by the limited power generation caused by the combination of Stbd SARJ anomalies, BGA 1A trips and the high Sun Beta angle period just ahead. Channel 1A is now in the so-called “parachute mode” as backup to channel 4A which carries the loads. [SPS was powered up again yesterday at 2:30-2:45pm.]
Onboard Work Look-ahead: The following tasks are being considered for Stage 10A (i.e., between now and 1E): OGS (Oxygen Generation System) activation (from Stage 1E), Regenerative ECLS modification kit, RPCM (Remote Power Controller Module) replacements in cases where RPCs have been open for some time, and R&R (removal & replacement) of ER1 (EXPRESS Rack 1)’s leaky water valve.

Over the holidays, the crew will be busy with payloads ops.

CEO photo targets uplinked for today were **Walvis Bay dunes, Namibia** (*Dynamic event*). Viewing conditions improve as winter coastal fog is reduced with the onset of southern spring. Fast-moving dunes [meters per year] on the Namibian coast leave tracks [“footprints”] that are thought to be analogs for hard-to-interpret features seen in many Mars impact craters. A mapping pass on the inshore margin of the small fishing port of Walvis Bay, where these features are known, was requested. Sun angles were ideal), **Addis Ababa, Ethiopia** (*Addis is seldom clear of cloud cover. The city has a population of more than 3 million. As the capital of Ethiopia and home of the African Union, it has communities representing 80 nationalities. It is growing fast, and CEO observers requested images of the urban fringe where change is focused), and **Chari River Basin, Chad** (*Dynamic event*). The imaging window between summer cloud and winter smoke haze in the Sahel allows documentation of the complex landscape south of Lake Chad. Major rivers are depositing sediment in the form of several very large fanlike features, both active and inactive. The active fans change constantly. ISS/CEO imagery helps understand these changes. A mapping pass along track at nadir and a touch left, was requested. Recent research suggests that the huge sediment fans may be a good analog for some rock units on Mars).

CEO photography can be viewed and studied at the websites:
- [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/18/07

All ISS systems continue to function nominally, except those noted previously or below.

EVA-13 by CDR Peggy Whitson & FE-2 Dan Tani was completed successfully in 6h 56m, accomplishing its objectives.

During the spacewalk, Tani (EV1) & Whitson (EV2), supported by FE-1 Yuri Malenchenko as intravehicular (IV) crewmember, inspected the Stbd (right-side) 1A BGA (Beta Gimbal Assembly) and BMRMM (Bearing Motor Roll Ring Module), followed by a detailed investigation and photo documentation of the Stbd SARJ (Solar Alpha Rotary Joint).

Specifically, the spacewalkers –

● Found no obvious signs of external damage on cables or hardware of the BGA & BMRMM that might have caused the repeated tripping of circuit breakers (RPCs/Remote Power Controllers), making it more likely that the issue is internal to the hardware or its electrical system;

● Entered into the S5 truss to disconnect some wiring to allow the ground to perform diagnostic continuity tests, and later reconnected the cables;

● Temporarily removed 22 protective MLI (Multi-Layer Insulation) covers to inspect the SARJ, its two DLAs (Drive Lock Assemblies), and its 12 TBAs (Trundle Bearing Assemblies), reattaching the covers afterwards,

● Found most metal shavings around TBA-4 and TBA-5, i.e., metallic, magnetic contamination on the main gear bearing’s outboard angled race ring as well as pitting and abrasions on the ring but no obvious damage on the inboard race ring or on the gear teeth themselves. DLA (Drive Lock Assembly) #2 appeared especially “ugly”, i.e., filled with contamination, and, according to the spacewalkers, the further away from the DLA, the less contamination was observed;

● Took photographs, measured the depth of surface pits with a special probe and collected debris samples; and

● Deinstalled and removed TBA-5 from its housing under cover #20, using a
PGT (Pistol Grip Tool), then brought it inside in a bag for eventual return to Earth aboard STS-122/Atlantis (SARJ can function OK on only 11 TBAs).

[Official start time of the spacewalk was 4:50am EST, 70 minutes ahead of the timeline, ending at 11:46am. Total EVA duration (PET = Phase Elapsed Time) was 6h 56min. It was the 100th spacewalk for ISS assembly & maintenance and the 72nd from the station (28 from Shuttle, 50 from Quest, 22 from Pirs) totaling 436h 3m, and the 4th for Expedition 16 (totaling 28h 11m. During the spacewalk, her fifth, Peggy Whitson set a new record of aggregated EVA time by a woman (of 32h 36m) when she exceeded the 29h 18m held by Sunita Williams. After today’s EVA, a total of 121 spacewalkers (90 NASA astronauts, 21 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 624h 25m outside the station on building, outfitting and servicing. It was also the 122nd spacewalk by U.S. astronauts. The 100th EVA dedicated to ISS assembly & maintenance originally was to have been conducted by Rex Walheim & Hans Schlegel of the delayed STS-122/1E mission.]

Prior to the spacewalk, FE-1 Malenchenko verified closure of the protective Lab window shutter.

Malenchenko also completed the pre-egress reconfiguration of the Russian STTS (onboard telephone/telegraph subsystem) to its EVA settings. After the crew’s return, Yuri reconfigured the STTS for nominal ops. [The "Voskhod-M" STTS enables telephone communications between the SM (Service Module), FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM’s outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]

During the spacewalk, Yuri provided IV support, prepared the DCS 760 camera setup for post-ingress photographing of the EVA gloves and subsequently assisted the spacewalkers in ingressing, CL (Crew Lock) repressurization and post-EVA activities.

The FE-1 also performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module). [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

During Campout, after wakeup and before breakfast, FE-2 Dan Tani again
accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

After returning on board from outside, Whitson and Tani doffed the EMUs, after taking photographs of the gloves and overgloves while still pressurized. As part of post-EVA tasks, the spacewalkers also reported on size fit of their EMUs and components.

Later today, CDR Whitson will downlink the EVA imagery to the ground and reconfigure the DCS 760 for regular use (e.g., removing its thermal blanket).

Afterwards, Peggy and Dan are also scheduled for their regular post-EVA PMCs (Private Medical Conferences) with the ground.

CEO photo target uplinked for today was Khartoum, Sudan (Greater Khartoum [population 8.3 million, 2007 est.] includes Khartoum [2.2 million] in the acute angle between the Blue and White Niles, and Omdurman [3+ million] on the west side of the White Nile. Omdurman is the largest city in the Sudan and the fastest growing, partly because of refugees fleeing western Sudan. The growth of cities, especially in the Third World, is best documented by remote means from the air or space. Looking a touch right for Khartoum and at nadir for Omdurman, shooting city margins).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 9 of Increment 16.

After wakeup and before breakfast, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

In preparation for Progress M-62/27P arrival on 12/26 at the DC1 Docking Compartment, Malenchenko and Whitson supported a ground-controlled functions test of the SM (Service Module) & Progress TORU telemanipulator system without Progress DPO thrusters firing. [Commands were entered via the RUO (Rotational Hand Controller) and RUD (Translational Hand Controller), during an RGS (Russian Groundsite) comm pass at 3:22am EST. The TORU teleoperator system provides a manual backup mode to the Progress’ KURS automated rendezvous radar system. The two crewmembers will be monitoring the approach and docking of Progress M-62 at the DC1 from the TORU station in the SM.]

FE-1 Malenchenko set up the pumping equipment and initiated (later closed out) the periodic transfer of urine from 3 EDV-U containers in the SM to the Rodnik BV1 tanks of Progress M-61/26P, adding ~5 L of disinfectant solution. [Leak checks performed by the crew on 10/8-9 on the membrane (expulsion bladder) of the Progress’ Rodnik BV1 tank showed that BV1 appeared unsuitable for liquid waste transfer due to a small leak in the tank’s bladder. Last week, TsUP-Moscow learned from the supplier that the bladder is acceptable for urine transfer provided the KN1 bladder expulsion valve is closed during today’s pump-over, i.e., no]
pressure adapter installed on the bladder outlet. Transfers to the BV2 tanks were performed on 10/23 and 11/15.]

For tomorrow’s EVA-13, final preparations by FE-2 Dan Tani & CDR Peggy Whitson today included -
  ● Reconfiguring two DCS 760 digital still cameras for the spacewalk (leaving them connected to station power for now to conserve batteries),
  ● Attaching a tie wrap around one camera's flash (to allow visual identification during EVA),
  ● Setting up 4 batteries in the A/L BSA (Airlock Battery Stowage Assembly) for charging during the prebreathe period and to be installed in the EVA flashes prior to egress,
  ● Powering down onboard amateur (ham) radio equipment (Kenwood in SM, Ericsson in FGB) to prevent RF (radio frequency) interference with the EMU (Extravehicular Mobility Unit)/spacesuits,
  ● Preparing the A/L EL (Airlock Equipment Lock) for the Campout & spacewalk,
  ● Tagging up with ground specialists at ~8:40am EST for reviewing EVA particulars, and
  ● Undergoing the standard pre-EVA PMC (Private Medical Conference) via S- & Ku-band audio/video.

Also for the spacewalk, FE-1 Malenchenko prepared three Russian “Pille-MKS” radiation dosimeters, recorded their dosages and equipped each of the two EMUs with a radiation sensor, on the outer surface (A0309/CDR & A0310/FE-2).  [A third sensor, A0308, was placed in the SM on the PULT reader for background readings.]

Dan (EV1) and Peggy (EV2) will begin their “campout” in the A/L with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi at ~2:20-2:50pm, followed by mask prebreathe at ~2:50-4:00pm. Sleep time for the ISS crew begins at 4:30pm.  [For the Campout, METOX (Metal Oxide) canisters #0017 & #0019 have been installed in the A/L for CO2 control.]

After the usual hygiene break/with mask prebreathe for Whitson & Tani at ~1:30-2:40am tomorrow morning after spending the night on 10.2 psi campout, the A/L hatch will be closed again by Malenchenko for EVA preps in 10.2 psi, followed by EMU purge (~4:20-4:35am) and prebreathe (~4:35-5:25am). Afterwards, with CL depressurization and EV1/EV2 egress, EVA-13 nominally begins at ~6:00am EST. Yuri will support the spacewalk as IV (Intravehicular) crewmember, keeping tabs with the detailed activity steps and crib sheet.

[EVA-13 is expected to last about 6h 30m. Its objectives are: (1) Inspection of 1A BGA (Beta Gimbal Assembly) and BMRMM (Bearing Motor Roll Ring Module,
“broom”), including assisting fault search by the ground by disconnecting/reconnecting cables and possibly performing an R&R (removal & replacement) of the 1A ECU (Electronic Control Unit) on the S4 truss; (2) inspection and photo documentation of the Stbd SARJ (Solar Alpha Rotary Joint), including temporary removal of protective MLI covers (8 double-wide, 12 single-wide, plus 2 DLA/Drive Lock Assembly covers), debris removal, DLA inspection, finally unbolting (3 bolts) & removing TBA-5 (Trundle Bearing Assembly #5) for return to Earth. **Note:** The A/L repress after crew ingress will use for the first time the new IMV (Intermodular Ventilation) Flange Saver installed by the CDR Whitson in Node-1 on 12/5. The new Flange Saver slows the equalization rate between the A/L and the ISS in the event of an emergency-triggered equalization during EVA campout, protecting the crew from possible ear damage due to the rapid pressure increase in the airlock.

Malenchenko completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Working from his discretionary “time permitting” task list, Yuri also handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

**ITCS Transition:** At ~11:15am, the Lab ITCS (Internal Thermal Control System) was switched by ground commanding from Single LTL (Low Temperature Loop) to Single MTL (Moderate Temperature Loop) to support offloading of power channel 1A for EVA-13, i.e., provide power balance. Transition back to nominal Single LTL will be on 12/19.

**MT Translation:** Relocation of the MT (Mobile Transporter) from WS7 (Worksite 7) to WS4, postponed on 12/14 due to a possible obstruction by MLI (Multi-Layered Insulation) on the NTA (Nitrogen Tank Assembly), has now been rescheduled for
12/20 (Thursday). Analysis of the NTA insulation showed that there is sufficient clearance for the roll-over which is intended to provide added protection of the TUS (Trailing Umbilical System) from MMOD (Micrometeoroid/Orbital Debris) between now and Flight 1E.

**KURS Radar Antenna Test:** The pre-docking test (for Progress M-62/27P) of the KURS automated rendezvous & docking system, performed on 12/13 with off-nominal results for the backup string 2, was repeated on 12/14 & 12/16. After an extended warm-up time for the system (1.5 hrs instead of nominal 30 min), results for string 2 were nominal. Both subsets of the KURS system are now considered ready for the docking, but another test is planned for 12/19-20.

**SVK-1 Air Conditioner Restoration:** As per report by Moscow this morning at the MMT (Mission Management Team), the Russian air conditioner SKV-1, long nonfunctional due to a blocked line 3 of the BRPK’s membrane tank, is now back in service.

No CEO photo targets uplinked for today.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/16/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday – EVA Preparation Day 1 for CDR Whitson, FE-1 Malenchenko and FE-2 Tani. Ahead: Week 9 of Increment 16.

After wakeup and before breakfast, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

The crew began preparations for the spacewalk (EVA-13) on 12/18 (Tuesday), starting with FE-2 Dan Tani printing out uplinked EVA procedures/timeline material which was then reviewed jointly by all crewmembers (covering SARJ overview, BGA inspection, updated EVA-13 procedures and the usual EVA crib sheet with contingency actions). [The spacewalk, scheduled to begin at approximately 6:00am and to last ~6.5 hrs, has two major objectives: (1) Inspection of 1A BGA (Beta Gimbal Assembly) and BMRMM (Bearing Motor Roll Ring Module, “broom”), including assisting fault search by the ground by disconnecting/reconnecting cables and possibly performing an R&R (removal & replacement) of the 1A ECU (Electronic Control Unit) on the S4 truss; (2) inspection and photo documentation of the Stbd SARJ (Solar Alpha Rotary Joint), including temporary removal of protective MLI covers (8 double-wide, 12 single-wide, plus 2 DLA/Drive Lock Assembly covers), debris removal, DLA inspection, finally unbolting (3 bolts) & removing TBA-5 (Trundle Bearing Assembly #5) for return to Earth.]

In Node-2, the FE-2 discontinued picture taking on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload and deinstalled the EarthKAM DCS 760 digital still
camera, which will be used for the EVA. The equipment will be returned to BCAT-3 photography on 12/19 after the EVA is complete.

In the course of the day, CDR Peggy Whitson & FE-2 Dan Tani worked in the Airlock (A/L) where they -

- Initiated (later terminated) recharging the EMU (Extravehicular Mobility Unit) batteries and two batteries for the DCS 760 camera;
- Configured the camera for taking outside;
- Prepared EVA tools required for the spacewalk activities;
- Consolidated the contents of two PWRs (Payload Water Reservoirs, #1023 & #1025) in a third PWR #1024), yielding approximately 9 lbs of water (PWR can contain up to 20 lbs), then
- Degassed PWR #1024 and inspected #1005 to degas if necessary (i.e., manually removing gas bubbles to minimize the amount of air introduced into the EMU feedwater tanks);
- Checked out the EMU spacesuits (#3006 for Tani, #1005 for Whitson);
- Resized the EMU that had been modified for 1E/Love;
- Equipped EMU #3006 with its REBA (Rechargeable EVA Battery Assembly) and checked out #1005’s already-installed REBA;
- Installed and checked out the METOX (Metal Oxide) CO2 absorption canisters in the suits, and
- Tagged up with the ground at ~10:05am EST to discuss EVA/timeline particulars.

FE-1 Yuri Malenchenko meanwhile performed a refresh of the cabin atmosphere from Progress M-61/26P section 2 storage tank, to utilize its gas stores prior to its jettisoning on 12/22.

The FE-1 also completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM).

[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]

At ~2:30pm, Dan Tani had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

The crewmembers performed their regular 2.5-hr physical workout program (about
half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Still on Yuri’s “time permitting” job list was the periodic collection & deletion of readings on the MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/display of the RBO-3-2 Matryoshka-R antroph-amorphous (human torso) "phantoms" located inside the station for sophisticated radiation studies, collecting radiation measurements every 15 minutes around the clock.

A second job item on the FE-1’s discretionary list for today was another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D1X digital camera with SIGMA 300-800mm telephoto lens. [KPT-3 photography has been a frequent earth observing experiment for ECON.]

Also on the voluntary task list for Yuri was a late-added session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera with 800 mm focal length lenses to take pictures of the Kerch Strait at low sun angle to record an oil spill, the aftermath of a ship wreck in the strait during a recent hurricane. [According to media report an oil spill covering several kilometers was spotted on 12/4. Also a target region for Uragan photography for today were glaciers of northern and southern islands of New Zealand in nadir.]

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:25am EST [= epoch]):
Mean altitude -- 337.1 km
Apogee height -- 337.7 km
Perigee height -- 336.4 km
Period -- 91.27 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000922
Solar Beta Angle -- -28.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 124m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51954

**Significant Events Ahead** (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
12/18/07 -- Stage 10A EVA (Whitson/Tani) -- Stbd SARJ, 1A BGA BMRRM; (~6:00am)
12/18/07 -- STS-122/Atlantis ET tanking test (7:00am)
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/10/08 – NET: STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket)** [Check it out at http://usspace50.com/]
02/07/08 -- Progress M-63/28P launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- NET: ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/29/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **50th Birthday of NASA**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
04/??/09 -- **Six-person crew on ISS** (with Soyuz 18S docking)
04/15/09 -- **Constellation’s Ares I-X Launch**

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/15/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work.

After wakeup and before breakfast, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

The crew conducted the regular weekly three-hour task of thorough station cleaning. "Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.

In the Lab, FE-2 Dan Tani wrapped up his support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) facility, terminating SPU-3 (Sample Processing Unit #3) processing, transferring its data to the MLC (MSG Laptop Computer) and verifying them, then removing SPU-3, installing a new SPU (#11), and finally turning the payload off. Later, the MSG was also powered off. [CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a]
liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings. By all indications, the CSLM runs were nominal.

In Node-2, with the BCAT-3 (Binary Colloidal Alloy Test-3) science payload running by itself since 12/13, the FE-2 performed his daily status check on the A31p laptop controlling the EarthKAM digital still camera, verifying on the last image taken that image focus and alignment remain in check. [The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour for the next few days. The EarthKAM camera will be required next week for post-EVA EMU glove photography.]

FE-1 Yuri Malenchenko performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

At ~6:35am EST, the FE-1 had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

At ~9:15am, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

A new task added to the voluntary “job jar” list for CDR and FE-2 calls for finishing up the audit and consolidation of photo/TV items in their CTBs (Cargo Transfer Bags), started by Dan Tani yesterday.
Also in the discretionary “job jar” for Dan for today were departure preparations for his end-of-increment cleanup.  *Due to the extension of his station tenure to NET mid-January, the FE-2 will have more leisure in completing this clean-up.*

Working from his own “time permitting” job list, Yuri was to perform the periodic collection & deletion of readings on the MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/display of the RBO-3-2 Matryoshka-R antroph-amorphous (human torso) "phantoms" located inside the station for sophisticated radiation studies, collecting radiation measurements every 15 minutes around the clock.

A second job item on Malenchenko’s discretionary list for today was another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D1X digital camera with SIGMA 300-800mm telephoto lens.  *[KPT-3 photography has been a frequent earth observing experiment for ECON.]*

**MT Translation:**  Yesterday’s planned MT (Mobile Transporter) translation from WS7 (Worksite 7) to WS4, erroneously reported here as completed, was deferred to no earlier than 12/20 (Thursday) due to a possible obstruction of MLI (Multi-Layered Insulation) on the NTA (Nitrogen Tank Assembly).  The translation will provide added protection of the TUS (Trailing Umbilical System) from MMOD (Micrometeoroid/Orbital Debris) between now and Flight 1E.  Ground controllers are assessing imagery of the translation path and developing a forward plan.

**BGA 1A Update:**  More testing was performed last night on the failed 1A BGA (Beta Gimbal Assembly).  During a power switch sequence the BCDU 3A1 CP RBI (Battery Charge/Discharge Unit/CP Remote Bus Isolator), a fuse-type switch, did not trip open, but the RPCs (Remote Power Controllers) of both primary and redundant power feeds to the 1A ECU (Electronics Control Unit) tripped several times.  At the conclusion of the test, the RPCs remained closed for about 3 hours, then tripped again.  ECU 1A is now unpowered and BGA 1A is locked, with the motor off, i.e., in stable configuration.  Engineering analysis of the dumped data continues, but no more troubleshooting is expected before the EVA-13.

**Weekly Science Update** (Expedition Sixteen -- Week 8)

**ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):**  Radiation measurements continue nominally in the PIRS module.  The next memory card replacement activity is currently scheduled on 12/10.

**ANITA:**  Completed.
**BCAT (Binary Colloidal Alloy Test):** The Binary Colloidal Alloy Test-3 experiment can now proceed, thanks to Astronauts Dr. Peggy Whitson and Dan Tani. Sample 3, the most critical of the samples (and the one closest to the critical point) was the first to be restarted to allow for the publication of the science data by Harvard University (Dr. David Weitz, PI, and Peter Lu, Doctorate Candidate). Operations (EarthKAM imaging) will continue for 4 days when parts of the BCAT-3 setup is needed for EVA activities. After the EVA BCAT-3 activities will continue for a total of 14 days.

**CARDIOCOG-2:** Completed.

**CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):** “Dan: Due to the slip of 1E, we will need to repeat your 2nd session at the appropriate time frame (within R–21 to R–14) to meet the experiment’s requirements. This activity will be hard scheduled. Again, thank you for your participation.”

**CFE (Capillary Flow Experiment):** Reserve.

**CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus):** In progress.

**CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):** Complete.

**CSLM-2 (Coarsening in Solid-Liquid Mixtures 2):** CSLM-2 SPU-3 34-hr soak is in progress and should be complete by 12/15/07.

**EarthKAM (Earth Knowledge Acquired by Middle School Students):** Complete.

**EPO (Educational Payload Operations):** EPO is very satisfied with the EPO Demos that the crew conducted within the past week including the Sanitation on Station, ISS Tour/Living Space, and Newton's Laws Demo. The videos will be used to enhance existing education resources. “We would like to thank the crew for their efforts in inspiring the next generation of explorers in science, technology, engineering, and mathematics.”

**ETD (Eye Tracking Device):** Second session for Yuri Malenchenko was performed nominally on 12/12.

**Integrated Immune:** In progress.

**LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):** Complete.
MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: MULTIGEN-1 samples will be downloaded on STS-122 (1E). Peggy performed successfully the Water Reservoirs Exchange activity on 12/12. That allows for additional dry-out of the EMCS (European Modular Cultivation System) Facility as preventive measure to the now delayed Clean-Up activities planned during 1E Stage.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Peggy: The Sleep PI appreciates you going “above and beyond” with your extra sleep logging. Remaining for the Sleep experiment, you have monthly downloads, doffing the Actiwatch, and two more weeks of required sleep logging.” “Dan: The Sleep team would appreciate if you could continue to sleep log so that the Sleep experiment’s logging requirements (3 weeks during the mission) are met.”

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress. To be conducted tomorrow (12/2).

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observation): On-going.

CEO photo targets uplinked for today were Afar Rift Zone, Ethiopia (looking to the right of track as ISS approached the "elbow" formed by the Red Sea and Gulf of Aden - the area to the west of the elbow is the Afar Rift Zone [also known as the Afar Triangle]. This geologically active region is a junction between the Arabian, Indian, and African tectonic plates - all of which are moving away from each other,
producing frequent earthquakes and historically active volcanoes [such as Erta Ale in Ethiopia]. Overlapping frames of the Afar Triangle area will provide a useful record of the rift area, particularly surface expressions of faults and lava flows), and Madrean Sky Islands (this target is located in the northern reaches of Mexico’s Sierra Madre Occidental which boast some of the richest biodiversity anywhere in North America. It is comprised of cool, moist, higher-altitude pine-oak forested mountain ranges that dot the hot, lower Sonoran and Chihuahuan deserts of southern Arizona and New Mexico and northwestern Mexico. These climatological islands are situated in remote and rugged areas and are vestiges of cooler, wetter periods during the ice ages. Nadir- or near-nadir imagery of the forested mountaintops was requested).

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
04/??/09 -- Six-person crew on ISS (with Soyuz 18S docking)
04/15/09 -- Constellation’s Ares I-X Launch

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.

After wakeup and before breakfast, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

Also upon wakeup, FE-1 Yuri Malenchenko terminated his fourth MBI-12 SONOKARD experiment session by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. [SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

The FE-2 again activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. Later today (~1:40pm EST), the MPC was powered off again.

Tani then assisted the ground in ongoing troubleshooting of the transmission &
downlinking of analog (as opposed to digital) video signals from the Russian Segment (RS) via the MPEG-2 (Moving Pictures Expert Group 2) encoder and Ku-band in “streaming video” packets over the U.S. OpsLAN. Prior end-to-end video test results had not been as expected, and the evaluation of downlinked log files continues. For today’s troubleshooting, Tani set up the software application for PAL (Russian)-to-NTSC (US) format conversion on an A31p laptop, connected cables and started the laptop. After the test, the A31p was left on for eventual downlinking of more log files.

Malenchenko completed the periodic switchover of the Russian STTS telephone/telegraph subsystem to an alternate string, today to the primary string after its operation on the backup string. The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.

Dan Tani had about 4 hrs scheduled for auditing and consolidating photo/TV items in their CTBs (Cargo Transfer Bags), including a large number of size AA batteries. This task has up to now been on the U.S. “job jar” task list for Dan and Peggy and was now hard scheduled due to crewtime availability.

The CDR and FE-2 conducted a one-hour review of an uplinked procedures briefing package for the US EVA-13 next week (12/18), covering topics like egress plan, timeline ordering of tasks, translation/fairleads/tether plan, hazards, and ingress plan. Later (~7:00am EST) Peggy and Dan tagged up with ground specialists to discuss particulars. The spacewalk of ~6.5 hrs duration has two major objectives: (1) Inspection of 1A BGA (Beta Gimbal Assembly) and BMRMM (Bearing Motor Roll Ring Module, “broom”), including assisting fault search by the ground by disconnecting/reconnecting cables and possibly performing an R&R (removal & replacement) of the 1A ECU (Electronic Control Unit) on the S4 truss; (2) inspection and photo documentation of the Stbd SARJ (Solar Alpha Rotary Joint), including temporary removal of protective MLI covers (8 double-wide, 12 single-wide, plus 2 DLA/Drive Lock Assembly covers), debris removal, DLA inspection, finally unbolting (3 bolts) & removing TBA-5 (Trundle Bearing Assembly #5) for return to Earth.

The FE-1 meanwhile worked in the RS on the line 3 BRPK-2 Air/Liquid Condensate Separator of the SRV-K2M Condensate Water Recovery System, removing the mechanical filter cartridge from the separator’s transfer unit.
Whitson took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the handheld CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. [Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. O₂ sensors checks used #1042, #1063, #1052, #1041. CO₂ sensors used are #1013, #1058, #1045. CO₂ level in Lab and SM was ~0.44%.] With the BCAT-3 (Binary Colloidal Alloy Test-3) science payload running by itself in Node-2 since yesterday, FE-2 Tani began a daily status check on the A31p laptop controlling the EarthKAM digital still camera, verifying on the last image taken that image focus and alignment remain in check. [The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour for the next few days.] Yuri handled the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Peggy and Yuri each had another ~4.5 hrs reserved for stowing U.S. and Russian trash cargo on the Progress 26P cargo ship-turned-trash can, currently docked at the DC-1 nadir port. [Discarded hardware, as specified on uplinked lists, includes such items as Russian food containers (U.S. food containers being recycled on the ground), food waste bags, Penguin-3 suits, TVIS malfunction kit & harnesses, payload containers, one old 760XD laptop, socks, coveralls, wipes & wet towels, medical kits, used & expired alkaline batteries, 35-mm film cassettes, hoses & adapters, cartridge belts with tools, foam pieces, etc.]

Dan conducted the periodic (every two weeks) 10-min inspection of the RED (Resistive Exercise Device) canister cords and accessory straps as well as the canister bolts for re-tightening if required.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM
storage medium (done six times a week).

A new task added to the voluntary “job jar” list for the CDR and FE-2 calls for an audit of rubber gloves on board, to report the quantity of available clean room rubber gloves and Nitrile gloves stowed in a CTB and in the ASU toilet facility.

At ~2:30am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:00am, Yuri linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~8:20am, the FE-1 also powered up the SM (Service Module)'s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 8:25am, a ham radio exchange with students and faculty at Kursk State Polytechnic University who actively participated in amateur sessions from Kursk, radio expeditions from Sochi (Dagomys) and from the peak of Mt. Elbrus with Expedition 15 Commander Fyodor Yurchikhin.

At ~2:00pm, the crew conducted their sixth weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. [S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].

KURS Antenna Test: Yesterday, a ground-commanded test of the KURS system was performed over RGS (Russian Ground Sites) from the DC1 Docking Compartment side in preparation for Progress M-62/27P docking on 12/26. Test results for string 1 of the KURS hardware were nominal, but results for string 2 were off-nominal. Specialists at TsUP-Moscow believe the off-nominal results may be due to a loss of VHF (Very High Frequency)-1 communication and the telemetry stream from RGS 27 (BRL). TsUP will decide if a retest on string 2 is required.

TORU Test: In preparation for 27P arrival, Moscow has scheduled a test of the TORU manual teleoperator control system in the SM for 12/17.

26P Rodnik Tank: Since 9/4, the expulsion bladder in Progress 26P’s Rodnik tank 1 has been suspected of a small leak, possibly rendering the tank unfit for the upcoming urine transfer from the SM. TsUP this week learned from the supplier that the bladder is acceptable for urine transfer provided the KN1 valve is closed during the pump-over, currently scheduled for 12/17 (Monday).

MT Translation: At 11:41am-1:41pm the MT (Mobile Transporter) was remotely driven from WS7 (Worksite 7) to WS4, in order to protect the MT TUS (Trailing
Umbilical System) cable from MMOD (micrometeoroid/orbital debris) damage. In pre-configuring the RS systems for the thruster-disabled period during the translation (to reduce loads), a software program uplinked was inadvertently executed, configuring the Russian SUDN (Motion Control & Navigation System) such that both it and the U.S. GNC (Guidance, Navigation & Control) systems were briefly in control of ISS attitude. Action to reconfigure into a structurally safe mode was taken immediately. The rail cart will be returned to WS4 shortly before 1E arrival. Before the translation, the rail path was surveyed with the SSRMS (Space Station Remote Manipulator System) vidcams for obstructions.

CEO (Crew Earth Observation) photo targets uplinked for today were Somalia Coast, Somalia (weather was predicted to be clear over Somalia for photography of coastal dune and vegetation patterns. Collection of baseline imagery during the current La Nina conditions will be useful for comparison with the next El Nino event. Looking to the right of track as ISS proceeded NE parallel to the coastline; overlapping, along-track frames were recommended), and Gulf of Fonseca, Honduras (scattered clouds were predicted over the Gulf of Fonseca, but there should have been opportunities for mapping photography of the site. Overlapping frames of the coastline were requested. Repeat imagery of the site will allow for assessment of land use and land cover change on the coastal environment over time).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:18am EST [= epoch]):
Mean altitude -- 337.3 km
Apogee height -- 337.8 km
Perigee height -- 336.8 km
Period -- 91.28 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000731
Solar Beta Angle -- -18.5 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 180 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51923

Significant Events Ahead (all dates Eastern Standard, some changes possible.)
NET = Not Earlier Than:
12/18/07 -- Stage 10A EVA (Whitson/Tani) -- Stbd SARJ, 1A BGA BMRRM
12/18/07 -- STS-122/Atlantis ET tanking test (7:00am)
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/10/08 – NET: STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket) [Check it out at http://usspace50.com/]
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- NET: ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- NET: ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- NET: ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/29/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**

Note: The daily ISS On-Orbit Status reports can also be found at [http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
ISS On-Orbit Status 12/13/07

All ISS systems continue to function nominally, except those noted previously or below.

After wakeup and before breakfast, FE-2 Dan Tani (whose station tenure has now been extended) again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink.  [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

Also before breakfast, CDR Whitson, FE-1 Malenchenko and FE-2 Tani performed the periodic Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (4th for CDR & FE-1, 3rd for FE-2), using the IM mass measurement device which Malenchenko afterwards broke down for stowage.  [Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember’s mass is calculated by the computer and displayed.]

Malenchenko and Whitson, assisting each other in turn, conducted a session with the biomedical protocol KARDIO-ODNT (MBI-5) in the "Chibis" garment, an extensive cardiovascular test of human pericardium (heart muscle) activity as well
as of primary parameters of central and regional blood circulation at rest and under the effect of lower body negative pressure (LBNP, Russian: ODNT). [The Chibis provides gravity-simulating stress to the body’s cardiovascular/circulatory system for evaluation of Yuri’s & Peggy’s orthostatic tolerance (e.g., the Gauer-Henry reflex) after 7 weeks in zero-G. The MBI-5 protocol again consisted of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced (“negative”) pressure, set at -25, -30, -35 and -40 mmHg for five minutes each, while shifting from foot to foot at 10-12 steps per minute. The body’s circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood and body fluids “down”. MBI-5 data output include blood pressure readings with the Tenzoplus Sphygmomanometer, today without telemetry data monitoring but reporting of heart rate and blood pressure to TsUP-Moscow.]

Later today, at sleeptime, Malenchenko will start another data take with the new Russian MBI-12 SONOKARD (Sonocard) experiment, his fifth. [During sleep, Yuri will wear a shirt with the special SONOKARD device in the shirt pocket. The objectives of the experiment are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

After familiarizing himself with the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, Dan Tani supported another session by setting up the MWA WSA (Maintenance Work Area/Work Surface Area) in Node-2 for BCAT Sample 3 operations, including arranging a digital still camera run by an A31p SSC (Station Support Computer) with EarthKAM software for automatically taking flash photography of the sample every two hours over the next several days. [On crew recommendation, the ground approved moving the payload to Node-2. Thus, BCAT-3 becomes the first science experiment conducted in the new Harmony node!]

Later, Dan also continued his work on the MSG (Microgravity Science Glovebox) facility, terminating the final (fourth) vacuum draw on the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment and initiating sample processing, to be run by the ground for the next 36 hrs. Dan’s next intervention will be on 12/15. [CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals]
CDR Whitson contributed to the current round of the monthly preventive maintenance of Russian segment (RS) ventilation systems, working in the FGB (Funktsionalnyi-Grusovoi Blok) to clean the detachable VT7 fan screens 1, 2, and 3 of the three SOTR (Thermal Control System) gas-liquid heat exchangers (GZhT4).

Yuri Malenchenko continued the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator by checking the unit’s pressure and charging it once again with pressurized N₂ from the BPA-M Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization was on 11/12. [During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]

Dan Tani serviced the CSA-CP (Compound Specific Analyzer-Combustion Products) primary unit (#1051) by changing out its battery after turning it off first.

The FE-2 also filled out the regular FFQ (Food Frequency Questionnaire), his 6th, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. At TsUP/Moscow, food specialists are currently preparing the Russian food “menu” for delivery by Progress M-63/28P next February. 28P will carry “bonus food” for Peggy and Yuri, plus about 15 kg of fresh food items (apples, grapefruit, oranges, lemons, garlic) in two containers.]

Peggy Whitson conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card (16-0018J), to be updated with today’s data, lists 24 CWCs; ~1041 liters total) for the four types of water identified on board: technical water (793.6 l, for Elektron, flushing, hygiene), potable water (221.3 l), condensate water (0 l), waste/EMU dump and other (26.6 l). Two CWCs (#1004 & #1081, ~89 l) with potable water are off limits due to the Wautersia bacteria found in sample analysis, the source of which is still not understood. Impact of losing this potable CWC is negligible since there are sufficient drinking water supplies onboard. Also currently not to be used are nine CWCs with technical water (~389 l).]

Yuri performed the routine servicing of the SOZh system (Environment Control &
Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Later, the FE-1 handled the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Yuri and Dan had another 2 hrs reserved for stowing discarded U.S. cargo on Progress 26P, currently docked at the DC-1 nadir port, for disposal later this month (12/22). [Discarded hardware, as specified on an uplinked list, includes such items as food containers, food waste bags, Penguin-3 suits, socks, coveralls, wipes & wet towels, medical kits, used & expired alkaline batteries, 35-mm film cassettes, hoses & adapters, cartridge belts with tools, etc.]

The crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~10:10am EST, Peggy, Yuri and Dan supported a 20-min joint crew news conference conducted with U.S. media at NASA centers and NASA Headquarters. [Media clients tape the event for use within their respective media outlets.]

At ~11:30am EST, the crew conducted their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

US EVA-13 Update: Planning is going ahead on the spacewalk scheduled for Whitson & Tani next Tuesday (12/18) for comprehensive in-situ inspection & photography of (1) the damaged starboard SARJ (Solar Alpha Rotary Joint) and (2) the 1A BGA (Beta Gimbal Assembly) on the S4 truss, particularly its BMRRM (Bearing Motor Roll Ring Module, sometimes pronounced “broom”). [Background: On 12/8, a currently unknown anomaly (most likely a short) caused a trip of three separate power feeds going through the BMRRM to the BGA ECU (Electronics Control Unit), resulting in loss of redundancy (i.e., the ECU remains powered by the redundant feed; the primary feed is off). To protect for 1E docking, the 1A BGA was then parked at 79 degs and latched. Last night, when the open RPC-1(Remote
Power Controller 1) of RPCM (RPC Module) 1A was commanded closed as a test, both it and the second RPCM feeding BGA 1A tripped open, indicating a short either upstream of the BMRRM (such as in the IEA/Integrated Equipment Assembly wiring, i.e., cables W05 & W06) or the BMRRM and downstream wiring (ECU or BGA platform). In addition to visual inspection, the spacewalkers will have to disconnect and reconnect connectors for the ground to isolate a short. Appropriate power inhibits will safe the connectors beforehand.

ATU-15 Recovery Update: Troubleshooting of the portside ATU-15 (Audio Terminal Unit 15) in Node-2 by CDR Whitson on 12/12 succeeded in restoring the unit to function. The fault was found to be a sticky PTT (Push-to-talk) button. [The ATU will be left in standby and available for use as desired. Ground work is underway to correct the sticking action.]

MT Translation: Due to the 1E launch slip, Robotics engineers will translate the MT (Mobile Transporter) tomorrow (12/14; 11:41am-1:41pm) from WS7 (Worksite 7) to WS4, in order to protect the MT TUS (Trailing Umbilical System) cable from MMOD (micrometeoroid/orbital debris) damage. The rail cart will be returned to WS4 on or about 1/2/08 in time for 1E arrival. [Before the translation, the rail path will be surveyed with the SSRMS (Space Station Remote Manipulator System) vidcams for obstructions. RS thrusters will be disabled for the duration of the MT translation.]

STS-122 Tanking Test: The comprehensive ECO (Engine Cut-Off) sensor system test being prepared for 12/18 (7:00am EST), will take the External Tank (ET) through a nominal thermal/cryo cycle, i.e., LH2 tanking/detanking. Background: Employing the real-time TDR (Time Domain Reflectometry) method commonly used for locating faults in very long cable lines (e.g., twisted wire pairs, coaxial cables for telecommunications, surveillance [e.g., checking for wire taps], microcircuits, optical fibers, etc.), an electronic instrument sends out a fast-rise-time electrical pulse which either will be absorbed at the other end if there is no break in resistance (impedance), or reflected back in various ways depending on the discontinuity (break) in resistance encountered. From the known travel time of the pulse-and-echo, the location of the fault can be located to within centimeters. The breakpoints in the cabling for introducing the TDR pulse are being set up inside the MLP (Mobile Launch Platform) on the pad without any changes to any connectors, feedthroughs, cabling trays etc. in the ET and Orbiter from their nominal state.

CEO (Crew Earth Observation) photo targets uplinked for today were Arkenu 1 and Arkenu 2 Impact Craters (ISS had a nadir pass over the paired Arkenu 1 [7 km diameter] and 2 [10 km diameter] impact craters. Both craters formed approximately 140 million years ago during impact of the same meteor. Looking for
the circular crater structure formed by dark rocks - contrast is high with the surrounding desert. Nadir, overlapping mapping frames taken along-track were recommended, Tin Bider Impact Crater (this approximately 70 million year old impact structure is located in a range of mountains to the south and west of two major North African dune fields. The crater is 6 km in diameter, and the concentric ring structure of disturbed rock layers should be clearly visible with the long lens. Overlapping, nadir mapping frames taken along track were recommended), and Pilcomayo River Dynamics, Northern Argentina (weather was predicted to be clear over the inland delta [aka megafan] of the Pilcomayo River. Of particular interest are the branching channels and wetlands of the Pilcomayo megafan. Nadir mapping frames along track are requested to capture imagery of the current channel configuration).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 3:49am EST [= epoch]):
Mean altitude -- 337.6 km
Apogee height -- 338.0 km
Perigee height -- 337.1 km
Period -- 91.28 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000718
Solar Beta Angle -- -13.8 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 265 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51904

Significant Events Ahead (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
12/18/07 -- Stage 10A EVA (Whitson/Tani) -- Stbd SARJ, 1A BGA BMRRM
12/18/07 -- STS-122/Atlantis ET tanking test (7:00am)
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/02/08 – NET: STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite. Launch period opens.
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket)**  [Check it out at http://usspace50.com/]

02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- NET: ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- NET: ATV-1 docking (SM aft port)
04/07/08 -- Progress M-62/27P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- NET: ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/29/08 -- STS-126/Discovery/ULF2 undocking.

**10/01/08 -- 50th Birthday of NASA**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment

04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/12/07

All ISS systems continue to function nominally, except those noted previously or below.

After wakeup and before breakfast, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

After his original troubleshooting (12/6) of the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks, the FE-2 activated the MPC to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. Later today (~2:00pm EST), the MPC was powered off again.

Also in the Lab, Dan Tani continued his work on the MSG (Microgravity Science Glovebox) facility, terminating the second vacuum draw on the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment, initiating the third draw, then terminating it after six hours and kicking off the final (fourth) overnight vacuum draw. After that, the ground will be ready for sample processing. [CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]

FE-1 Yuri Malenchenko performed his second session of the ETD (Eye Tracking Device) experiment in the DC-1 Docking Module, first installing the target board,
measuring distances and making hardware connections, then calibrating the setup and making the audio recordings of his eye tracking exercises from three different distances (60 cm, 100 cm, 150 cm).

After yesterday’s temporary installation of the BUAP (antenna switching control box), Yuri continued the ATV PCE (Automated Transfer Vehicle/Proximity Communications Equipment; Russian: MBRL) testing in the Service Module (SM) by checking the AFU (antenna feeder unit) circuit lines and connections for continuity and RF (radio frequency) performance with a “Standing Wave Coefficient” (KSV) test using an FSH3 spectrum analyzer from the GTS (Global Timing System). The FHS3 measurements were then transferred to the TP2 laptop and prepared for downlink to the ground.

After the testing, Malenchenko deinstalled and removed the BUAP from the onboard cabling system (BKS) and stowed it in the FGB at its original location. [The PCE/MBRL components for ATV prox ops are the space-to-space radio “monoblock” (PCE Z0000), the antenna switching control box (BUAP), and the ATV control panel (PU) which Valery Tokarev dismantled last year (March 2006) after (reportedly successful) three-day end-to-end testing.]

Later, the FE-1 transferred application software log files from the Russian RS3 laptop to a CD-ROM disk for subsequent downlink.

CDR Whitson and FE-2 Tani had ~2 hrs reserved for stowing discarded U.S. cargo on Progress 26P, currently docked at the DC-1 nadir port, for disposal later this month (12/22).

After reviewing today’s EPO (Educational Payload Operation) session and setting up the PD-100 camcorder, Dan Tani and Peggy Whitson performed and narrated a demo of Newton’s 1st Law of Motion. Afterwards, the EPO hardware was put back in stowage.  [The activities were downlinked in real-time video/audio via Ku- & S-band and taped on the ground. Today’s activities were a repetition of a demo earlier this month which was out of camera focus.]

The CDR completed the PiP (Inventory Management System/Plug-in Plan) audit in the US Segment (USOS) started yesterday, listing Node-1 and Airlock UOPs (Utility Outlet Panels) and providing connectivity information including power supplies, cabling, and equipment updates to the IMS (Inventory Management System).  [The audit allows IMS to accurately reflect the parent-child relationship for how equipment is plugged in on ISS.]

Tani meanwhile arranged for a better protected stowage place for a spare Ku-band Forward Link Receiver unit behind a closeout panel of the Node-2 DDCU (DC-to-
Dan also stowed a number of MLI (Multi-Layer Insulation) cover pieces in “Harmony”, which were retrieved and brought in from the recent external Node-2 outfitting work, such as the PDGF (Power & Data Grapple Fixture) mounting ring MLI.

Peggy serviced the EMCS (European Modular Cultivation System) in ER3 (EXPRESS Rack 3) by removing the water reservoirs from both rotors and replacing them with new reservoirs (#FM005 on Rotor A, #FM006 on Rotor B). The old H₂O tanks were stowed. [The 298-kg EMCS, delivered on ULF1.1, is a multi-purpose combination centrifuge/growth chamber with eight small research containers that allows plant growth experiments to be carried out in controlled partial and microgravity conditions and under controlled pressure, light, temperature and humidity. The goal of these experiments is to enable growing plants in space that could serve as a basic nutrition source for astronauts on future long-duration missions to the Moon or Mars.]

Later, the CDR performed troubleshooting on the Node-2 ATU-15 (Audio Terminal Unit 15) on the port side, after verifying that the Node-2 starboard ATU-7 is functioning separately from ATU-15. [Troubleshooting of the failed ATU-15 was to include checking for debris in the ATU’s headset/PMIC (Portable Microphone) connector, for a stuck control button, etc.]

The FE-2 undertook the monthly FDS PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit. [The IMS-supported inspection involves verification that PFEs (portable fire extinguishers), PBAs (portable breathing apparatus), QDMAs (quick-don mask assemblies) and EHTKs (extension hose/tee kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware (QDMA harness inspection was not required this time). In the USOS, there are a total of 5 PFEs and 7 PBAs, plus 7 QDMAs and 4 EHTKs.]

Whitson ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a
cooperative investigation with the European Space Agency.]

Yuri performed the routine servicing of the SOZ\(h\) system (Environment Control & Life Support System, ECLSS) in the SM.  \[Regular daily SOZ\(h\) maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.\]

Later, the FE-1 handled the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

CEO (Crew Earth Observation) photo targets uplinked for today were \textit{Bosumtwi Impact Crater, Ghana} (\textit{the crew had a nadir pass over this 10.5 km diameter impact structure. The crater is filled with a lake; cloud cover was expected to be minimal so the crew was asked to look for this distinctive feature. Ground recommendation was to start taking overlapping nadir frames along-track as ISS approached the African coastline as a good strategy to capture the crater}), \textit{Lake Poopo, Bolivia} (weather was predicted to be clear over Lake Poopo. Imagery of the shoreline of the Lake is requested for monitoring of water levels. Water levels respond quickly to changes in regional precipitation, making the Lake a useful indicator of regional climate change. Looking the left of track for the Lake, and for large white salars [salt pans] to the south), and \textit{Caracas, Venezuela} (orbit track brought the ISS over the western urban-rural fringe of the Venezuelan capital of Caracas. The city is located in a valley of the northern Coastal Range of Venezuela. Overlapping, nadir mapping frames of the western metropolitan area, taken along-track, are requested).

CEO photography can be viewed and studied at the websites:

\url{http://eol.jsc.nasa.gov} (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
\url{http://earthobservatory.nasa.gov/}
ISS Orbit  (as of this morning, 3:29am EST [= epoch]):
Mean altitude -- 337.8 km
Apogee height -- 338.2 km
Perigee height -- 337.5 km
Period -- 91.29 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000538
Solar Beta Angle -- -9.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 130 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51888

Significant Events Ahead  (all dates Eastern Standard, some changes possible.
NET = Not Earlier Than):
12/18/07 -- Stage 10A EVA (Whitson/Tani) -- Stbd SARJ, 1A BGA BMRRM

Note: The daily ISS On-Orbit Status reports can also be found at [http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
ISS On-Orbit Status 12/11/07

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software after wakeup and before breakfast, for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

FE-1 Yuri Malenchenko underwent the periodic (generally monthly) health test with the cardiological experiment PZEh MO-1 (“Study of the Bioelectric Activity of the Heart at Rest”) on the TVIS (Treadmill with Vibration Isolation System). [During the 45-min. test, the FE-1 tagged up with ground specialists on a Russian ground site (RGS) pass via VHF (~4:32am EST) and downlinked data from the Gamma-1M ECG (electrocardiograph) for about 5-6 minutes.]

Later, Malenchenko also conducted a run with the Russian MBI-21 PNEVMOKARD experiment, his second on-orbit session (which forbids moving or talking during data recording). The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. [PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember’s electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the
cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers’ organism during their return to ground.

In the Lab, after inspecting, activating and configuring the MSG (Microgravity Science Glovebox) facility, FE-2 Tani initiated another vacuum draw on the sample chamber (by opening the vent and vacuum valves) for subsequent CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment ops for its third run.  [Ground analysis of the downlinked data for SPU-2 (Sample Processing Unit #2), which ran from 12/3-12/5, indicated excellent science results (samples to be are returned to Earth), boding well for SPU-3 which the ground started today.]

Using a printout of the IMS PiP (Inventory Management System/Plug-in Plan) tool, CDR Peggy Whitson spent about 3 hrs on the periodic PiP audit, focusing on Lab, Node-1 and Airlock.  [Node-2 not required.  The PiP is a tabular compilation listing locations where on-board electrical equipment is plugged in.]

Yuri Malenchenko had several hours reserved for maintenance work on the ATV PCE (Automated Transfer Vehicle/Proximity Communications Equipment; Russian: MBRL) in the Service Module (SM), installing and connecting its antenna switching control box (BUAP) to the onboard cabling system (BKS) for ground-commanded testing.  [The MBRL components are the space-to-space radio “monoblock” (PCE Z0000), the antenna switching control box (BUAP), and the ATV control panel (PU) which Valery Tokarev dismantled last year (March 2006) after (reportedly successful) three-day end-to-end testing.]

The FE-2 conducted more inflight coolant sampling on the Node-2 ITCS (Internal Thermal Control System)’s MTL (Moderate Temperature Loop) by adjusting its fluid sampling adapter metering valve and then taking another periodic fluid sample for OPA (Ortho-Phthalaldehyde) testing (with test strips).  The sampling process for OPA was then repeated on the LTL (Low Temperature Loop) side of the Node-2 ITCS and subsequently also on the MTL loop of the Lab ITCS.  [OPA, an antimicrobial agent, was introduced into the Lab ITCS coolant by the AmiA (Antimicrobial Applicator), before the AmiA was removed again on 11/2 by Clay Anderson for Earth return.]

Peggy Whitson checked out IMV (Intermodular Ventilation) performance between the US (USOS) and Russian segment (RS) by first using the Velocicalc meter to take airflow measurements at fan sites, then cleaning the inlet flow straighteners at
the Node-1 & Lab aft port ventilators and finally again measuring their airflow rates. [After FOD (Foreign Object Debris) removal by Peggy, flow rate increased from 75 cfm (cubic feet / minute) to 106 cfm (i.e., nominal). There is no direct measurement of airflow except as reflected by differences in atmosphere partial pressures measured between the RS and USOS. ppCO₂ (CO₂ partial pressure) is a good yardstick since an increasing ppCO₂ in the Lab not reflected in the SM indicates that Vozdukh is not receiving the air from the Lab at an efficient rate. Periodic air flow degradation checks support establishing a most effective fan cleaning schedule.]

Dan Tani and Peggy (from “job jar” task list) had 75 min set aside for replacing a failed PDA (Personal Digital Assistant), used for updating the IMS, with a new PDA. [PDA #1010 (with failed display) was replaced by PDA #1004; the latter was then equipped with the battery from #1010 and reloaded with uplinked BCR (Barcode Reader) software to recover BCR functionality for the IMS.]

Dan also set up the EPO (Educational Payload Operations) PD-100 camcorder for downlinking his subsequent EPO Demo of “Living on the Station”, taking the viewers through the living area of the ISS and explaining its utilization by the crew. [The activities were downlinked in real-time video/audio via Ku- & S-band and taped on the ground. Peggy’s EPO demo of “Sanitation on the Station” of 12/7, discussing "house-cleaning" methods and the importance of good sanitation onboard ISS, received great kudos by ground specialists for its excellence.]

Yuri performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Later, the FE-1 handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

On the RED (Resistive Exercise Device), the FE-2 performed the periodic (every two weeks) inspection of the canister cords and accessories. The maintenance today also included tightening the RED hardmount plate bolts on the Node-1 “ceiling”, done once every 6 months.

The crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS
cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1/MO-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~11:50am EST, Dan had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

Stage EVA Planning: Because of the Mission 1E stand-down till early January (based on solar Beta angle restrictions, not on anticipated time for resolving ECO/Engine Cut-off sensor issues), teams are currently assessing a possible Stage-10A EVA (on or around 12/18) for in-situ inspection & photography of the damaged starboard SARJ (Solar Alpha Rotary Joint) and also the 1A BGA (Beta Gimbal Assembly) on the S4 truss, particularly its BMRRM (Bearing Motor Roll Ring Module). [Background: On 12/8, a currently unknown anomaly caused a trip of three separate power feeds going through the BMRRM to the BGA ECU (Electronics Control Unit), resulting in loss of redundancy (i.e., the ECU remains powered by the redundant feed; the primary feed is off). To protect for 1E docking, the 1A BGA was then parked at 79 degs and latched.]

CEO (Crew Earth Observation) photo targets uplinked for today were Ganges River Delta (ISS flew over the easternmost portion of the Ganges Delta, near the border region of India, Bangladesh, and Myanmar. The crew was to shoot to the left of track for the Delta. Overlapping mapping frames along-track were requested to document stream channel and coastal morphology), South Tibesti Megafans (ISS orbit track was to the SE of a series of large fanlike spreads of sediment, hundreds of km long and wide, that extend southward from the Tibesti Mts into central Chad. A discontinuous overlapping pattern of former stream channels, large and small, suggests that the entire surface of the megafans was formed by the action of rivers shifting across the surface when the regional climate was wetter. This megafan structure also serves as a potential analog for channel structures on Mars. Looking to the left of track for the channel pattern; oblique imagery will aid geolocation of higher resolution nadir imagery), Oasis Impact Crater, Libya (Libya contains several recognized impact structures of various ages and sizes. ISS passed over two of these craters; the first encounter was with the Oasis Crater. This crater appears as a circular structure of dark rocks contrasting sharply with the surround desert. Overlapping mapping frames, along-track and begun as the station approached the target coordinates, were suggested to ensure capturing imagery of the crater), and B.P. Structure, Libya (looking slightly to the left of track
after passing over the previous Oasis Crater target. The B.P. Structure is roughly one-quarter the size of the Oasis Crater, and has less contrast with the surrounding desert. As with the previous target, overlapping mapping frames provide the best chance of capturing imagery of the impact structure.

CEO photography can be viewed and studied at the websites:

09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/29/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below. **Underway:** Week 8 of Increment 16.

Aboard the space station, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software after wakeup and before breakfast, for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

CDR Whitson (as Operator) and FE-2 Tani (as Subject) conducted the first scanning session for the Braslet experiment (SDTO/Station Development Test Objective), leading off by a material review by Peggy and followed in the afternoon by the actual ultrasound scanning activity on the FE-2 (who had to abstain from caffeine 12 hrs prior to the scan session, heavy meals 4 hrs before and any food at all 2 hrs prior to the scan, plus no exercise 2 hours before and no liquids 30 mins before). [The SDTO-17011 “Validation of On-Orbit Methodology for the Assessment of Cardiac Function and Changes in the Circulating Volume Using Ultrasound and Braslet-M Occlusion Cuffs (Braslet)” is a collaborative effort between NASA and the Russian FSA (Federal Space Agency), with the goal to establish a valid ultrasound methodology for assessing a number of aspects of central and peripheral hemodynamics and cardiovascular function, specifically in rapid changes in intravascular circulating volume. Braslet uses Braslet-M occlusion cuffs, i.e., the Russian-made operational countermeasure already pre-calibrated and available onboard for each ISS crewmember. Braslet employs multiple modes of ultrasound imaging and measurements, in combination with short-term application of Braslet-M occlusive cuffs and cardiopulmonary maneuvers (Valsalva, Mueller) to demonstrate and to evaluate the degree of changes in the circulating]
volume on orbit. This will be accomplished by performing echocardiographic examinations in multiple modes (including Tissue Doppler mode), ultrasound measurements of lower extremity venous and arterial vascular responses to Braslet-M device under nominal conditions and also during cardiopulmonary Mueller and Valsalva maneuvers. Identical measurements will be repeated without Braslet-M, with Braslet-M applied, and immediately after releasing the occlusion device.]

FE-1 Malenchenko meanwhile worked on the Russian BRPK Condensate Separation & Pumping Unit, disassembling its DU-6 electromagnetic valve into its two halves, inspecting the membrane inner cavities and cleaning the valve of any deposits that could obstruct flow. The valve was then reassembled, reinstalled and tested.

Later, Malenchenko continued the current round of preventive maintenance on the Russian segment (RS) ventilation system, cleaning the TsV1, SV2 & VT7 ventilation system fans in the FGB and changing out the filters in the PF1-4 dust collector cartridges in the SM (Service Module).

Peggy Whitson and Dan Tani completed a major IFM (Inflight Maintenance) task on the Lab ITCS (Internal Thermal Control System) by refilling both its MTL (Moderate Temperature Loop) and LTL (Low Temperature Loop) lines with coolant fluid, using the FSS (Fluid System Servicer) equipment. [Prior to the refilling activities, Dan Tani had to remove stowage goods temporarily to provide access to the Lab’s ITCS rack and clear the way for FSS ops. Crew and Ground activities had to be carefully timed for the loop fills due to the large interaction between the Crew and Ground required in performing this activity. Prior to any Crew action, the Ground configured the system from single loop LT mode to dual loop mode, depressurizing the loops, and configuring software in preparation for ITCS loop fills. Following the loop fills, the Ground returned the ITCS system to its nominal single LT mode, and the ITCS rack was subsequently restowed and put back in action.]

Yuri conducted the regular weekly task of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- & FGB-to-Soyuz tunnels, and the DC1-to-Progress and FGB-to-Node-1 passageways.

Performing the periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), the FE-1 removed the PCMCIA memory card #934 from the AST spectrometer’s slot and copied the accumulated data for subsequent downlinking via OCA. Card 934 was then bagged for return to Earth and PCMCIA card 940 inserted to continue AST ops.

Using the SKDS CMS (Pressure Control & Atmosphere Monitoring System/
Countermeasure System), Malenchenko took readings of potentially harmful contaminants in the SM. The hardware was then returned to initial stowage. [The CMS uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip.]

The FE-2 checked out the IMV (Intermodal Ventilation) valves on the port & starboard side of the Lab aft end.

Yuri performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Later, the FE-1 handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the CDR copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:10am EST, the crew participated in two PAO TV message/greeting downlinks, the first an improvised Christmas and New Year’s greeting from all three, taking turns to talk about the holidays ahead on board, the second addressed to the NASA-sponsored series of “Future Forums” throughout 2008 in observance with the agency’s 50th anniversary, showcasing technology and how NASA’s Exploration plans tie in to the future. [The Forums are scheduled for Seattle (Jan. 25, 2008), Columbus, Ohio (Feb. 21), New York City (March), Miami (April), Sacramento (May 2), Boston (September) and Chicago (October 2-3).]

At ~2:00pm, the crew is scheduled for their 5th weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio [S/G-2 (Space-to-Ground 2) phone patch
BGA & BCDU Events: On 12/6, BGA (Beta Gimbal Assembly) 1A experienced an LOC (Loss of Communications) due to multiple occurrences of an overcurrent trip. Also BCDU 3A1 CP RBI (Battery Charge/Discharge Unit/CP Remote Bus Isolator), a fuse-type switch, tripped open on the first event. The RBI was recovered, and there is no additional impact. On BGA 1A, the secondary power feed, RPC2 (Remote Power Controller 2 of RPCM 3A_A (RPC Module), is closed and the primary feed (RPCM 1A_A RPC 1) is open. In this configuration there is a loss of redundancy. After the initial cleanup activities, work is now underway to assess and remedy the situation (which benefits from the 1E mission scrub).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:30am EST [= epoch]):
Mean altitude -- 338.2 km
Apogee height -- 338.6 km
Perigee height -- 337.7 km
Period -- 91.30 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000611
Solar Beta Angle -- -0.2 deg (magnitude bottoming out)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 124 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51868

Significant Events Ahead (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/02/08 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET).
Launch period opens
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket) [Check it out at http://usspace50.com/]

via SSC-10 (Station Support Computer 10)].
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- NET: ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry

10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.  Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani.  Ahead: Week 8 of Increment 16.

The launch of STS-122/Atlantis/Mission ISS-1E has now been targeted for not earlier than 1/2/08, to allow for more concerted troubleshooting of the four LH$_2$ low level cutoff sensors (after the #3 sensor again failed during another tanking attempt this morning).

Aboard the space station, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software after wakeup and before breakfast, for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink.  [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

The FE-2 later conducted inflight maintenance on the Node-2 ITCS (Internal Thermal Control System)’s MTL (Moderate Temperature Loop) by adjusting its fluid sampling adapter metering valve and then taking another fluid sample for return to the ground and one for OPA (Ortho-Phthalaldehyde) testing.  Afterwards, Dan repeated the sampling process on the LTL (Low Temperature Loop) side of the Node-2 ITCS.  [OPA, an antimicrobial agent, was introduced into the Lab ITCS coolant by the AmiA (Antimicrobial Applicator)].

FE-1 Malenchenko performed monthly maintenance on the Russian IK0501 GA (gas analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System, deactivating the unit and replacing its CO$_2$ filter assembly (BF) with a new unit from
FGB stowage (replaced last: 10/29). [After ensuring good seals on the instrument’s base and no leaks around the installed filter, Yuri reactivated the GA and stowed the spent BF for disposal. IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed.]

CDR Whitson completed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling CWC (Contingency Water Container) #1062 with the collected water slated for processing, and putting aside two water samples in sample bags for analysis. [Estimated offload time before termination (leaving ~6 kg in the tank): ~20 min.]

The crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Job items on Peggy’s and Dan’s discretionary “job jar” task list today were –
- Removal of panel fasteners in Node-2 to provide temporary access to the AR SDS (Atmosphere Revitalization/Sample Delivery System). [The SDS, along with the MCA (Major Constituents Analyzer), PCA (Pressure Control Assembly), TCCS (Trace Contaminant Control Subassembly) and CVV (Carbon Dioxide Vent Valve assembly), is a subsystem of the Atmosphere Control & Supply System of the Lab’s ECLSS (Environment Control & Life Support System)];
- Lubrication of TVIS treadmill SPDs (Subject Positioning Devices); and
- Monthly battery check and rebooting of the PCS (Portable Computer System) A31p laptops.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 3:59am EST [= epoch]):
Mean altitude -- 338.3 km
Apogee height -- 338.7 km
Perigee height -- 338.0 km
Period -- 91.30 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000524
Solar Beta Angle -- 4.0 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 124 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51841

**Significant Events Ahead** (all dates Eastern Standard, some changes possible. 
*NET = Not Earlier Than*):

04/??/09 -- *Six-person crew on ISS*
04/15/09 -- *Constellation’s Ares I-X Launch.*

Note: The daily ISS On-Orbit Status reports can also be found at
[http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work.

The delayed launch of STS-122/Atlantis/Mission ISS-1E has tentatively been rescheduled for tomorrow, Sunday (12/9) at 3:21pm EST, assuming no major problems turn up in engineering reviews taking place today. Weather forecast for 12/9 predicts an 80 percent chance of good weather.

Aboard the space station, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software after wakeup and before breakfast, for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

The crew conducted the regular weekly three-hour task of thorough station cleaning. ["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

For today’s Voluntary Weekend Science activities, CDR Peggy Whitson started out with software replacement for the HRF-2 RIC (Human Research Facility 2 Rack Interface Controller), first replacing the HRF-2 laptop’s Ultrabay Adapter, then...
uploading the RIC software (EXPRESS Load 5) and rebooting the computer. [This activity was also performed on HRF-1 on 12/2.]

Later, Dr. Whitson also set up the PD-100 camcorder for unattended video of herself performing BCAT-3 (Binary Colloidal Alloy Test-3) science activities involving mixing magnet unsticking from Samples 3, 5 and 9, followed by returning the sample module from CGBA-4 (Commercial Generic Bioprocessing Apparatus 4), deactivating the hardware and leaving CGBA powered off but recabled.

FE-2 Dan Tani retrieved and stowed the two FMKs (Formaldehyde Monitoring Kits) deployed by him on 12/6 in the Lab (below CEVIS cycle) and SM (most forward handrail).

FE-1 Yuri Malenchenko completed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

The crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the CDR copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~6:35am, the FE-1 had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

**Weekly Science Update** (Expedition Sixteen -- Week 7)

*ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):* Radiation measurements continue nominally in the PIRS module. The next memory card replacement activity is currently scheduled on 12/10.

*ANITA:* Completed.

*BCAT (Binary Colloidal Alloy Test):* Reserve.
CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): “Dan, thanks for completing your in-flight portion of the CCISS experiment! Also, thanks for completing the Holter check out procedure off the task list. The PI looks forward to seeing you on landing day!”.

CFE (Capillary Flow Experiment): Reserve.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): CSLM-2 SPU #2 operated 12/3-5, currently reviewing down linked files.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

EPO (Educational Payload Operations): “Thank you for your excellent EPO Sanitation demo this week. The PD was very happy with the downlinked video and audio.”

ETD (Eye Tracking Device): In progress.

Integrated Immune: In progress.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: From Week 5: MULTIGEN-1 samples will be downloaded on STS-122 (1E).

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.
PMDIS  (*Perceptual Motor Deficits in Space*):  Complete.

**SLEEP** (*Sleep-Wake Actigraphy & Light Exposure during Spaceflight*):  "Peggy, thanks for completing the Sleep Actiwatch download/initialization activity off the task list. You have monthly downloads, doffing the Actiwatch, and two more weeks of required sleep logging. Additional sleep logging is above and beyond and greatly appreciated by the PI. Dan, thanks for participating in the sleep experiment as a reserve subject. Please continue to sleep log until 12/14 to fulfill the three week requirement."

**SPHERES** (*Synchronized Position Hold, Engage, Reorient, Experimental Satellite*):  In progress. To be conducted tomorrow (12/2).

Swab (*Characterization of Microorganisms & Allergens in Spacecraft*):  In progress.

**TRAC** (*Test of Reaction & Adaptation Capabilities*):  Planned.

**CEO** (*Crew Earth Observations*):  Through 12/6 the ground has received a total of 5,003 CEO frames for review and cataloging for Increment 16. "Once again about 1,000 frames in the past week alone! We are focusing our efforts on 5 sessions in which you acquired imagery with camera times corresponding to our target request times: S. Georgia/ S. Sandwich Islands, South Atlantic Ocean (2 sessions confirmed); Patagonian Glaciers (confirmed); Nairobi, Kenya; and Mt. Kilimanjaro, Kenya. We are also pleased to confirm your excellent imagery for Acraman Impact Crater, Australia with a few more clouds than we expected. A portion of your handsome image of the New Zealand capital of Wellington will be published on NASA/GSFC’s Earth Observatory website this weekend. Your sharp, long lens view provides great detail for this rarely photographed city."

CEO photo targets uplinked for today were **Coastal dunes, Namibia** (Dynamic event. Small crescent-shaped dunes are driven north along the hyperarid coast of Namibia by very strong southerly winds. Small dunes move fast, many yards per year. Looking immediately left and right of track as ISS crossed the coastline [the driest part of the desert], shooting a few detailed images of the coastal strip where these small dunes occur. There is interest in comparing positions of known dunes through time, both for geological and budgetary reasons—dunes 2-4 feet high often cross roads and other infrastructures. Clearing these dunes [or slowing them down by spraying with oil] is a major public-works expense around the few coastal towns in Namibia.)
CEO photography can be viewed and studied at the websites:

ISS Orbit (as of this morning, 5:12am EST [= epoch]):
Mean altitude -- 338.4 km
Apogee height -- 338.8 km
Perigee height -- 338.1 km
Period -- 91.30 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000509
Solar Beta Angle -- 8.1 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 125 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51826

Significant Events Ahead (all dates Eastern Standard, some changes possible.
NET = Not Earlier Than):
12/09/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~3:21pm
EST
12/11/07 -- STS-122/Atlantis/1E docking
  ▪ 12/12 -- EVA-1 (Walheim/Schlegel), 6.5h
  ▪ 12/12 -- Columbus transfer & berthing @ Node-2
  ▪ 12/13 -- Columbus ingress, ~5:08pm
  ▪ 12/14 -- EVA-2 (Walheim/Schlegel), 6.5h
  ▪ 12/16 -- EVA-3 (Walheim/Love), 6.5h
12/18/07 -- STS-122/Atlantis undocking
12/20/07 -- STS-122/Atlantis landing
12/22/07 -- Yuri Malenchenko's Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone
rocket) [Check it out at http://usspace50.com/]

10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**.

Note: The daily ISS On-Orbit Status reports can also be found at
[http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
All ISS systems continue to function nominally, except those noted previously or below.

**After yesterday's launch scrub for STS-122/Atlantis/Mission ISS-1E due to failure indications of two (of four) engine cut-off sensors in the LH$_2$ tank, the Shuttle is now in a 48-hour turnaround to protect for launch no earlier than Saturday, at 3:43pm EST.**

Aboard the space station, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software after wakeup and before breakfast, for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink.  *[To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]*

Afterwards, Tani started periodic maintenance work on the TVIS (Treadmill with Vibration Isolation & Stabilization) in the Service Module (SM) “pit”, first powering the exercise machine off, then one hour later performing the 4-hr job of removing and replacing five Roller Bearing (#6, 7, 8, 9,10) on the forward left side of the treadmill. Afterwards the TVIS ready for use again.

CDR Peggy Whitson set up the EPO (Educational Payload Operations) camcorder for recording her subsequent EPO Demo of “Sanitation on the Station”, discussing "house-cleaning" methods and the importance of good sanitation onboard ISS.  *[The activities were also downlinked in real-time video/audio via Ku- & S-band.]*

FE-1 Yuri Malenchenko spent several hours with the periodic collection of cabin air samples, i.e. by using --
● The SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System) to take readings of potentially harmful contaminants in the SM. [The CMS, part of the GANK-4M analyses (see below), uses preprogrammed microchips to measure Formaldehyde (H$_2$CO, methanal), Carbon Monoxide (CO) and Ammonia (NH$_3$), taking one measurement per microchip. CMS is part of the GANK-4M analysis conducted today;]
● The GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH$_4$), Ammonia (NH$_3$), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO$_2$), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]; and
● The AK-1M adsorber and Draeger tubes to conduct the periodic sampling of cabin air for subsequent analysis on the ground. [Yuri started out by taking air samples in the SM and FGB and to check for leaked-out Freon in the SM, then switched to the IPD-CO Draeger tubes sampler to check for CO (carbon monoxide) in the SM.]

Dan Tani collected air samples also, with a U.S. GSC (Grab Sample Container) at the center of the Lab and SM.

Malenchenko had about 90 minutes set aside for major equipment servicing in the ASU toilet facility, changing out replaceable ASU parts with new components, viz., two receptacles (PR & MP), four hoses, a T-connector, an elbow fitting, an indicator, a filter insert (F-V), the pretreat container (E-K) with its hose. All old parts were discarded as trash. [E-K contains five liters of pre-treat solution, i.e., a mix of H$_2$SO$_4$ (sulfuric acid), CrO$_3$ (chromium oxide, for oxidation and purple color), and H$_2$O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]

Peggy Whitson used the on-board OpsLAN printer to print out Node-2 Leak Pinpoint Procedures. The material was then placed in the ISS Leak Kit for reference.

Having finished the latest session of the German/Russian TEKh-20 Plazmennyi-Kristall/PK-3+ (Plasma Crystal-3+) experiment yesterday, the FE-1 disassembled the payload for subsequent removal and stowage.

Yuri performed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV
Later, Malenchenko completed the daily IMS (Inventory Management System) maintenance by updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Yuri also performed the periodic (monthly) functional closure test of spare emergency vacuum valves (AVK) for the Vozdukh, in the spare parts kit. [The AVKs are critical because they close the Vozdukh’s vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]

At 3:15pm EST, CDR Whitson is scheduled to conduct the periodic VHF1 emergency communications check over NASA’s VHF (Very High Frequency) sites at Wallops Island (3:14-3:18pm), talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator) and Moscow/GLAVNI (TsUP Capcom) in the normal fashion via VHF radio from a handheld microphone and any of the U.S. segment ATUs (audio terminal units). [Purpose of the test is to verify signal reception and link integrity, and to ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the FE-2 copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:15am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

Job items on Peggy’s and Dan’s discretionary “job jar” task list today were crew departure preparations for Dan, Photo/TV bag audit/consolidation for both of them, and a session with the BCAT-3 (Binary Colloidal Alloy Test-3) Magnet Unstick,
using the CGBA-4 (Commercial Generic Bioprocessing Apparatus-4).

CEO photo targets uplinked for today were Coastal dunes, Namibia (Dynamic event. Small crescent-shaped dunes are driven north along the hyperarid coast of Namibia by very strong southerly winds. Small dunes move fast, many yards per year. Looking immediately left and right of track as ISS crossed the coastline [the driest part of the desert], shooting a few detailed images of the coastal strip where these small dunes occur. There is interest in comparing positions of known dunes through time, both for geological and budgetary reasons—dunes 2-4 feet high often cross roads and other infrastructures. Clearing these dunes [or slowing them down by spraying with oil] is a major public-works expense around the few coastal towns in Namibia.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/06/07

All ISS systems continue to function nominally, except those noted previously or below.

Today’s launch of STS-122/Atlantis on Mission ISS-1E was postponed due to failure indications of two (of four) engine cut-off sensors in the LH₂ tank during early-morning tanking operations. The next liftoff opportunity is tomorrow, Friday, at 4:09pm EST.

Aboard the space station, FE-2 Dan Tani again accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software after wakeup and before breakfast, for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

FE-1 Malenchenko supported the Russian TEKh-20 Plazmennyi-Kristall/PK-3+ (Plasma Crystal-3+) experiment on its sixth day, first activating the turbopump in the Service Module (SM)’s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated, then starting the experiment, terminating it later and performing close-down ops. Yuri copied the data to USB stick for subsequent downlinking via OCA, deactivated all the hardware, and disassembled and stowed it. [Main objective of PK-3 is to study non-linear dust plasma wave propagation and dispersion ratio at a specified power of an alternating electric field, pressure, and a varied number of particles, controlled by the experimenter. Today’s experiment session was performed with 6.81- and 9.2-micron particles in Argon at different pressure and HF generator power output.]

The FE-1 conducted a search in the RS (Russian Segment) for a “lost” back-up
feeder cable for the Kurs-P systems, to be installed later for using the KURS-P antenna for long-range rendezvous control.

Yuri also conducted an inspection of the BP1A onboard transmitter of the BITS2-12 onboard telemetry measurement system, located in the SM (Service Module) between panels 309 & 312, for possible malfunction. [The troubleshooting focused on checking how well the device connector is mated to the cabling and whether a bonding strap is present and connected.]

FE-2 Dan Tani performed the periodic deployment of two passive FMK (formaldehyde monitoring kit) sampling assemblies in the Lab (below CEVIS) and SM (most forward handrail) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

In the Joint Airlock (A/L), CDR Whitson terminated the charge cycle (after approximately 20 hrs) on the supplementary EMU battery started yesterday in the BSA (Battery Stowage Assembly).

Also in the A/L, Whitson and Tani transferred EMUs for 1E.

The FE-2 had time set aside for troubleshooting the television MPC (Multi-Protocol Converter) downlink, going through a number of progressive steps. [Step 1: check cables; step 2: swap IEEE 1394 Firewire; step: 3: swap the MPC.]

Peggy Whitson supported ongoing troubleshooting testing on the MPEG-2 (Moving Pictures Expert Group 2) encoder, preparing for downlinking of log files of the system which is designed to transmit RS analog video signals (as opposed to digital signals) via Ku-band and MPEG-2 “streaming” packets over the U.S. OpsLAN. [Prior end-to-end video test results were not as expected and the downlinked files need to be analyzed on the ground.]

Dan Tani conducted inflight maintenance on the Node-2 ITCS (Internal Thermal Control System)’s MTL (Moderate Temperature Loop) by adjusting its fluid sampling adapter metering valve and then taking a fluid sample for return to the ground. Afterwards, Dan repeated the sampling process on the LTL (Low Temperature Loop) side of the Node-2 ITCS.

The CDR meanwhile performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling CWC (Contingency Water Container) #1062 with the collected water slated for processing, and putting aside two water samples in sample bags for analysis. [Estimated offload time before termination (leaving ~6 kg in the tank): ~20 min. There is currently increased attention on water sampling after the discovery of some contaminated CWCs. The
identified contaminant, a common soil bacterium (unicellular organism) called Wautersia after Belgian microbiologist Georges Wauters, is no more critical than what is found often in faucet water on the ground or in farm soil. Wautersia lives off hydrogen & carbon dioxide, oxidizing H₂ and producing gaseous oxyhydrogen as energy for itself. Since it can turn sugar into a synthetic biodegradable fuel, it was seen for a short while as a promising long-term solution to the petroleum dependency, until it became clear that this “solution” would require gigantic amounts of expensive sugar.]

Peggy Whitson also conducted the weekly 10-min. CWC audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week.]

The CDR took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. [Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. O₂ sensors checks used #1042, #1063, #1052, #1041. CO₂ sensors used are #1013, #1058, #1045. CO₂ level in Lab and SM was ~0.44%.]

Yuri Malenchenko performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

The FE-1 took photographs behind panel 305 in the SM, to assess the operational temperature environment for the new GTS-2 (Global Timing System 2) experiment.

The FE-2 filled out the regular FFQ (Food Frequency Questionnaire), his 5th, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. At TsUP/Moscow, food specialists are currently preparing the Russian food “menu” for delivery by Progress M-63/28P next February. 28P will carry “bonus food” for Peggy and Yuri, plus about 15 kg of fresh food items (apples, grapefruit, oranges, lemons, garlic) in two containers.]
The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the CDR copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~10:35am, the FE-2 had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

At ~11:45am, Yuri Malenchenko downlinked a PAO TV message of greetings, congratulating the CIS Anti-Terrorist Center personnel and Russia’s Federal Security Forces on the 90th Anniversary of Russia’s State Security Agency and for successfully completing their Baikonur 2007 International Antiterrorist Exercise.

CEO photo targets uplinked for today were S. Georgia Island, S. Atlantic (International Polar Year (IPY) Site. Looking right of track for this remote island. Weather during this pass was expected to be marginal, but the crew was to try for detailed views of the glaciers on the north coast of South Georgia. South Georgia Island is mountainous with active glaciers. It has about 20 inhabitants, mainly scientists of the British Antarctic Survey. King Edward Point is the capital town, with fishing and whaling stations scattered along the more protected, leeside coast, to accommodate seasonal fishing boats. Tourism has recently become the largest income generator), and Mt. Kilimanjaro, Kenya (looking right of track for this peak. Snow-capped peaks can appear visually distinct from cumulus cloud. The ice fields on the summit at 19,000+ feet are melting fast.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

**ISS On-Orbit Status 12/05/07**

All ISS systems continue to function nominally, except those noted previously or below.

After wakeup and before breakfast, FE-2 Dan Tani accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. 

*To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.*

FE-1 Malenchenko supported the Russian TEKh-20 Plazmennyi-Kristall/PK-3+ (Plasma Crystal-3+) experiment on its sixth day, first activating the turbopump in the Service Module (SM)’s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated, then starting the experiment, terminating it later and performing close-down ops. The turbopump will be deactivated tonight at ~4:25pm EST.

*Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of an alternating electric field, pressure, and a varied number of particles, controlled by the experimenter. Afterwards, Yuri copied the data to USB stick for subsequent downlinking via OCA, and turned off the hardware. This experiment was performed with 3.42-micron particles. The main goal is to study behavior of structures affected by permanent electrical field of varying amplitude and to compare their behavior to that when being exposed to low-frequency AC field. This experiment is conducted in a semi-automatic mode, to generate a homogeneous plasma dust cloud with a small void in the center by incrementally stepping down RF generator power output. Like yesterday, Yuri made four attempts during the experiment.*

Malenchenko also serviced the Russian BMP (Harmful Impurities Removal
System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated at ~3:55pm EST.  

Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.

CDR Peggy Whitson worked in Node-2, making preparations for the later deployment of an SSC (Station Support Computer) for COL (Columbus).  

For this Get-ahead task for Flight Day 6 of the 1E mission, Whitson registered the new laptop as SSC-13 and stowed it with its supplies and cables.

FE-2 Tani set up and tested a PCS (Portable Computer System) A31p laptop in Node-2, including its UOP (Utility Outlet Panel).  

The PCS was powered down once verification was complete.

Later, Dan downloaded the collected data from his final CCISS(Cardiovascular & Cerebrovascular Control on Return from ISS) session on 12/4 and stowed the equipment.  

CCISS studies the effects of long-duration spaceflight on crewmembers' heart functions and their blood vessels that supply the brain (="cerebrovascular"). Learning more about the changes in cardiovascular & cerebrovascular systems in zero-G could lead to specific countermeasures that might better protect future space travelers.

FE-2 Tani had about an hour set aside for more hardware packing for return on STS-122/Atlantis.

The CDR meanwhile serviced the CSLM-2 (Coarsening in Solid-Liquid Mixtures-2) payload, initiating data transfer from its SPU2 (Sample Processing Unit 2) hard drive to the MSG MLC (Microgravity Science Glovebox Laptop Computer).  

Afterwards, Peggy verified the data transfer, powered down CSLM-2, removed and stowed SPU2 and inserted SPU3 instead. Later, she also deactivated the MSG via its A31p laptop.

In Node-1 "Unity" Whitson installed IMV (Intermodal Ventilation) equipment, replacing the starboard IMV Flange Saver with a new unit.  

The new Flange Saver will slow the equalization rate between the Airlock and the ISS in the event of an emergency triggered equalization during EVA campout, to prevent possible ear damage due to the rapid pressure increase in the airlock.

The crew joined in a 90-min. review of the latest timeline for the 1E missions, then, at ~10:25am EST, conducted a teleconference with ground specialists to discuss timeline particulars.
Peggy initiated charging an additional EMU battery in the A/L BSA (Airlock Battery Stowage Assembly) to support 1E. [The logistics team decided that this battery is needed in order to stretch the remaining EMU batteries out until new ones can be manufactured.]

Peggy and Dan conducted another 1E EVA procedures review and later tagged up with spacewalk specialists at MCC-Houston via S- & Ku-band.

The CDR also ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

Yuri Malenchenko completed the daily routine maintenance of the SM's SOZh environment control & life support system, with the regular replacements in its toilet system (ASU), plus the periodic checkout/verification of IP-1 airflow sensors in the various Russian Segment hatchways, including the SM-to-DC1 (22P) tunnel, and the FGB-to-Node and FGB-to-Soyuz passageways.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the FE-2 copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

**Progress Prop Line Purge:** At ~11:25am EST, station attitude control was handed over from USOS (U.S. segment) momentum management to the RS MCS (Russian Segment Motion Control System) thrusters for the subsequent propellant line purge conducted by TsUP-Moscow on Progress 26P, docked at the DC1 Docking Compartment. For the purge operation, Dan Tani closed the protective Lab science window shutter. [The fuel lines were purged at 11:38am for the regular ~ 9 minutes, the oxidizer lines at 1:29pm, also for 9 min. Attitude authority returned to USOS at 1:40pm. The purge will prevent any further transfer of propellant with 26P which was left with sufficient propellant to support the 1E mission where it will be used for roll control.]

**ATU-6 Update:** Troubleshooting for the Airlock ATU-6 (Audio Terminal Unit #6) continued today. Audio engineers are reviewing the data dumps from the test.
Latest STS-122 Launch Advisory: The launch countdown is proceeding smoothly and there are no significant issues being worked. The launch window opens on Thursday, 12/6, at 4:26pm EST and closes at 4:36pm. The in-plane (optimal) launch time is 4:31pm and provides for a Flight Day 3 rendezvous and docking with the ISS. On 12/6, the weather forecast calls for a 90 percent chance of acceptable conditions at launch time.

CEO photo targets uplinked for today were Nile floodplains, S Sudan (Dynamic Event. ISS pass crossed the Nile where it forms a vast swampland with a complex pattern of channels on either side of the Nile. River channels here shift continuously. The present window between the rainy season [clouds] and the beginning of the fire season [smoke and fire scars obscuring patterns] is the best time to document changes in river course. This is part of ongoing research with interesting analogs for Mars. Images taken at nadir and a touch left—following the Nile in a mapping swath for ~2 mins—were requested), and Galapagos Islands (Dynamic Event. The present extra-dry La Nina phase should have caused a die-down of the little vegetation that exists. Documenting these extreme conditions was requested during this nadir pass.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:16am EST [= epoch]):
Mean altitude -- 338.8 km
Apogee height -- 339.2 km
Perigee height -- 338.4 km
Period -- 91.31 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000571
Solar Beta Angle -- 18.8 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 93 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51780

Significant Events Ahead (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST
12/08/07 -- STS-122/Atlantis/1E docking, ~1:15pm
  ◦ 12/09 -- EVA-1 (Walheim/Schlegel), ~11:28am, 6.5h
  ◦ 12/09 -- Columbus transfer & berthing @ Node-2, ~5:30pm
  ◦ 12/10 -- Columbus ingress, ~5:08pm
  ◦ 12/11 -- EVA-2 (Walheim/Schlegel), ~11:28am, 6.5h
  ◦ 12/13 -- EVA-3 (Walheim/Love), ~10:25am, 6.5h

12/15/07 -- STS-122/Atlantis undocking, ~8:22am
12/17/07 -- STS-122/Atlantis landing ~12:29pm EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket) [Check it out at http://usspace50.com/]
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- NET: ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- NET: ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- NET: ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/04/07

All ISS systems continue to function nominally, except those noted previously or below.

After wakeup and before breakfast, FE-2 Dan Tani accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

FE-1 Malenchenko supported the Russian TEKh-20 Plazmennyi-Kristall/PK-3+ (Plasma Crystal-3+) experiment on its fifth day, first activating the turbopump in the Service Module (SM)’s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated, then starting the experiment, terminating it later and performing close-down ops. The turbopump will be deactivated tonight at ~4:25pm EST. [Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of an alternating electric field, pressure, and a varied number of particles, controlled by the experimenter. Afterwards, Yuri copied the data to USB stick for subsequent downlinking via OCA, and turned off the hardware.]

Before breakfast and exercise, Malenchenko completed his first session with the periodic Russian MedOps test "Hematokrit" (MO-10), measuring red cell count of the blood. [The blood samples were drawn from a finger with a perforator lancet, then centrifuged in two microcapillary tubes in the M-1100 kit's minicentrifuge, and its hematocrit value was read off the tubes with a magnifying glass. It is a well-known phenomenon of space flight that red blood cell count (normal range: 30-45%) tends to go down over time. After the exam, the data were saved in the IFEP
software (In-Flight Examination Program) on the MEC (Medical Equipment Computer), and Oleg Kotov stowed the equipment.

Afterwards, the FE-1 serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~2:05pm EST. Regeneration of bed #2 follows tomorrow. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]

CDR Whitson activated the A31p laptop in the FGB for Russian segment (RS) to US segment (USOS) video transmission, after which Malenchenko and Tani conducted the downlink end-to-end testing of streaming video (analog signals) from the Russian TVS television system’s KL-211 MPEG-2 TV Encoder via the new JSL (Joint Station LAN) and then to the ground by U.S. OCA.

FE-2 Tani completed his second (and last) on-orbit session with the CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS) experiment, with Peggy Whitson acting as operator, by setting up and donning the Holter Monitor, donning the CBPD (Continuous Blood Pressure Device), performing the Baro Study, doffing the CBPD, and starting the 24-hr passive heart rate data collection. Data are recorded on a PCMCIA memory card, with the HRF (Human Research Facility) rack laptop for control. Data download and equipment stowage is scheduled tomorrow (~7:10am EST) after the 24-hr period. [CCISS studies the effects of long-duration spaceflight on crewmembers' heart functions and their blood vessels that supply the brain (="cerebrovascular"). Learning more about the changes in cardiovascular & cerebrovascular systems in zero-G could lead to specific countermeasures that might better protect future space travelers. For the Baro study of CCIS, heart rate and blood pressure are being recorded for resting and timed breathing for 5 min, with no caffeine or food (water is acceptable) allowed two hours before the start of the Baro Study and no exercise prior to the Baro Study.]

The CDR worked in the Airlock (A/L) to replace one of the two smoke detectors (SDs), which had shown erratic behavior in its data readouts, with a spare. The removed unit was temporarily stowed for later troubleshooting by the crew. [Problems with tool access prevented two of the four fasteners from being installed to the designated torque value. Whitson tightened the two fasteners by hand. The fasteners are captive and no further action is required at this time. The smoke detector is now functioning nominally. During EVA Campout operations, the A/L duct SD is not available. If the A/L cabin SD continued this behavior during campout operations, there would have been the risk of a false fire alarm.]
Also in the A/L, Peggy & Dan conducted the first part of troubleshooting tasks on the ATU-6 (Audio Terminal Unit 6). [This first step was to verify there were no sticky keys on the ATU by pressing the all keys on the ATU keypad while a BIT (built-in test) was running. The test was completed successfully and no anomalies were reported. Troubleshooting will continue tomorrow. The ATU was reported locked up (“frozen”) on 10/17 and could not be reconfigured or set to Transmit. After cycling the unit out & back into Public Calls mode, the ATU functioned only intermittently.]

The FE-2 meanwhile retrieved a PBA (Portable Breathing Apparatus) from Node-1 and installed it with its bottle (#1027) and mask (#1032) in the Node-2 aft emergency locker.

Peggy and Yuri each performed the CHeCS CMO (Crew Health Care Systems/Crew Medical Officer) on-board training drill, a 30-min. video & audio refresher course, taken individually, to hone the CMO’s acuity in emergency medical operations. [The proficiency drill focuses on re-familiarization with skills and techniques required in procedures related to medical issues arising on board and concludes with a self-assessment questionnaire. The HMS (Health Maintenance Systems) hardware, which includes ACLS (Advanced Cardio Life Support) equipment, may be used in contingency situations where crew life is at risk. To maintain proficiency, crewmembers spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS CBT (computer-based training) and the ACLS CBT.]

In the A/L, Dan Tani continued prior EVA systems preparations for the 1E spacewalks.

Malenchenko inspected the Russian de-ionized water container (KOV/EDV), used for supplying water to the Elektron electrolytic oxygen (O₂) generator, for bubbles and for filling it up, as necessary, with U.S. condensate from a CWC (Contingency Water Container). [Air bubbles larger than ~10 mm in the water must be prevented from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

Yuri also performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Later, the FE-1 handled the daily IMS (Inventory Management System)
maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The CDR and FE-2 had 30 min. reserved for a joint review of MSS (Mobile Service System)/Robotics operations planned for the STS-122/1E docked period.

Yuri performed the periodic collection & deletion of readings on the MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/display of the RBO-3-2 Matryoshka-R anthrop-amorphous (human torso) "phantoms" located inside the station for sophisticated radiation studies, collecting radiation measurements every 15 minutes around the clock.

At the HRF1 (Human Research Facility 1) rack, Whitson deactivated the MedOps cardiac defibrillator and conducted its periodic checkout, which was to be recorded on video and later dumped to the ground (Last time done: 10/16). 

[This routine maintenance task is scheduled as soon as possible from Expedition start and every 60 days thereafter. For the checkout, the defib is connected to the 120V outlet, equipped with its battery (today #1020) and then allowed to charge, for about five seconds, to a preset energy level (e.g., 100 joules). After the button-triggered discharge, a console indicator signals success or failure of the test. The pacing signal is downlinked via S-band for 1 min. The HRF was powered down afterwards.]

Peggy had another ~130 min set aside to prepack cargo items for transfer to STS-122/Atlantis for return to Earth.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the CDR copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Later, the crew conducted a joint review of uplinked STS-122/1E spacewalk procedures and will link up with EVA personnel at MCC-Houston at ~4:00pm via Ku- & S-band to discuss details.

At ~11:25am EST, the crew participated in a live PAO TV interview with the Chicago Sun Times (Andrew Herrmann). In the second part of the comm window, the crew downlinked a deferred release message of greetings to the Jules Verne
Adventure Film Festival.  [The Festival, to be held for the 15th year, this time in Los Angeles instead of Paris, honors the “Father of Science Fiction” whose name is carried by the first European ATV (Automated Transfer Vehicle).]

At ~11:45am, the crew downlinked best wishes and congratulations to Lt. Gen. Vladimir Aleksandrovich Shatalov on the occasion of his 80th birthday next Saturday (12/8).  [Shatalov, twice Hero of the Soviet Union, is a veteran Pilot-Cosmonaut who flew on Soyuz 4, Soyuz 8, and Soyuz 10, making the first Russian space docking. Later, he served as Commander of GCC (Gagarin Cosmonaut Training Center) from 1971-1987.]

Node-2 CAA: Twelve of the 20 required liters of condensate have been collected in the Node-2 CCAA (Common Cabin Air Assembly) air conditioner. Node-2 is currently running cold. Moscow has turned off the Russian SKV air conditioner to help in the condensate collection.

Progress 26P Purge: Tomorrow (12/5), TsUP/Moscow will perform a purge of the 26P fuel systems. Enough reserve fuel will be left in 26P for it to support roll control as planned for 1E.

Latest STS-122 Launch Advisory: The launch countdown is going well and there are no significant issues being worked. The launch window opens on Thursday, 12/6, at 4:26pm EST and closes at 4:36pm. The in-plane (optimal) launch time is 4:31pm and provides for a Flight Day 3 rendezvous and docking with the ISS. On 12/6, there is a 0% chance of weather prohibiting tanking and a 10% chance of weather prohibiting launch due to low cloud ceilings. If there is a 24-hour launch delay, the probability of KSC weather prohibiting launch increase to 40% due to low cloud ceilings and a chance of rain showers.

CEO photo targets uplinked for today were Betsiboka River Delta, Madagascar (Dynamic Event. The estuary of this river has filled with sediment just since WWII, and continues to change rapidly. Deforestation inland in Madagascar appears to be the main cause. Looking left for this coastal target which has been obscured by cloud for weeks), Nairobi, Kenya (Nadir pass over Kenya’s capital city. The gray speckled cityscape contrasts with the more uniform national park immediately to the south. A prominent straight border separates the two. The city is one of several whose rapid growth CEO observers are monitoring), and Patagonian Glaciers (weather may have been clear enough to shoot the often obscured glaciers on the cloudy, Pacific side of the Andes. Looking left and right of track for the smaller glaciers).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 6:55am EST [= epoch]):
Mean altitude -- 338.9 km
Apogee height -- 339.2 km
Perigee height -- 338.5 km
Period -- 91.31 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000555
Solar Beta Angle -- 21.8 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 98 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51764

Significant Events Ahead (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST
12/08/07 -- STS-122/Atlantis/1E docking, ~1:15pm
  o 12/09 -- EVA-1 (Walheim/Schlegel), ~11:28am, 6.5h

Date: Monday, December 03, 2007 1:32:59 PM

ISS On-Orbit Status 12/03/07

All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 7 of Increment 16.

FE-1 Malenchenko continued his support of his first experiment session with the Russian TEGh-20 Plasma Crystal-3+ (Plazmennyi-Kristall/PK-3+) payload by activating the turbopump in the Service Module (SM)’s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. The turbopump will be deactivated tonight at ~4:25pm EST. [Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles.]

CDR Whitson and FE-2 Tani assisted the ground in deactivating the CDRA (Carbon Dioxide Removal Assembly) at 2:25am-3:25am EST, used to support yesterday’s SPHERES experiment. With cooling no longer required, the crew also disconnected the LTL (Low Temperature Loop) jumper of the ITCS (Internal Thermal Control System) from the CDRA rack.

At ~3:05am, in support of HDTV (High Definition TV) playback & downlink by ground commanding, FE-2 activated the Photo/TV MPC (Multi-Purpose Converter). [MPC was turned off again by Tani at ~1:20pm.]

Dan then also set up the Ku-band for downlinking analog video signals (streaming video) via U.S. OCA from the Russian TVS television system in a test of the relatively new KL-211 MPEG-2 TV Encoder in the new JSL (Joint Station LAN).

The CDR prepared the CSLM-2 (Coarsening in Solid-Liquid Mixtures-2) experiment for operation, turned on the SAMS ICU (Space Acceleration Measurement System/Interim Control Unit) in LAP2 Rack, and started CSLM-2 by activating heating of the sample.

Peggy and Dan spent time in the Joint Airlock to continue EVA preparations, today
verifying and configuring tools for the SARJ (Solar Alpha Rotary Joint) inspection on 1E EVA-2, then performing the regular checkout and test of the SAFER (Simplified Aid for EVA Rescue) units to be used for the spacewalks by Walheim, Schlegel and Love (#1006 & #1007).

Later, the crew conducted a joint review of uplinked STS-122/1E spacewalk procedures and will link up with EVA personnel at MCC-Houston at ~4:00pm via Ku- & S-band to discuss details.

Peggy and Dan each had ~90 min set aside to prepack cargo items for transfer to STS-122/Atlantis for return to Earth. The FE-2 used an additional 15 min for prepacking the failed IVCPDS (Intravehicular Charged Particle Directional Spectrometer) hardware for return.  [The IVCPDS, found to be hard failed on 10/30, was a secondary radiation detection measurement tool; the primary radiation measurement tool is the TEPC (Tissue Equivalent Proportional Counter).]

The CDR conducted the microbial (bacterial & fungal) “T+5 Day” analysis of air samples collected on 11/28 by Dan Tani with the MAS (Microbial Air Sampler) kit in Lab, Node and SM.  [The sampling analysis is performed once per month for the first three months, and once every three months thereafter.  Bacterial and fungal air samples are taken at two locations in each module.  The colony growth on the sampling slides is analyzed after five days of incubation in four Petri dishes.  For onboard visual analysis of media slides from SSK (Surface Sampling Kit), MCDs (microbial capture devices) from WMK (Water Monitoring Kit), coliform detection bags from MWAK (Microbial Water Analysis Kit), and Petri dishes from MAS, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]

Continuing the current round of monthly preventive maintenance of RS (Russian Segment) ventilation systems, FE-1 Malenchenko inspected and cleaned the “Group B” (B1 & B2) fan grills in the SM, followed later by reporting to TsUP-Moscow on equipment status and any presence of moisture in work areas.

Yuri also performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.  [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Dan handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).
Malenchenko set up the "Urolux" equipment, hooked it up to the Power Supply Center (BP Tsentr) and ran the periodic functional health test and calibration on it, then deactivating the hardware.

Later, the FE-1 unstowed and installed the equipment for the periodic Russian PZE-MO-10 "Hematokrit" testing that is scheduled tomorrow for him.  *[MO-10 measures the hematocrit (red blood cell mass) value of the blood (it is a well-known phenomenon of space flight that red blood cell mass {normal range: 30-45%} tends to go down over time).]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~1:05pm, Peggy and Yuri had a 15-min teleconference with ground specialists to discuss the images downlinked from their recent (11/29) Shuttle RPM (R-bar Pitch Maneuver) skill training.  *[The skill training prepares the crew for the bottom side mapping of the Orbiter at the arrival of STS-122/1E. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Orbiter, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]*

At ~9:35am, Whitson and Tani participated in two live PAO TV interviews with media in Chicago, one with WGN Radio (Spike O’Dell), the other with WJMK Radio (Steve Dahl).

At 2:30pm, Dan is scheduled for a CDC (Crew Discretionary Conference).

*Lab/Node-2 Vestibule Leak Check Update:* The second Fine Leak check on the Lab/Node-2 vestibule conducted by Peggy Whitson on 12/1 has passed. The indicated pressure drop of ~9 mmHg in 7 hours is equivalent to a loss of 0.13 pound-mass of air at 14.7 psia. This is far below the limit criterion used, resulting in the conclusion that there is no leak. The vestibule was completely repressurized by equalization with the ISS stack and is ready for 1E.
SSRMS Pre-launch Checkout Update: The regular pre-launch checkout of the Canadian SSRMS (Space Station Remote Manipulator System) went without issue. The robotarm is now properly positioned for 1E, having “walked off” the Lab PDGF (Power & Data Grapple Fixture) and changed its base to the Node-2 PDGF.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:08am EST [= epoch]):
Mean altitude -- 339.0 km
Apogee height -- 339.3 km
Perigee height -- 338.6 km
Period -- 91.31 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000554
Solar Beta Angle -- 24.4 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 93 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51749

Significant Events Ahead (all dates Eastern Standard, some changes possible. NET = Not Earlier Than):
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST
12/08/07 -- STS-122/Atlantis/1E docking, ~1:15pm
  ○ 12/09 -- EVA-1 (Walheim/Schlegel), ~11:28am, 6.5h
  ○ 12/09 -- Columbus transfer & berthing @ Node-2, ~5:30pm
  ○ 12/10 -- Columbus ingress, ~5:08pm
  ○ 12/11 -- EVA-2 (Walheim/Schlegel), ~11:28am, 6.5h
  ○ 12/13 -- EVA-3 (Walheim/Love), ~10:25am, 6.5h
12/15/07 -- STS-122/Atlantis undocking, ~8:22am
12/17/07 -- STS-122/Atlantis landing ~12:29pm EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)

04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/02/07

All ISS systems continue to function nominally, except those noted previously or below. **Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani. Ahead: Week 7 of Increment 16.**

FE-1 Malenchenko supported his first experiment session with the Russian TEKh-20 Plasma Crystal-3+ (Plazmennyi-Kristall/PK-3+) payload by activating the turbopump in the Service Module (SM)’s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. The turbopump will be deactivated tonight at ~4:25pm EST. *Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles.*

The crew conducted the regular weekly three-hour task of thorough station cleaning. *"Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.*

As part of the house cleaning, Yuri Malenchenko performed preventive maintenance cleaning on the V3, FS5 & FS6 fan screens in the DC1 (Docking Compartment) and on the VPkhO, VdPrK, VPrK & TsV2 fan grilles in the FGB (Funktsionalnyi-Grusovoi Blok).

Peggy Whitson & Dan Tani both spent several hours of their own time with their selected “Voluntary Weekend Science” activities:

- The CDR started out with software replacement for the HRF-1 RIC (Human Research Facility 1 Rack Interface Controller), first replacing the HRF-1 laptop’s Ultrabay Adapter, then uploading the RIC software (EXPRESS Load
5) and rebooting the computer. Later, Peggy also serviced the CGBA/CSI-02 (Commercial Generic Bioprocessing Apparatus Science Insert 2), sowing its PDA (Plant Development Habitat) with new seeds and then restowing the hardware.

- The FE-2 performed another session with the SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) experiment, flying two & three satellites, requiring 2 video camcorders & 2 VTRs. Afterwards, Dan conducted an EPO (Educational Payload Operation) demo, recording a narrated tour of the ISS living area on a camcorder. As all EPO videos, the DVD will be used by the Educational Community for school classes.

The FE-1 meanwhile performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.*

The FE-1 completed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.*

In the Joint Airlock, the CDR terminated the recharging on the second set of EVA batteries.

Working off his “time permitting” discretionary task list, Yuri conducted his third run of the Russian "Diatomeya" ocean observations program, using the NIKON-F5 still camera and SONY PD-150 camcorder to obtain high-contrast fields in ocean water color, wakes of turbulent water, and cloud cover pattern anomaly along the flight path. *Special target zone was the Bay of Bengal in the Indian Ocean.*

At ~7:30am EST, Malenchenko participated in an event set up for him in Moscow to cast his ballot in the Elections to the 5th State Duma of the Russian Federation Federal Assembly, formally authorizing his proxy agent Dmitry Alexandrovich Zhukov to fill out the ballot for him, with the required confidentiality being observed. *Yuri: “Participation in Russia’s political life is a crucial right of every citizen of the country! By casting our vote we shape the direction our nation will take in the future. Our future depends on our vote!”*
At ~9:05am, the crew held a teleconference with crewmembers of the upcoming STS-122/1E mission via S- & Ku-band.

At ~10:35am, the FE-1 followed up on his earlier balloting with a downlink to an event arranged by Russia’s Central Election Committee (Moscow) which today elects deputies to the State Duma of the Russian Federation Federal Assembly. Present at the event were Election Committee Chairman Vladimir Evgenyevich Churov and Yuri Malenchenko’s family, Ekaterina Victorovna Malenchenko and daughter Camilla. “[We are happy to welcome here the ISS crew consisting of Commander Peggy Whitson, Flight Engineer Daniel Tani, and Flight Engineer Yuri Ivanovich Malenchenko, the 78th cosmonaut of Russia and the 308th cosmonaut of the world. Specialists believe that your international crew has the most difficult and challenging mission in the entire station history because the science program involves many experiments some of which have never been staged before on the ISS]”

At ~2:30pm, the CDR had her weekly PFC (Private Family Conference) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 12/01/07

All ISS systems continue to function nominally, except those noted previously or below. *Saturday.*

FE-1 Malenchenko continued preparations for operating the Russian/German TEKh-20 Plasma Crystal-3 Plus (PK-3+) experiment payload. *After yesterday’s hardware setup, leak checking of the electronics box and evacuation of the vacuum work chamber (ZB) with the turbopump, the CDR conducted more testing and calibration, uploaded new software from a USB stick to the payload laptop, checked out the software installation and verified the readiness of the experiment. After additional leak checking on the work chamber during the day, Yuri will deactivate the turbopump tonight at ~4:25pm EST. The experiment is performed on plasma, i.e., fine particles charged and excited by HF (high frequency) radio power inside the evacuated work chamber. Main objective is to obtain a homogeneous plasma dust cloud at various pressures and particle quantities with or without superimposition of an LF (low frequency) harmonic electrical field. The experiment is conducted in automated mode. PK-3+ has more advanced hardware and software than the previously used Russian PKE-Nefedov payload.*

CDR Whitson continued final 10A EVA preparations in the Joint Airlock (A/L) by setting up and starting the periodic scrubbing process on the cooling water loops of EMU (Extravehicular Mobility Unit) #3006 & #3018, afterwards initiating their ionic and particulate filtration, one at a time, with the ion and 3-micron filter. *Purpose of the scrubbing, including iodination of the LCVGs (Liquid Cooling & Ventilation Garments) for biocidal maintenance, is the elimination of any biomass (organic) and particulate matter that may have accumulated in the loops.*

The CDR then terminated the recharging on the first set of EMU helmet light and PGT (Pistol Grip Tool) batteries, started yesterday, and initiated the process on the second set. *The recharged helmet light batteries were then installed in the #3006 & #3018 EMUs, the PGT batteries in PGTs #1001, #1005, #1004 & #1008. Remaining charged batteries were stowed.*
FE-2 Dan Tani (who will return to Earth with STS-122/Atlantis in two weeks) performed the standard inspection and degassing of A/L PWRs (Payload Water Reservoirs, #1012, #1013). [The de-gassing manually removes any air bubbles from the PWR water to minimize the amount of air introduced into the EMU feedwater tanks.]

While waiting for the EMU scrubbing to complete, Peggy Whitson terminated the Fine Leak check conducted overnight on the Lab/Node-2 vestibule, then repressurized the vestibule, restowed the measuring equipment and re-installed the IMV (Intermodal Ventilation) supply-&-return jumpers, two ducts and four O-rings.

The FE-2 meanwhile took two water samples from the EDV water container associated with the hygiene station in the FGB for return on 1E, one from flush water, the other for post-flight microbial analysis.

Peggy & Dan conducted the standard pre-launch SSRMS (Space Station Remote Manipulator System) checkout activities. The SSRMS was then maneuvered by the ground via S-band to the position required for 1E: first a base change (~7:50-8:50am EST) by "walking off" the Lab PDGF (Power & Data Grapple Fixture), i.e., grappling the Node-2 PDGF and releasing the Lab PDGF, then moving its joints by JOCAS (Joint Operator Commanded Auto Sequence) through two “waypoints” to the 1E start position.

Yuri Malenchenko performed the semi-annual inspection and photo-documentation of Service Module (SM) windows, tagging up with ground specialists. To check for new defects, photographs of the window panes will be recorded, along with text files, on the RSK1 laptop for subsequent downlink via U.S. OCA assets. [Objective of the inspection, using digital still camera (Nikon D1X w/SB-28DX flash), voice recorder and a flaw log, is to assess the pane surfaces on SM windows 6, 7, 8, 12, 13 for any changes (new cavities, scratches, new or expanded old stains or discolorations affecting transparency properties) since the last inspection, performed by Oleg Kotov on 6/26/07. The new assessment will be compared to the earlier observations.]

Later, Peggy connected the regular ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) coolant jumper to the LAB1D6 rack, to support the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly) at ~3:00pm in support of tomorrow’s SPHERES experiment by Dan. [The experiment’s floating “satellite” spheres use CO₂ as propellant.]

The FE-1 completed handled the daily routine maintenance of the SOZh system
(Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

In the SM, Malenchenko worked on the ESA/Russian KUBIK-3 refrigerator, setting it up, copying data to laptop, switching the data cable, copying data again, for download via BSR-TM payload telemetry channel, then closed out operations and deactivated the refrigerator. Stowage was to be photographed as a task item from the voluntary “time permitting” job list.

As a second discretionary task list item, Yuri was to complete another radiation data monitoring & logging session for flow & dose power data with the Matryoshka-R radiation payload and its LULIN-5 electronics box (accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Later, Dan Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~8:50am EST, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

At ~9:40am, the FE-1 had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

**Weekly Science Update** (Expedition Sixteen -- Weeks 5 & 6)

*ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):* From Week 5: The ALTEINO instrument has been rotated and re-activated nominally on 11/22. Subsequent downlink of the files has been performed nominally on 11/23. Radiation measurements continue to be performed throughout the Increment 16 in the PIRS module. From Week 6: Radiation measurements continue nominally in
the PIRS module.

**ANITA:** Completed.

**BCAT (Binary Colloidal Alloy Test):** Reserve.

**CARDIOCOG-2:** Completed.

**CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):** “Dan, next week your second and last on-orbit session will be hard scheduled. Thanks for participating and performing your first session as Voluntary Science”.

**CFE (Capillary Flow Experiment):** Reserve.

**CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus):** In progress.

**CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):** Complete.

**CSLM-2 (Coarsening in Solid-Liquid Mixtures 2):** The CSLM SPU (Sample Processing Unit) is currently under vacuum and should be ready to process on Monday.

**EarthKAM (Earth Knowledge Acquired by Middle School Students):** Complete.

**ETD (Eye Tracking Device):** In progress.

**Integrated Immune:** In progress.

**LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):** Complete.

**MISSE (Materials ISS Experiment):** Ongoing.

**MTR-2 (Russian radiation measurements):** Passive dosimeters measurements in DC1 “Pirs”.

**MULTIGEN-1:** From Week 5: The EMCS (European Modular Cultivation System) Facility has been switched off on 11/15. MULTIGEN-1 samples will be downloaded on STS-122 (1E).

**MSG-SAME (Microgravity Science Glovebox):** Complete.
**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION/REPOSITORY:** Dr. Whitson was thanked for completing her Flight Day 30 Nutrition/Repository collections: "We appreciate the crew notes with all of the barcode and hardware information, they were very helpful". Her next session is on FD60.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** Ongoing.

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** "Peggy, we have placed an Actiwatch download/initialization session on the task list for next week. This will include downloading and initializing the lost Actiwatch. Thanks for continuing to sleep log. And thanks also to Dan."

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** In progress. To be conducted tomorrow (12/2).

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** In progress.

**TRAC (Test of Reaction & Adaptation Capabilities):** Planned.

**CEO (Crew Earth Observations):** Through 11/28 the ground has received a total of 4,017 CEO frames for review and cataloging for Increment 16. "That includes nearly 1,000 frames in the past week alone! We are focusing our efforts on 14 sessions in which you acquired imagery with camera times corresponding to our target request times: Acraman Impact Crater, Australia; Afar Rift Zone, Ethiopia (confirmed); Bosumtwi Impact Crater, Ghana; Gulf of Fonseca (confirmed), Central America; Heard Island, Southern Ocean; Honolulu, HI (confirmed); Kingman Reef & Palmyra Atoll, central Pacific (confirmed); Mississippi Delta Region (confirmed); Mount Nyiragongo, central Africa; Patagonian Glaciers (confirmed); Pilcomayo River dynamics, Argentina; Santa Barbara Coast, CA (confirmed); and Volcan Colima, Mexico (confirmed). This is an incredible response to our target requests! We have also noted with interest your views of cities at night (PAO has inquired about your very nice views of Chicago). We’d also like to acknowledge the striking views of Australia and New Zealand acquired on your time. Thank you for your energetic and enthusiastic support of our payload!"

CEO photo targets uplinked for today were **Heard Island** *(Heard Island is a bleak, uninhabited, and mountainous island located in the Southern Ocean; about two-thirds of the way from Madagascar to Antarctica. Its mountains are covered in*
glaciers and dominated by Mawson Peak, a 9,006 ft high complex volcano which forms part of the Big Ben massif. A long thin spit named "Elephant Spit" extends from the east of the island. As was the case yesterday, this pass was just after midday, however weather is marginal. Looking well right of track and using the long lens for details), Goat Paddock Impact Crater (this small, young impact site is located in northwestern Australia. It lies just north of the Great Sandy Desert and near where the Margaret River breaks out of the Kimberly Plateau. Although Goat Paddock is only 5.1-km in diameter it is less than 50 million years old and is a fairly distinct feature. ISS approach was from the SW in mid-afternoon light. Looking just left of track with the long lens), and Patagonian Glaciers (ISS pass was near nadir over the southern part of the Southern Patagonian Ice Field; the larger of two icefields in the southern Andes Mountains of Chile and Argentina. The crew had several passes over Patagonia today, but the weather looked to be best for a late morning pass. As the station approached the coast from the west, the crew was to look for views and details of the less-photographed glaciers on the western and southern flanks of the ice field).

CEO photography can be viewed and studied at the websites: 
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site); 
http://earthobservatory.nasa.gov/ 
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 7:25am EST [= epoch]): 
Mean altitude -- 339.2 km 
Apogee height -- 339.6 km 
Perigee height -- 338.7 km 
Period -- 91.32 min. 
Inclination (to Equator) -- 51.64 deg 
Eccentricity -- 0.0000711 
Solar Beta Angle -- 28.3 deg (magnitude decreasing) 
Orbits per 24-hr. day -- 15.77 
Mean altitude loss in the last 24 hours -- 91 m 
Revolutions since FGB/Zarya launch (Nov. 98) -- 51717

Significant Events Ahead (all dates Eastern Standard, some changes possible): 
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST 
12/08/07 -- STS-122/Atlantis/1E docking, ~1:15pm 
   o 12/09 -- EVA-1 (Walheim/Schlegel), ~11:28am, 6.5h 
   o 12/09 -- Columbus transfer & berthing @ Node-2, ~5:30pm
12/10 -- Columbus ingress, ~5:08pm
12/11 -- EVA-2 (Walheim/Schlegel), ~11:28am, 6.5h
12/13 -- EVA-3 (Walheim/Love), ~10:25am, 6.5h

12/15/07 -- STS-122/Atlantis undocking, ~8:22am
12/17/07 -- STS-122/Atlantis landing ~12:29pm EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket)** [Check it out at http://usspace50.com/]

02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- **50th Birthday of NASA**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 11/30/07

All ISS systems continue to function nominally, except those noted previously or below.

As is standard for new Expeditions, the two Flight Engineers, Malenchenko & Tani, performed the periodic 3-hr. routine health checkout on the RS (Russian segment)’s STTS telephone/telegraph subsystem, including inspection and audio function checks of all comm panels (PA) in and between the Service Module (SM), FGB and Docking Compartment (DC1), VHF receiver tests, and an audit of headsets. [The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM’s outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support. Last time done 4/15/07 by Yurchikhin & Kotov.]

Malenchenko also completed the 2-hr Part 2 of his first onboard “Profilaktika” (MBI-8, “Countermeasures”) series of preventive health maintenance fitness testing, including ECG (Electrocardiogram), blood test and subjective rating. [Today’s fitness test was performed on the TVIS treadmill in unmotorized (idle) mode, with free choice of speeds within the range permitted. The test investigates the action mechanism and efficiency of various countermeasures (currently VELO and TVIS) aimed at preventing locomotor system disorders in weightlessness. The test differs from the normal TVIS session by the use of the TEEM-100 gas analyzer (via a mask equipped with a pneumotachometer sensor), measurement of blood lactate level and subjective evaluation of physical exertion levels during the test. The lactate blood samples were taken twice at the end of the session, using the ACCUSPORT analyzer and REFLOTRON-4 accessories. Results were entered on a log sheet. TEEM and ECG (electrocardiograph) data were transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results were also called down via S-band to]
specialists standing by at TsUP-Moscow.]

Yuri made preparations for another run of the Russian/German TEKh-20 Plasma Crystal-3 Plus (PK-3+) experiment payload by unstowing the hardware, installing it in the SM for operation and photographing the setup. The images were downlinked to TsUP via OCA for inspection, and the FE-1 performed the initial leak check of the PK-3 Electronics Box. More work to come tomorrow. [The experiment is performed on plasma, i.e., fine particles charged and excited by HF (high frequency) radio power inside an evacuated work chamber. Main objective is to obtain a homogeneous plasma dust cloud at various pressures and particle quantities with or without superimposition of an LF (low frequency) harmonic electrical field. The experiment is conducted in automated mode. PK-3+ has more advanced hardware and software than the previously used Russian PKE-Nefedov payload.]

In the Joint Airlock, the CDR started the recharge cycle on the first batch of EMU (Extravehicular Mobility Unit) batteries in the BSA (Battery Stowage Assembly) following their discharge.

Dan Tani continued the daily servicing of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment on its second session. [Today, FE-2 terminated the second vacuum draw on the sample chamber and began the final vacuum draw for Sample #2. This draw will run over the weekend, and sample processing will then begin on Monday.]

In the Soyuz TMA-11/15S, docked to the FGB Nadir port, the FE-1 deactivated the gas analyzer that was running since 11/28.

After partially pressurizing the PMA-2 (Pressurized Mating Adapter 2) to 5 psia on 11/28, CDR Whitson today performed a leak check on the adapter using the installed test equipment (ISA/Internal Sampling Adapter, VAJ/Vacuum Access Jumper, Multimeter and ISA Scopemeter Pressure Probe), then initiated the depressurization of PMA-2 to vacuum until its planned repressurization on 12/7 for 1E docking. The equipment was torn down and stowed.

Peggy Whitson completed late-added preparations for a second overnight Fine Leak Check on the Lab-to-Node-2 vestibule, temporarily removing the IMV (Intermodular Ventilation) supply-&-return jumpers, two ducts and four O-rings, then initiating the vestibule depress. [The test repetition was requested by ground specialists because of inconclusive results of the first 15-hour leak check on the Lab/Node-2 vestibule on 3/27, which appeared to indicate a leak to space of ~3-4 lbs/day but could not be confirmed by a Coarse Leak check or by Whitson with the ULD (Ultrasonic Leak Detector) on 11/28 and may have been a false alarm.]
Due to the late-added vestibule leak check, the scheduled monthly (Week 6) potable water sampling for inflight & post-flight chemical analysis for the CDR was moved to her discretionary “job jar” task list. [Water samples are collected using jointly approved Russian sampling procedures with the U.S. WS&A (Water Sampler & Archiver) kit for collection. Samples are taken in the SM at the potable water SRV-K hot port and SRV-K warm port and from CWCs (Contingency Water Containers) for the SVO-ZV water supply system.]

Yuri Malenchenko made preparations and set up equipment for tomorrow’s scheduled semi-annual inspection and photo-documentation of Service Module (SM) windows, tagging up with ground specialists. To check for new defects, photographs of the window panes will be recorded, along with text files, on the RSK1 laptop for subsequent downlink via U.S. OCA assets. [Objective of the inspection, using digital still camera (Nikon D1X w/SB-28DX flash), voice recorder and a flaw log, is to assess the pane surfaces on SM windows 6, 7, 8, 12, 13 for any changes (new cavities, scratches, new or expanded old stains or discolorations affecting transparency properties) since the last inspection, performed by Oleg Kotov on 6/26/07. The new assessment will be compared to the earlier observations.]

Dan Tani performed his 6th ICEPAC insertion in the MELFI (Minus Eighty-Degree Laboratory Freezer for ISS), retrieving one -32 degC ICEPAC belt from stowage and placing it in Dewar 1/Tray B/Section 4. [The reason the crew is currently performing several ICEPAC insertions is because the amount of warm mass that can be placed in a dewar at one time is limited by the allowable temperature rise. These activities are in preparation for the next Cold Bag packing, planned for STS-122/1E.]

The FE-2 filled out the regular FFQ (Food Frequency Questionnaire), his 4th, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. At TsUP/Moscow, food specialists are currently preparing the Russian food “menu” for delivery by Progress M-63/28P next February. 28P will carry “bonus food” for Peggy and Yuri, plus about 15 kg of fresh food items (apples, grapefruit, oranges, lemons, garlic) in two containers.]

In preparation for 1E, Peggy & Dan performed the usual one-hour review of new uplinked DOUG (Dynamic Onboard Ubiquitous Graphics) software for tomorrow’s standard pre-launch SSRMS (Space Station Remote Manipulator System) checkout.
activities.  [As part of tomorrow’s checkout, the SSRMS will be maneuvered to the position required for 1E by "walking off" the Lab PDGF (Power & Data Grapple Fixture), grappling the Node-2 PDGF for base change, releasing the Lab PDGF and its joints then moved by JOCAS (Joint Operator Commanded Auto Sequence) through two “waypoints” to the 1E start position. DOUG is a periodically updated software program on the MSS (Mobile Service System) laptops that provides a birdseye-view graphical image of the external station configuration and the SSRMS arm, showing its real-time location and configuration on a laptop during its operation.]

The crew prepared for STS-122/Atlantis arrival next week by conducting a joint review of cargo transfer requirements (resupply deliveries & return cargo) by going through uplinked draft material on transfer choreography (“who transfers what on which Flight Day”) and transfer items.

Dan Tani handled the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

The daily IMS (Inventory Management System) maintenance was conducted today by Yuri Malenchenko again as a task item from his voluntary “time permitting” job list, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (FE-1/MBI-8, FE-2), and RED resistive exerciser (CDR, FE-2).

Later, Peggy Whitson copied the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~8:40am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~10:55am, the FE-2 had his weekly PFC (Private Family Conference) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground
At ~2:45pm, the crew is scheduled for their 4th weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio [S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].

SARJ Issue Update: Deliberate investigation and strategic planning continue on the ground on the ramifications of the observed damage on the starboard SARJ (Solar Alpha Rotary Joint) bearing. Work in progress includes consideration of possibly manifesting 12 new TBAs (Trundle Bearing Assemblies) on STS-123/1J/A next February, removing, but not immediately replacing, one TBA on one of the 1E EVAs (i.e., operating SARJ in directed position on only 11 of the 12 TBAs), and much more.

CEO (Crew Earth Observation) photo targets uplinked for today were Lawn Hill Impact Crater (this impact site is estimated to be 515 million years old and has been heavily weathered to where what is visible is a very subtle 18-km in diameter feature. It is located just inland from the Gulf of Carpentaria in northern Australia. ISS approach was from the SW in late afternoon sun which may have helped to accentuate the remaining features of the impact in the near-nadir view. Because this feature is so indistinct, it may not actually be visible to the crew, but they simply were to try for a contextual mapping swath over this area, with ground observers then trying to locate it), S. Georgia/S. Sandwich (South Georgia Island is an arching, mountainous and glaciated island that lies about 860 miles ESE of the Falkland Islands. The South Sandwich Islands form a separate island group and are to the SE. Weather is marginal with the islands near the NW edge of an extensive cloud field. The crew was to try for detailed views of the glaciers on the north coast of South Georgia), and Patagonian Glaciers (ISS pass was near nadir over the central part of the Southern Patagonian Ice Field; the larger of two icefields in the southern Andes Mountains of Chile and Argentina. A strong cold front is moving through the region today and clearing from the W is expected tomorrow. As the station approached the coast from the SW just after midday, the crew was to shoot views and details of the less-photographed glaciers on the western flanks of the ice field).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography
**ISS Orbit** (as of this morning, 8:37am EST [= epoch]):
Mean altitude -- 339.2 km
Apogee height -- 339.8 km
Perigee height -- 338.7 km
Period -- 91.32 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000804
Solar Beta Angle -- 29.5 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 102 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51702

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST
12/08/07 -- STS-122/Atlantis/1E docking, ~1:15pm
  - 12/09 -- EVA-1 (Walheim/Schlegel), ~11:28am, 6.5h
  - 12/09 -- Columbus transfer & berthing @ Node-2, ~5:30pm
  - 12/10 -- Columbus ingress, ~5:08pm
  - 12/11 -- EVA-2 (Walheim/Schlegel), ~11:28am, 6.5h
  - 12/13 -- EVA-3 (Walheim/Love), ~10:25am, 6.5h
12/15/07 -- STS-122/Atlantis undocking, ~8:22am
12/17/07 -- STS-122/Atlantis landing ~12:29pm EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. Satellite on Redstone rocket) [Check it out at http://usspace50.com/]
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- **50th Birthday of NASA**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.

Upon wakeup, FE-1 Malenchenko terminated his third MBI-12 SONOKARD experiment session by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. [SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

Before breakfast, CDR Whitson, Malenchenko and FE-2 Tani performed the periodic Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (3rd for CDR & FE-1, 2nd for FE-2), using the IM mass measurement device which Malenchenko afterwards broke down for stowage. [Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]

Yuri also completed a 2-hr session of Part 1 of his first onboard “Profilaktika” (MBI-
8, “Countermeasures”) series of preventive health maintenance fitness testing, starting with the VELO stationary cycle ergometer. [Tomorrow (11/30), Yuri will do the second part of the test on the TVIS treadmill. Test procedure for MBI-8 is identical to the Russian MO-5 assessment, but in addition to the nominal protocol it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med Laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results were also called down to specialists standing by at TsUP.]

Peggy Whitson continued the daily servicing of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment on its second session, which yesterday included successful ground-commanded reprogramming of the ECU (Electronic Control Unit). [Today, the CDR reset the MSG WV (Microgravity Science Glovebox Work Volume) to its nominal configuration and opened the vent & vacuum valves to initiate the required vacuum draw on the sample chamber.]

The crew worked through the regular Fire OBT (on-board training), a mandatory periodic one-hour drill with the primary goal of providing the station residents with the most realistic emergency training possible, supported by ground specialist tagup. The drill is always conducted with the support of both MCCs in close coordination. [OBT objectives are to (a) practice fire response procedures (FRPs) and all incorporated actions for the case of a software-detected fire to locate, extinguish, and verify extinguishing attempts; (b) browse through RS laptop and the Signal-VM fire detection system displays as well as the automated software (algorithms) response to the fire event; (c) practice interaction/communication among the crew and with MCC necessary to perform emergency FRPs; and (d) update the locations of support hardware (CSA-CP compound specific analyzer-combustion products, PBA portable breathing apparatus, IPK-1M gas masks and OKR-1 fire extinguishers. Emergency procedures are documented in the EMER-1 and EMER-2 books. These exercises do not actually use any fire equipment but simulate such actions to the maximum extent possible. The OBT concluded with a 15-min. debrief with Russian/U.S. ground specialists via S-band at ~12:10pm EST.]

Afterwards, the crew also performed the mandatory 90-min. New Module Delta Emergency Procedure drill, intended to familiarize the station residents with the changes associated with the arrival of a new module, to be conducted not later than 7-10 days after berthing. [The OBT focused, among else, on identifying and memorizing the location of emergency equipment in Node-2 including hatches and passageways, and with changes to the emergency procedures associated with the
FE-2 Tani reconfigured the Lab THC CCAA (Temperature & Humidity Control Common Cabin Air Assembly) air conditioner, swapping it from its portside channel to the alternate system on the starboard side of the Lab, then switching the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) accordingly, i.e., from port to starboard. [The CCAA is a network of ducting that draws in the air through filters, delivers it for conditioning, and returns it to the modules. The swap-over between the CCAA channels is generally done by the crew once a month, with ground support, to dry out the heat exchanger of the deactivated side. MCC-H commands the required systems configurations for the dryout via S-band.]

After reviewing the video tape of their last (Thanksgiving Day) training session for the Shuttle RPM (R-bar Pitch Maneuver) picture-taking, Whitson and Malenchenko conducted another standard 30-min RPM imaging skill training, Peggy’s fourth, Yuri’s fifth, using DCS-760 digital still cameras in the Service Module (SM) to take photos of an Orbiter cut-out for practice, using the 400mm & 800mm telephoto lenses. [The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-122/1E next week. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]

Afterwards, Whitson worked with the DCS-760 still cameras, taking blank and white images with each camera to “clean” and calibrate the CCDs (Charge-Coupled Devices). The test photos were stored on a 1GB Microdrive PCMCIA and downlinked to MCC-Houston for determining which cameras will be used for the actual RPM activities.

In the Joint Airlock (A/L), the CDR continued the daily troubleshooting of the leaking UIA (Umbilical Interface Assembly)'s O₂ supply line by mating PHA (Prebreathe Hose Assembly) “Tee” connectors to one PHA port at a time, in order to determine which of them is leaking as well as what type of leakage that PHA port is experiencing. [Each setup takes about 5 min, followed by ~24 hours of unattended test.]
Dan Tani performed his fifth ICEPAC insertion in the MELFI (Minus Eighty-Degree Laboratory Freezer for ISS), retrieving two more -32 degC ICEPAC belts from stowage and placing them in Dewar 2/Tray C/Section 4 & Tray D/Section 4.  

*The reason the crew is currently performing several ICEPAC insertions is because the amount of warm mass that can be placed in a dewar at one time is limited by the allowable temperature rise. These activities are in preparation for the next Cold Bag packing, planned for STS-122/1E.*

Peggy Whitson conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies.  

*Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card, to be updated with today’s data, lists 26 CWCs ~1093 liters total for the four types of water identified on board: technical water (793.6 l, for Elektron, flushing, hygiene), potable water (221.3 l), condensate water (51.5 l), waste/EMU dump and other (26.6 l). Two CWCs (#1004 & #1081, ~89 l) with potable water have been put off limits due to the Wautersia bacteria found in sample analysis, the source of which is still not understood. Impact of losing this potable CWC is negligible since there are sufficient drinking water supplies onboard. Also currently not to be used are nine CWCs with technical water (~389 l).*

Malenchenko conducted the second recharging of the Motorola Iridium-9505A satellite phone brought up on Soyuz 15S, a monthly routine job.  

*After retrieving it from its location in the TMA-11/15S descent module (BO) at ~3:35am EST, Yuri initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~5:00am, the phone was returned inside its SSSP Iridium kit and stowed it back in the BO’s operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an “undershoot” ballistic reentry). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap.*

The FE-1 completed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables.  

*Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.*

Yuri also conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular
weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1/MBI-8).

Later, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The FE-2 transferred the video footage of yesterday’s TVIS workout from camcorder to VTR (Video Tape Recorder) for subsequent downlink to the ground via Ku-band, swapped tapes between VTR1 & VTR2 and then disassembled and stowed the video equipment.

In preparation for the upcoming EVAs during the STS-122 docked period, the CDR spent time in the A/L with her camcorder to record a video tour of the interior layout, for review by the 1E spacewalkers for their familiarization with current equipment locations, etc.

At ~3:50am, Yuri linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations. [Issues of discussion today included the stowage location of Elektron water samples collected on 11/23 and any vacant stowage spots in the FGB for cargo to be delivered on the next Progress (M-62/27P).]

At ~1:40pm, the crew will participate via S-band/audio phone patch in the traditional official plaque hanging in ISS Mission Control/Houston for the Mission 10A Plaque.

Afterwards, ~2:25pm, Peggy, Dan and Yuri will conduct their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G audio.

**PMA-2 Leak Test:** The PMA-2 (Pressurized Mating Adapter 2), now that it has been berthed to Node-2 Forward, was pressurized yesterday by the crew to 5 psia for a leak check and is currently still in the required 24-hour hold.

**CEO (Crew Earth Observation)** photo targets uplinked for today were **S. Georgia/S. Sandwich** (South Georgia Island is an arching, mountainous and glaciated island that lies about 860 miles ESE of the Falkland Islands. The South Sandwich Islands
form a separate island group and are to the SE. Weather satellite imagery suggested a clearing trend from the west by the time of this ISS pass, late in the morning. The crew was asked to try for detailed views of the glaciers on the north coast of South Georgia, right of track), and Patagonian Glaciers (ISS pass was near-nadir over the northern part of the Southern Patagonian Ice Field, the larger of two icefields in the southern Andes Mountains of Chile and Argentina. As the station approached the coast from the SW in late morning light, the crew was to look for views and details of the less-photographed glaciers on the northwestern and northern flanks of the ice field).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 8:16am EST [= epoch]):
Mean altitude -- 339.3 km
Apogee height -- 340.0 km
Perigee height -- 338.7 km
Period -- 91.32 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0000952
Solar Beta Angle -- 30.1 deg (magnitude peaking)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 102 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51686

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST
12/08/07 -- STS-122/Atlantis/1E docking, ~1:15pm
  - 12/09 -- EVA-1 (Walheim/Schlegel), ~11:28am, 6.5h
  - 12/09 -- Columbus transfer & berthing @ Node-2, ~5:30pm
  - 12/10 -- Columbus ingress, ~5:08pm
  - 12/11 -- EVA-2 (Walheim/Schlegel), ~11:28am, 6.5h
  - 12/13 -- EVA-3 (Walheim/Love), ~10:25am, 6.5h
12/15/07 -- STS-122/Atlantis undocking, ~8:22am
12/17/07 -- STS-122/Atlantis landing ~12:29pm EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket)** [Check it out at http://usspace50.com/]
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- **50th Birthday of NASA**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 11/28/07

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Dan Tani continued servicing the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment on its second session. [The FE-2 configured the hardware to allow the ground to perform ground commanding to the MLC (Microgravity Science Glovebox Laptop Computer) for diagnostic testing and to develop recovery steps for the ECU (Electronic Control Unit) to be reprogrammed correctly.]

FE-1 Yuri Malenchenko performed a thorough 2-hr. troubleshooting inspection & verification of the connections of the Russian segment’s Onboard Cabling System (BKS) to the FGB’s Thermal Control System (SOTR). [Using the Nikon D200 digital camera, Yuri documented the SOTR layout behind panel 215 and checked connector pins for dirt or misalignment.]

Later, Malenchenko prepared for the upcoming activation of the Russian/ESA BIO-3 experiment payload by conducting a search for a suitable PCMCIA (Portable Computer Memory Card International Adapter) storage card. [A new PCMCIA card is required for BIO-3 due to the loss of an earlier PCMCIA with BIOKIN, AT-Space and P-KINASE data. BIO-3, delivered on Soyuz 15S, is the latest in a series of ESA’s BIO payload system which makes use of the KUBIK incubator facility, currently the “facility of choice” for this program. BIO-1, delivered on 12S (March 2006) comprised six experiments that gave almost 100% of expected output. BIO-2 followed in the second half of 2006 as part of the ESA Astrolab mission aboard ISS, with the three experiments LEUKIN-2, BASE-A, and YING-A. In support of LEUKIN, new payload deliveries included the PGB (Portable Glovebox) for containment. The new BIO-3 will include three separate experiments. Development of BIO-4 is underway.]

After the overnight fine leak check of the Lab/Node-2 vestibule and Node-2 aft hatch interface, CDR Whitson spent about 20 min. on terminating the check,
Continuing Node-2 interior outfitting, Whitson then installed the IMV (Intermodular Ventilation) valve jumper in the vestibule, opened Harmony’s starboard hatch latches to their hardstop position to test the mechanism (hatch remaining safely closed due to pressure differential), and deployed two new SSCs (Station Support Computer) laptops in Node-2 (SSC-11 & SSC-12).

Also in Node-2, FE-2 Tani installed and checked out the CBCS (Centerline Berthing Camera System) at the starboard hatch in preparation for Columbus’ berthing during 1E, after rerouting the necessary power line from UOP-3 (Utility Outlet Panel 3) in Node-2 to a Y-cable disconnected from the failed UOP-1.  [The electronics extension cable from the CBCS was then disconnected to avoid its hatch dragthrough for safety.]

Peggy meanwhile worked in the Joint Airlock (A/L) on preparations for the 1E spacewalks, by –
- Removing LiOH (Lithium Hydroxide) CO₂ absorber cans #2016 & #2023 from EMUs (Extravehicular Mobility Units) #3018 & 3006,
- Plugging vent ports in the EMUs and capping the LiOH openings,
- Prepacking the used LiOH cans for return to Earth,
- Resizing EMU #3018 for Stan Love (EV3 on 1E),
- Continuing gathering EVA tools required during the spacewalks, and
- Checking out three PGTs (Pistol Grip Tools), replacing batteries as necessary.

Yuri Malenchenko inspected the KOV de-ionized water container (EDV), used for supplying water to the Elektron oxygen (O₂) generator for electrolysis, for bubbles and possible need for filling up with U.S. condensate from a CWC (Contingency Water Container).  [Air bubbles larger than ~10 mm in the water must be prevented from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

Afterwards, Yuri supported the ground’s reactivation of the Elektron O₂ generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating.  Yesterday, the FE-1 had installed an EMI (Electro-Magnetic Interference) filter on the Elektron’s current stabilizer (FPP ST-64).  [During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause...
overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.

Malenchenko set up the hardware and took a “refresher” course of the onboard “Profilaktika” (MBI-8, “Countermeasures”) preventive health maintenance fitness test, scheduled to start tomorrow and running through Friday. [Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med Laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP.]  

As part of his regular physical fitness evaluation, the FE-1 undertook the Russian MO-5 MedOps protocol of cardiovascular assessment during graded physical load on the VELO cycle ergometer, his first, assisted by his CDR as CMO (Crew Medical Officer). [The assessment uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. For the graded-load exercise, the subject works the pedals after a prescribed program at load settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]  

Dan Tani sampled the Node-2 atmosphere by collecting air samples with the MAS (Microbial Air Sampler) kit at mid-module and later also by using the SSK (Surface Sample Kit) for sampling at locations near air diffusers. [Bacterial and fungal air samples are usually taken at two locations in the module being checked. The colony growth on the MAS sampling slides is analyzed after five days of incubation in four Petri dishes. For onboard visual analysis of media slides from SSK (Surface Sampling Kit), the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]  

Yuri performed the periodic activation of the gas analyzer in the Soyuz TMA-11/15S, docked to the FGB Nadir port.  

Dan ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to
At ~1:05pm EST, Peggy and Yuri tagged up with ground specialists to discuss the downlinked imagery from their recent RPM (R-Bar Pitch Maneuver) photo/video operations.

Later today, at sleeptime, Malenchenko will start another data take with the new Russian MBI-12 SONOKARD (Sonocard) experiment, his fourth. [During sleep, Yuri will wear a shirt with the special SONOKARD device in the shirt pocket. The objectives of the experiment are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

The FE-1 completed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Yuri also conducted the daily IMS (Inventory Management System) maintenance again as a voluntary task from his “time permitting” discretionary task list, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Dan Tani’s treadmill workout was recorded by video camcorder for biomechanical assessment of the hardware status by ground engineers. Peggy and Yuri had their video sessions yesterday. Afterwards, the CDR transferred the footage from camcorder to VTR (Video Tape Recorder) for subsequent downlink to the ground via Ku-band.

Dan also copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done
six times a week).

At ~1:35pm, the FE-2 supported two live “crew choice” PAO TV interview exchanges with two stations in Chicago, WFLD-TV (Patrick Elwood) and WLS Radio (Jerry Agar).

**Array Deflection Test:** At ~1:08pm, MCC-H conducted a remote-commanded deflection test on U.S. solar arrays due to thermal dynamics during insolation & eclipse (orbital day & night). The Channel 1A array was parked for about 30 min., and video of the array motion was captured by MSS (Mobile Service System) cameras. No exercise was allowed during this time.

**Voluntary Weekend Science:** Five optional activities for the voluntary “Saturday Science” program for next weekend (12/2) were suggested to Peggy and Dan for their choice. Selection is required ASAP. [The five choices are: (1) SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), flying two & three satellites, requiring 2 video camcorders & 2 VTRs; (2) EPO (Educational Payload Operation) ISS Tour/Living Area Demo; (3) HRF 1 RIC (Human Research Facility 1 Rack Interface Controller) software load; (4) BCAT-3 (Binary Colloidal Alloy Test-3) Magnet Unstick, using the CGBA-4 (Commercial Generic Bioprocessing Apparatus-4), powered up 12 hrs before to initiate cooling; and (5) CGBA/CSI-02 (Commercial Generic Bioprocessing Apparatus Science Insert 2), sowing PDA (Plant Development Habitat) with new seeds]

**Node-2 ISL Router Installation:** “Ping” tests onboard and now also from the ground have shown that Dan Tani’s completion of ISL (Integrated Station LAN) installation in Node-2 yesterday was a success.

**CEO (Crew Earth Observation) photo targets uplinked for today were Heard Island (Heard Island is a bleak, uninhabited, and mountainous island located in the Southern Ocean; about two-thirds of the way from Madagascar to Antarctica. Its mountains are covered in glaciers and dominated by Mawson Peak, a 9,006 ft high complex volcano which forms part of the Big Ben massif. A long thin spit named “Elephant Spit” extends from the east of the island. ISS pass was just before midday with weather satellite imagery suggesting clearing from the west. Looking well right of track and using the long lens for details), Kerguelen (this glaciated and volcanic archipelago is located in the far south Indian Ocean nearly 2,000 miles SE of the island of Madagascar. Of primary interest is photography for monitoring of the rarely photographed ice field and glaciers located on the western end of the main island. ISS had a nadir pass approaching from the west in mid-afternoon light. Trying for a mapping pass of the western ice field), and S. Georgia/S. Sandwich (the South Georgia Island is an arching, mountainous and glaciated island that lies about 860 miles east-southeast of the Falkland Islands. The South
Sandwich Islands form a separate island group and are to the SE. Weather was marginal, but the crew was to try for detailed views of the glaciers on the north coast of South Georgia. ISS pass was in late morning, and the crew was to shoot well right of track).

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);  
http://earthobservatory.nasa.gov/  
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 8:08am EST [= epoch]):
Mean altitude -- 339.4 km  
Apogee height -- 340.2 km  
Perigee height -- 338.7 km  
Period -- 91.32 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.000106  
Solar Beta Angle -- 30.2 deg (magnitude peaking)  
Orbits per 24-hr. day -- 15.77  
Mean altitude loss in the last 24 hours -- 106 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 51670

Significant Events Ahead  (all dates Eastern Standard, some changes possible):
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST  
12/08/07 -- STS-122/Atlantis/1E docking, ~1:15pm  
  o 12/09 -- EVA-1 (Walheim/Schlegel), ~11:28am, 6.5h  
  o 12/09 -- Columbus transfer & berthing @ Node-2, ~5:30pm  
  o 12/10 -- Columbus ingress, ~5:08pm  
  o 12/11 -- EVA-2 (Walheim/Schlegel), ~11:28am, 6.5h  
  o 12/13 -- EVA-3 (Walheim/Love), ~10:25am, 6.5h  
12/15/07 -- STS-122/Atlantis undocking, ~8:22am  
12/17/07 -- STS-122/Atlantis landing  ~12:29pm EST  
12/22/07 -- Yuri Malenchenko’s Birthday  
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry  
12/23/07 -- Progress M-62/27P launch  
12/26/07 -- Progress M-62/27P docking (DC1)  
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket)  [Check it out at http://usspace50.com/]  
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, Dr. Whitson completed the last day of her 2nd session with the NASA/JSC experiment NUTRITION w/Repository (Peggy’s third session will be on her Flight Day 60). Today she collected another urine sample for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away.  [The current NUTRITION project expands the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

FE-1 Malenchenko worked several hours on the Service Module (SM)’s fire warning system, removing and replacing all ten SIGNAL-VM DS-7A smoke detectors, which were expired. The SIGNAL-VM system was deactivated from the ground beforehand and later turned on again.  [The ten DS-7A units were replaced last by Mikhail Tyurin and Mike Lopez-Alegria on 12/28/06 on Expedition 14.]

Later, Malenchenko performed outfitting on the Elektron O₂ (Oxygen) generator to improve its performance, by installing a new device -- an interference filter (FPP ST-64) -- between the Elektron Liquid Unit (BZh) and the associated Common Power Switching Unit (BSK) of the SUBA (Onboard Equipment Control System).  [SUBA controls, monitors, and diagnoses SM systems status. It operates using sensor output signals and command radio link SM functional outputs, onboard computer system (BVS) units, SM control panels, and system relay outputs. Its software resides in the SM central computer (TsVM) and terminal computer (TVM). The BSKs are used to switch electrical power and protect electrical circuits with fuses against overloads.]

A third maintenance task for Yuri in the Russian Segment (RS) was to check out the
cable of an air filter (A-2) in the FGB’s Fire Detection & Suppression System (SPOPT).

Dan Tani continued his servicing of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment on its second session.  [In Step 1, the FE-2 configured the MSG (Microgravity Science Glovebox) facility, closed the vacuum vent, checked for acceptable humidity levels, and opened the SPU (Sample Processing Unit) water valve to initiate unattended vacuum preparation. Later, in Step 2, he reset MSG, closed the water valve, again checked for acceptable humidity levels in the sample chamber, then opened the vent & vacuum valves to initiate the required vacuum draw on the sample chamber.]

Since the CDRA (Carbon Dioxide Removal Assembly) was deactivated overnight by the ground (9:25pm-2:25am) and LTL temperature setpoint raised to nominal, with cooling is no longer required, Peggy Whitson today disconnected the LTL (Low Temperature Loop) jumper of the ITCS (Internal Thermal Control System) from the CDRA rack.  [Cabin temperature in Node-2 was set to 21 degC.]

The CDR and FE-2 continued their interior outfitting of Node-2. With Harmony’s aft NPRV (Negative Pressure Relief Valve) already replaced (on 10/28) with an IMV (Intermodular Ventilation) valve, Tani today first subjected the Node’s IMV to a checkout, in particular the correct function of its aft port & starboard IMV valves and caution annunciations.

Afterwards, Peggy & Dan performed “plumbing” work on the “vestibule” space connecting Lab and Node-2 by installing O₂ and N₂ (Nitrogen) transfer jumpers.

Later, the CDR set up the Node-2/Lab vestibule for depressurization and leak checking, uncapping both PPRVs (Positive Pressure Relief Valves).  [Starting the outfitting with connecting the high-pressure O₂ jumper at the vestibule’s Node-2 side (to be followed later on 1E by the Lab-side connection plus purging and leak checking), the crewmembers then installed and connected the low-pressure O₂ & N₂ jumpers, finally purging the hoses. The purge-and-leak check activity on the O₂ lines was conducted remotely from MCC-H, first commanding the low-pressure O₂ supply valve closed to vent down the lines, then purging the vestibule O₂ jumpers, followed by a fine leak check, and concluding with reopening of the supply valve. The O₂ PBA (Portable Breathing Apparatus) ports were not available during that time.]

The FE-2 had 2 hrs. reserved for working in Node-2 to complete the task of connecting its ISL (Integrated Station LAN) Router, which he had started on 11/2
prior to Harmony’s relocation to the Lab front end. [The Payloads LAN connection is at the base of AV-3 (Avionics Rack 3, LAB1D2) where Clay Anderson on 9/12 had prepositioned two connectors. ISL is an upgraded onboard LAN (Local Area Network) utilizing Ethernet connectivity over the Router via cable or WAP (Wireless Access Point). JSL is the designation for the overall network, including IP (International Partner) hardware and integration, while ISL refers to specifically US hardware. JSL/ISL integrates all ISS “user” devices, eventually including RS docking video distribution, payload comm & downlink (from IP modules, e.g., Columbus or Kibo), crew operations, procedures viewing, email, IP phone, etc. JSL/ISL eliminates drag-through cables in hatches, will be up to ten times faster than the current OpsLAN, and has provisions for future modules.]

After the installation, Dan Tani printed out uplinked ISL port mapping labels, then used tape and a protective transparency to affix the sheet on a Node-2 rack cover next to the Lab ISL Interface Panel.

Whitson meanwhile set up the Node-2/Lab vestibule for depressurization & leak checking, uncapping both PPRVs (Positive Pressure Relief Valves).

The CDR spent 2.5 hrs in the Joint Airlock (A/L) gathering U.S. EVA tools in preparation for use during the 1E spacewalks by Walheim, Schlegel and Love. [Tool locations and stowage places of unused tools were uplinked in a matrix table listing stowage places of deployed and unused tools, a staging bag and an IV (Intravehicular) bag in the A/L CL (Crewlock), a tether staging area, and other A/L locations. The work included configuring a mesh bag for EVA-2 containing a round scoop, plus another mesh bag for EVA-3 with two handrails. EVA-1 preps were been done earlier.]

Peggy also continued the four-day troubleshooting of the leaking UIA (Umbilical Interface Assembly)’s O2 supply line in the A/L by mating PHA (Prebreathe Hose Assembly) “Tee” connectors to one PHA port at a time, in order to determine which of them is leaking as well as what type of leakage that PHA port is experiencing. [Each setup takes about 5 min, followed by several hours of unattended test.]

Additionally, Whitson terminated the discharge cycle on the second batch of EMU (Extravehicular Mobility Unit) batteries, controlled by an automated SSC (Station Support Computer)-based DOS application.

FE-2 Dan Tani conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister cords and accessory straps as well as the canister bolts for re-tightening if required.
Peggy Whitson also configured the video equipment in the SM for filming Yuri’s and her own subsequent TVIS workout, for biomechanical assessment of the hardware status by ground engineers. [Dan Tani’s TVIS video session is scheduled tomorrow. The footage from the three sessions will then be transferred from camcorder to VTR (Video Tape Recorder) for subsequent downlink to the ground when Ku-band is available.]

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Tani transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Malenchenko completed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables. [Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

The FE-1 also conducted the daily IMS (Inventory Management System) maintenance again as a voluntary task from his “time permitting” discretionary task list, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

CEO (Crew Earth Observation) photo targets uplinked for today were Heard Island (Heard Island is a bleak, uninhabited, and mountainous island located in the Southern Ocean; about two-thirds of the way from Madagascar to Antarctica. Its mountains are covered in glaciers and dominated by Mawson Peak, a 9,006 ft high complex volcano which forms part of the Big Ben massif. A long thin spit named "Elephant Spit" extends from the east of the island. ISS pass was just before midday with weather satellite imagery suggesting clearing from the west. Looking well right of track and using the long lens for details), and Acraman Impact Crater.
(this 590 million year old impact is located in the north central part of the Eyre Peninsula of southern Australia. It is approximately 90km in diameter and its basin includes several dry to partially dry lakes. Station pass was in late afternoon so the crew was to try for a short lens, nadir mapping strip over the target area).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 7:46am EST [= epoch]):
Mean altitude -- 339.6 km
Apogee height -- 340.3 km
Perigee height -- 338.8 km
Period -- 91.33 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001119
Solar Beta Angle -- 29.7 deg (magnitude increasing, to peak on 11/28 at 30.2 deg)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 115 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51654

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/28/07 -- ISS Reboost (SDMS taking data)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST
12/08/07 -- STS-122/Atlantis/1E docking, ~1:15pm
  ▪ 12/09 -- EVA-1 (Walheim/Schlegel), ~11:28am, 6.5h
  ▪ 12/09 -- Columbus transfer & berthing @ Node-2, ~5:30pm
  ▪ 12/10 -- Columbus ingress, ~5:08pm
  ▪ 12/11 -- EVA-2 (Walheim/Schlegel), ~11:28am, 6.5h
  ▪ 12/13 -- EVA-3 (Walheim/Love), ~10:25am, 6.5h
12/15/07 -- STS-122/Atlantis undocking, ~8:22am
12/17/07 -- STS-122/Atlantis landing  ~12:29pm EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)

05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/?/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 11/26/07

All ISS systems continue to function nominally, except those noted previously or below. Off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani. Underway: Week 6 of Increment 16.

Having passed the Day 30 mark in her flight, CDR-16 Whitson began her second session with the NASA/JSC experiment NUTRITION w/Repository, for which she had to forego exercising and food intake for eight hours. [After collecting an initial urine sample, Whitson, assisted by Dan Tani, followed it with phlebotomy, i.e., drawing blood samples (from an arm vein) which she first allowed to coagulate in the Repository, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned (see RC troubleshooting, below). The equipment was then stowed. NUTRITION activities today included the required 24-hour data urine collection by Whitson, by securing samples during the day, all stored immediately in MELFI. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing inflight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R +30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]
FE-1 Malenchenko performed troubleshooting on the Russian RS1 laptop, spending about an hour with specialist tagup-supported tests of battery and HDD (Hard Disk Drive) performance as well as a checkout of display parameters using the temporarily connected external AGAT monitor.

For today’s Voluntary Weekend Science program, FE-2 Tani had selected two optional activities: EPO (Education Payload Operations) demonstrating Newton’s Laws (Three Laws of Motion & Conservation of Angular Momentum); and HRF RC (Human Research Facility Refrigerated Centrifuge) troubleshooting, i.e., determining why the RC is not cooling and or supplying H&S (Health & Status) data.  

For the first activity, Dan reviewed the EPO protocol, then set up the camcorder for video recording his subsequent demos which provide a simple visual explanation of Newton’s Three Laws of Motion (EPO supports national science education standards, and the video will be used in museum and science center student and educator programs). For the second activity, Dan configured the RC, then conducted cooling and “ping” tests, after which the centrifuge was to be deconfigured, depending on the outcome of previous steps, and cleaned.

Later, Dan Tani set up and prepared the equipment for the second session with the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment, starting by supporting the ground-commanded activation of the MSG (Microgravity Science Glovebox), extending the WV (Work Volume) as required, starting and reprogramming the ECU (Electronic Control Unit), attaching the D/L Adapter and activating CSLM-2.

Afterwards, Tani disconnected the CSLM-2 D/L Adapter, retracted & secured MSG WV and powered down the MSG.

To allow troubleshooting of the UIA (Umbilical Interface Assembly)’s O₂ (oxygen) supply line in the U.S. Airlock (A/L), Peggy Whitson set up and mated the PHA (Prebreathe Hose Assembly) “Tee” connector to one of the PHA QDs (Quick Disconnects).

Later, the CDR terminated the discharge cycle on the first batch of EMU (Extravehicular Mobility Unit) batteries, and initiated it on the second batch, controlled by an automated SSC (Station Support Computer)-based DOS application. Peggy also finished up with the current regeneration of METOX (Metal Oxide) CO₂ filter canisters in the A/L bakeout oven.

Yuri Malenchenko completed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables. Regular daily SOZh maintenance consists, among else, of replacement of the KTO & KBO solid waste
The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Whitson transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off his voluntary “time permitting” task list, the FE-1 used the Nikon D1X digital camera with SIGMA 300-800mm telephoto lens to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON). [KPT-3 photography has been a frequent earth observing experiment for ECON.]

A second job item on Malenchenko’s discretionary list for today was another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X with 400 & 800 mm focal length lenses to take pictures of the impact of global warming on the planet’s ice cover. [Photo targets were the Patagonia Southern Ice Field Glaciers, icebergs in the Drake Passage and Scotia Sea, and South Georgia Island Glaciers.]

The CDR and FE-2 each had a PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Peggy at ~7:25am EST, Dan at ~10:15am.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:26am EST [= epoch]):
Mean altitude -- 339.7 km
Apogee height -- 340.5 km
Perigee height -- 338.9 km
Period -- 91.33 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001175
Solar Beta Angle -- 28.7 deg (magnitude increasing, to peak on 11/28 at 30.2 deg)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 116 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51638

Significant Events Ahead (all dates Eastern Standard, some changes possible):
11/28/07 -- ISS Reboost (SDMS taking data)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST

ISS On-Orbit Status 11/25/07

All ISS systems continue to function nominally, except those noted previously or below.  

The FE-1 started his day by recording post-EVA radiation readings from the Russian “Pille-MKS” dosimeters in the two spacesuits worn by Whitson & Tani during yesterday’s spacewalk and from one background dosimeter.  Measurements were logged in a table for subsequent downlink to the ground.

In the SM (Service Module), Malenchenko afterwards activated the Kenwood D700 amateur radio station and started the program for the Russian SHADOW-BEACON (Tenj-Mayak) experiment.  [Objective of the experiment is the automatic retranslation of time tag (pre-planned executable) packets from ground stations.  SHADOW (or ECLIPSE), sponsored by Roskosmos and its leading Moscow research organization TSNIIMASH (Central Research Institute of Machine Building), employs VHF amateur radio (ham) operators around the globe (via ARISS/Amateur Radio on ISS) to help in observing refraction/scattering effects in artificial plasmas using the method of RF (radio frequency) sounding in space experiments under different geophysical conditions.  This is the experiment’s second run, after Flight Engineer Mikhail Tyurin conducted it first on Expedition 14 in November 2006.]

The FE-2 meanwhile performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling CWC (Contingency Water Container) #1062 with the collected water slated for processing, and putting aside two water samples in sample bags for analysis.  [Estimated offload time before termination (leaving ~6 kg in the tank): ~20 min.  There is currently increased attention on water sampling after the discovery of some contaminated CWCs.  The identified contaminant, a common soil bacterium (unicellular organism) called Wautersia after Belgian microbiologist Georges Wauters, is no more critical than what is found often in faucet water on the ground or in farm soil.  Wautersia lives off
hydrogen & carbon dioxide, oxidizing \( H_2 \) and producing gaseous oxyhydrogen as energy for itself. Since it can turn sugar into a synthetic biodegradable fuel, it was seen for a short while as a promising long-term solution to the petroleum dependency, until it became clear that this “solution” would require gigantic amounts of expensive sugar.]

Working in the Airlock, Dan Tani & Peggy Whitson later recharged the water tanks of their EMU (Extravehicular Mobility Unit) backpacks, using the fresh water from CWC #1062 and dumping the remaining water from the suits into CWC #1059, after UIA (Umbilical Interface Assembly) capping & plugging. The LTAs (Lower Torso Assemblies) and HUTs (Hard Upper Torsos) were then reassembled.

The CDR initiated the 8-10 hrs. discharge process on the EMU batteries in the BSA (Battery Stowage Assembly). [This procedure, required prior to their use on the next spacewalk, consists of fully discharging and then recharging the storage units. The process, originally handled manually by a crewmember, is an automated procedure controlled from an A31p SSC (Station Support Computer) laptop with a special DOS application.]

Whitson also initiated and monitored the regeneration of METOX (Metal Oxide) CO\(_2\) filter canisters #0007 & #0011, used during the Campout.

At ~11:20am, spacewalk-specific activities concluded for today with a post-EVA debriefing conference between the crew and the ground via S-band audio.

Later, Peggy ingressed Node-2 after its isolation during the EVA, opening Harmony’s aft hatch, installing the caps on the Node-2 Stbd & Port PPRVs (Positive Pressure Relief Valves) and manually opening the Node-2 aft port IMV (Intermodular Ventilation) valve. Next step in Harmony was for Peggy to check out the Node’s C&W (Caution & Warning) panel, testing & verifying connectivities and reporting the “all clear” to MCC-H for further Node-2 activation steps from the ground.

Continuing the current round of monthly preventive maintenance of RS (Russian Segment) ventilation systems, Yuri Malenchenko cleaned the four “Group B” fan grills (VT1, VT2, VTK1, VTK2) in the SM.

Malenchenko also completed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Later, Yuri conducted the daily IMS (Inventory Management System) maintenance,
updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).- today as a voluntary task from his “time permitting” discretionary task list.

Working on the RBO MATRYOSHKA-R radiation monitoring payload in the DC1 (Docking Compartment), the FE-1 also completed the periodic collection and logging of accumulated data of its MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/display. [The reader automatically records radiation readings at strictly defined times (:00, :15, :30, :45 minutes). The complex Matryoshka payload suite is designed for sophisticated radiation studies. The payload collects radiation measurements every 15 minutes of each hour around the clock.]

The CDR unstowed and set up the NUTRITION with Repository hardware for the blood draw and urine collection part of her second session with the NUTRITION experiment, beginning tomorrow, requiring Dr. Whitson to forego exercising & food intake for eight hours, i.e., starting tonight. Urine sample collection begins tomorrow morning and continues for 24h, i.e., through Tuesday morning. [The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing in-flight samples (plus an additional postflight sample), made possible by the MELFI (Minus Eighty Degree Celsius Laboratory Freezer for ISS). Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status & nutrient requirements.]

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~8:35am, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.
At ~9:40am, the FE-2 had another PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

At ~2:25pm, Dan Tani conducted a crew discretionary conference via S- & Ku-band.

Later, at ~3:40pm, Yuri Malenchenko is scheduled to downlink a PAO TV message of greetings for replay on 12/7 at a special meeting by the Russian Federation State House commemorating the 50th anniversary of the formation of the Military & Industrial Commission, headed by Sergey Borisovich Ivanov, First Vice Prime Minister of the RF Government. [“…please accept our warm greetings on the 50th Anniversary of the Military & Industrial Commission! Over the past 50 years, the Military & Industrial Commission has made a major contribution to the defense & industrial potential of the USSR and subsequently of the Russian Federation…”]

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 8:37am EST [= epoch]):
Mean altitude -- 339.8 km
Apogee height -- 340.5 km
Perigee height -- 339.1 km
Period -- 91.33 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001079
Solar Beta Angle -- 27.2 deg (magnitude increasing, to peak on 11/28 at 30.2 deg)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 125 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51623

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/28/07 -- ISS Reboost (SDMS taking data)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/17/07 – STS-122/Atlantis landing ~12:29pm EST, or
12/18/07 -- STS-122/Atlantis landing ~11:27am EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket) [Check it out at http://usspace50.com/]
02/06/08 -- Progress M-61/26P undocking (DC1) & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
05/04/08 -- STS-124/Discovery/1J docking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at [http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
ISS On-Orbit Status 11/24/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- Stage EVA day for CDR Whitson, FE-1 Malenchenko, FE-2 Tani, and Node-2 Harmony is ready to accept Columbus!

EVA-12 “Charlie” was completed successfully in 7 hrs 4 min, accomplishing all objectives & get-ahead tasks. As a consequence, Node-2 Harmony was fully activated by the ground, one day earlier than originally planned, enabling interior activations by the crew tomorrow.

During the spacewalk, CDR Peggy Whitson (EV1) and FE-2 Dan Tani (EV2), supported by FE-1 Yuri Malenchenko as intravehicular (IV) crewmember, connected and configured the second half of the Node-2 fluid, power, and cooling jumpers (the first half was accomplished on EVA-11 “Bravo” on 11/20). Specifically, the spacewalkers -

- Removed the portside S0 truss NH3 (ammonia) shunt jumper;
- Configured vent tools, removed Node-2 fluid QD (quick disconnect) caps and vented & stowed the Port NH3 shunt jumper;
- Relocated an APFR (Articulating Portable Foot Restraint) from Lab WIF-11 (Worksite Interface Fixture 11) to Lab WIF-12;
- Relocated the 300 lbs (136 kg), 18.5 ft (5.6 m) Node-2 Loop B fluid tray to the Lab, attached it and deployed its hinged section;
- Mated S0 fluid QDs, then opened S0 valves and 2 fluid QDs;
- Connected two Node-2 fluid line heater cables;
- Connected five Stbd avionics cables to Node-2;
- Released Node-2 Stbd CBM (Common Berthing Mechanism) petal launch locks (8 latches);
- Released Node-2 Port CBM petal launch locks (8 latches) [Nadir CBM launch locks remaining closed at this time to prevent the unlatched petals from opening (due to lost pin)];
- Mated backup SSPTS (Station-to-Shuttle Power Transfer System)
umbilical (connector J16A) to PMA-2 (ctr P16)

- Installed Lab/Node-2 gap spanner between two handrails (Lab & Node 2);
- Removed Stbd SARJ (Solar Alpha Rotary Joint) Cover 7 and two MMOD shields for inspection & photography;
- Re-installed the CETA (Crew & Equipment Translation Aid) Light Fixture that had been temporarily moved out of the way; and
- Cleaned up a Lab MMOD (micrometeoroid/orbital debris) shield installed on an earlier EVA.]

[Official start time of the spacewalk was 4:50am EST, 70 minutes ahead of the timeline, ending at 11:54am. Total EVA duration (PET = Phase Elapsed Time) was 7h 4min. It was the 99th spacewalk for ISS assembly & maintenance and the 71st from the station (28 from Shuttle, 49 from Quest, 22 from Pirs) totaling 429h 7m, and the 3rd for Expedition 16 (totaling 21h 15m). After today's EVA, a total of 119 spacewalkers (88 NASA astronauts, 21 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 617h 29m outside the station on building, outfitting and servicing. It was also the 121st spacewalk by U.S. astronauts. The 100th EVA dedicated to ISS assembly & maintenance will be conducted in December by Rex Walheim & Hans Schlegel, crewmembers of the STS-122/1E mission that will feature two additional EVAs (by Walheim/Schlegel & Walheim/Love). ]

As a late-added task, Tani and Whitson inspected and photographed Bay 7 of the anomalous starboard (right-side) SARJ (Solar Alpha Rotary Joint). They reported metallic, magnetic contamination on the main gear bearing’s outboard angled race ring, similar to debris Dan saw in Bay 12 during his inspection on 10A EVA-2, as well as pitting and abrasions on the bearing race ring but not on the gear teeth themselves. [With the Bay 7 cover remaining removed (returned onboard in a bag), the stage is set for the IMMT (ISS Mission Management Team) to consider close-up video inspections of the damage site with the SSRMS (Space Station Remote Manipulator System) cameras.]

Prior to the spacewalk, FE-1 Malenchenko verified closure of the protective Lab window shutter.

Malenchenko also completed the pre-egress reconfiguration of the Russian STTS (onboard telephone/telegraph subsystem) to its EVA settings. After the crew’s return, Yuri reconfigured the STTS for nominal ops. [The "Voskhod-M" STTS enables telephone communications between the SM (Service Module), FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM’s outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel.]
Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]

During the spacewalk, Yuri provided IV support and prepared the DCS 760 camera setup for post-ingress photographing of the EVA gloves. CDR Whitson later downlinked the EVA imagery to the ground and reconfigured the DCS 760 for regular use (e.g., removing its thermal blanket).

The FE-1 also performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module). [Regular daily SOZh maintenance consists, among else, of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

After returning on board from outside, Whitson and Tani doffed the EMUs, after taking photographs of the gloves and overgloves while still pressurized. As part of post-EVA tasks, the spacewalkers also reported on size fit of their EMUs and components.

Later, Peggy and Dan are scheduled for another session of the standard Russian crew health-monitoring program's medical assessment MO-9/Biochemical Urinalysis, after which Yuri restowed the Urolux equipment. [MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).]

Additionally, both spacewalkers also had their regular post-EVA PMCs (Private Medical Conferences) with the ground.

**RPCM Failure:** The RPC-2 (Remote Power Controller 2) switch in RPCM (RPC Module) SO-1A-D powering the Node-2 ammonia (NH₃) umbilical survival heaters failed to close after two tries. If the cause is found to be a failed hybrid FET (Field Effect Transistor) as has been seen before, R&R (removal & replacement) of the RPCM is required. [These heaters are needed only if the NH₃ loop is shut down.]

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/

**ISS Orbit** (as of this morning, 8:16am EST [= epoch]):
Mean altitude -- 339.9 km
Apogee height -- 340.7 km
Perigee height -- 339.2 km
Period -- 91.33 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001107
Solar Beta Angle -- 25.1 deg (magnitude increasing, to peak on 11/28 at 30.2 deg)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 133 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51607

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/28/07 -- ISS Reboost (SDMS taking data)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:31pm EST
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/17/07 – STS-122/Atlantis landing ~12:29pm EST, **or**
12/18/07 -- STS-122/Atlantis landing ~11:27am EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket)** [Check it out at http://usspace50.com/]
02/06/08 -- Progress M-61/26P undocking (DC1) & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Yuri Malenchenko performed Part 2 of the ground-controlled test of the Russian data telemetry system’s MKO multiplex exchange channel, using BSR-TM payload data telemetry (TM) and the 4PrNP-6 data gathering application of the BITS2-12 Onboard Telemetry Measurement System. [The test, controlled from the RSS2 laptop, began 11/21 with Yuri switching from the regular 128-byte TM frame to a 206-byte format, for TsUP to run tests from RGS (Russian Ground Sites). Today, in Part 2 as per plan the FE-1 returned the BSR-TM to the nominal 128-byte format.]

Malenchenko also transferred measurements & imagery from the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) to OCA for subsequent downlink to the ground, after yesterday’s first repositioning of the spectrometer. [ALTCRISS uses the AST spectrometer to monitor space radiation in the Russian segment (RS).]

FE-2 Dan Tani started his workday with another 60-min of personal time for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Later, the CDR transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).
After the physical workout, CDR Whitson took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary.  

*Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.*

Dan Tani filled out the regular FFQ (Food Frequency Questionnaire), his third, on the MEC (Medical Equipment Computer).  

*By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. At TsUP/Moscow, food specialists are currently preparing the Russian food “menu” for delivery by Progress M-63/28P next February. 28P will carry “bonus food” for Peggy and Yuri, plus about 15 kg of fresh food items (apples, grapefruit, oranges, lemons, garlic) in two containers.*

The FE-1 collected the periodic water samples downstream of the BKO multifiltration/purification column unit, to be returned to the ground on STS-122/1E for monitoring the quality of the water being fed to the Elektron O₂ generator by the BKO.  

*The SRV-K2M Condensate Water Processor’s BKO column removes dissolved mineral and organic impurities from the condensate.*

Malenchenko also completed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables.

Later, Yuri conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).- again a voluntary task from his “time permitting” discretionary task list.

Working off the voluntary U.S. “job jar” task list, the CDR performed computer maintenance, doing the regular bi-weekly reboots of the SSC (Station Support Computer) File Server and OCA Comm Router laptops.

Spending time in the Airlock (A/L) for final preparations for EVA “Charlie”, Peggy
Whitson and Dan Tani –
  ● Configured the DCS-760 digital camera to be taken outside,
  ● Recharged one DCS battery for the EMU Prebreathe activity in the A/L (when off station power),
  ● Prepared the A/L EL (Airlock Equipment Lock) for the Campout & spacewalk,
  ● Tagged up with ground specialists at ~10:40am EST for reviewing EVA particulars, and
  ● Underwent the standard pre-EVA PMC (Private Medical Conference) via S- & Ku-band audio/video.

Also in the A/L, Peggy terminated the regeneration of METOX (Metal Oxide) canisters #0020 & #0021 in the bakeout oven.  

*The reusable METOX CO₂ absorbents will not be used in the EMUs for EVA-12, but in the A/L during tonight’s “Campout” lockout. During the spacewalk, CO₂ in the EMUs will be scrubbed with non-reusable LiOH (Lithium Hydroxide) canisters, with more “lifetime” than METOX cans, to protect against a possible timeline extension of EVA “Charlie” that - like EVA “Bravo” - is considered a “full” EVA. This means that all timeline content needs to be done in one EVA due to Node-2 Thermal Loop System shutdown timing. Also, working with ammonia (NH₃) fluid couplings could require additional time for decontamination procedures.*

Before the Campout, the CDR powered down onboard amateur (ham) radio equipment (Kenwood in SM, Ericsson in FGB) to prevent RF (radio frequency) interference with the EMUs.

Yuri again prepared three Russian “Pille-MKS” radiation dosimeters, recorded their dosages and equipped each of the two EMUs (Extravehicular Mobility Unit) with a radiation sensor (A0309/CDR & A0310/FE-2).  

* [A third sensor, A0308, was placed in the SM on the PULT reader for background readings.]*

At ~3:55am EST, Yuri linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.  

* [Issues of discussion today included the search for a “lost” cable of the Russian Agat-2 Audio & Video Complex, needed for the future.]*

At ~1:45pm, the crew is scheduled for their third weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio [S/G 2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].

At ~2:50pm EST, Whitson & Tani will begin their Campout mask prebreathe, lasting
until ~4:00pm and followed by hatch closure by Yuri and overnight lockout in the A/L at 10.2 psi for denitrogenation.

Before his sleep time, Malenchenko will again isolate the Node-2 for the EVA (after its ground-commanded deactivation at ~12:00pm), by uncapping Harmony’s Stbd & Port PPRVs (Positive Pressure Relief Valves), temporarily stowing the caps, closing the Node-2 Port IMV (Intermodal Ventilation) valve manually and closing Node-2 aft hatch.

**EVA-12 “Charlie” Preview:** After an 8.5-hr Campout sleep period on 10.2 psi, the A/L CL (Crewlock) hatch will be cracked for the usual hygiene break/with mask prebreathe. Afterwards, the hatch will be closed again by Yuri for EVA preparations at 10.2 psi, followed by EMU purge & prebreathe, then CL depressurization and EV1/EV2 egress. Tomorrow morning, EVA-12 begins nominally at ~5:55am EST, probably much earlier in real-time (knowing Peggy), with a 6h 30m timeline duration.

Dedicated to Part 2 of Node-2 outfitting (i.e., connecting & configuring the second half of Harmony’s fluid, power and cooling jumpers), its objectives are for Peggy & Dan to:

- **Remove the S0 truss NH₃ (ammonia) shunt jumper on Port;**
- **Configure vent tools;**
- **Remove Node-2 fluid QD (quick disconnect) caps;**
- **Vent & stow the Port NH₃ shunt jumper;**
- **Relocate an APFR (Articulating Portable Foot Restraint) from Lab WIF-11 (Worksite Interface Fixture 11) to Lab WIF-12;**
- **Relocate Node-2 Loop B fluid tray to the Lab & attach it;**
- **Deploy Node-2 Loop B fluid tray hinged section;**
- **Mate S0 fluid QDs, then open S0 valves and 2 fluid QDs;**
- **Connect two Node-2 fluid line heater cables;**
- **Connect five Node-2 Stbd avionics cables to Node-2;**
- **Release Node-2 Stbd CBM (Common Berthing Mechanism) petal launch locks (8 latches);**
- **Mate remaining SSPTS umbilical (connector J16A) to PMA-2 (connector; P16)**
- **Install Lab/Node-2 gap spanner on two handrails (Lab & Node 2); and**
- **Remove Stbd SARJ (Solar Alpha Rotary Joint) Cover 7, using PGT (Pistol Grip Tool) on its 6 bolds.**

**Get-ahead tasks are:**

- **Release Node-2 Port CBM petal launch locks (8 latches). [Nadir CBM launch locks remain closed at this time to prevent the unlatched petals from...**
opening (due to lost pin);
● Re-installation of CETA (Crew & Equipment Translation Aid) Light Fixture;
● Clean-up of Lab MMOD (micrometeoroid/orbital debris) shield.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 8:02am EST [= epoch]):
Mean altitude -- 340.0 km
Apogee height -- 340.8 km
Perigee height -- 339.3 km
Period -- 91.34 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001075
Solar Beta Angle -- 22.7 deg (magnitude increasing, to peak on 11/28 at 30.2 deg)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 139 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51591

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani)
11/28/07 -- ISS Reboost
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:41pm EST
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing  ~11:27am EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket)  [Check it out at http://usspace50.com/]
02/06/08 – Progress M-61/26P undocking (DC1) & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.  

Happy Thanksgiving -- on Earth & in Heaven (and in between)!

CDR Whitson & FE-1 Malenchenko started off on today’s light-duty schedule with another standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, Peggy’s third, Yuri’s fourth, using DCS-760 digital still cameras with 400 & 800mm lenses at Service Module (SM) windows 6 & 8 to take imagery of documented EO (Earth Observation) targets facing the velocity vector (i.e., in flight direction). Afterwards, Peggy downlinked the obtained images to the ground for analysis, to be discussed at a subsequent tagup.  

[The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-122/1E in December. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]

Afterwards, the FE-1 continued the current round of periodic preventive maintenance of cabin ventilation systems in the RS (Russian Segment), today cleaning “Group A” fan grilles in the SM.

The CDR conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of the continuing WDS (Water Delivery System) assessment of onboard water supplies.  

[Updated “cue cards” based on the crew’s water calldowns are sent up every other week. Analysis of samples of water transferred in CWCs from Discovery to ISS during 10A confirmed bacterial contamination in all containers transferred. Currently off-limit for crew use until further word are two CWCs with potable water and nine CWCs with technical water. Background: The identified contaminant, a common soil bacterium (unicellular organism) called Wautersia after Belgian microbiologist Georges Wauters, is no more critical than what is found often]
in faucet water on the ground or in farm soil. *Wautersia* lives off hydrogen & carbon dioxide, oxidizing $H_2$ and producing oxyhydrogen as energy for itself. Since it can turn sugar into a synthetic biodegradable fuel, it was seen for a short while as a promising long-term solution to the petroleum dependency, until it became clear that it would require gigantic amounts of expensive sugar.]

The FE-2 performed his fourth ICEPAC insertion in the MELFI (Minus Eighty-Degree Laboratory Freezer for ISS), retrieving two more -32 degC ICEPAC belts from stowage and placing them in Dewar 2/Tray B/Section 1 & Tray A/Section 4. *The reason the crew is performing several ICEPAC insertions this week is because the amount of warm mass that can be placed in a dewar at one time is limited. These activities are in preparation for the next Cold Bag packing, planned for STS-122/1E.*]

In the SM, Malenchenko conducted his first periodic repositioning of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) by changing the position of its AST spectrometer on panel 437 (90 deg rotation in its place to face in the Z- or upward direction) and swapping the AST’s PCMCIA (Portable Computer Memory Card International Adapter) storage card #936 with #937. The activity was photo-recorded, with imagery downlinked afterwards. *[ALTCRISS uses the AST spectrometer to monitor space radiation in the Russian segment (RS).]*

Continuing their preparations for the next spacewalk, EVA-12 “Charlie” on 11/24 (Saturday), EV1 Peggy Whitson & EV2 Dan Tani worked in the U.S. Airlock (A/L) where they –

- Readied EVA tools (including checking a tether for EV2),
- Recharged the EMU backpacks with water (EMU #3006 got a full water tank dump & recharge; #3018 had only its water supply recharged),
- Reviewed uplinked updated procedural material for the spacewalk (some tasks, including get-aheads, were added since yesterday, see below),
- Terminated regeneration of METOX (Metal Oxide) canister #0015 & #0019 in the A/L bakeout oven and started the process on canisters #0020 & #0021 [*the A/L, currently Dan Tani’s sleeping quarters, is staying within allowable ppCO$_2$ (Carbon Dioxide Partial Pressure) limits for Dan’s sleeptime*], and
- Terminated BSA (Battery Stowage Assembly) recharging of the EMU batteries used in EVA “Bravo”.

*Background: The regenerable METOX absorbers of CO$_2$ are currently not used in the EMUs but in the A/L during tomorrow night’s “Campout” lockout of Peggy &
Dan. During their spacewalk, CO₂ scrubbing in the EMUs will be handled by LiOH (Lithium Hydroxide) canisters, with more “lifetime” than METOX cans, to protect against possible timeline extension of EVA “Charlie” that - like EVA “Bravo” - is considered a "full" EVA. This means that all timeline content needs to be done in one EVA due to Node-2 Thermal Loop System shutdown timing. Also, working with ammonia (NH₃) fluid couplings could require additional time for decontamination procedures.]

FE-1 Malenchenko completed the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Yuri’s daily maintenance of the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur) today was a voluntary item on his “time permitting” discretionary task list.

The FE-1 used the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System) to take the periodic readings of potentially harmful contaminants in the SM. The hardware was then returned to initial stowage.  [The CMS, part of the Russian GANK-4M atmospheric analysis suite, uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip.]

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:35pm, the FE-2 is scheduled for another PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

Task items waiting for Whitson & Tani on their discretionary U.S. “job jar” list include -

(1) Work on BCAT-3 (Binary Colloidal Alloy Test-3, specifically remove
samples from the CGBA-4 (Commercial Generic Bioprocessing Apparatus-4) & unstick the mixing magnet, with photography;
(2) Relocating, in Node-2, the PS-120 (Power Strip) Junction Box from UOP-1 (Utility Outlet Panel 1) to the failed UOP-2; and
(3) Starting U.S. trash gathering for disposal in Progress M-61/26P, aided by an uplinked preliminary (pre-E1) list of items.

EVA “Charlie” Preview  [Update 11/22]:  EVA-12 on Saturday begins nominally at ~5:00AM EST, probably much earlier real-time (knowing Peggy), with a 6h 30m timeline. Dedicated to Part 2 of Node-2 outfitting (i.e., connecting & configuring the second half of Harmony’s fluid, power and cooling jumpers), its objectives are for Peggy Whitson & Dan Tani to:

- Remove the S0 truss NH₃ (ammonia) shunt jumper on Port;
- Configure vent tools;
- Remove Node-2 fluid QD (quick disconnect) caps;
- Vent & stow the Port NH₃ shunt jumper;
- Relocate an APFR (Articulating Portable Foot Restraint) from Lab WIF-11 (Worksite Interface Fixture 11) to Lab WIF-12;
- Relocate Node-2 Loop B fluid tray to the Lab & attach it;
- Deploy Node-2 Loop B fluid tray hinged section;
- Mate S0 fluid QDs, then open S0 valves and 2 fluid QDs;
- Connect two Node-2 fluid line heater cables;
- Connect five Node-2 Stbd avionics cables to Node-2;
- Release Node-2 Stbd CBM (Common Berthing Mechanism) petal launch locks (8 latches);
- Mate remaining SSPTS umbilical (connector J16A) to PMA-2 (connector; P16)  [New]
- Install Lab/Node-2 gap spanner on two handrails (Lab & Node 2); and (as get-ahead)
- Release Node-2 Port CBM petal launch locks (8 latches). [Nadir CBM launch locks remain closed at this time to prevent the unlatched petals from opening (due to lost pin);
- Remove Stbd SARJ (Solar Alpha Rotary Joint) Cover 7, using PGT (Pistol Grip Tool) on its 6 bolds.]  [New]

Newly added Get-ahead tasks are:

- Re-installation of CETA (Crew & Equipment Translation Aid) Light Fixture;
- Clean-up of Lab MMOD (micrometeoroid/orbital debris) shield.

Node-2 Checkout Status:  After crew ingress in Node-2 yesterday, ground controllers
successfully executed Part 1 of Node-2 Activation & Checkout. Powered on & verified were Node-2 connections to the MTL (Moderate Temperature Loop), ETCS (External Thermal Control System) Loop A, and EPS (Electrical Power System) Channel 1/4. It has been determined that Node-2 will remain activated during EVA-12, although its interior lighting and the functioning UOP (Utility Outlet Panel) will be turned off. 

Checkout of one string of the Node-2 EPS via activation of the DDCUs (DC-to-DC Converter Units) and RPCMs (Remote Power Control Modules) was successfully completed, as were the activations of the #1 MDM (Multiplexer/Demultiplexer) computer of Harmony and of the Node-2 MTL. CSA (Canadian Space Agency) Robotics successfully performed a brief SSRMS (Space Station Remote Manipulator System) base change to the Node-2 PDGF (Power and Data Grapple) to check out that connection, afterwards moving the robotarm back to the Lab PGDF to support EVA-12 viewing by its cameras. Node-2 Stbd & Port CBMs (Common Berthing Mechanisms) petals are properly latched so that the EVA-12 spacewalkers can remove their launch locks. The Nadir CBM, with petals unlatched because of the hatch pip pin lost in their mechanism, for the time being remains safed with launch locks engaged.

CEO (Crew Earth Observation) photo targets uplinked for today were Mount Nyiragongo (this is one of Africa’s most notable volcanic peaks and is located near the eastern border of the Democratic Republic of the Congo, just north of Lake Kivu, with much larger Lake Victoria well to the east. It is an active and dangerous volcano with steep slopes and extremely fluid lava flows. ISS pass was near nadir in mid-morning light. Frequent cloudiness makes this a challenging target, but the crew looked for landmarks and tried for long-lens, detailed views), Bosumtwi Impact Crater (this well-marked impact crater is located about 150 km west of the south end of Lake Volta in south central Ghana. It is a very young impact [just over a million years old], about 10.5 km in diameter, and almost completely filled by a lake. There are only a few images of this crater in the CEO database because the area is usually cloud and/or haze covered. On this early morning pass, as ISS approached the coast from the NW, the crew was to find Lake Volta and look just right of track), Kingman Reef, Central Pacific (Kingman Reef is a largely submerged, uninhabited tropical atoll located in the North Pacific Ocean, roughly half way between Hawaiian Islands and American Samoa. It is the northernmost of the Northern Line Islands and lies 65 km NNW of Palmyra Atoll, the next closest island. The total area within the rim of the reef, which has greater depths in the western part, is 60 km². There is just one small strip of dry land on the eastern rim, with an area of less than 0.01 km². The ISS pass was near nadir in early morning light, requiring long-lens settings for detail), and Palmyra Atoll, Central Pacific (Palmyra is one of the Northern Line Islands of the North Pacific Ocean and lies to the S-SE of Kingman Reef [previous CEO target]. This oddly shaped atoll has an area of 4.6 square miles [12 km²], and it consists of an extensive reef, two shallow lagoons, and some 50 sand and reef-rock islets and bars covered with vegetation with a small air strip on the north side. ISS pass was near nadir in early morning,
less than 10 seconds after Kingman).

CEO photography can be viewed and studied at the websites:

http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 9:07am EST [= epoch]):
Mean altitude -- 340.2 km  
Apogee height -- 341.2 km  
Perigee height -- 339.2 km  
Period -- 91.34 min.  
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.000151  
Solar Beta Angle -- 19.9 deg (magnitude increasing, to peak on 11/28 at 30.2 deg)
Orbits per 24-hr. day -- 15.76  
Mean altitude loss in the last 24 hours -- 125 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 51576

Significant Events Ahead  (all dates Eastern Standard, some changes possible):
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani)
11/28/07 -- ISS Reboost
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:41pm EST 
12/08/07 -- STS-122/Atlantis/1E docking 
12/15/07 -- STS-122/Atlantis undocking 
12/18/07 -- STS-122/Atlantis landing  ~11:27am EST 
12/22/07 -- Yuri Malenchenko’s Birthday
12/23/07 -- Progress M-62/27P launch 
12/26/07 -- Progress M-62/27P docking (DC1) 
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket)  [Check it out at http://usspace50.com/]
02/06/08 – Progress M-61/26P undocking (DC1) & reentry 
02/07/08 -- Progress M-63/28P launch 
02/09/08 -- Progress M-63/28P docking 
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking 
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- **50th Birthday of NASA**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

ISS On-Orbit Status 11/21/07

All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Yuri Malenchenko started his workday with Part 1 of a software test of the Russian data telemetry system’s MKO multiplex exchange channel, via BSR-TM payload data telemetry and the 4PrNP-6 data gathering application of the BITS2-12 Onboard Telemetry Measurement System. [The test, using the RSS2 laptop, consisted of switching from the regular 128-byte TM frame to a 206-byte format, for the ground to run tests overnight from RGS (Russian Ground Sites). Tomorrow, in Part 2 the FE-1 will reconfigure the BSR-TM back to 128-byte format.]

Afterwards, Malenchenko recorded the post-EVA radiation readings from the Russian EMU-worn plus one background “Pille-MKS” dosimeters in a log table for subsequent downlink to the ground.

Starting preparations of their next spacewalk, EVA-12 “Charlie” on 11/24 (Saturday), CDR Whitson and FE-2 Tani –
  ● Printed out the uplinked final version of EVA-12 procedures,
  ● Conducted a 2-hr. timeline & procedures review, joined by IV Malenchenko (see Preview, below), and
  ● At ~11:20am EST tagged up with ground specialists for a 45-min teleconference on spacewalk details via S- & Ku-band.

In the U.S. Airlock (A/L), Peggy and Dan then worked on their EMUs (Extravehicular Mobility Units), installing LiOH (Lithium Hydroxide) CO₂ absorption canisters, starting recharging the EMU batteries used in EVA “Bravo” and initiated the regeneration of METOX (Metal Oxide) canisters #0015 & #0019 in the A/L bakeout oven. [The A/L, currently Dan Tani’s sleeping quarters, is expected to stay within allowable ppCO₂ (Carbon Dioxide Partial Pressure) limits for Dan’s sleeptime.]
Peggy Whitson terminated Node-2 isolation maintained during the EVA by opening Harmony’s aft hatch, installing the caps, which Yuri set aside on 11/19, on the Node-2 Stbd & Port PPRVs (Positive Pressure Relief Valves) and manually opened the Node-2 aft port IMV (Intermodal Ventilation) valve.

The FE-1 performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables.

Malenchenko also conducted the periodic (weekly) job of checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the FGB-to-Soyuz tunnel and the FGB-to-Node-1 passageway.

Later, Yuri completed the daily maintenance of the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 performed his third ICEPAC insertion in the MELFI (Minus Eighty-Degree Laboratory Freezer for ISS), retrieving two more -32 degC ICEPAC belts from stowage and placing them in Dewar 2/Tray C/Sections 1 & 2. [The reason the crew is performing several ICEPAC insertions this week is because the amount of warm mass that can be placed in a dewar at one time is limited. These activities are in preparation for the next Cold Bag packing, planned for STS-122/1E.]

Tani also completed the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~7:20am EST, the crew convened for their weekly teleconference with ISS
Later, at ~12:45pm, Dan Tani held a 30-min. crew conference via Ku- & S-band with the next FE-2, Garrett Reisman, who will be his successor after arriving on STS-123 in February next year.  

**[Performed every other week, these 30-min. crew conferences are being included in the current station crew’s schedule to pass on the lessons learned to the upcoming Expedition Crew. The purpose is to begin the handover process prior to the arrival on orbit through Videocons and Data Exchanges between the current crew and the upcoming crew. These tagups usually start toward the end of the 1st month on orbit.]**

At ~3:15pm, the FE-2 is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

Working off his voluntary “time permitting” task list, Malenchenko took photographs of a QD (quick disconnect) screw clamp which has a spring missing. The snapshots were then transferred to OCA download files.

**Task items waiting for Whitson & Tani on their discretionary U.S. “job jar” list include**

1. Work on BCAT-3 (Binary Colloidal Alloy Test-3, specifically remove samples from the CGBA-4 (Commercial Generic Bioprocessing Apparatus-4) & unstick the mixing magnet, with photography;
2. Relocating, in Node-2, the PS-120 (Power Strip) Junction Box from UOP-1 (Utility Outlet Panel 1) to the failed UOP-2; and
3. Starting U.S. trash gathering for disposal in Progress M-61/26P, aided by an uplinked preliminary (pre-E1) list of items.

**Voluntary Weekend Science:**  Three optional activities for the voluntary “Weekend Science” program were suggested to Peggy and Dan for their upcoming off-duty day on 11/26 (Monday). Their selection is required by tonight.  

**[The three choices are: (1) EPO (Education Payload Operations) demonstrating Newton’s Laws (Three Laws of Motion & Conservation of Angular Momentum); (2) HRF RC (Human Research Facility Refrigerated Centrifuge) troubleshooting (determining why the RC is not supplying H&S (Health & Status) data); and (3) HRF-1 RIC (Rack interface Controller) software load (to enable powering up HRF Rack-1 PC (Portable Computer) via ground commanding and synchronizing the HRF Rack and PC time via ground commanding.]**

**EVA-12 “Charlie” Preview:**  EVA-12 on Saturday begins nominally at ~5:00AM EST, with a 6h 25m timeline. Dedicated to Part 2 of Node-2 outfitting (i.e., connecting & configuring the second half of Harmony’s fluid, power and cooling
jumper), its objectives are for Whitson and Tani to:

- Remove S0 truss NH3 (ammonia) shunt jumper on Port;
- Configure vent tools;
- Remove Node-2 fluid QD (quick disconnect) caps;
- Vent & stow the Port NH3 shunt jumper;
- Relocate an APFR (Articulating Portable Foot Restraint) from Lab WIF-11 (Worksite Interface Fixture 11) to Lab WIF-12;
- Relocate Node-2 Loop B fluid tray to Lab & attach it;
- Deploy Node-2 Loop B fluid tray hinged section;
- Mate S0 fluid QDs, then open S0 valves and 2 fluid QDs;
- Connect two Node-2 fluid line heater cables;
- Connect five Node-2 Stbd avionics cables to Node-2;
- Release Node-2 Stbd CBM (Common Berthing Mechanism) petal launch locks (8 latches);
- Install Lab/Node-2 gap spanner on two handrails (Lab & Node 2); and (as get-ahead)
- Release Node-2 Port CBM petal launch locks (8 latches). [Nadir CBM launch locks remain closed at this time to prevent the unlatched petals from opening.]

STS-122/Atlantis/E1 Mission/EVAs: The STS-122/Atlantis (1E) mission, expected to launch on 12/6, is baselined for 11+1+2 days and 3 scheduled EVAs. Inspection of the flawed SARJ (Solar Alpha Rotary Joint) is not one of the scheduled objectives but would be a get-ahead task for the crew on the third EVA if there is time left for it. If the 1E mission can be extended by two added docked days (i.e., 13+1+2), a fourth unscheduled EVA for dedicated SARJ work may be considered by the IMMT (ISS Mission Management Team).

CEO (Crew Earth Observation) photo targets uplinked for today were S. Mozambique (this target area is in the coastal plains of far southern Mozambique just north of the capital city of Maputo. Rapid development of this area is now being planned. To better monitor this change, CEO observers are seeking baseline, pre-development imagery. ISS approach was from the NW in mid-morning light. Fair weather was expected, and observers requested a nadir mapping strip of this area along the orbit track. There are very few strong landmarks or visual features to guide the photographer), Kerguelen (this glaciated and volcanic archipelago is located in the far south Indian Ocean nearly 2,000 miles SE of the island of Madagascar. Of primary interest is photography for monitoring of the rarely photographed ice field and glaciers located on the western end of the main island. ISS approach was from the W in mid-afternoon illumination. Using the long lens settings for a detailed, nadir mapping pass), and Patagonian Glaciers (the
Northern Patagonian Ice Field is the northernmost of two large remaining ice fields of South America, located in the Andes Mountains of southern Chile. It is also the world’s largest ice field so far from the poles. Looking just right of track on this fair-weather pass near midday. The crew was asked to try for detailed views of the glacier features, particularly on the western and northern margins.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:50am EST [= epoch]):
Mean altitude -- 340.3 km
Apogee height -- 341.2 km
Perigee height -- 339.4 km
Period -- 91.34 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001289
Solar Beta Angle -- 16.7 deg (magnitude increasing, to peak on 11/28)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 226 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51560

Significant Events Ahead (all dates Eastern Standard, some changes possible):
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani)
11/28/07 -- ISS Reboost
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:41pm EST
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing ~11:27am EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket) [Check it out at http://usspace50.com/]
02/06/08 – Progress M-61/26P undocking (DC1) & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
definition: 03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm

HAPPY THANKSGIVING!
Have a great & safe holiday!
All ISS systems continue to function nominally, except those noted previously or below. >>>Today 9 years ago, at Baikonur/Kazakhstan a Proton-K rocket (Flight 1A/R) launched the Khrunichev-built FGB (Funktsionalnyi-Grusovoi Blok) “Zarya” (Dawn), the first ISS element [see History Footnote, below.]<<

Crew sleep cycle: 1:00am – 4:30pm EST.

**EVA-11 “Bravo” was completed fully successfully** in 7 hrs 16 min, accomplishing all objectives plus several get-ahead tasks. During the spacewalk, CDR Peggy Whitson (EV1) and FE-2 Dan Tani (EV2), supported by FE-1 Yuri Malenchenko as intravehicular (IV) crewmember, connected and configured one half of the Node-2 fluid, power, and cooling jumpers. The other half will be done on EVA-12 “Charlie” on 11/24 (Saturday).

*Specifically, the spacewalkers -*
  - Removed the Stbd NH₃ (ammonia) shunt jumper;
  - Configured vent tools; then vented & stowed the NH₃ jumper;
  - Released Node-2 fluid caps, reconfigured P1 radiator SFUs (Squib Firing Units, fired on 11/9), and released the Node-2 Loop A fluid tray;
  - Relocated the Loop A fluid tray, then attached it, deployed/mated it, and vented N₂ (nitrogen) from it;
  - Mated & opened hinge QDs (Quick Disconnects), S0 fluid QDs, and Node-2 fluid QDs;
  - Connected 6 Node-2 fluid line heater cables;
  - Connected 11 Node-2 Port avionics cables to Node-2; and
  - Mated primary PMA-2/Node-2 umbilicals.

*In addition, accomplishing three get-ahead tasks, Peggy & Dan -*
  - Connected 5 stbd avionics umbilicals to Node-2;
  - Connected PMA-2 redundant umbilicals; and
  - Deployed SSPTS (Station-to-Shuttle Power Transfer System) cabling.
Official start time of the spacewalk was 5:10am EST, and it ended at 12:26pm. Total EVA duration (PET = Phase Elapsed Time) was 7h 16min. It was the 98th spacewalk for ISS assembly & maintenance and the 70th from the station (28 from Shuttle, 48 from Quest, 22 from Pirs) totaling 422h 3m. After today’s EVA, a total of 117 spacewalkers (86 NASA astronauts, 21 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 609h 27m outside the station on building, outfitting and servicing. It also was the 120th spacewalk by U.S. astronauts.

For safety, the spacewalkers had been advised to wear APMAs (Adjustable Protective Mitten Assemblies), i.e., overgloves, at their discretion. Inspection of the EMU gloves was required frequently during the EVA.

Prior to the spacewalk, FE-1 Malenchenko verified closure of the protective Lab window shutter. He also completed the pre-egress reconfiguration of the Russian onboard telephone/telegraph subsystem (STTS) to its EVA settings. After crew ingress, Yuri reconfigured the STTS for nominal ops. The "Voskhod-M" STTS enables telephone communications between the SM (Service Module), FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM’s outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.

During the spacewalk, Yuri prepared the DCS 760 camera setup for post-ingress photographing of the EVA gloves. CDR Whitson later downlinked the EVA imagery to the ground.

The FE-1 also performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. Regular daily SOZh maintenance consists, among else, of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.

After returning on board from the EVA, Peggy and Dan Yuri were scheduled for another session of the standard Russian crew health-monitoring program's medical assessment MO-9/Biochemical Urinalysis. Both spacewalkers also had their regular post-EVA PMCs (Private Medical Conferences) with the ground. MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro
diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).

STS-122/Atlantis/E1 Mission/EVAs: The STS-122/Atlantis (1E) mission, expected to launch on 12/6, is baselined for 11+1+2 days and 3 scheduled EVAs. Inspection of the flawed SARJ (Solar Alpha Rotary Joint) is not one of the scheduled objectives but would be a get-ahead task for the crew on the third EVA if there is time left for it. If the 1E mission can be extended by two added docked days (i.e., 13+1+2), a fourth unscheduled EVA for dedicated SARJ work may be considered by the IMMT (ISS Mission Management Team).

History Footnote -- Zarya’s 9th Anniversary: When the FGB was launched on 11/20/1998, our Russian partners had special reasons to choose this name for the first ISS element, which means "Dawn" (and not "Sunrise" as often reported in the US): When Yuri Gagarin flew into space in Vostok-1 on April 12, 1961, his radio call name was "Kedr" (=Cedar), while the code word for the main ground station was "Zarya", and Chief Designer Sergei Pavlovich Korolev's call sign was "Zarya-1". Later, when the Soviet Union launched their first space station, using the “TKS” spacecraft, its Khruunichev builders wanted to name it "Zarya" in Gagarin's and Korolev's honor, but word from "higher-up" changed it to "Salyut" (=Greeting). That's why Zarya was chosen for the ISS/FGB, to signify the dawn of a new era of international cooperation in space, while the old "space traditionalists" had the last laugh.

CEO (Crew Earth Observation) photo targets uplinked for today were Lake Chad (DYNAMIC EVENT: Lake Chad is a landmark feature of the Sahel region of north central Africa. Mostly dry now [sand dunes are exposed on the eastern side], the lake is a good indicator of climate and weather pattern shifts in the broad transition zone between savanna and desert. With the rainy season over, the crew was to try for contextual views of the lake level and vegetation patterns in the surrounding area. As ISS tracked SE-ward from the Sahara Desert in mid-morning, the target was well right of track), Bosumtwi Impact Crater (this well-marked impact crater is located about 150 km west of the south end of Lake Volta in south central Ghana. It is a very young impact [just over a million years old], about 10.5 km in diameter, and almost completely filled by a lake. There are only a few images of this crater in the CEO database because the area is usually cloud and/or haze covered. On this mid-morning pass, as ISS approached the coast from the NW, the crew was to find Lake Volta and look just right of track), and Jarvis Island, equatorial Pacific (Jarvis Island [formerly also known as Bunker Island] is an uninhabited 4.5 square kilometer coral island located in the South Pacific Ocean about one-half of the way from Hawaii to the Cook Islands. As the station approached from the NW in late morning sun, this trapezoid-shaped island was left of track.)
CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are
downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 8:28am EST [= epoch]):
Mean altitude -- 340.5 km
Apogee height -- 341.8 km
Perigee height -- 339.3 km
Period -- 91.34 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.000184
Solar Beta Angle -- 13.2 deg (magnitude increasing, to peak on 11/28)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 93 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51544

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani)
11/28/07 -- ISS Reboost
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite, ~4:41pm EST
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing  ~11:27am EST
12/22/07 -- Yuri Malenchenko’s Birthday
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. Satellite on Redstone rocket)** [Check it out at http://usspace50.com/]
02/06/08 – Progress M-61/26P undocking (DC1) & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 5 of Increment 16.

Before breakfast, CDR Peggy Whitson & FE-2 Dan Tani accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Peggy and Dan wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, currently as part of the crew’s discretionary “job jar” task list.]

Also before breakfast, in preparation for tomorrow’s EVA-11 “Bravo”, CDR Whitson, FE-1 Malenchenko and FE-2 Tani took the standard 15-min. pre-EVA session with the Russian crew health-monitoring program's medical assessment MO-9/ Biochemical Urinalysis. [MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).]

Yuri Malenchenko also completed the periodic (generally monthly) health test with the cardiological experiment PZEh MO-1 (“Study of the Bioelectric Activity of the Heart at Rest”) on the TVIS (Treadmill with Vibration Isolation System). [During the 30-min. test, the FE-1 tagged up with ground specialists on Russian ground site (RGS) passes via VHF (~12:23pm EST) and downlinked data from the Gamma-1M ECG (electrocardiograph) for about 5-6 minutes.]
Later, Yuri collected 10 Russian “Pille-MKS” radiation dosimeters from their nominal exposure locations, recorded their dosages and equipped Peggy’s and Dan’s EMU (Extravehicular Mobility Unit) with one dosimeter each (A0309/CDR & A0310/FE-2). [A third sensor, A0308, was placed in the SM (Service Module) on the PULT reader for background readings, and the others redeployed at their nominal locations in the SM and DC1.]

Also in preparation for the spacewalk, Peggy Whitson & Dan Tani –
- Configured one DCS-760 still camera for the EVA with the 28mm lens, leaving it connected to station power until tomorrow’s EMU Prebreathe activity,
- Initiated charging of one DCS battery, to take over from station power tomorrow,
- Installed LiOH CO₂ (Lithium Hydroxide Carbon Dioxide) absorber canisters in their EMU/spacesuits,
- Powered down onboard amateur (ham) radio equipment (Kenwood in SM, Ericsson in FGB) to prevent RF (radio frequency) interference with the EMUs,
- Prepared the A/L EL (Airlock Equipment Lock) for the Campout & spacewalk,
- Tagged up with ground specialists at ~10:35am EST for reviewing EVA particulars, and
- Before Campout underwent the standard pre-EVA PMC (Private Medical Conference) via S- & Ku-band audio/video.

After completing the EVA teleconference with MCC-H, Peggy (EV1) and Dan (EV2), were ready to begin their “campout” in the A/L, starting mask prebreathe at ~2:00pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi. Sleep time for the ISS crew begins at 4:30pm.

After the usual hygiene break/with mask prebreathe for Whitson and Tani at ~1:30am tomorrow morning after spending the night on 10.2 psi campout, the A/L hatch will be closed again by Malenchenko for EVA preps in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, with CL depressurization and EV1/EV2 egress, EVA-11 “Bravo” nominally begins tomorrow at ~6:00am EST (knowing Peggy, most likely earlier). Yuri will support the spacewalk as IV (Intravehicular) crewmember.

[EVA-11 is expected to last about 6h 40m. Its Node-2 Outfitting objectives are:
- Remove Stbd NH₃ (ammonia) Shunt Jumper;
- Configure Vent Tools;
- Vent & Stow the Stbd NH₃ Shunt Jumper;
- Release Node-2 Fluid Caps, reconfigure P1 radiator SFUs (Squib Firing
Units, fired today), and release Node-2 Loop A Fluid Tray;
● Relocate Node-2 Loop A Fluid Tray, then attach it, deploy/mate it, and vent $N_2$ (nitrogen) from it;
● Mate & open hinge QDs (Quick Disconnects), S0 Fluid QDs, and Node-2 Fluid QDs;
● Connect Node-2 Fluid Line Heater Cables;
● Connect Node-2 Port Avionics to Node-2; and
● Mate Primary PMA-2/Node-2 Umbilicals.

Potential get-ahead tasks, should there be time, are:
● Relocate $N_2$ VTE (Vent Tool Extender) bag for EVA-12 “Charlie”;
● Relocate APFR (Articulating Portable Foot Restraint) for EVA-12;
● Connect Stbd Avionics umbilicals to Node-2;
● Connect PMA-2 redundant umbilicals;
● Deploy SSPTS (Station-to-Shuttle Power Transfer System) cable; and
● Relocate APFR for 1E.

Prior to Campout lockout, FE-2 Tani serviced the MELFI (Minus Eighty-Degree Laboratory Freezer for ISS) with another ICEPAC insertion, by retrieving two -32 degC ICEPAC belts from stowage and placing them in a MELFI dewar. [The reason the crew is performing several ICEPAC insertions this week is because the amount of warm mass that can be placed in a dewar at one time is limited. These activities are in preparation for the next Cold Bag packing, planned for STS-122/1E.]

Yuri performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

The FE-1 also completed the daily maintenance of the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Following his support of Campout start, FE-1 Malenchenko, after verifying with MCC-H that IMV (Intermodular Ventilation) with Node-2 has been deactivated, is to uncap the Node-2 starboard & port PPRVs (Positive Pressure Relief Valves), shut the Node-2 aft port IMV valve and close Harmony’s aft hatch.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1,FE-2), RED resistive exerciser (CDR,
FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani transferred the crew's exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:30am EST, the crew supported a PAO TV interview exchange with WBBM Radio (Steve Grzanich) in Chicago, IL.

At ~1:35pm, Malenchenko downlinked via VHF a message of greetings to congratulate Major General Sergey Alexandrovich Derepko on his appointment as Chief of the Military Financial & Economic Academy. [“…Thank you for your support of our launch. I hope that the fruitful cooperation between Russian pilot-cosmonauts and the Military Financial & Economic Academy will continue.”]

Elektron Deactivation:  The station’s Elektron O₂ (oxygen) generator in the SM has been turned off in support of the EVA. TsUP/Moscow’s plan is to reactivate the electrolysis machine on 11/28. Meanwhile, the cabin atmosphere will be refreshed periodically with O₂ from Progress M-61/26P stores.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: 
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); 
http://earthobservatory.nasa.gov/ 
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 8:07am EST [= epoch]):
Mean altitude -- 340.6 km
Apogee height -- 341.7 km
Perigee height -- 339.6 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001545
Solar Beta Angle -- 9.5 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 106 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51528

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/20/07 -- US EVA-11 “Bravo” (Whitson/Tani)
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani)
11/28/07 -- ISS Reboost
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Yuri Malenchenko’s Birthday
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)** [Check it out at http://usspace50.com/]
02/06/08 -- Progress M-61/26P undocking (DC1) & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- **50th Birthday of NASA**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at
[http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
All ISS systems continue to function nominally, except those noted previously or below. Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani. Ahead: Week 5 of Increment 16.

The crew completed the mandatory CHeCS (Crew Health Care Systems) emergency/contingency medical OBT (on-board training) drill, a one-hour U.S. exercise designed to refresh crewmembers’ acuity in applying HMS (Health Maintenance System) equipment like ACLS (Advanced Cardio Life Support) in an emergency. [The drill gives the crew the opportunity to work as a team in resolving a simulated medical emergency onboard ISS and to refresh their memory of on-orbit stowage & deployment locations, equipment use, and procedures. Setting up (but not actually operating/manipulating) onboard equipment such as the RSP (Respiratory Support Pack), ALSP (Advanced Life Support Pack), intubation kit, HMS defibrillator, all stowed in the Lab CHeCS rack, and the CMRS (Crew Medical Restraint System), Peggy, Yuri and Dan stepped through the ACLS algorithm manual to resolve a simulated medical emergency onboard ISS. Objectives of the exercise include practicing communication and coordination necessary to perform medical emergency procedures, locating appropriate emergency medical components, and determining each crewmember’s individual method of delivering CPR (cardio-pulmonary resuscitation) in zero-G.]

Malenchenko continued the current round of monthly preventive maintenance/cleaning of Russian segment SOTR ventilation systems, today working in the SM. [The cleaning involved “Group C” fans and the heat exchanger (GZhT) grille of the currently inactive air conditioner (SKV1), plus the associated flexible air ducts.]

Whitson printed out the latest uplinked procedures material on this week’s Stage EVA-11 “Bravo” (11/20) and gathered the crew for another 2-hr review of EV1/EV2 timelines, procedures and constraints.

Afterwards, Peggy Whitson and Dan Tani had two more hours reserved for
preparing the EVA tools to be used by them on the spacewalk.

At ~10:10am EST, the crew also tagged up with ground specialists in a teleconference via S- and Ku-band, supported by the SSC-10 laptop, to go again through the EVA-11 procedures, particularly regarding ammonia decontamination. [After the standard A/L Campout tomorrow night, EVA-11 is expected to last about 6h 40m. Its Node-2 Outfitting objectives are:

- Remove Stbd NH₃ (ammonia) Shunt Jumper;
- Configure Vent Tools;
- Vent & Stow the Stbd NH₃ Shunt Jumper;
- Release Node-2 Fluid Caps, reconfigure P1 radiator SFUs (Squib Firing Units, fired today), and release Node-2 Loop A Fluid Tray;
- Relocate Node-2 Loop A Fluid Tray, then attach it, deploy/mate it, and vent N₂ (nitrogen) from it;
- Mate & open hinge QDs (Quick Disconnects), S0 Fluid QDs, and Node-2 Fluid QDs;
- Connect Node-2 Fluid Line Heater Cables;
- Connect Node-2 Port Avionics to Node-2; and
- Mate Primary PMA-2/Node-2 Umbilicals.

Potential get-ahead tasks are:

- Relocate N₂ VTE (Vent Tool Extender) bag for EVA-12 “Charlie”;
- Relocate APFR (Articulating Portable Foot Restraint) for EVA-12;
- Connect Stbd Avionics umbilicals to Node-2;
- Connect PMA-2 redundant umbilicals;
- Deploy SSPTS (Station-to-Shuttle Power Transfer System) cable; and
- Relocate APFR for 1E.

Also in preparation for the EVA, FE-2 Tani did some work on an EVA camera (#1019), removing the shutter release button of the camera’s thermal blanket and concluding with the standard sharp-edge inspection of the modified blanket configuration.

In the “Quest” Airlock (A/L), Dan finished the regeneration cycle on the METOX (Metal Oxide) CO₂ absorption canisters #0017 & #0019 in the bakeout oven started yesterday by Peggy, and later also terminated the recharging of EMU (Extravehicular Mobility Unit) batteries in the A/L BSA (Battery Stowage Assembly).

Yuri Malenchenko meanwhile performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). [Regular daily SOZh maintenance consists, among else, of checking the ASU
toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]

Afterwards, the FE-1 conducted the daily maintenance of the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The Russian Flight Engineer also set up the Russian equipment for tomorrow’s planned “Urolux” biochemical urine test (PZE MO-9), standard operating procedure for crewmembers before & after each EVA.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Tani transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Dan had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

At ~3:05pm EST, the FE-2 conducted his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

ISS Orbit (as of this morning, 7:44am EST [= epoch]):
Mean altitude -- 340.7 km
Apogee height -- 341.9 km
Perigee height -- 339.5 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001791
Solar Beta Angle -- 5.5 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 112 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51512

Significant Events Ahead (all dates Eastern Standard, some changes possible):
11/20/07 -- US EVA-11 “Bravo” (Whitson/Tani)
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani)
11/28/07 -- ISS Reboost
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Yuri Malenchenko’s Birthday
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket) [Check it out at http://usspace50.com/]
02/06/08 – Progress M-61/26P undocking (DC1) & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/01/08 -- 50th Birthday of NASA
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 11/17/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work.

After setting up the video camera gear for covering their CEVIS cycle ergometer workout, Peggy Whitson and Dan Tani activated the OUM-PFE (Oxygen Uptake Measurement - Periodic Fitness Evaluation) equipment at the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). Both crewmembers then completed the evaluation protocol, wearing HRMs (Heart Rate Monitors), with each one in turn acting as subject and operator, obtaining measurements on themselves on the CEVIS cycle ergometer. [The operations were documented with photo and video. Later, Peggy and Dan updated the evaluation protocol, deactivated & stowed the gear, including photo/video equipment, and powered down the OUM-PFE laptop. Purpose of OUM-PFE is to measure aerobic capacity during exercise within 14 days after arrival on ISS, and once monthly during routine PFEs. The data allows exercise physiologists & flight doctors to assess the crew’s health & fitness and to provide data for modifying & updating crew-specific exercise regimes. PFE-OUM is a collaborative effort between NASA and ESA (European Space Agency).]

In the Lab, the CDR performed the periodic inspection and cleaning of the FDS (Fire Detection & Suppression) system’s bacteria filter und SD (smoke detector).

Yuri Malenchenko worked at the SM CP (Service Module Central Post), swapping the RS1 A31p laptop with the RS3 A31p. After making the connections, the FE-1 conducted a test of the replacement.

Malenchenko & Whitson undertook another 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, Peggy’s second, Yuri’s third, using DCS-760 digital still cameras with 400 & 800mm lenses at SM windows 6 & 8 to take imagery of
documented EO (Earth Observation) targets. Today’s RPM training was scheduled to coincide with daylight ground tracks to support the EO shooting while practicing setting manual focus. Afterwards, Peggy downlinked the obtained images to the ground for analysis, to be discussed at a subsequent tagup. [The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-122/1E in December. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]

Using the vacuum cleaner and other tools, FE-2 Tani performed the periodic 80-min US segment (USOS) hatch seal inspection (Node-1 forward, aft & starboard, Lab aft & forward, Node-2 aft & forward, and Joint Airlock) in support of ACS (Atmospheric Control System) maintenance (last time done: 9/25).

CDR Whitson had about an hour scheduled to update and deploy US SODF (Station Operation Data File) Warning books, required after the recent Node-2 relocation and prior to Harmony’s activation. Updating consists of replacing page sections with new uplinked and printed-out material. [The three Node-2 Relocate/Activation Warning books are deployed in the SM, FGB, and Lab.]

In preparation for the upcoming Stage EVA-11 “Bravo” next week (11/20), the crew reviewed uplinked NH3 (ammonia) decontamination OBT (Onboard Training) material, followed by tagging up with ground specialists via Ku- & S-band to discuss procedural particulars. [EVA-11 will involve some handling of NH3 coolant gear (venting & stowing).]

Afterwards, Dan Tani started battery recharging for the EMU (Extravehicular Mobility Unit) spacesuits in the A/L BSA (Battery Stowage Assembly). [Since BC (Battery Charger) 1 is hard failed, the procedure uses only BCs 2, 3 & 4.]

Later, Peggy Whitson initiated METOX (Metal Oxide) CO2 absorption canister regeneration, after installing used canister #0017 & #0019 in the A/L bakeout oven.

Yuri performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

The crewmembers completed their regular 2.5-hr. physical workout program (about
half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR/with OUM, FE-2/with OUM), TVIS treadmill (FE-1, FE-2), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the FE-2 transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Dan had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

At ~7:05am EST, Yuri conducted his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

At ~8:50am, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

Working off the Russian voluntary task list, FE-1 Malenchenko used the Nikon D1X (SIGMA 300-800mm telephoto lens) to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON). [KPT-3 photography has been a frequent earth observing experiment for ECON.]

As a second discretionary task list item, Yuri completed another radiation data monitoring & logging session for flow & dose power data with the Matryoshka-R radiation payload and its LULIN-5 electronics box (accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel).

Task List Items: Among the items waiting for Whitson & Tani on their discretionary "job jar” list are two audits – of onboard CTBs (Cargo Transfer Bags) and the “stowage rack of the week”, currently the one at LAB1P5 -- using a new Audit function introduced with the implementation of the laptop-based IMS 2.0 version on Increment 15. [This function allows the user to setup audits of bags, kits, stowage locations, just about anything that is considered a container, via a special Audit window with a linked Object Properties window.]

Weekly Science Update (Expedition Sixteen -- 4th)
**ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):** Radiation measurements continue to be performed throughout the Increment 16.

**ANITA:** Completed.

**BCAT (Binary Colloidal Alloy Test):** Reserve.

**CARDIOCOG-2:** Completed.

**CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):** Reserve

**CFE (Capillary Flow Experiment):** “CFE ended with a bang! And it has been a fun and productive ride. CFE’s last (19th) experiment run in space, CFE-CL1, was conducted yesterday (11/16) by ISS CDR Peggy Whitson. The experiments were performed to round out CFE-CL experimental data that will serve as a benchmark for large scale capillary dynamics pertinent to fuels/cryogen/water management systems on spacecraft. Difficulties were encountered early when attempting to reset the experiment for subsequent runs, requiring Peggy to impart large disturbances to the test vessel to clear liquid from a pinning lip. It was not known by the science and engineering team how difficult this procedure would be for this container a priori. Despite the difficulties encountered, Peggy was successful in resetting the experiment at least three times after which successful data sets were collected each time. It cannot be overemphasized that all disturbances imparted to the container and/or MWA (Maintenance Work Area) by Peggy within the field of view of the camera produced new quantitative data extending our database and providing truly complex phenomena to test our numerical predictions. We wish to especially thank her and all of NASA in the air and ground for the fun and data. You will like our results when we publish!”

**CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus):** In progress.

**CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):** Complete.

**CSLM-2 (Coarsening in Solid-Liquid Mixtures 2):** Planned.

**EarthKAM (Earth Knowledge Acquired by Middle School Students):** Complete.

**ETD (Eye Tracking Device):** In progress.

**Integrated Immune:** In progress.
LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Since last report on 11/08, all the ECs (Experiment Containers) have been dried out in view of the experiment termination. MULTIGEN-1 Containers have been removed from EMCS European Modular Cultivation System) on 11/15. Reference ECs have been inserted in the EMCS, and the final dry out is under way. The EMCS Facility was switched off on 11/15.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress (CDR); Reserve (FE-2).

PMDIS (Perceptual Motor Deficits in Space): Complete.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Peggy, thanks for the quick turnaround in initializing another Actiwatch and completing your SLEEP logs off the task list. If the missing watch is found, the activity on the Task List will be to download three Actiwatches and initialize two. Additional SLEEP logging is above and beyond and greatly appreciated by the PI, however only the weeks with a targeted sleep differential will be on the Task List at this time. -- Dan, as you requested, we would like to remind you that your SLEEP logs have been added as a task list item. Only three weeks of SLEEP logging is required of continuous logging during varying weeks of sleep shifting to count as a SLEEP subject. Additional SLEEP logging is above and beyond and greatly appreciated by the PI, however only the weeks with a targeted sleep differential will be on the Task List at this time.”

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): “Dan, the SPHERES team salutes you for your time and great effort this morning. The Group A Test 2 ran perfectly and a lot of the other data will allow for fine tuning satellite controllers. The 'attached satellite' tests use state-of-the-art algorithms, and they will require a substantial amount of data to succeed. We are look forward
to future operations that will focus on formation and docking tests. We expect that these will not only collect useful data, but also be visually amazing."

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** In progress.

**TRAC (Test of Reaction & Adaptation Capabilities):** Planned.

**CEO (Crew Earth Observations):** Through 11/13 the ground has received a total of 1,367 CEO images for review and cataloging for Increment 16. Observers are pleased to report a target acquisition success on their first day’s target list (11/8). The crew had some success in acquiring useful imagery of the Toshka Lakes, Egypt site. Most new crews take some time to settle in and usually take a couple of weeks before observers see any hits from their target requests. “Thanks for your prompt, enthusiastic startup of our payload! Nearly two-thirds of your imagery so far has been acquired with the long lens settings and most of it has good focus. It appears that we can begin sooner making target requests using these settings.”

**CEO (Crew Earth Observation) photo targets uplinked for today were Ouarkziz Impact Crater** (Ouarkziz is a relatively "young" impact crater, dated at 70 million years. The crater is 3.5 km in diameter and is located in the Atlas Mountains of western Algeria near the border with Morocco. As ISS crossed the Atlas Mountains from the NW in mid-morning sun, the crew was to shoot just left of track for the impact in folded rocks near the south side of the E-W mountain range), **Gulf of Fonseca** (observers are monitoring the rapid coastal development around this area shared by the three Central American countries of El Salvador, Honduras, and Nicaragua. ISS approach was from the NW along the Pacific side of Central America for a nadir pass with mid-morning lighting conditions. Looking for the landmark feature, the Consiguina Volcano on the south side of the gulf, and mapping the coastal margins and the sediment plumes for this area), and **Pilcomayo River dynamics, Northern Argentina** (this dynamic river issues from the Andes Mountains to the W and then breaks SE-ward across the Chaco Plain forming part of the border between Argentina and Paraguay. Overlapping frames were requested to document the current channel and riverbank morphology for comparison to historical imagery. After crossing the Andes from the NW in midday sun, the crew was to look right of track for the bright sandbars of the river as it leaves the mountains. Mapping the area from NW to SE until the river dissipates a megafan on the Chaco Plain).

CEO photography can be viewed and studied at the websites:
[http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
[http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/)
ISS Orbit (as of this morning, 8:41am EST [= epoch]):
Mean altitude -- 340.8 km
Apogee height -- 342.0 km
Perigee height -- 339.7 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001703
Solar Beta Angle -- -1.4 deg (magnitude bottoming out)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 137 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51497

Significant Events Ahead (all dates Eastern Standard, some changes possible):
11/20/07 -- US EVA-11 “Bravo” (Whitson/Tani)
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani)
11/28/07 -- ISS Reboost
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Yuri Malenchenko's Birthday
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)** [Check it out at http://usspace50.com/]
02/06/08 -- Progress M-61/26P undocking (DC1) & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/01/08 -- Progress M-62/27P undocking (DC1) & reentry
03/06/08 -- ATV-1 docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.

10/01/08 -- **50th Birthday of NASA**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.

The crew conducted the regular weekly three-hour task of thorough station cleaning. ["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

As part of the house cleaning, FE-1 Malenchenko performed preventive maintenance cleaning on the V3 fan screen in the DC1 (Docking Compartment) and on the VPkhO, VdPrK, VPrK and TsV2 fan grilles in the FGB (Funktsionalnyi-Grusovoi Blok).

In preparation for the first data collection session with the CEVIS-based OUM-PFE (Oxygen Uptake Measurement-Periodic Fitness Evaluation) by Whitson & Tani scheduled tomorrow, the CDR broke out and set up the OUM-PFE gear on the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). [The OUM-PFE experiment, which uses the CEVIS cycle ergometer, demonstrates crewmembers’ capability to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during long-duration space flight.]
After a 15-min familiarization review of reference material, FE-2 Dan Tani had 2.5 hrs reserved for his first test session with the payload SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites). In support of this important experiment, the ground yesterday activated CDRA (Carbon Dioxide Removal Assembly). [The SPHERES experiment is a test bed for the development and testing of formation flying and other multi-spacecraft control algorithms. SPHERES, done first by FE-1 Jeff Williams on Expedition 13, serves to mature autonomous satellite formation flight, rendezvous and docking algorithms in a long duration, microgravity environment. Dan set up the Work Area, dimmed GLAs (General Luminaire Assemblies), programmed & deployed two & three gas-propelled satellites (orange, red, blue), with five beacons, and used two PD-100 camcorders for video capture. Per applicable Flight Rule, SPHERES operations have no CO₂ (Carbon Dioxide) output constraints if the CDRA (CO₂ Removal Assembly) is operating in dual-bed or single-bed mode. Should CDRA not work properly, ECLSS (Environmental Control & Life Support System) engineers will assess the ppCO₂ flight rule requirement. The experiment run was time-critical since Ku-band is required for real-time video downlink.]

Also in the “station onboard science research” regime, Dr. Whitson set up the CFE (Capillary Flow Experiments) payload, i.e., unstowing hardware, preparing the Lab MWA (Maintenance Work Area), securing CFE gear on the MWA surface and positioning the camcorder. Afterwards, Peggy conducted a ~2 hrs single-block test run of the CFE-CL1 (Contact Line 1) experiment and later tore down & restowed the hardware.

Peggy and Dan completed their first run with the MedOps WinSCAT (Spaceflight Cognitive Assessment Tool) experiment by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. [WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]

Yuri Malenchenko performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]

The crewmembers completed their regular 2.5-hr. physical workout program (about
half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani transferred the crew’s exercise data file to the MEC for downlink.

At ~1:35pm EST, the crew held their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio [S/G 2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].

At ~4:00pm, Yuri Malenchenko is scheduled for a PAO TV downlink to TsUP/Moscov as part of “Space Era Anniversary” features, today in support of the first talk show project “Great Ukrainians” on Channel INTER TV. [Talk show guests include General Director of NKAU/Ukrainian National Space Agency Yuri Alekseev, the first Ukrainian Cosmonaut, Leonid Kadeniuk and the great-grandson of Konstantin E. Tsiovkovsky, Sergey Samburov. Yuri will be answering a number of questions (“Do you perceive yourself as a Ukrainian?”; “Which Ukrainian do you consider to be great?”). Note: Great Ukrainians in the field of spaceflight also include Sergey P. Korolev, M.K. Yangel, and others.]

Plaque Hanging: At 12:50-1:15pm EST, the traditional official plaque hanging took place in ISS Mission Control/Houston for the Increment 15 Plaque.

Russian Solar Array Efficiency Test: At 6:40pm-10:00pm EST, during crew sleep, TsUP/Moscow is scheduled to conduct the periodic SM Solar Array Efficiency Testing. No ISS attitude change from the current +XVV (X-axis in Velocity Vector) will be necessary. [If SNT (Voltage & Current Stabilizer) powerdown between USOS & RS is required, it will be a real-time call.]

Task List Items: Among the items waiting for Whitson & Tani on their discretionary “job jar” list are two audits – of onboard CTBs (Cargo Transfer Bags) and the “stowage rack of the week”, currently the one at LAB1P5 -- using a new Audit function introduced with the implementation of the laptop-based IMS 2.0 version on Increment 15. [This function allows the user to setup audits of bags, kits, stowage locations, just about anything that is considered a container, via a special Audit window with a linked Object Properties window.]

CEO (Crew Earth Observation) photo targets uplinked for today were Afar Rift Zone, Ethiopia (this target is located at the northern end of the Great Rift Valley System of east Africa, just inland from the southern end of the Red Sea. In recent years, this region has become increasingly seismically active leading geologists to believe that major visible changes, with potential sea flooding, are possible in the
Observers are monitoring this area for landscape changes in water bodies, fault lines, and volcanic activity. On this late morning pass the crew tried for a nadir mapping strip from NW to SE, Tin Bider Impact Crater (this 70-million year old impact site is located in central Algeria just south of the extensive sand sea known as the Grand Erg Oriental. On this pass in mid-morning sun the target was just left of track. Since the crater itself is just 6-km in diameter, requested were only context views this time. As ISS approached from the NW, the crew was to locate the southern end of the Erg and try for views of the plateau just to the south), Mississippi Delta Region (this classic, “bird’s foot”, river delta system is a prominent and dynamic feature of the northern Gulf of Mexico. A cold front has just passed, skies should have been clear, and tides were low on this mid-morning pass. As ISS tracked SE-ward across Louisiana, the crew was to locate the Mississippi River and then try mapping the delta area, especially the more dynamic southwestern flank), Volcán de Colima (the Colima volcanic complex is the most prominent volcanic center of the western Mexican Volcanic Belt. It consists of two distinctive volcanoes, Nevado de Colima [the 4320-m-high point of the complex] on the north and the 3850-m-high historically active Volcán de Colima at the south. Weather looked excellent and the view from the station was near nadir, so the crew tried for a long lens view of structural details of this feature. ISS approach was from the NW, over the Mexican coast in mid-morning), and Honolulu, HI (CREW REQUEST: This may have been one of the last opportunities for the crew to find the Hawaiian Islands in adequate light for the next several weeks. Oahu was well right of track to the SW. There probably was some fair weather cumulus at mid-morning. However, with the long lens settings the crew may still have obtained decent detail of Honolulu).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit (as of this morning, 8:36am EST [= epoch]):**
Mean altitude -- 341.0 km
Apogee height -- 341.9 km
Perigee height -- 340.0 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001414
Solar Beta Angle -- -2.9 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 155 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51481

**Significant Events Ahead (all dates Eastern Standard, some changes possible):**
11/20/07 -- US EVA-11 “Bravo” (Whitson/Tani)
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani)

12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket) [Check it out at http://usspace50.com/]
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.

After wakeup and before breakfast, CDR Peggy Whitson & FE-2 Dan Tani accessed the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink.  [To monitor the crewmember’s sleep/wake patterns and light exposure, Peggy and Dan wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition.  The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]

FE-1 Yuri Malenchenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated at ~3:55pm EST.  [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]

Malenchenko & Whitson undertook the standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, Peggy’s first, Yuri’s second, using DCS-760 digital still cameras with 400 & 800mm lenses at Service Module (SM) windows 6 & 8 to take imagery of documented CEO Earth targets facing the velocity vector (i.e., in flight direction). Afterwards, Peggy downlinked the obtained images to the ground for analysis, to be discussed at a subsequent tagup.  [The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-122/1E in December.  During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment.  Thus, time available for the shooting will be very limited,
requiring great coordination between the two headset-equipped photographers and the Shuttle.]

The FE-2 worked on the EMCS (European Modular Cultivation System) facility, removing MULTIGEN-1 (Molecular & Plant Physiological Analyses of the Microgravity Effects on Multigenerations of Arabidopsis thaliana) experiment containers from the rotors, as MULTIGEN-1 has reached the end of its 75-day run. [MULTIGEN was activated on 8/25. This ESA experiment evaluates the morphology of A. thaliana over three generations. The plants grown in EMCS are the First Generation of A. thaliana to be grown on ISS. A. thaliana, commonly know as Thale Cress, is a model organism to study genetic morphological events since its genome has been mapped and is widely used in genetic and molecular research. MULTIGEN studies the morphological and genetic effects of microgravity on plants, which will be grown to maturity (7-8 weeks) and then dried and stored for return to Earth. Some of the seeds that are returned will be used in ground studies and others will be returned to ISS for the Second Generation of growth. The Second Generation’s seeds will be analyzed genetically and also used for a Third Generation of plants on ISS. Ultimately, the data collected from this multigenerational experiment could be applied to future agriculture endeavors for long-duration space flight.]

The CDR and FE-2 spent ~40 min in the U.S. Airlock (A/L), successfully completing the standard water recharge of the EMUs (Extravehicular Mobility Units) used by her and Yuri during the recent EVA-10 “Alpha”. [The MIB (Mishap Investigation Board) that evaluated the results from the chamber EMU inspection -- after a “smell of smoke” was noticed in a SSATA (Space Station Airlock Test Article) chamber on 11/9 -- has cleared the on-orbit suits for the normal EMU water recharge (the original Flight Rule limit of 48 hrs for post-EVA recharge was extended to 7 days). The EMUs have the Go for spacewalk use.]

Afterwards, the crew had two hours for reviewing the latest uplinked EVA procedures material and crib sheets, particularly on ammonia decontamination, of the upcoming spacewalk, EVA-11 “Bravo” on 11/20 (next Tuesday), followed by a teleconference with ground personnel to discuss details. [After the standard A/L Campout Monday night, EVA-11 is expected to last about 6h 40m. Its Node-2 Outfitting objectives are:

- Remove Stbd NH₃ (ammonia) Shunt Jumper;
- Configure Vent Tools;
- Vent & Stow the Stbd NH₃ Shunt Jumper;
- Release Node-2 Fluid Caps, reconfigure P1 radiator SFUs (Squib Firing Units, fired today), and release Node-2 Loop A Fluid Tray;
- Relocate Node-2 Loop A Fluid Tray, then attach it, deploy/mate it, and vent]
\( \text{N}_2 \) (nitrogen) from it;

- Mate & open hinge QDs (Quick Disconnects), S0 Fluid QDs, and Node-2 Fluid QDs;
- Connect Node-2 Fluid Line Heater Cables;
- Connect Node-2 Port Avionics to Node-2; and
- Mate Primary PMA-2/Node-2 Umbilicals.

Potential get-ahead tasks are:

- Relocate \( \text{N}_2 \) VTE (Vent Tool Extender) bag for EVA-12 “Charlie”;
- Relocate APFR (Articulating Portable Foot Restraint) for EVA-12;
- Connect Stbd Avionics umbilicals to Node-2;
- Connect PMA-2 redundant umbilicals;
- Deploy SSPTS (Station-to-Shuttle Power Transfer System) cable; and
- Relocate APFR for 1E.

Continuing the interior outfitting of Node-2, Peggy Whitson completed a major task conducting activation & checkout of SPS ELPS (Secondary Power System/Emergency Light Power Supply) systems in Harmony (22 bolts per panel!).

The CDR also performed the periodic thorough inspection of ELPS units in Node-1. [There are three ELPS units in the Node.]

The FE-2 meanwhile inspected and checked out the ELPS in the A/L, which has one unit.

In Node-2, Dan Tani removed the PPRV (Positive Pressure Relief Valve), now no longer required, and installed an MPEV (Manual Pressure Equalization Valve) in its place.

Whitson conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of the continuing WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week. Preliminary analysis of samples of water transferred in CWCs from Discovery to ISS during 10A indicates bacterial contamination in all containers transferred. This newly transferred water (no more critical than common faucet water on the ground) is not scheduled to be used in the near future, and there are ample other supplies on board. An investigation is underway to develop a forward plan.]

FE-1 Malenchenko set up the pumping equipment and initiated (later closed out) the periodic transfer of urine from 4 EDV-U containers in the SM to the Rodnik BV2 tanks of Progress M-61 (26P). [Leak checks performed by the crew on 10/8-9 on
the membrane (expulsion bladder) of the Progress’ Rodnik BV1 tank showed that BV1 is unsuitable for liquid waste transfer due to a small leak in the tank’s bladder.

Dan Tani took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]

Peggy Whitson connected the regular ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) coolant jumper to the LAB1D6 rack, to support the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), and Houston lowered the temperature setpoint to the regular 9.4 degC. [CDRA activation is from 1:31pm-2:31pm.]

Afterwards, the CDR activated the AR SDS (Atmosphere Revitalization/Sample Delivery System) in Node-2 by opening the SDS manual valves to allow for MCA (Major Constituents Analyzer) sampling of Node-2. [The SDS, along with the MCA, PCA (Pressure Control Assembly), TCCS (Trace Contaminant Control Subassembly) and CVV (Carbon Dioxide Vent Valve assembly), is a subsystem of the Atmosphere Control & Supply System of the Lab's ECLSS (Environment Control & Life Support System).]

Yuri completed the routine maintenance of the SOZh system (Russian ECLSS) in the SM, including ASU toilet facilities systems/replaceables; and

Dan filled out the regular FFQ (Food Frequency Questionnaire), his second, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

The FE-2 also conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister cords and accessory straps as well as the canister bolts for re-tightening if required.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).
Afterwards, Tani transferred the crew's exercise data file to the MEC for downlink.

Dan had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

At ~3:15am EST this morning, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:05am, Yuri linked up with TsUP stowage specialists via S-band to conduct the weekly IMS (Inventory Management System) tagup, discussing stowage issues and equipment locations. [Issues of discussion today pertained to updating equipment locations assigned to Soyuz TMA-11, including packing of return equipment already stowed on ISS.]

Two items waiting for Whitson and Tani on their discretionary “job jar” task list, besides the SLEEP logging (see above), are two audits – of onboard CTBs (Cargo Transfer Bags) and the “stowage rack of the week”, currently the one at LAB1P5 -- using a new Audit function introduced with the implementation of the laptop-based IMS 2.0 version on Increment 15. [This function allows the user to setup audits of bags, kits, stowage locations, just about anything that is considered a container, via a special Audit window with a linked Object Properties window.]

_P1 Radiator Deployment:_ This morning at ~6:00-7:00am EST, the ground successfully deployed the ETCS (External Thermal Control System) Loop B PVRs (Photovoltaic Radiators) #1 & #3 on the P1 truss, observed by video camera on the SSRMS robotarm, after it ungrappled Node-2 but remains based on the Lab PDGF (Power & Data Grapple Fixture). [Russian thrusters were inhibited from 5:10-7:32am, and exercise prohibited during the deployment. Following the deployment, ETCS Loop A & B temperature setpoints were raised from 2.8 to 6.1 degC in preparation for commissioning of the six Node-2 IFHX’s (Interface Heat Exchangers) during EVAs 11 (Bravo) and 12 (Charlie).]

CEO (Crew Earth Observation) photo targets uplinked for today were Ouarkziz Impact Crater (Ouarkziz is a relatively "young" impact crater, dated at 70 million years. The crater is 3.5 km in diameter and is located in the Atlas Mountains of western Algeria near the border with Morocco. As ISS crossed the Atlas Mountains from the NW in late morning, the crew was to shoot left of track for the impact in folded rocks near the south side of the E-W mountain range), S. Mozambique (this target area is in the coastal plains of far southern Mozambique just north of the capital city of Maputo. Rapid development of this area is now being planned. To
better monitor this change, CEO observers are seeking baseline, pre-development imagery. ISS approach was from the NW just after midday. Fair weather was expected and observers requested a nadir mapping strip of this area along the orbit track, and **Patagonian Glaciers** (the Northern Patagonian Ice Field is the northernmost of two large remaining ice fields of South America, located in the Andes Mountains of southern Chile. It is also the world’s largest ice field so far from the poles. The crew had a near-nadir, fair-weather pass in mid-afternoon. They were to try for detailed views of the glacier features, particularly on the western and northern margins.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit**  (as of this morning, 8:15am EST [= epoch]):
Mean altitude -- 341.1 km
Apogee height -- 342.4 km
Perigee height -- 339.9 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001814
Solar Beta Angle -- -7.3 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 128 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51465

**Significant Events Ahead** (*all dates Eastern Standard, some changes possible*):
11/20/07 -- US EVA-11 “Bravo” (Whitson/Tani)
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (*1st U.S. satellite on Redstone rocket*)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at
[http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
ISS On-Orbit Status 11/14/07

All ISS systems continue to function nominally, except those noted previously or below. “…and I’m sooo happy it was all nominal!” (CDR Whitson, early this morning).

Station sleep cycle: 1:00am – 4:30pm EST.

Node-2 “Harmony”/PMA-2 (Pressurized Mating Adapter 2) relocation has been completed nominally, and the crew has ingressed Node-2 way ahead of schedule.

With CDR Peggy Whitson operating CBMs (Common Berthing Mechanisms) and FE-2 Dan Tani controlling the SSRMS (Space Station Remote Manipulator System), the 17-ton Node-2/PMA-2 stack was unberthed at ~4:21am EST and transferred to the front of the station (first motion ~4:27am). After reaching pre-mate position at the Lab Forward port at ~5:10am, full capture, with all 16 motorized bolts driven home OK, was achieved at ~5:45am -- about 2 hrs ahead of schedule.

Early after breakfast, before the transfer, Whitson terminated Node-1/Node-2 Vestibule depressurization, while Tani activated the CBCS (Centerline Berthing Camera System) and started the laptop-based DOUG (Dynamic Onboard Ubiquitous Graphics) software to support his SSRMS ops. For the relocation, Russian thrusters were temporarily inhibited.

With Node-2/Harmony firmly attached at the Destiny Lab, Peggy Whitson initiated pressurization of the Vestibule between the two modules and conducted the usual 1-hr checking for hermeticity (leak-tightness), using the ISA (Internal Sampling Adapter), VAJ (Vacuum Access Jumper), ISA scopemeter pressure probe, and a Multimeter.

Dan Tani meanwhile powered down the CBCS and removed the camera equipment and associated electronics & power cabling from its position at the Lab forward port.
FE-1 Yuri Malenchenko, after starting the new Russian MBI-12 SONOKARD (Sonocard) payload last night for his third experiment session, this morning terminated the run right after wakeup by taking the recording device from his SONOKARD sports shirt pocket. Later, Yuri copied the measurements to the RSE-MED laptop for subsequent downlink to the ground. [SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

Afterwards, Malenchenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~4:15pm EDT. Regeneration of bed #2 follows tomorrow. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]

After leak check termination and vestibule hatch opening, Peggy and Dan had several hours set aside for Lab/Node-2 Vestibule Outfitting/Part 1, focusing on stringing & connecting avionics data & instrumentation jumpers, secondary power 1553 cables essential for Node-2 heater activation, and installing ACBM (Active CBM)-to-PCBM (Passive CBM) grounding straps.

Since Whitson and Tani were able to complete Part 1 of Vestibule Outfitting very much sooner than expected, including steps scheduled for tomorrow, the crew was given a Go to move forward with some of the Lab/Node-2 Vestibule Outfitting/Part 2 activities that were not scheduled to be completed until later this month (e.g., installation of remaining avionics & life support jumpers plus removal of the CBM CPAs).

Continuing to stay starkly ahead of schedule, Peggy and Dan then received the Go from the ground to open Node-2 hatch and ingress Harmony at ~11:35am (originally scheduled for 11/26).

FE-1 Malenchenko meanwhile was busy completing a number of servicing tasks such as –

● Continuing the current round of periodic preventive maintenance of ventilation systems in the RS (Russian Segment), first working in the DC1 (Docking Compartment) to replace the PF1,2 filter cartridges and clean the
V1 & V2 fan grilles and VD1 & VD2 air ducts, then moving to the Soyuz TMA-11/15S at the FGB nadir port to clean the screen of its BVN fan/heater assembly;

- Performing the periodic time synchronization between the RSS1 and the BSPN payload server, after testing functionality by checking data comm between the two computers and synching RSS1 to station time, in support of payload data transfers from the BSPN for subsequent downlink on OCA comm (via the Russian RSS1 laptop to a PCMCIA flash card). \[Before RSS1/BSPN synchronization, the RSS1 is updated with the exact time as per the station clock (which in turn is synchronized daily from RGS/Russian Ground Site). Experiment control application is a payload file transfer program called ShellForKE.\]

- Conducting the periodic checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1;

- Taking CWC (Contingency Water Container) #1069 to the RS for the periodic (about twice a month) replenishing of the Elektron oxygen generator’s water supply for electrolysis, filling the KOV thermal loops’ EDV container (also vom CWC #1029 if necessary). Once filled, the EDV was connected to the BPK transfer pump for processing. \[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.\]

- Completing the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables; and

- Performing the daily maintenance of the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Yuri also had about an hour set aside for inspecting RS onboard computer & OpsLAN/Ethernet systems, including verifying laptop equipment, familiarizing himself with cabling functions and laptop assignments, checking anti-virus signature updates on the RSS2 laptop, and checking computer spares & accessories kits. The audit was supported by ground specialist tagup. \[In the RS, there are currently seven Russian computers in use: RSS1, RSS2, RSK1, RSE1, RSE-Med, TP2, and Laptop3.\]
The crewmembers completed a reduced physical workout program, limited today by structural constraints during the Node-2 transfer and outfitting.

At ~2:55pm EST, Malenchenko downlinked a TV PAO message of greetings to the participants of the 12th Kachin Readings Conference, sponsored by Y.A. Gagarin Cosmonaut Training Center (GCTC) in Star City on 11/24. [This year’s Kachin Readings, a “Scientific and Practical Conference” dedicated to the 97th anniversary of the creation of the Kachin Military Flight School, the first of its kind and recipient of the Lenin’s Order and Red Banner, are being held in Star City, “not only because many cosmonauts started their careers as military pilots and Kachin School graduates, but also because aviation is a cradle of cosmonautics and has always been in the past and will continue to be in the future inextricably tied to space exploration.” Kachin School history and the achievements of its alumni have become an integral part of the Russian national legacy. The school was founded by Grand Duke Alexander Michailovich following Nicholas II order using voluntary donations by the Russian public. On November 21, 1910, the School opened as the Sebastopol Officer School of Aviation and became a cradle for the air fleet, both military and civil.]

EVA Designations: The original 10A EVA-5 has now become EVA-10 “Alpha”, after it was delayed to 11/9, after 10A/Discovery’s departure. Consequently, the next two Stage spacewalks by the ISS crew are now known as EVA-11 “Bravo” and EVA-12 “Charlie”.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:44am EST [= epoch]):
Mean altitude -- 341.3 km
Apogee height -- 342.6 km
Perigee height -- 340.0 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001918
Solar Beta Angle -- -11.8 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 122 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51449

**Significant Events Ahead** *(all dates Eastern Standard, some changes possible):*

11/20/07 -- US EVA-11 “Bravo” (Whitson/Tani) -- renamed
11/24/07 -- US EVA-12 “Charlie” (Whitson/Tani) -- renamed
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)

10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at
[http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
ISS On-Orbit Status 11/13/07

All ISS systems continue to function nominally, except those noted previously or below.

Station sleep cycle: 1:00am – 4:30pm EST.

FE-1 Yuri Malenchenko set up the equipment for the Russian MBI-18 DYKHANIE ("respiration", "breathing") experiment, then conducted the session, supported by ground specialist tagup, later closing down ops and stowing the equipment. [Dykhanie-1 gear uses two belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements taken and recorded involve a pneumotachogram, thoracic pneumogram, abdominal pneumogram, and pressures in the oral cavity. All experimentally derived and salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]

In preparation for tomorrow’s scheduled Node-2/PMA-2 relocation from the Node-1 portside dock to the Lab forward port, CDR Whitson and FE-2 Tank conducted the usual 1-hr review of the DOUG (Dynamic Onboard Ubiquitous Graphics) application for the required SSRMS (Space Station Remote Manipulator System) maneuvers.
Also for the relocation, later in the day (~8:40am EST) the MT (Mobile Transporter) was moved on its rail tracks from WS4 (Worksite 4) to WS7 by ground commanding. In support of this translation, the Russian thrusters were disabled from 7:35am to 10:40am. [The translation was delayed by ~45 min due to a microswitch error message requiring troubleshooting and clearing up by ground controllers.]

Later, Whitson and Tani worked on the Vestibule connecting Node-1 and Node-2, preparing it for Node-2 demating by installing the CPAs (Controller Panel Assemblies) on the ACBM (Active Common Berthing Mechanism), then conducting a final check of the vestibule, installing the CBM center disk cover and closing the Node-1 port hatch to the Vestibule.

Following hatch closure and the subsequent depressurization of the Vestibule to vacuum, started by the CDR after setting up the depress connections, the Node-2/ PMA-2 “stack” is ready for the transfer tomorrow, scheduled around 5:25am, after a vestibule leak check and CBM demate. [Correction: For yesterday’s PMA-2 relocation, the SSRMS grappled the PMA on one of its two FRGFs (Flight Releasable Grapple Fixtures), not PDGFs (Power & Data Grapple Fixtures) as erroneously reported here; the PMAs have no PDGFs.]

Malenchenko used the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System) to take readings of potentially harmful contaminants in the SM (Service Module). The hardware was then returned to initial stowage. [The CMS, part of the GANK-4M analyses (see below), uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip. CMS is part of the GANK-4M analysis conducted today.]

Later, Yuri also collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]

Dan Tani retrieved and stowed the two FMKs (Formaldehyde Monitoring Kits) deployed by him on 11/11 in the Lab (below CEVIS cycle) and SM (most forward handrail).

Dan had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks
after starting station residency.

The FE-1 continued the current round of monthly preventive maintenance of RS (Russian Segment) ventilation systems, today working in the FGB (Funktsionalnyi-Grusovoi Blok) to access and clean the protective mesh screens of its TsV1 central ventilation fan assembly.

Also in the Khrunichev-built module, Malenchenko, supported by ground specialist tagup, conducted troubleshooting on temperature sensors of the FGB’s retracted SB4 starboard solar array wing.

The FE-1 performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Additionally, Yuri conducted the daily maintenance of the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2), and VELO bike with bungee cord load trainer (FE-1).

The FE-2 then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

**Weekend Voluntary Science:** Four optional activities for the voluntary “Saturday Science” program for next weekend (11/16-18) were suggested to Peggy and Dan for their choice. Selection is required by tonight.  
[The four choices are: (1) BCAT-3 (Binary Colloidal Alloy Test-3) Magnet Unstick, using the CGBA-4 (Commercial Generic Bioprocessing Apparatus-4), powered up 12 hrs before to initiate cooling; (2) CFE-CL (Capillary Flow Experiment – Contact Line): voice & video of a 4-hr run of his last session to complete the CFE investigations; (3) SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), flying two & three satellites, requiring 2 video camcorders & 2 VTRs; and (4) EPO (Education Payload Operations) demonstrating Newton’s Laws (Three Laws of Motion & Conservation of Angular Momentum).]

No CEO (Crew Earth Observation) photo targets uplinked for today.
CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/

ISS On-Orbit Status 11/12/07

All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 4 of Increment 16.

Station sleep cycle: 1:00am – 4:30pm EST.

PMA-2 (Pressurized Mating Adapter 2) relocation was successfully completed. Using the SSRMS (Space Station Remote Manipulator System), CDR Whitson and FE-2 Tani unberthed the PMA-2, transferred it, and reberthed it at the Node-2 Forward dock. [Prior to the transfer ops, the Node-2 Fwd CBM (Common Berthing Mechanism) unexpectedly deactivated due to a comm dropout. Ground controllers executed troubleshooting steps to restore the CBM to function for the transfer, and the ops proceeded nominally.]

Early after breakfast, before the transfer, Whitson removed and temporarily stowed CTBs (Cargo Transfer Bags) from Node-1 stowage location to gain access to the Node-1 P1 panel until the THC (Temperature & Humidity Control) vent configuration in Node-1 was completed later in the day and the panel was back in place. Dan Tani then restowed the CTBs in Node-1 at panel P1.

Afterwards, Dan Tani activated the CBCS (Centerline Berthing Camera System) at the Node-2 Fwd hatch, to help in PMA pre-mate aligning for reberthing.

In the FGB, FE-1 Malenchenko meanwhile disconnected and stowed power cables for the FGB SAWs (Solar Array Wings) deploy/retract drive.

While Dan started up the DOUG (Dynamic Orbital Ubiquitous Graphics) software for monitoring SSRMS maneuvering, Peggy conducted another leak check, verifying that PMA-2 internal pressure had decreased to less than 1.4 mmHg. After notifying MCC-Houston, the Go was given for unberthing.

With the PMA PDGF (Power & Data Grapple Fixture) firmly gripped by the
Canadian robotarm, the Node-1 Fwd CBM was unbolted from the ground, and the PMA slowly moved over to the ISS port side by Whitson and Tani, to be successfully docked, mated and bolted at the Node-2 Fwd CBM.

During the transfer, Yuri Malenchenko was busy auditing and restocking the Russian SSVP (Docking & Internal Transfer System) accessory kits. [Support equipment in the SSVP kits includes handles, caps, screwdrivers, extenders, quick-disconnect clamps, wrenches, etc.]

After the transfer, FE-2 Tani performed safing procedures for the SSRMS.

Malenchenko worked on the SRV-K2M Condensate Water Recovery System, removing and replacing the lifetime-expired BRPK-2 Air/Liquid Condensate Separator unit with a new spare, stowing the old part for disposal.

Yuri also continued the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator by charging the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (# by21). The last test pressurization was on 7/19 by Kotov. [During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]

CDR Whitson started preparations for the relocation of the Node-2/PMA-2 “stack” on 11/14 by deactivating the interim ventilation configuration in “Harmony”, disassembling the air duct and installing an IMV (Intermodal Ventilation) valve at Node-2 aft starboard.

After Dan Tani removed the deactivated CBCS and relatched the Node-2 Fwd hatch, the crew egressed from “Harmony” and isolated the Italian-built module by closing the inner hatches (after ingressing a second time to remove covers). The CBCS was then set up at the Node-1 Fwd hatch to support the upcoming “stack” transfer.

Using the vacuum cleaner and other tools, the FE-2 performed a 15-min hatch seal inspection on the Node-1 port hatch where “Harmony” is currently berthed.

Tani also completed the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

Afterwards, Dan did the periodic checkout of the prime CSA-CP (Compound
Specific Analyzer-Combustion Products), #1051, changing out its sensor battery.

Using the Russian AK-1M adsorber and IPD Draeger tubes, Yuri conducted the periodic sampling of cabin air for subsequent analysis on the ground.  *[FE-1 started out by taking air samples in the SM (Service Module) and FGB and to check for leaked-out Freon in the SM, then switched to the IPD-CO Draeger tubes sampler to check for CO (carbon monoxide) in the SM.]*

Later, Dan Tani also collected air samples with a U.S. GSC (Grab Sample Container) at the center of the Lab and SM.

Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The FE-1 did the daily maintenance of the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

FE-2 Tani had another 60 minutes for general crew orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

The crewmembers completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (FE-1/fulltime), and RED resistive exercise device (CDR).

Dan then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

*EMU Spacesuit Troubleshooting:* During a SSATA (Space Station Airlock Test Article) chamber run on the ground this past Friday, a crew member reported the smell of smoke inside the EMU (Extravehicular Mobility Unit). The run was terminated, and the crew member extracted without incident. A mishap investigation board was formed and has recommended that all life support system operations (power, O₂ ops, etc.) for the on-orbit EMUs be terminated until a root cause can be determined. Thus, the on-orbit EMUs are No Go. All other ops, such as suit resizing, can be performed.
No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**Significant Events Ahead (all dates Eastern Standard, some changes possible):**
11/14/07 -- Node-2 (Harmony) plus PMA-2 relocation to front of Lab
11/20/07 -- US EVA-10 (Peggy Whitson/Dan Tani)
11/24/07 -- US EVA-11 (Peggy Whitson/Dan Tani)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 11/11/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday – Crew off duty. Ahead: Week 4 of Increment 16.

Station sleep cycle: 1:00am – 4:30pm EST.

The crew conducted the regular weekly three-hour task of thorough station cleaning. ["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

As part of the house cleaning, FE-1 Yuri Malenchenko performed preventive maintenance cleaning on the V3 fan screen in the DC1 (Docking Compartment) and on the VPkhO, VdPrK, VPrK and TsV2 fan grilles in the FGB.

Later, the FE-1 completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Malenchenko also gathered weekly data on total operating time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s SOGS air revitalization subsystem for reporting to TsUP.

In preparation of tomorrow’s planned transfer of the PMA-2 (Pressurized Mating Adapter 2) from the Lab forward port to the Node-2 portside CBM (Common Berthing Mechanism), CDR Whitson depressurized PMA-2, evacuating any atmospheric residuals to vacuum and afterwards monitoring the internal state.
Also for the PMA-2 move, FE-2 Dan Tani unlatched the Node-2 forward hatch to its hardstop to test the mechanism (hatch remaining safely closed due to pressure differential) and then installed the CBCS (Centerline Berthing Camera System), with its cabling through the Node-1/Node-2 hatchway, at the Node-2 port where PMA-2 will be berthed.

The crew conducted the standard pre-Robotics review of SSRMS (Space Station Remote Manipulator System) procedure using the DOUG (Dynamic Orbital Ubiquitous Graphics) software application.

Tani performed the periodic deployment of two passive FMK (formaldehyde monitoring kit) sampling assemblies in the Lab (below CEVIS) and SM (most forward handrail) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

The FE-2 and CDR had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop), Dan at ~9:30am EST, Peggy at ~10:45am.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 11/10/07

All ISS systems continue to function nominally, except those noted previously or below.  Crew off duty.

Station sleep cycle remains at the regular 1:00am – 4:30pm EST.

For today's workouts by all crewmembers on the RED (Resistive Exercise Device), CDR Whitson set up the video camcorder for filming the sessions. Afterwards, the video equipment was put back in stowage. [The RED video, showing the apparatus on the “ceiling” hatch of the Node, is periodically required to support biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection.]

Following up on yesterday’s successful EVA-5, FE-1 Malenchenko recorded the post-EVA radiation readings from the EMU/suit-worn and background “Pille-MKS” dosimeters and returned the sensors to their regular sites.

FE-2 Tani took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary.  [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]

At ~8:30am EST, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

Afterwards, at ~9:00am, the crew held the standard post-EVA debriefing session with ground specialists, discussing details of yesterday's spacewalk.  [EVA-5 by
Whitson and Malenchenko achieved all objectives except for the get-ahead task of installing handrail HR-0371 on Node-2. EV2 Malenchenko had problems getting the second bolt installed, almost identical to the problems reported during the 10A EVA-2. Repeated increases in installation torque put the handrail into an undefined and structurally unstable configuration, so the handrail was brought back inside. The crew also reported minor RTV (Room Temperature Vulcanizing) material damage to Malenchenko’s EMU gloves. Glove photos are currently under review.

Dan Tani filled out the regular FFQ (Food Frequency Questionnaire), his first, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

Yuri Malenchenko used the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System) to take readings of potentially harmful contaminants in the SM (Service Module). The hardware was then returned to initial stowage. [The CMS uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip.]

Later, Malenchenko took CWC (Contingency Water Container) #1069 to the Russian Segment for the periodic (about twice a month) replenishing of the Elektron oxygen generator’s water supply for electrolysis, filling the KOV thermal loops’ EDV container, also vom CWC #1029 if necessary). Once filled, the EDV was connected to the BPK transfer pump for processing. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

CDR Whitson worked on stowage relocation from Node-2, preparing “Harmony” for the relocation on 11/14.

At ~7:05am, Yuri had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop).

Dan Tani had another 60 minutes for general crew orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.
Malenchenko performed the regular daily maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Dan then transferred the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

**Weekly Science Update (Expedition Sixteen -- 3rd)**

**ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):** Radiation measurements will continue to be performed throughout the Increment 16.

**ANITA:** Completed.

**BCAT (Binary Colloidal Alloy Test):** Reserve.

**CARDIOCOG-2:** Completed.

**CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):** “Dan, thanks for volunteering your time for the first CCCISS session. The Investigator team is very pleased to have you as a subject. We've been able to look over some of the data and so far it looks good.”

**CFE (Capillary Flow Experiment):** Planned.

**CHROMOSOME-2 (E14 SFP):** Completed.

**CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus):** “We have received CHab and Cell Culture Hab (just returned from CSI-02). At first glance: CHab seems to have inoculated and grown well (Yeast). One of the Cell Culture Hab opticells containing the orchid cells was contaminated, the other looked good. It appears the *arabidopsis* did not grow well in the flight or ground units but further checking is required to confirm. If true, this is most likely due to low initial cell counts. The tree cells grew more and differently in flight compared to both grounds. It was obvious at a glance. More detail to follow.”

**CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):** Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

EMCH (Elastic Memory Composite Hinge): Complete.

EPO (Educational Payload Operation) Kit C: Planned.

ETD (Eye Tracking Device): First session for Yuri Malenchenko has been performed nominally on 10/18.

Integrated Immune: “Peggy and Dan, thanks for your time and participation in the first Integrated Immune session. So far the PI has received strong, viable samples for analysis.”

IMMUNO (Saliva Sampling): Inc-15 first session samples have been returned on 10A. First report confirms good transportation to ground.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Since last report on 11/1, the scientists have intensively observed the stem that appeared in the A2 Experiment Container. Images acquired by EMCS have indicated that there exist weak circumnutation motions in 0-g and 1-g conditions. This was never observed in the past space experiments. From 10/30 on, side shoots have also been observed. 2D then 3D-recordings of stem circumnutation - in 0-g and 1-g conditions and in light and darkness conditions - have been performed for several days, making use of any possibility to get additional science between the planned power outages during the 10A mission. Before the end of the experiment run (scheduled on 11/10), it is expected that flowering and pollenization will occur, leading possibly to seeds that may be collected by the science team after return with 1E mission. Experiment Container A2 is currently in dry-out mode, progressively decreasing its relative humidity level. The EMCS Facility will be switched off and 8 Experiment Containers will be removed from EMCS on 11/15 and stowed until return on 1E.

MSG-SAME (Microgravity Science Glovebox): Complete.
**NEOCYTOLYSIS (E14 SFP):** Complete.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION:** Planned.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** n/a

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** "Peggy, thanks for performing the Sleep Actiwatch download for yours and Dan’s Actiwatch. Also thanks for downloading the data for the CCISS experiment. We’ve looked at some of the data and so far everything looks good. We heard the good news that it was easy to use the neoprene band on the Actiwatch Reader, and we look forward to the download next month of the Actiwatches. Please feel free to perform any extra logbooking in the SleepLog software per your preference. Dan, thanks for your participation in Sleep so far. The data is looking good. Please feel free to perform any extra logbooking in the SleepLog software per your preference."

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** Planned.

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** In progress.

**TRAC (Test of Reaction & Adaptation Capabilities):** Planned.

**CEO (Crew Earth Observations):** Planned.

CEO (Crew Earth Observation) photo targets uplinked for today were **Tigris-Euphrates Delta** (the crew was asked to shoot the coastline under and left of track. Draining of swamplands just upstream of the delta [by the previous Iraqi government] has released vast quantities of sediment into the rivers. The shape of the coastline has consequently changed as the sediment has poured in), and **West African dust event** (Dynamic event. A dust mass several hundred km wide is moving off the coast of West Africa into the Atlantic Ocean. Saharan dust reaches the Americas every month, and may be critical in seeding Amazon basin soils with critical nutrients. Looking left for the densest part).

CEO photography can be viewed and studied at the websites: [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
Significant Events Ahead (all dates Eastern Standard, some changes possible):
11/12/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-5)
11/14/07 -- Node-2 (Harmony) plus PMA-2 relocation to front of Lab
11/20/07 -- US EVA-10 (Peggy Whitson/Dan Tani)
11/24/07 -- US EVA-11 (Peggy Whitson/Dan Tani)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation's Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.

**EVA-5 was completed fully successfully** in 6 hrs 55 min, accomplishing all objectives. One get-ahead task was left for a future excursion. During the spacewalk, CDR Peggy Whitson (EV1) and FE-1 Yuri Malenchenko (EV2), supported by FE-2 Dan Tani as IV (Intravehicular) crewmember ---

- Stowed SSPTS (Station-to-Shuttle Power Transfer System) Cabling;
- Stowed PMA-2/Lab Umbilicals, prepping PMA-2 for its relocation on 11/12;
- Retrieved a Lab CETA (Crew & Equipment Translation Aid) Light;
- Temp stowed Node-2 Port & Starboard Tray Avionics;
- Installed Node-2 PDGF (Power & Data Grapple Fixture) Horseshoe Connectors & harness;
- Removed & replaced RPCM (Remote Power Controller Module) 4B-C on S0 truss;
- Removed ACBM (Active Common Berthing Mechanism) Cover & surveyed the CBM;
- Mated S0/Node-1 SM Power Cable;
- Configured PMA-1/FGB H-Jumpers;
- Retrieved a BSP (Baseband Signal Processor); and
- Relocated the N₂ VTE (Vent Tool Extender) bag.]

Not done: Installing a Node-2 handrail (a get-ahead task).

[Official start time of the spacewalk, the “left over” fifth EVA from Mission 10A, was 4:54am EDT. It ended at 11:49am. Total EVA duration (PET = Phase Elapsed Time) was 6h 55min. It was the 97th spacewalk for ISS assembly & maintenance and the 69th from the station (28 from Shuttle, 47 from Quest, 22 from Pirs) totaling 414h 47m. After today's EVA, a total of 115 spacewalkers (84 NASA astronauts, 21 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-]
1 and Sweden-3) have logged a total of 602h 11m outside the station on building, outfitting and servicing. It also was the 119th spacewalk by U.S. astronauts.

For safety, the spacewalkers had been advised to wear APMAs (Adjustable Protective Mitten Assemblies), i.e., overgloves, for the entire EVA except for the ACBM thermal cover and S0/N1 SM power cables tasks. [Removing the APMAs was at the crew’s discretion if they did not feel safe due to reduced body control or tool manipulation. Inspection of the EMU gloves was required before re-donning the over-glove.]

FE-2 Dan Tani completed the post-ingress reconfiguration of the Russian onboard telephone/telegraph subsystem (STTS) to its pre-EVA settings. [The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM’s outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]

Dan also disassembled the Kodak-760 DCS digital camera’s EVA configuration.

At ~2:00pm EST, Yuri will support the ground’s reactivation of the Elektron O2 generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there is no overheating. [During nominal operations a gas analyzer is utilized to detect hydrogen (H2) in the O2 line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

Before sleeptime (4:30pm EST), Peggy and Yuri are to take another session of the standard Russian crew health-monitoring program’s medical assessment MO-9/ Biochemical Urinalysis. [MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).]

AFPR Inspection Update: Teams are continuing to analyze the root cause of the cut EMU spacesuit gloves. No defects were observed on the retrieved APFRs (Articulating Portable Foot Restraints) #3 & #7 during their recent inspection by
Whitson. A possible cause could be crew technique or translation paths.

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 7:30am EST [= epoch]):
Mean altitude -- 341.9 km
Apogee height -- 343.4 km
Perigee height -- 340.2 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002365
Solar Beta Angle -- -35.0 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 115 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51370

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/12/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on EVA-5 on 11/9)
11/14/07 -- Node-2 (Harmony) plus PMA-2 relocation to front of Lab
11/20/07 -- US EVA-10 (Peggy Whitson/Dan Tani)
11/24/07 -- US EVA-11 (Peggy Whitson/Dan Tani)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
**01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 11/08/07

All ISS systems continue to function nominally, except those noted previously or below.

In preparation for tomorrow’s EVA-5, CDR Whitson and FE-1 Malenchenko, before breakfast, took the standard pre-EVA session with the Russian crew health-monitoring program's medical assessment MO-9/Biochemical Urinalysis. [MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]

Spending time in the Airlock (A/L), Peggy and Yuri completed A/L EL (Equipment Lock) configuration for their spacewalk tomorrow and tagged up with ground specialists at MCC-H to discuss details. As part of last-minute preparations, the spacewalkers installed the regenerated METOX (Metal Oxide) CO₂ absorber canisters in their EMUs (Extravehicular Mobility Units) and underwent the standard pre-EVA PMC (Private Medical Conference).

Dan Tani configured the DCS-760 digital camera to be taken outside and recharged its battery.

FE-1 Malenchenko performed a software upgrade for the BSPN payload server by deleting old files on the RSS1 laptop and installing the new software, uplinked overnight. Afterwards, the new load was tested with a communications check between RSS1 and BSPN. [In preparation for today's upgrade, on 10/29 Malenchenko had conducted the periodic time synchronization between the RSS1 and the BSPN. Before RSS1/BSPN synchronization, the RSS1 is updated with the exact time as per the station clock (which in turn is synchronized daily from RGS/
Yuri prepared three Russian “Pille-MKS” radiation dosimeters, recorded their dosages and equipped each of the two EMUs (Extravehicular Mobility Unit) with a radiation sensor (A0309/CDR & A0310/FE-2). [A third sensor, A0308, was placed in the SM on the PULT reader for background readings.]

At ~1:20pm, the crew conducted its first weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio.

At ~2:50pm EST, Whitson and Malenchenko are beginning their overnight Campout prebreathe and lockout in the A/L for denitrogenation.

EVA-5 will start tomorrow (Saturday) at ~5:55am EST and last an estimated 6h 35min, nominally ending at 12:30pm. Dan Tani will support the spacewalk as IV (Intravehicular) crewmember, sharing in the initial pre-breathe.

[Main objectives of EVA-5 are:
• Stow SSPTS (Station-to-Shuttle Power Transfer System) Cable;
• Stow PMA-2/Lab Umbilicals;
• Remove Lab CETA (Crew & Equipment Translation Aid) Light;
• Temp stow Node-2 Port & Starboard Tray Avionics;
• Install Node-2 PDGF (Power & Data Grapple Fixture) Horseshoe Connectors & harness;
• R&R RPCM 4B-C (Remove & Replace Remote Power Controller Module) on S0 truss;
• Remove ACBM (Active Common Berthing Mechanism) Cover/survey CBM;
• Mate S0/Node-1 SM Power Cable;
• Configure PMA-1/FGB H-Jumpers;
• Retrieve BSP (Baseband Signal Processor);
• Relocate N2 VTE (Vent Tool Extender) bag; and
• Install Node-2 handrail.]

The FE-2 powered down the ham radio equipment in SM (Service Module) and FGB at ~12:30pm to prevent RF interference with the EMUs during the spacewalk.

Malenchenko performed the regular daily maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

Yuri also serviced the SM’s ASU toilet facilities systems/replaceables, performing the periodic replacement of the toilet's urine receptacle (M-P) and filter insert (F-V), plus associated hoses and a sensor, and stowing the old units for disposal.
Peggy conducted the weekly 10-min. CWC audit as part of the continuing WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week.]

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Dan then transferred the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Dan also had another 60 minutes for general crew orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

PMA-2 Robotics Preps: At ~8:15-10:15am EST, the MT (Mobile Transporter) was moved by ground commanding from WS-8 (Worksite 8) to WS-4 and the SSRMS (Space Station Remote Manipulator System) was maneuvered to the Lab PDGF (Power & Data Grapple Fixture) pre-grapple position in preparation for the PMA-2 relocation planned for 11/12. Also, the Cupola and Lab RWSs (Robotics Workstations) were to be powered up for tomorrow’s EVA-5; the SSRMS will then walk off to the Lab PDGF and prepare for PMA-2 operations on 11/11. DOUG (Dynamic Orbital Ubiquitous Graphics) notes and procedures for the PMA-2 and Node-2 relocations were uplinked for the crew.

CDRA Powerdown: The Carbon Dioxide Removal Assembly (CDRA) in the Lab was deactivated by the ground during 7:00am-12:00pm EST.

RED Cord Replacement: On 11/1, the crew nominally completed changeout of the Resistive Exercise Device (RED) cords. During review of downlinked imagery specialists noted that the cords had been inadvertently installed backwards. The crew was informed to not extend the cord past the 40 inch mark during exercise to preclude damage to the system. The crew reported that they have used RED several times and have not extended the cord past 28 to 32 inches. Ground teams are analyzing forward plans.

CEO (Crew Earth Observation) photo targets uplinked for today were Lake Eyre, Australia (Lake Eyre is a large, usually dry lakebed in south-central Australia and the lowest part of a larger basin that drains nearly a seventh of the continent. It has a complex cycle of filling and drying, not completely linked to the ENSO [El Niño-
Southern Oscillation Cycle]. As we are entering a La Niña this winter and have no recent photographs, CEO would like some baseline imagery of conditions in and around the lake. This pass was to the NE of the lake in afternoon sun), Lake Nasser, Toshka Lakes, Egypt (these man-made lakes are located in the Egyptian Desert west of Lake Nasser and the Nile River. We have monitored their formation and evolution for the past decade. After expanding rapidly westward for several years of high river flow in the Nile, recent images suggest that they are now in retreat. Requested are context mapping views of these lakes or what is left of them), and Tin Bider Impact Crater (this 70-million year old impact site is located in central Algeria just south of the extensive sand sea known as the Grand Erg Oriental. On this pass in early afternoon sun the target was left of track. Since the crater itself is just 6-km in diameter, the ground requested only context views this time).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:43am EST [= epoch]):
Mean altitude -- 341.9 km
Apogee height -- 343.6 km
Perigee height -- 340.2 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002593
Solar Beta Angle -- -39.7 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 115 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51355

Significant Events Ahead (all dates Eastern Standard, some changes possible):
11/09/07 -- EVA-5 (Peggy Whitson/Yuri Malenchenko) ~5:55am
11/12/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-5)
11/14/07 -- Node-2 (Harmony) plus PMA-2 relocation to front of Lab
11/20/07 -- US EVA-10 (Peggy Whitson/Dan Tani)
11/24/07 -- US EVA-11 (Peggy Whitson/Dan Tani)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)

09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

**Note:** The daily ISS On-Orbit Status reports can also be found at
[http://www.hq.nasa.gov/osf/iss_reports/index.htm](http://www.hq.nasa.gov/osf/iss_reports/index.htm)
ISS On-Orbit Status 11/07/07

All ISS systems continue to function nominally, except those noted previously or below.

After 12d 17h 57min in space, STS-120/Discovery today returned to Earth, touching down at KSC on the first landing opportunity at 1:02pm EDT, after 238 orbits, 6,250,000 st.mi. and a perfect ISS 10A mission, during which its seven-member crew conducted four EVAs, delivered a new Expedition 16 crewmember (FE-2 Dan Tani) and returned his predecessor (FE-2 Clay Anderson). It was the 120th flight of a Space Shuttle, the 23rd shuttle mission to visit the station and the 34th of Discovery. Welcome back, Discovery! Next up: STS-122/Atlantis on December 6 with the Columbus module – ESA’s BIG day.

Before breakfast, CDR Whitson, FE-1 Malenchenko and FE-2 Tani started the day with the periodic session of the Russian biomedical routine assessments PZEH-MO-7/Calf Volume Measurement and PZEH-MO-8/Body Mass Measurement (second for CDR & FE-1, first for FE-2), using the IM mass measurement device which Yuri Malenchenko afterwards broke down for stowage. [Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember’s mass is calculated by the computer and displayed.]

At ~2:30am EST, Yuri supported the ground’s reactivation of the Elektron O2 generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was
no overheating.  \textit{[During nominal operations a gas analyzer is utilized to detect hydrogen (H$_2$) in the O$_2$ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]}\\

After the EMCS (European Modular Cultivation System) facility was powered down by ground command, Dan Tani manually closed the EMCS gas valves (must be done within 24 hours following the remote powerdown).

Dan also retrieved nine -32 degC ICEPAC belts from stowage and placed them into the MELFI (Minus Eighty-Degree Laboratory Freezer for ISS) Dewar 3.  \textit{[Tray A/Section 1 & 4; Tray B/Section 1 & 4; Tray C/Section 1, 2, 3 & 4; Tray D/Section 1.]}

After the FE-2 had printed out the uplinked timeline/procedures for the EVA-5 by Whitson & Malenchenko on Friday (11/9), the crewmembers spent two hours reviewing the material, followed by a teleconference with ground personnel to discuss details. Afterwards, Peggy and Yuri checked out REBA (Rechargeable EMU Battery)-powered hardware in the Airlock and configured the EVA tools needed for the spacewalk.

\textit{[After the standard Campout in the A/L Thursday night, EVA-5 is scheduled to begin at approximately 6:00am EST. Expected to last about 6h 35m, its objectives are:}

- Stow SSPTS (Station-to-Shuttle Power Transfer System) Cable;
- Stow PMA-2/Lab Umbilicals;
- Remove Lab CETA (Crew & Equipment Translation Aid) Light;
- Temp stow Node-2 Port & Starboard Tray Avionics;
- Install Node-2 PDGF (Power & Data Grapple Fixture) Horseshoe Connectors & harness;
- R&R RPCM 4B-C (Remove & Replace Remote Power Controller Module) on S0 truss;
- Remove ACBM (Active Common Berthing Mechanism) Cover/survey CBM;
- Mate S0/Node-1 SM Power Cable;
- Configure PMA-1/FGB H-Jumpers;
- Retrieve BSP (Baseband Signal Processor);
- Relocate N$_2$ VTE (Vent Tool Extender) bag; and
- Install Node-2 handrail.]

In support of the on-going EMU/spacesuit glove troubleshooting, the CDR had an hour set aside to inspect and photograph the two retrieved EVA APFRs (Articulating Portable Foot Restraints) #3 & #7 for any sharp edges that may have caused the glove damage.

Peggy also performed the regular monthly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats,
corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

Dan completed the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

Terminating the 24-hr passive data collection period of the HRF CCISS (Human Research Facility/Cardiovascular & Cerebrovascular Control on Return from ISS) experiment, the FE-2 disassembled and stowed the CCISS hardware, used for his first two-day session.

Yuri Malenchenko set up the equipment for tomorrow’s planned “Urolux” biochemical urine test (PZE MO-9), standard operating procedure for cosmonauts before & after each EVA.

FE-2 Tani connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the LAB1D6 rack in support of the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), and Houston lowered the temperature setpoint to the regular 9.4 degC. [CDRA activation took place at 6:35am-7:05am EST.]

Dan Tani also had another 60 minutes for general crew orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

The FE-2 performed the regular daily maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including routine ASU toilet facilities replacings.

Malenchenko did the daily maintenance of the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).
Dan then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 8:19am EST [= epoch]):
Mean altitude -- 342.0 km
Apogee height -- 343.8 km
Perigee height -- 340.3 km
Period -- 91.38 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.00007682
Solar Beta Angle -- -44.2 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 125 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51339

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/09/07 -- EVA-5 (Peggy Whitson/Yuri Malenchenko); ~6:00am
11/12/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-5)
11/14/07 -- Node-2 (Harmony) plus PMA-2 relocation to front of Lab
11/20/07 -- US EVA-10 (Peggy Whitson/Dan Tani)
11/24/07 -- US EVA-11 (Peggy Whitson/Dan Tani)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below.  Crew rest day.

Station sleep cycle is now back to the regular 1:00am – 4:30pm EST.

For FE-2 Dan Tani, it was Day 1 of the two-day activities of the HRF CCISS (Human Research Facility/Cardiovascular & Cerebrovascular Control on Return from ISS) experiment.  CDR Peggy Whitson assisted with electrode placement and documentary photography.  [CCISS studies the effects of long-duration spaceflight on crewmembers' heart functions & blood pressure (="cardiovascular") and on the blood vessels that supply the brain (="cerebrovascular").  Learning more about the changes in cardiovascular & cerebrovascular systems in zero-G could lead to specific countermeasures that might better protect future space travelers.  Today’s activities focus on hardware set-ups including the Holter harness for heart rate monitoring (with PCMCIA card), the CBPD (Continuous Blood Pressure Device) cuffs, and two Actiwatches (not the same as for SLEEP).  For the Baro study of CCISS, using finger cuffs, heart rate and blood pressure were recorded for resting and timed breathing for 5 min.  Between today and tomorrow, there is also a 24-hr passive data collection period.  Exercise, caffeine or food are not allowed prior to the Baro study.]

Peggy Whitson worked on updating and deploying new SODF (Station Operation Data File) Warning Books.  [The new books are valid for post-P6 activation.  They are deployed in the Lab, Service Module (SM), and FGB.]

FE-1 Yuri Malenchenko performed the regular daily maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including routine ASU toilet facilities replacings.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS
cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Yuri then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~7:35am EST, the FE-1 downlinked two PAO TV messages of greetings via S-band to TsUP/Moscow: (1) to Yaroslavl Region Militia Officers on the Day of Militia (“…Yaroslavl Militia honorably and courageously protects law and order at the birthplace of Valentina Vladimirovna Tereshkova, Hero of the Soviet Union and first woman cosmonaut…”); (2) the other to TsUP Director Vladimir Ivanovich Lobachev who will have his 70th birthday on 11/8 (“…for almost a quarter of a century, you’ve been at the helm of the Mission Control Center. We know that you started your professional career working under the direct supervision of Sergei Pavlovich Korolev… Vladimir Ivanovich, we would like to express our deep gratitude to you for your truly fatherly care for us space workers. Once again, happy birthday to you!”)

Later, at ~8:40am, FE-2 Dan Tani held a crew conference via Ku- & S-band with the next FE-2, Garrett Reisman, who will be his successor after arriving on STS-123 in February next year. [Performed every other week, these 30-min. crew conferences are being included in the current station crew’s schedule to pass on the lessons learned to the upcoming Expedition Crew. The purpose is to begin the handover process prior to the arrival on orbit through Videocons and Data Exchanges between the current crew and the upcoming crew. These tagups should start toward the end of the 1st month on orbit.]

**EWIS Update:** After FE-2 Tani yesterday reconnected EWIS (External Wireless Instrumentation System) 1553 cabling in the Lab, EWIS has been successfully activated. [The structural dynamics measuring system is monitoring in “trigger” mode dynamics of the P4, P5 and S4 truss segments. Data of the activation are currently being reviewed by engineers.]

**STS-120 Landing Preview:** For tomorrow’s planned touchdown of STS-120/Discovery, KSC has two opportunities: i.e., from Orbits 238 & 239. Weather at KSC is forecast GO.

* First opportunity (Orbit 238):
  Deorbit Burn (TIG) – 12:00pm EST
  Landing --- 1:02pm;
* Second opportunity (Orbit 239):
  Deorbit Burn (TIG) – 1:34pm
Landing – 2:36pm

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 4:54am EST [= epoch]):
Mean altitude -- 342.1 km  
Apogee height -- 344.3 km  
Perigee height -- 340.0 km  
Period -- 91.38 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.0003148  
Solar Beta Angle -- -48.6 deg (magnitude decreasing)  
Orbits per 24-hr. day -- 15.76  
Mean altitude loss in the last 24 hours -- 70 m (Shuttle-caused delta-V)  
Revolutions since FGB/Zarya launch (Nov. 98) -- 51321

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/07/07 -- STS-120/Discovery/10A landing @ KSC (FD16/1:02pm EST)  
11/09/07 -- EVA-5 (Peggy Whitson/Yuri Malenchenko)  
11/12/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-5)  
11/14/07 -- Node-2 (Harmony) plus PMA-2 relocation to front of Lab  
11/20/07 -- US EVA-10 (Peggy Whitson/Dan Tani)  
11/24/07 -- US EVA-11 (Peggy Whitson/Dan Tani)  
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)  
12/08/07 -- STS-122/Atlantis/1E docking  
12/15/07 -- STS-122/Atlantis undocking  
12/18/07 -- STS-122/Atlantis landing  
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry  
12/23/07 -- Progress M-62/27P launch  
12/25/07 -- Progress M-62/27P docking (DC1)  
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)  
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**  
02/06/08 – Progress M-62/27P undocking  
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 3 of Increment 16.

STS-120/Discovery and ISS are flying in separate orbits again (Flight Day 14 for STS-120/10A)

After final preparations on both sides of the hatches (closed yesterday at 2:42pm EST), Discovery this morning undocked smoothly at 5:32am from PMA-2 (Pressurized Mating Adapter 2), after a total docked time of 10d 21h 52min. [For undocking, the station was turned ~180 deg to +XVV ZLV (+x-axis in velocity vector, z-axis in local vertical) at 4:28am, put briefly on free drift for the undocking, and then maneuvered to 10A Stage attitude of +XVV TEA attitude at 6:15am.]

KSC landing is nominally expected on 11/7 (Wednesday) at ~1:02pm EST. [If the landing occurs as planned, Discovery’s mission duration will be 15d 2h 24m.]

Aboard the station, the crew is enjoying a light-duty day. Wakeup for CDR Peggy Whitson, FE-1 Yuri Malenchenko and FE-2 Dan Tani was at ~1:40am. Sleep time tonight: 4:30pm EST.

After the CDR prepared the auditory test equipment, she, FE-1 Malenchenko and FE-2 Tani took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC laptop application. It was the first session for the three crewmembers. [The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still
be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.

With the U.S. CDRA (Carbon Dioxide Removal Assembly) deactivated by the ground late last night (~10:30pm EST) and its cooling no longer required, Whitson demated and took down the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack.

Both Dan Tani and Peggy Whitson used the DCS760 digital cameras and PD-100 camcorder to document the undocking, backing away and separation of the Discovery. Tani later conducted the playback for transmitting the footage to the ground.

FE-1 Malenchenko performed the periodic MLI (Multi-Layer Insulation) Nikon D2X photography on Soyuz TMA-11/15S, docked at the FGB nadir port, from the DC1 EVA hatch 2 window, to assess the condition of the spacecraft’s MLI (Multi-Layer Insulation) material.

After the crew reconfigured the PMA-2-to-Lab vestibule last night in preparation for PMA-2 demate & relocation to Node-2, removed the CBM (Common Berthing Mechanism) ground strap and connected the CBM bolt actuator to load cell sensor, Yuri opened the Lab hatch to the PMA-2 today, to verify that all Kapton tape is removed from the PMA-2 grille and that the Velcro grille cover is off of the PMA-2 hard duct.

CDR Whitson later performed the remaining preparatory PMA-2 tasks. [Work items consisted of disconnecting the $O_2$ & $N_2$ recharge lines, installing the four CBM CPAs (Controller Panel Assemblies (CPA), installing the CBCS (Centerline Berthing Camera System) target assembly, removing all stowage & tools from PMA-2, verifying CBM hardware config, conducting photo documentation, and installing the Lab forward hatch thermal cover.]

Afterwards, Dan Tani removed the PMA-2 ventilation air duct, closed the Lab forward hatch, depressurized the PMA-2 and performed a leak check of the Lab fwd hatch (several times).

The new Exp-16 crew, Peggy, Yuri & Dan, performed a one-hour OBT (onboard training) emergency egress drill. [Purpose of the refresher drill was to familiarize the entire crew with Node-2 hardware and valves used in emergency situations, familiarize Dan Tani with the locations of ISS hardware and the positions of valves]
used in emergency situations as well as the translation routes to the Soyuz crew return vehicle, working through the Russian Segment (RS) hardware deactivation procedures, and practicing crew interactions in emergency situations.]

In the Airlock, the two spacewalkers on EVA-5 next Friday (11/9), Whitson and Malenchenko, relocated and configured their EMU (Extravehicular Mobility Unit) spacesuits, i.e., EMU #3006 on the forward EDDA (EMU Don Doff Assembly), #3018 on the aft EDDA. [After terminating recharge of the suit batteries and regeneration of the METOX (Metal Oxide) filter canisters, Peggy and Yuri installed both batteries and canisters in the EMUs. Afterwards, they verified proper configuration for helmet lights, video cameras (ERCAs), identification stripes, wrist mirrors and cuff checklists.]

The CDR also deconfigured the BPSMU (Battery Powered Speaker Microphone Unit) and its long drag-through cable, used during the docked phase, and stowed the equipment.

Malenchenko completed the post-undocking reconfiguration of the Russian telephone/telegraph subsystem (STTS) to its pre-docked settings, from its primary string back to nominal mode on the backup string. This also severed the VHS (UHF) channel to the receding Shuttle Orbiter and restored the RSA-2 S/G (Space-to-Ground) comm configuration on Panel 3. [The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]

FE-2 Tani rerouted an EWIS (External Wireless Instrumentation System) 1553 cable in the Lab, disconnecting it, then reconnecting it behind another panel and closing the panel cover.

As is regular procedure for newly arrived cosmonauts, the FE-1 spent some time filling out the questionnaire for the standard Russian biomedical Braslet-M/Anketa ("bracelet/questionnaire") test procedure. [The objective is for Yuri to evaluate a number of "bracelet" cuffs for their usefulness in suppressing the adverse effects of micro-G for the "newcomer" aboard the station during the acute phase of adaptation to weightlessness, if there are such indications. The "bracelets" are compression cuffs attached to a belt and worn on the upper thighs over the coveralls, intended as countermeasures against the initial micro-G effects of blood filling (vascularity) in the upper torso (heaviness and blood pulsation in the head), facial puffiness, nasal
stuffiness, painful eye movement, and vestibular disorders (dizziness, nausea, vomiting). They create artificial blood accumulation in the upper thirds of the thighs, causing some of the circulating blood volume to relocate from the upper body to the lower extremities, thereby (hopefully) correcting the adverse hemodynamic effect of micro-G and thus improving the crewmember's working capability. The actual compression cuff in the Braslet units is a combination of alternating multi-layer tensile and non-tensile elements, whose distension by body movements creates elastic forces that produce the necessary pressure on the body surface.

At ~8:50am, Yuri supported the ground’s reactivation of the Elektron O₂ generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. [During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

Later, the FE-1 performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including routine ASU toilet facilities replacings.

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR), and VELO bike with bungee cord load trainer (FE-1).

Yuri then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Payload Transfers: As part of ISS-to-Shuttle transfers yesterday, the crew packed science samples and ICEPACs in two DCBs (Double Coldbags) on Discovery before hatch closure. When Clay Anderson ran into some difficulties packing one of the bags during these activities, he was instructed to remove seven NUTRITION samples from one of the bags and re-stow them in the MELFI (Minus Eighty-Degree Laboratory Freezer for ISS) until the next flight.

Water Transfers: A total of 10 CWCs (Contingency Water Containers) were transferred from Discovery to the station. CDR Whitson reported that a CWC (#1006), previously filled and transferred, was found to be leaking. The CWC was returned to the Shuttle, to be vented overboard during a post-undock water dump.
No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 8:55am EST [= epoch]):
Mean altitude -- 342.2 km
Apogee height -- 344.1 km
Perigee height -- 340.3 km
Period -- 91.38 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002835
Solar Beta Angle -- -52.7 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude gain in the last 24 hours -- 89 m (Shuttle-caused delta-V)
Revolutions since FGB/Zarya launch (Nov. 98) -- 51308

**Significant Events Ahead** (all dates Eastern Standard, some changes possible):
11/07/07 -- STS-120/Discovery/10A landing @ KSC (FD16/1:02pm EST)
11/09/07 -- EVA-5 (Peggy Whitson/Yuri Malenchenko)
11/12/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-5)
11/14/07 -- Node-2 (Harmony) plus PMA-2 relocation to front of Lab
11/20/07 -- US EVA-10 (Peggy Whitson/Dan Tani)
11/24/07 -- US EVA-11 (Peggy Whitson/Dan Tani)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite  (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 11/04/07

All ISS systems continue to function nominally, except those noted previously or below. Day 150 for Clayton Anderson. Flight Day 13 for STS-120/10A; Day 11 of Joint Ops. Sunday – Farewell Day.

>>>Today 50 years ago the first living space passenger was launched into orbit: the female dog Laika on Soviet Russia’s Sputnik-2 (see picture, below). <<<

ISS/Shuttle crew wake-up: 1:08am EST. Sleeptime: 5:10pm (ISS), 6:08pm (Shuttle).

After a touching (and a bit tearful) Crew Farewell at ~2:25pm EST, hatches between ISS and Discovery were closed at 2:42pm. What an unbelievably successful mission!

Shuttle Undocking is scheduled tomorrow at 5:32am. [Since PMA-2 cabling has not been disconnected as originally planned for EVA-5, the automatic undocking software for the PMA-2 departure under Russian thruster control will still be used. The procedure provides for the crewmember to stand by with a stopwatch and to take over the automatic operational attitude control sequence manually if the software does not resume control after the period of free drift a few minutes after physical separation.]

For CDR Whitson and FE-2-16 Dan Tani, the day began with their fifth session with the INTEGRATED IMMUNE (Validation of Procedures for Monitoring Crew Member Immune Function) experiment, today collecting “dry” saliva samples for Dan five times during the morning hours (using special filter paper), plus blood samples from both, drawn by Dr. Scott Parazynski. All samples were then to be stored on the Shuttle for return. [The experiment integrates studies of neuroendocrine & immune responses in humans during and after long-term stay at ISS to provide an understanding for the development of pharmacological tools to countermeasure unwanted immunological side effects during long-duration missions in space (Moon
Immune protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Previous observations suggest that space flight might have a negative impact on different elements of the immune system; possible causes are the effects of microgravity on the body, stress and radiation exposure. However, the fact that there have been very few infections of astronauts makes it difficult to translate observations of immune system changes into a risk assessment. Integrated Immune is the first study that will comprehensively monitor the performance of the immune system before, during and after space flight missions of long and short durations.

Both crews worked busy morning hours to prepare for the hatch closing:

FE-1 Malenchenko disassembled the gas transfer equipment used for supplying Shuttle oxygen (O₂) for EVA prebreathing in the Airlock (A/L).

CDR Whitson collected and restowed the recharge hoses that were used for transferring O₂ and N₂ (nitrogen) from the Shuttle to the high-pressure tanks outside the A/L, onto their PMA-2 (Pressurized Mating Adapter 2) stowage brackets.

In the A/L, Peggy reconfigured Doug Wheelock’s EMU (Extravehicular Mobility Unit) from yesterday’s EVA-4 for her own use during the EVA-5 with Dan Tani next Thursday (11/8), which was deferred from the 10A docked period. Parazynski’s EMU was transferred back to the Shuttle. [EVA-5 tasks, estimated to take ~6.5 hrs, include: 1. Stow SSPTS (Station-to-Shuttle Power Transfer System) cabling; 2. Stow PMA-2/Lab umbilicals; 3. Retrieve Lab CETA (Crew & Equipment Translation Aid) light; 4. Temp stow Node-2 starboard tray avionics umbilicals; 5. Remove & stow ACBM (Active Common Berthing Mechanism) cover & survey CBM; 6. Install Node-2 “horseshoe” connectors on PDGF (Power & Data Grapple Fixture); 7. Mate a power cable; 8. Retrieve BSP (Baseband Signal Processor); 9. Configure PMA-1/FGB jumpers; 10. Remove & replace RPCM (Remote Power Controller Module) 4B-C on S0 truss; 11. Relocate N₂ VTE (Vent Tool Extender) bag; and 12. Install Node-2 handrail.]

FE-2 Clay Anderson used part of his final day on the station for some last-minute handover activities with his successor, Dan Tani.

Clayton also turned on the VOA (Volatile Organic Analyzer) which is currently in a troubleshooting phase. [After six consecutive hard shutdowns, VOA enters a diagnostic mode where the ground cannot communicate with it for several hours. That limit has almost been reached. In addition, VOA has exhibited several "funnies" as of late. Because a controlled powerdown might reset the instrument,
the FE-2 first switched it back on for allowing it to complete its activation and warm-up sequence, then commanded a “graceful” shutdown, from which ground will power-cycle the VOA RPC (Remote Power Controller) to return it to a good config.

Afterwards, Anderson joined Shuttle crewmembers in transferring return cargo to the Shuttle, going by uplinked detailed transfer lists and drawing on tagup support by ground specialists in Houston (MCC-H) and Huntsville (POC/Payload Operations Center).

For POC, Anderson and Tani packed payload samples and ICEPACs from MELFI (Minus-Eighty Laboratory Freezer for ISS) in two DCBs (Double Coldbags) for return on Discovery. MELFI will be powered down for undocking. [Three cold samples will be coming down: NUTRITION, TROPI, and IMMUNO.]

For the CSI-2/CGBA-5 (Commercial Generic Bioprocessing Apparatus 5/Science Insert-02) science experiment, Clay deactivated the payload, uncabled it for accessing its interior, removed the CSI-02 hardware and restored CGBA-5 to operation, powering it back on. [POC is looking forward to forward to receiving CGBA-5’s CHab and Cell Culture Hab back soon. No germination has as yet been observed in the Plant Hab but additional watering could initiate the process.]

FE-1 Malenchenko reconfigured two DCS-760 digital cameras used during the EVA, resetting them for nominal IVA use.

Yuri also conducted the (currently) daily job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway.

Later, the FE-1 performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Malenchenko also gathered weekly data on total operating time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s SOGS air revitalization subsystem for reporting to TsUP.

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2-16), TVIS treadmill (CDR, FE-2), RED resistive exercise device (CDR), and VELO bike with bungee cord load trainer (FE-1).
Clay then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

**Weekly Science Update (Expedition Sixteen – 2<sup>nd</sup>)**

**ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):** A memory card exchange was performed nominally on 10/30. Radiation measurements will continue to be performed throughout the Increment 16.

**ANITA:** Completed.

**BCAT (Binary Colloidal Alloy Test):** Reserve.

**CARDIOCOG-2:** Completed.

**CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):** Planned.

**CFE (Capillary Flow Experiment):** Planned.

**CHROMOSOME-2 (E14 SFP):** Completed.

**CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus):** On 11/2, the ground issued a command to the Cell Culture Hab to take the last sample on orbit before return. Once received on the ground, the specimens of CHab and Cell Culture Hab will be analyzed. Researchers found with ground testing that adding a few drops of water to the seed plugs in the Plant Hab will initiate germination due to the plugs drying out over time. They plan to implement the extra watering for future Plant Hab runs.

**CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):** Complete.

**CSLM-2 (Coarsening in Solid-Liquid Mixtures 2):** Planned.

**EarthKAM (Earth Knowledge Acquired by Middle School Students):** Complete.

**EMCH (Elastic Memory Composite Hinge):** Complete.

**EPO (Educational Payload Operation) Kit C:** Planned.

**ETD (Eye Tracking Device):** First session for Yuri Malenchenko has been performed nominally on 10/18.
Integrated Immune:  In Progress

**IMMUNO (Saliva Sampling):** Inc-15 first session samples are currently stowed in MELFI Dewar #2, to be returned on 10A.

**LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):** Complete.

**MISSE (Materials ISS Experiment):** Ongoing.

**MTR-2 (Russian radiation measurements):** Passive dosimeters measurements in DC1 “Pirs”.

**MULTIGEN-1:** Since last report on 10/25, the scientists have intensively observed the stem that appeared in the A2 Experiment Container. This stem grows very fast, and images acquired by EMCS indicate that there exist weak circumnutation motions in 0-g conditions. This was never observed in the past space experiments. On 10/30, side shoots have also appeared and the plant is in very healthy condition. 2D then 3D-recordings of stem circumnutation - in 0-g and 1-g conditions and in light and darkness conditions -are pursued for several days, making use of any possibility to get additional science between the planned power outages during the 10A mission. Before the end of the experiment run (scheduled on 11/08–11/10, under discussion with POIC), it is expected that flowering and pollenization will occur, leading possibly to seeds that may be collected by the science team after return with 1E mission.

**MSG-SAME (Microgravity Science Glovebox):** Complete.

**NEOCYTOLYSIS (E14 SFP):** Complete.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION:** Planned.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** n/a

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** Planned.

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** Planned.
Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observations): Planned.

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:34am EST [= epoch]):
Mean altitude -- 342.1 km
Apogee height -- 344.05 km
Perigee height -- 340.3 km
Period -- 91.38 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002737
Solar Beta Angle -- -56.6 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 25 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51292

Significant Events Ahead (all dates Eastern Standard, some changes possible):
11/05/07 -- STS-120/Discovery/10A undocking (FD14/5:32am)
11/07/07 -- STS-120/Discovery/10A deorbit burn (FD16/10:44am EST)
11/07/07 -- STS-120/Discovery/10A landing @ KSC (FD16/11:44am EST)
11/08/07 -- EVA-5 (Peggy Whitson/Dan Tani)
11/12/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-5)
11/14/07 -- Node-2 (Harmony) plus PMA-2 relocation to front of Lab
11/20/07 -- US EVA-10 (Peggy Whitson/Dan Tani)
11/24/07 -- US EVA-11 (Peggy Whitson/Dan Tani)
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below. Day 149 for Clayton Anderson. Flight Day 12 for STS-120/10A; Day 10 of Joint Ops. “It’s been a great day!” (MS1 Scott Parazynski).

.....and thank God for the Canadian MSS!

ISS/Shuttle crew wake-up: 1:38am EDT. Sleeptime: 5:38pm (ISS), 6:08pm (Shuttle).

P6 Solar Array Wing 4B has been fully restored to service and is deployed for its entire length of 110 ft (33.5 m), under its nominal stretch load of ~70 lbs (32 kg).

EVA-4 was completed fully successful in 7 hrs 19 min, accomplishing its objective by MS1 Scott Parazynski & MS2 Doug “Wheels” Wheelock, thanks to truly great team work:

- After approaching the damage site on the 4B inboard solar blanket on the OBSS/SSRMS (Orbiter Boom Sensor System/Space Station Remote Maneuvering System) combination, expertly “piloted” by Stephanie Wilson and Daniel Tani, Parazynski (EV1), closely monitored by Wheelock (EV2) at the 4B Mast base, inserted the first suture-like brace/stabilizer across the hinge at ~8:50am, cut a snarled guidewire and then installed the remaining four braces (~9:04-11:00am), each built the previous day by Peggy Whitson & George “Zambo” Zamka from existing jerry-rig materials (wires of specific lengths with a cufflink-like aluminum anchor on each end, plus lots of insulating tape). Having performed the delicate surgery, Physician-Astronaut Dr. Parazynski moved back to monitor the full extension of all remaining 4B Mast bays by the onboard crew, one-half bay at a time (finished at ~11:23am);
- Before terminating the spacewalk, the crew also completed the get-ahead task of retrieving APFR (Articulating Portable Foot Restraint) #3 for sharp-
edge inspection aboard the station.

[Official start time of the spacewalk was 6:03am EDT (~32 min ahead of schedule). It ended at 1:22pm. Total EVA duration (PET = Phase Elapsed Time) was 7h 19m, bringing the EVA total for the four 10A EVAs to 27h 14m. It was the 96th spacewalk for ISS assembly & maintenance and the 68th from the station (28 from Shuttle, 46 from Quest, 22 from Pirs) totaling 407h 52m. After today's EVA, a total of 113 spacewalkers (83 NASA astronauts, 20 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 595h 16m outside the station on building, outfitting and servicing. It also was the 118th spacewalk by U.S. astronauts.]

For CDR Whitson and FE-2-16 Dan Tani, the day began with their fourth session with the INTEGRATED IMMUNE (Validation of Procedures for Monitoring Crew Member Immune Function) experiment, today collecting “dry” saliva samples five times during the day (using special filter paper). [The experiment integrates studies of neuroendocrine & immune responses in humans during and after long-term stay at ISS to provide an understanding for the development of pharmacological tools to countermeasure unwanted immunological side effects during long-duration missions in space (Moon & Mars). Immune protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Previous observations suggest that space flight might have a negative impact on different elements of the immune system; possible causes are the effects of microgravity on the body, stress and radiation exposure. However, the fact that there have been very few infections of astronauts makes it difficult to translate observations of immune system changes into a risk assessment. Integrated Immune is the first study that will comprehensively monitor the performance of the immune system before, during and after space flight missions of long and short durations.]

Before spacewalk begin, FE-2 Anderson verified powerdown of onboard ham radio equipment (Kenwood in SM & Ericsson in FGB) to prevent RF interference with the EMUs.

Afterwards, Anderson rebooted all PCS (Portable Computer System) laptops at the Lab and Cupola Robotic Workstations (RWS) to ready them for the subsequent Robotics activities.

Also in preparation for the spacewalk, FE-1 Malenchenko retrieved a PBA (Portable Breathing Apparatus), consisting of an O₂ bottle and QDM (Quick-Don Mask), from a Node-1 ZSR (Zero-G Stowage Rack) locker and stowed it in the A/L EL (Airlock Equipment Lock). After the egress of the spacewalkers, Yuri returned the PBA to
its storage location on the ZSR.

Clay Anderson completed several outfitting tasks, first mounting hatch handle rings at the forward and aft hatches of Node-1, then moving to the Lab for similar guide assembly installations forward and aft.

The FE-2 also performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing.  

*Estimated offload time before termination (leaving ~5.25 kg in the tank): ~25 min.*

Later, Anderson deactivated the IWIS (Internal Wireless Instrumentation System, first downloading the recorded data of yesterday’s Shuttle ergometer workout by Doug Wheelock to the SSC-2 (Station Support Computer 2) laptop for downlink, then tearing down the four RSUs (Remote Sensor Units) in Lab, Node, FGB & SM (Service Module) as well as the fifth RSU on the Shuttle middeck and the NCU (Network Control Unit) for subsequent stowage on the station.

FE-1 Malenchenko meanwhile conducted the (currently) daily job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway.  

*This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons.*

Later, Yuri conducted the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the SM, including ASU toilet facilities systems/replaceables.

Anderson did the daily maintenance of the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

CDR Whitson again assisted the spacewalkers when they returned at ~1:25pm, handling CL (Crewlock) repress, joint A/L post-EVA ops, and setting up a DCS 760 camera for EMU glove inspection.

Also after the EVA, Malenchenko opened the protective shutter of SM window #9.

At ~2:55pm, Yuri supported the ground’s reactivation of the Elektron O2 generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating.
[During nominal operations a gas analyzer is utilized to detect hydrogen \( (H_2) \) in the \( O_2 \) line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

Peggy Whitson filled out the regular FFQ (Food Frequency Questionnaire), her second, on the MEC (Medical Equipment Computer). [Erroneously reported as completed on 11/1. By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1), TVIS treadmill (CDR, FE-1, FE-2), and RED resistive exercise device.

Clayton then transferred the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm
All ISS systems continue to function nominally, except those noted previously or below. **Day 148 for Clayton Anderson. Flight Day 11 for STS-120/10A; Day 9 of Joint Ops.**

ISS/Shuttle crew wake-up: 1:08am EDT. Sleeptime: 5:08pm (ISS), 5:38pm (Shuttle).

After crew wake-up, onboard activities moved briskly in continuation of preparations for tomorrow’s EVA-4 (see Note below). [EMU (Extravehicular Mobility Unit) suit and EVA tool configuration were completed, as well as almost all hazard assessments. The SSRMS (Space Station Remote Manipulator System) grappled and handed off the OBSS (Orbiter Boom Sensor System) extension arm to the SRMS (Shuttle RMS) for overnight parking, after completing the necessary MT (Mobile Transporter) translations from WS8 (Worksite 8) to WS3 and back.]

FE-2 Clay Anderson started his day with the IWIS (Internal Wireless Instrumentation System, first transferring the recorded data of the last IWIS structural dynamics data take (during P6 berthing) from the standard four RSUs (Remote Sensor Units) in Lab, Node, FGB & SM (Service Module) to the FS (File Server) laptop. The RSUs were then reset (programmed) for the next data take, later in the morning for Doug Wheelock’s workout on the Shuttle ergometer at ~5:50am EDT. [The second Lab RSU with accelerometer for recording the Shuttle exercise is currently located near the Orbiter’s cycle ergometer on the middeck.]

FE-1 Yuri Malenchenko had ~2.5 hrs scheduled for the periodic/long-term inspection of the pressure hull in the SM Working Compartment (RO), looking for any moisture, deposits, mold, corrosion and pitting behind panels 130, 134, 135, 138, 139 and underneath the TVIS treadmill.

Continuing the current round of the regular monthly preventive maintenance of RS (Russian Segment) ventilation systems, Yuri also spent time in the FGB cleaning...
interior panel ventilation grilles.

Additionally, Malenchenko conducted the regular task (currently daily) of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- & FGB-to-Soyuz tunnels, the DC1-to-Progress and FGB-to-Node-1 passageway (this is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons).

CDR Whitson worked on the UOP-6 (Utility Outlet Panel 6) PS-120 Junction Box on reconfigurations for the LAN (Local Area Network) for Node-2 integration. [Tasks included adding a mass storage cable (W-cable) to PS(Power Strip)-120, switching HRF (Human Research Facility) laptop power from HRF-1 to the W-cable, and configuring the ER5 (EXPRESS Rack 5) laptop with a PS-28 connection from the HRF-PC.]

Continuing Node-2 outfitting for ~2.5 hrs, the CDR and Clay Anderson installed the cabling for the ISL (Integrated Station LAN) Router, to be strung and connected to the ISL later this month after Node-2 relocation to the Lab front end.

In Node-1/Unity, Peggy also inspected and cleaned the FDS (Fire Detection & Suppression) system's bacteria filter und SDs (smoke detectors). [There are a total of two SD units in Node-1 (NOD1D3-1 & NOD1D3-03). Inspection included the Kapton tape at the rear of vacuum for damage or wear. If repair was necessary, photo documentation was required.]

On the IATCS (Internal Active Thermal Control System in the Lab, the FE-2 disconnected the AmiA (Antimicrobial Applicator), relieved the pressure in its canister and stowed AmiA for return. Afterwards, Clayton removed low-flow jumpers from ITCS locations, performed a flush and took an OPA (Ortho-Phthalaldehyde) sample for return on the Shuttle. [AmiA introduced OPA, an antimicrobial agent, into the Lab IATCS coolant fluid. An NH₃ (ammonia) sample was not required.]

Yuri performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]
Clay later worked on the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Malenchenko again had about 60 minutes for general crew orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

In preparation for tomorrow’s EVA, the CDR set up two DCS-760 digital camera batteries for recharge in the Battery Charger in the Airlock (A/L).

At ~2:50am EDT, the FE-1 downlinked two PAO TV messages of greetings during VHF comm passes over RGS (Russian Ground Site) to TsUP/Moscow, one to a much-valued member of the Moscow Region Administration, the other to the Balashiha Military Prosecutor’s Office on the 25th Anniversary of its formation.

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (FE-1, FE-2/full-time), RED resistive exerciser (CDR, FE-1) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy transferred the crewmembers’ exercise data files to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

After completing A/L EL (Equipment Lock) configuration for the 4th spacewalk tomorrow and conducting several extensive reviews and teleconferences of EVA-4 timeline, procedures, hazard avoidance, etc. with all crewmembers and ground specialists, the two spacewalkers, Scott Parazynski (EV1) and Doug Wheelock (EV2), will begin their “campout” in the “Quest” A/L, starting mask prebreathe at ~3:53pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi. Sleep for the ISS crew begins at 5:08pm, for the Shuttle crew at ~5:38pm.

**EVA-4 Overview:** Primary focus of Scott & Wheels’ outside venture will be inspection and repair of the torn P6 Solar Array Wing (SAW). Afterwards, if certain criteria are satisfied (see below), EV1 & EV2 will get out of the way and monitor the deployment of the wing. Subsequent get-ahead tasks include retrieval of two APFRs (Articulating Portable Foot Restraints, #3 & #7) for inspection, if time available and room in Airlock, mating of a PDGF (Power & Data Grapple Fixture) “horseshoe” connector at Node-2, and installation of the Node 2 HR (hand rail) #371 that was deferred from EVA-2. After the regular overnight Campout by the
spacewalkers for denitrogenation/pre-breathe, egress is expected around 6:35am EDT tomorrow morning. EVA duration will again be about 6.5 hrs.  

Repair Concept: There are two damaged areas on the SAW 4B inboard blanket: a large rip from the hinge between array segments (“bays”) 35 & 36, and a small gap between bays 37 & 38. To stabilize the blanket in those areas, the affected bays will be “stitched” across the respective hinges (35/36 & 37/38) with five jerry-rigged wire clamps similar to dress shirt cufflinks, utilizing existing pin holes for inserting the cufflink anchors and requiring one-side access only. Because of the location of the pin holes, each of the “stitches” fortunately will run along spine-like rigidizing lines, called “stiffeners”. Criteria for going ahead with the subsequent deployment of the 4B Array Mast include:

- Snag on 4B right blanket eliminated;
- Array electrically safed by hinge wire being cut & end secured;
- Five stabilizers installed across hinge (priority from inboard to outboard);
- Guide wire cleared from creating additional hazards (grommet snag, FOD, free float); and
- Low tension mode during deployment visually confirmed and blanket stability monitored after each one-half bay deploy (i.e., stabilizers remaining in place, blanket deploying symmetrically, no additional snags, etc.).

Why 4B Panel Repair is required:

- Array is believed to be stable for the near term;
- However, it needs to be able to take loads over the long term;
- Right now, about 3 feet of the 15-ft long hinge are missing, which is designed to distribute a load of ~70 lbs across it, i.e. there is a load concentration;
- Therefore, the blanket could tear further over time;
- If the blanket tears too much, the array cannot be stabilized and would have to be jettisoned (loss of ~20 kW of power);
- Thus, P6 deployment is the number one priority for the rest of the mission.

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:38am EDT [= epoch]):
Mean altitude -- 342.2 km
Apogee height -- 344.5 km
Perigee height -- 339.8 km
Period -- 91.38 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003515
Solar Beta Angle -- -62.8 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 145 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51259

Significant Events Ahead (all dates Eastern, some changes possible. Also: Stage 10A is under reassessment):
11/03/07 (FD11) -- EVA-4 (Parazynski/Wheelock) ~6:35am EDT
11/04/07 -- 50-Year Anniversary of launch of female dog Laika, first living space passenger, into orbit
11/04/07 -- 2:00am: DST ends, ST begins
11/05/07 -- STS-120/Discovery/10A undocking (FD14/5:32am)
11/07/07 -- STS-120/Discovery/10A deorbit burn (FD16/10:44am EST)
11/07/07 -- STS-120/Discovery/10A landing @ KSC (FD16/11:44am EST)
TBD -- relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
TBD -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.
All ISS systems continue to function nominally, except those noted previously or below. Day 147 for Clayton Anderson. Flight Day 10 for STS-120/10A; Day 8 of Joint Ops.

ISS/Shuttle crew wake-up: 12:08am EDT. Sleeptime: 4:38pm (ISS), 5:08pm (Shuttle).

Mission Schedule Changes: EVA-4 for fixing the ripped P6 4B inboard blanket has been deferred one more day, to 11/3 (Saturday), to give crewmembers and ground teams more time for careful preparations. Also, the originally planned Shuttle deorbit & landing times on 11/7 have been shifted from ascending leg entries to descending leg entry opportunities. The latter not only significantly improve the crews’ timeline and sleep shift but also provide daylight landing at KSC or EDW. The change in sleep cycles results in tonight’s sleep time being delayed by 90 minutes (from the original 3:08pm to 4:38pm for ISS (5:08pm for STS); wakeup: 1:08am). Sleep time will be shifting later every day.

SAW Repair: Most of the crew’s activities today dealt with timeline reviews, gathering tools and preparing equipment for Saturday’s EVA-4 spacewalk. Main focus today and tomorrow, besides readying EMUs and gloves, is on building jerry-rigged equipment for stabilizing the SAW (Solar Array Wing) hinge, by following uplinked plans and instructions developed overnight by MCC-H specialists. Being constructed, with onboard resources & available tools, are three sizes of Hinge Stabilizers:- two long, two medium & two short, using components from the Clamp & Bracket Kit and Large & Small Gauge Pin Kit. The Hinge Stabilizers/Spanners, essentially simple 12-gauge wire lengths fitted at each end with short aluminum strips, work similarly to tuxedo shirt cufflinks: each end will be fed through a hole in the SAW on opposite sides of the separated hinge. The Stabilizers even have a safety loop for an EVA tether, to reduce the risk of their floating away. After clearing the snagged guide wire, EV1 will clear the hinge pins and then install the
hinge stabilizer tools (spanners).]

Why is the 4B Panel Repair required?

• The array is believed to be stable for the near term;
• However, the array needs to be able to take loads over the long term;
• Right now its 15-ft hinge, which should distribute a load of ~70 lbs, is missing about 3 feet, resulting in load concentration;
• Therefore, over time the blanket could tear further;
• If the blanket tears too much, the array cannot be stabilized and would have to be jettisoned (loss of ~20 kW of power);
• That makes P6 deployment the number one priority for the rest of the mission.

EVA-4 Preparations: In addition, crewmembers in space and engineers on the ground, particularly also Canadian MSS (Mobile Service System) specialists, are tackling the second difficult problem of the spacewalk: how to get the spacewalkers to the site of the damage for the repair efforts. [The plan is for the SSRMS (Space Station Remote Manipulator System), to grapple and handoff the OBSS (Orbiter Boom Sensor System) extension arm to the SRMS (Shuttle RMS) tomorrow for overnight parking, after having moved on the MT (Mobile Transporter) from WS8 (Worksite 8) to WS3 and back. On Saturday/EVA day, the SSRMS will regrapple the OBSS at its middle PDGF (Power & Data Grapple Fixture). EV1 (Parazynski) and EV2 (Wheelock) will install a PAD/WIF (Portable Foot Restraint Device/Worksite Interface Fixture) adapter, WIF extender and APFR (Articulating PFR) on the OBSS, which then provides EV1 transportation & support for moving to and fixing the torn blanket bays. Wheels’ main role is to support Scott and to provide/relay GCA (ground control assist). Unpowered OBSS time will be minimized to preserve its science instrumentation equipment. A get-ahead task for EV2 will be the retrieval of an APFR which is suspect of having cut Wheels’ glove and past EVA gloves, for IV inspection.]

In the morning right after wakeup, Malenchenko terminated his second MBI-12 SONOKARD experiment session by taking the recording device from his SONOKARD sports shirt pocket. Later, Yuri copied the measurements to the RSE-MED laptop for subsequent downlink to the ground. [SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]
Also before breakfast, CDR Whitson and FE-2-16 Tani collected their third saliva samples for the new INTEGRATED IMMUNE experiment payload. [This experiment integrates studies of neuroendocrine & immune responses in humans during and after long-term stay at ISS to provide an understanding for the development of pharmacological tools to countermeasure unwanted immunological side effects during long-duration missions in space (Moon & Mars). Immune protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature.]

The FE-1 serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated later tonight. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated on 10/30.]

FE-2 Anderson worked on the newly installed AmiA (Antimicrobial Applicator), removing its insulation jackets to allow temperatures to equalize. [After its installation a couple of days ago, flow through AmiA has been completed and the canister isolated. The AmiA introduces OPA (Ortho-Phthalaldehyde), an antimicrobial agent, into the Lab IATCS (Internal Thermal Control System) coolant.]

Clay completed more outfitting tasks in Node-2, disconnecting a nitrogen (N\textsubscript{2}) line to the external Airlock hi-P tanks, closing all associated panels, taking documentary photographs of Node-2 closeout panels after the recent launch bolt removal, transferring stowage to Harmony for ZSR (Zero-G Stowage Rack) loading and then moved to Node-1 to install a Hatch Handle Guide Assembly on the starboard side.

CDR Whitson performed major IFM (In-flight Maintenance) on the Resistive Exercise Device (RED), replacing all canister pulley cables (done after every 53,515 cycles, based on life cycle testing results & safety controls), afterwards concluding with the standard Flexpac canister load calibration as required after cable replacements. (Last time done: 7/30/07). [The on-orbit calibration of the Schwinn RED cans re-establishes the relationship of specific load settings with a specific number of pulls per setting, followed by recording of the load values measured with a calibration tool and steel handles from the on-orbit calibration kit.]

As part of the regular monthly preventive maintenance of RS (Russian Segment) ventilation systems, Yuri spent time in the FGB (Funktsionalnyi-Grusovoi Blok), cleaning up and servicing the detachable VT7 fan screen guards (grilles) of the TCS/SOTR (Thermal Control System)’s gas-liquid heat exchangers (GZhT4) as well as replacing the PS1,2 dust collector filters.
Clay conducted the weekly 10-min. CWC audit as part of the continuing WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week.]

Anderson also took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]

CDR-16 Whitson and FE-2 Anderson filled out the regular FFQ (Food Frequency Questionnaire), his 16th, her second, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

FE-1 Malenchenko conducted the regular task (currently daily) of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- & FGB-to-Soyuz tunnels, the DC1-to-Progress and FGB-to-Node-1 passageway (this is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons);

Yuri also performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). [Regular daily SOZh maintenance consists, among else, of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]

Anderson worked on the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).
Afterwards, Clayton transferred the crew’s exercise data file to the MEC for downlink.

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:

07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**
All ISS systems continue to function nominally, except those noted previously or below. Day 146 for Clayton Anderson. Flight Day 9 for STS-120/10A; Day 7 of Joint Ops.

ISS/Shuttle crew wake-up: 12:38am EDT. Sleeptime: 4:08pm (ISS), 4:38pm (Shuttle).

**Mission Schedule Change:** The IMMT (ISS Mission Management Team) this morning deferred EVA-4 from tomorrow to Friday (11/2). Top priority on board & ground has been re-directed from inspecting the Stbd SARJ (Solar Alpha Rotary Joint) to fixing the ripped P6 4B Solar Array Wing (SAW) blanket as best as can be done, as long as the Discovery crews are on ISS. EVA-5 (Whitson/Malenchenko) may become a Stage EVA. Four special teams (Damage/root cause, EVA Assessment, Solar array constraints, Stage ops assessment) have been designated to study the situation and develop a new EVA-4 timeline for alleviating the current structurally unsound SAW condition. Stbd SARJ meanwhile remains in Directed (fixed) Position, out of Autotrack.

CDR Whitson assisted MS4 Paolo Nespoli in his first session with the ASI (Italian Space Agency) HPA (Hand Posture Analyzer) experiment by setting up the hardware and later tearing it down for stowage. [HPA is used to study the crew’s ability to use the upper limb in weightlessness. In zero-G, fatigue can have major effects on the hand and forearms of an astronaut. Thus, experiments based on the utilization of the upper limbs are assuming increasing significance in the framework of Human Physiology in space. By using different scientific protocols it will make it possible to determine the degradation in performance affecting the muscle-skeletal apparatus in weightlessness and help to facilitate studies on learning mechanisms for motor control. The results of such experiments can help to find methods of]
countering fatigue, thus maintaining the condition and improving the performance of astronauts, which is of greater importance with proposed longer-term missions. Such methods can also be used on Earth for the treatment of subjects with local traumas, muscle atrophy, or diseases of the CNS (Central Nervous System). The HPA, which was used before by Ed Lu and Mike Foale on Increments 7 & 8, consists of two dynamometers (HGD-PFD/Handgrip & Pinch Force Dynamometers) for measuring handgrip and pinch forces, together with a gloved instrumented device (PAG/Posture Acquisition Glove) worn by the astronaut, which allows for measurement of the bending angles on individual fingers. PAG is attached to an electronic box (WEB/Wrist Electronic Box), which houses an inertial tracking system made up of accelerometers and gyroscopes in order to determine the linear and angular motion, rotation and acceleration of the hand and forearm in all directions.

FE-1 Malenchenko spent about 90 minutes of major equipment servicing in the ASU toilet facility, changing out replaceable ASU parts with new components, viz., two receptacles (PR & MP), four hoses, a T-connector, an elbow fitting, an indicator, a filter insert (F-V), the pretreat container (E-K) with its hose. All old parts were discarded as trash. [E-K contains five liters of pre-treat solution, i.e., a mix of $H_2SO_4$ (sulfuric acid), $CrO_3$ (chromium oxide, for oxidation and purple color), and $H_2O$ (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]

Besides ASU maintenance, the FE-1 also performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). [Regular daily SOZh maintenance consists, among else, of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]

Later, Malenchenko took CWC (Contingency Water Container) #1064 to the Russian Segment (RS) for the periodic (about twice a month) replenishing of the Elektron oxygen generator’s water supply for electrolysis, filling the KOV thermal loops’ EDV container. Once filled, the EDV was connected to the BPK transfer pump for processing. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

Peggy Whitson continued outfitting work in Node-2, installing ITCS (Internal Thermal Control System) sampling adapters and DDCU (DC-to-DC Converter Unit) protective covers on two racks, on the deck (NOD2D4) and overhead (NOD2O4).
Also in Node-2, FE-2-16 Dan Tani removed AVM (Anti-Vibration Mount) launch brackets from Harmony’s CCAA (Common Cabin Air Assembly). [The CCAAs, located in the Lab, Airlock and now also in Node-2, remove excess heat & excess moisture from the atmosphere. Depending on the module heat loads, the atmosphere flow-rate can range from 8,490 to 14,150 L/min (300 to 500 cfm). The CCAA/air conditioners are designed to be repairable by ORUs (Orbital Replacement Units).]

Yuri Malenchenko conducted the regular task (currently daily) of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- & FGB-to-Soyuz tunnels, the DC1-to-Progress and FGB-to-Node-1 passageway (this is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons);

In the A/L, the CDR terminated the EVA-3 EMU battery recharge in the BSA (Battery Stowage Assembly). Also on her schedule was recharging four batteries for upcoming DCS760 digital cameras ops during EVA, while Clay was to take care of METOX (Metal Oxide) canister regeneration.

The two U.S. Flight Engineers, Anderson and Tani, joined for another 4 hrs of handover activities, used by Clay to familiarize his successor Dan with specific onboard tasks. In addition, there are “generic” handovers where crewmembers are joining to complete various designated standard tasks.

Yuri again had about 45 minutes for general station familiarization and acclimatization, as is standard daily rule for the first two weeks after starting station residency.

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1), TVIS treadmill (CDR, FE-2), and RED resistive exercise device (CDR, FE-1, FE-2, FE-2-16).

Afterwards, Peggy transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Shortly before sleep time, FE-1 Malenchenko set up the new Russian MBI-12 SONOKARD (Sonocard) payload and started his second experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the
Skin measurements are recorded on a data card for return to Earth. **[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]**

At ~5:05am EDT, Yuri supported a PAO TV interview with the State TV Broadcasting Company’s “Kultura” Channel in Moscow, which observes its 10th Anniversary tomorrow (11/1). In that time, “Kultura” has aired many shows dedicated to space. [“When you are on the ground getting ready for your flight, do you watch TV Channel Kultura shows, and what appeals to you most of all in them?”; “Yuri, this is your fourth space flight. It is known that every minute of ISS residents is accounted for. Do you have any leisure time left under these conditions? If yes, how do you personally spend it?”]

At ~7:48am, all ten station residents participated in a PAO TV joint crew news conference with U.S. media at NASA Centers, European media at the Esperia Mission Information Center at Hotel Aleph in Rome, Italy, and Russian news media at TsUP-Moscow.

Afterwards, both crews also joined for the traditional all-crew photo shoot.

**IV-CPDS Update:** Troubleshooting attempts by Peggy Whitson on the IV-CPDS (Intravehicular Charged Particle Directional Spectrometer) yesterday by reformatting its memory drive were not successful. The instrument is considered hard-failed and will be returned on a future flight. **[The IVCPDS was a secondary radiation detection measurement tool; the primary radiation measurement tool is the TEPC (Tissue Equivalent Proportional Counter).]**

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:

- [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
- [http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/)
- [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** (as of this morning, 8:24am EDT [\(=\) epoch]):
Mean altitude -- 341.9 km
Apogee height -- 343.7 km
Perigee height -- 340.1 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002712
Solar Beta Angle -- -65.0 deg (magnitude decreasing, was highest ever!)
Orbits per 24-hr. day -- 15.76
Mean altitude gain in the last 24 hours -- 110 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51228

**Significant Events Ahead** *(all dates Eastern, some changes possible. Also: Stage 10A being re-assessed!):*

11/02 (FD11) -- EVA-4 (Parazynski/Wheelock)
11/04/07 -- 2:00am: DST ends, ST begins
11/05/07 -- STS-120/Discovery/10A undocking (FD14/12:56am)
11/07/07 -- STS-120/Discovery/10A deorbit burn (FD16/4:09am EST)
11/07/07 -- STS-120/Discovery/10A landing @ KSC (FD16/5:11am EST)
   TBD -- relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
   TBD -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osf/iss_reports/index.htm
ISS On-Orbit Status 10/30/07

All ISS systems continue to function nominally, except those noted previously or below. Day 145 for Clayton Anderson. Flight Day 8 for STS-120/10A; Day 6 of Joint Ops. [Mission Extension: see Note below.]

Truss segment P6 was successfully installed at the P5 element, at the end of the port-side truss.

Also, all P6 umbilicals were connected without issues.

P6 Solar Array Wing 2B was deployed by the crew nominally (~11:25am).

Deployment of SAW 4B, consisting of two photovoltaic blankets, each made up of 31 individual segments (“bays”), was aborted at ~12:25pm when one of the bays showed a tear at its corner (not clear at this time whether this happened during deployment or retraction). [See photo below.]

EVA-3 was completed fully successful, accomplishing all objectives and lasting 7h 8m.

MS1 Scott Parazynski (EV1) & MS 3 Doug Wheelock (EV-2) –
  ● Attached P6 to P5 (with SSRMS);
  ● Connected P5-to-P6 umbilicals;
  ● Removed the SSU (Sequential Shunt Unit) shroud;
  ● Released P6 outboard Radiator cinch;
  ● Inspected portside SARJ (Solar Alpha Rotary Joint), [no shavings found];
- Transferred spare MBSU (Main Bus Switching Unit) with SRMS from Shuttle PLB to ESP-2 (External Storage Platform 2); and
- Reconfigured P1 & S1 SFUs (Squib Firing Units) after their use for the radiator deployments.

[Official start time of the spacewalk was 4:45am EDT (~43 min ahead of schedule). It ended at 11:53am. Total EVA duration (PET = Phase Elapsed Time) was 7h 8m, bringing the EVA total for the first three 10A EVAs to 19h 55m. It was the 95th spacewalk for ISS assembly & maintenance and the 67th from the station (28 from Shuttle, 45 from Quest, 22 from Pirs) totaling 400h 33m. After today's EVA, a total of 111 spacewalkers (81 NASA astronauts, 20 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 587h 57m outside the station on building, outfitting and servicing. It also was the 117th spacewalk by U.S. astronauts.]

Before breakfast, CDR Whitson and FE-2-16 Tani (camping out in the Airlock) collected their second saliva samples for the new INTEGRATED IMMUNE experiment payload. [This experiment integrates studies of neuroendocrine & immune responses in humans during and after long-term stay at ISS to provide an understanding for the development of pharmacological tools to countermeasure unwanted immunological side effects during long-duration missions in space (Moon & Mars). Immune protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature.]

FE-1 Yuri Malenchenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated at ~3:05pm EDT. Regeneration of bed #2 follows tomorrow. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]

FE-2 Clay Anderson, CDR Peggy Whitson and Malenchenko continued with Node-2 outfitting. Clay and Yuri had ~70 min set aside for removing launch restraint bolts from closeout panels, while Peggy configured one (of two) Node-2 RSR (Resupply Stowage Rack) for on-orbit operations, installing a K-BAR (Knee-Brace Assembly Replacement) and restowing a "bad" K-BAR.

Afterwards, Anderson worked on the U.S. OGS (Oxygen Generation System) in the Lab, safing an SPS (Secondary Power System) cable connector with Kapton tape, to cover all metal parts.

Whitson performed troubleshooting on the failed IV-CPDS (Intravehicular Charged
Particle Directional Spectrometer), reformatting its memory drive and loading an executable file from the MEC (Medical Equipment Computer) to verify proper functioning after the reformatting. [The IV-CPDS memory drive was found to be corrupted during the first part of troubleshooting on 10/1. The IV-CPDS is used for taking background radiation readings in the cabin.]

Malenchenko conducted the first recharge of the Motorola Iridium-9505A satellite phone brought up on Soyuz 15S, a monthly routine job. The FE-1 took care of the recharge, completing the process and cleaning up at about 10:55am EDT. [After retrieving it from its location in the Soyuz TMA-11/15S descent module (BO), Yuri initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion, the phone was returned inside its SSSP Iridium kit and stowed it back in the BO’s operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an “undershoot” ballistic reentry). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap.]

In the course of his day, Yuri also –

- Conducted the regular task (currently daily) of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- & FGB-to-Soyuz tunnels, the DC1-to-Progress and FGB-to-Node-1 passageway (this is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons);
- Terminated BSA (Battery Stowage Assembly) recharge of EVA-2 EMU batteries from EVA-2;
- Performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables,
- Performed the periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), by removing the PCMCIA memory card #939 from the AST spectrometer’s slot and replacing it with card #936 to continue AST ops,
- Conducted his second run of the Russian "Diatomeya" ocean observations program, using the HDV (High Definition Video) camcorder to obtain imagery of bio-luminescent glow of high-production zones in the Indian Ocean (possibly visible as light greenish spots of low intensity), and
- Supported reactivation of the Elektron O2 generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating.
[During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

Peggy Whitson, assisted by Dan Tani, performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. [Estimated offload time before termination (leaving ~5.25 kg in the tank): ~30 min.]

Malenchenko again had about 50 minutes for general station familiarization and acclimatization, as is standard daily rule for the first two weeks after starting station residency.

The two U.S. Flight Engineers, Anderson and Tani, joined for a period of handover activities, used by Clay to familiarize his successor Dan with specific onboard tasks.

CDR Whitson again assisted the spacewalkers when they returned at ~11:53am, handling CL repress, joint A/L post-EVA ops, and setting up a DCS 760 camera for EMU glove inspection.

Later, Dan Tani reconfigured the cameras for photographing the SAW deployment.

Clay performed the regular EVA photo downlink to MCC-H, initiated the recharge of the EVA-3 EMU batteries in the “Quest” BSA, and started METOX (Metal Oxide) canister regeneration in the A/L.

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2, FE-2-16), RED resistive exercise device (FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Yuri transferred the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

**10A Mission Extension:** Mission 10A has been extended by one day to accommodate a rest day (Friday) inserted between EVA-4 and EVA-5. EVA-4, originally planned for 4h 45m, will be extended to full duration (6.5 hrs) to dedicate 100% of the spacewalk to more detailed attention to the Stbd SARJ issue. An R&R repair of a SARJ TBA (Trundle Bearing Assembly) or DLA (Drive Lock Assembly) is currently not planned. The T-RAD (Tile Repair Ablator Dispenser) demonstration in
the Shuttle PLB originally scheduled for EVA-4 will be deferred to a later date. EVA-5 timeline remains unchanged from pre-mission plan.

Background info on SARJ: Each of the two SARJs enables the solar arrays to always point to the sun by rotating like a Ferris wheel. The port SARJ on P3/P4 provides tracking for the P4 & P6 solar arrays; the starboard SARJ provides tracking for the S4 & S6 solar arrays (S6 to be delivered on 15A). The SARJ can rotate 360 degrees clockwise and counterclockwise. SARJ also provides the structural interface between the P3 or S3 and P4 or S4 elements. It includes hardware to route power & data through the rotating SARJ interface to the outboard truss segment. The SARJ includes an inboard and an outboard race ring, which provide the structural connection between the P3 & P4 elements. Along the circumference of each race ring are gear teeth that mesh with the DLA (Drive Lock Assembly) pinion gear to rotate the SARJ. The outboard race ring is used by the DLA for rotating the SARJ. SARJ inboard & outboard race rings are held together by 12 equally-spaced trundle bearings. Each trundle bearing is fixed to the inboard race ring and is clamped onto the outboard race ring with a roller interface to allow for SARJ rotation. There are three rollers on each trundle bearing that interface with the outboard race ring, - an inner and outer upper roller and a center roller. Each roller consists of two bearings: the primary and journal bearings. The primary bearing rotates. If the primary bearing seizes up, the journal bearings will begin rotating. The journal bearing is designed to operate for about 30 days. There are micro switches in the trundle bearing that allow the ground to know if the journal bearing is rotating.

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:

04/15/09 -- **Constellation’s Ares I-X Launch.**
ISS On-Orbit Status 10/29/07

All ISS systems continue to function nominally, except those noted previously or below. Day 144 for Clayton Anderson. Flight Day 7 for STS-120/10A; Day 5 of Joint Ops. Underway: Week 2 of Increment 16.

ISS/Shuttle crew wake-up: 12:38am EDT. Sleeptime: 4:08pm (ISS), 4:38pm (Shuttle).

Today’s four major assembly activities were completed successfully and on time:

- **Heat rejection Radiators (PVRs) #1/outboard & #3/inboard on the S1 segment were unfolded** (12:52am-1:52am) during crew sleeptime (but observed by crewmembers);

- **P6 truss segment, with retracted solar arrays, was handed off to the SRMS (Shuttle Remote Maneuvering System) from the SSRMS (Space Station RMS), after overnight “parking”;

- **Mobile Transporter (MT), with the SSRMS based on it, has rolled on its rails to Worksite 8 (WS-8) on the station’s port side;

- **P6 truss handed back to & grappled by the SSRMS** for overnight parking until tomorrow’s installation on the P5 truss.

[Crewmembers on the SSRMS & SRMS controls were Zamka, Wilson, Anderson & Tani.]

After breakfast, FE-2 Anderson worked with the DCS 760 EVA cameras, deconfiguring them and using specific items from them for preparing DCS 760 camera #1038, equipped with 28-mm lens, for tomorrow’s EVA-3, leaving it
connected for battery charging.

In support of upcoming payload data transferring from the BSPN payload server for subsequent downlink on OCA comm (via the Russian RSS1 laptop to a PCMCIA flash card), FE-1 Malenchenko performed the periodic time synchronization between the RSS1 and the BSPN, after testing functionality by checking data comm between the two computers and synching RSS1 to station time.  

Before RSS1/BSPN synchronization, the RSS1 is updated with the exact time as per the station clock (which in turn is synchronized daily from RGS/Russian Ground Site). Experiment control application is a payload file transfer program called ShellForKE.

As a major activity on their timelines, CDR Whitson and FE-2-16 Tani today worked in Node-2, outfitting Harmony’s four Avionics Racks for on-orbit operations. Configuring the AV racks (NOD2D4, NOD2S4, NOD2O4, NOD2P4) in Bay 4 involved disengaging launch restraints, installing left & right pivot fittings for rack rotation (away from wall), K-Bars, and DDCU (DC-to-DC Converter Unit/N2P3A) Parallel Connector, removing Knee Braces for each rack, rack rotation to upright, and closing out.

Malenchenko performed monthly maintenance on the Russian IK0501 GA (gas analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System, deactivating the unit and replacing its CO$_2$ filter assembly (BF) with a new unit from FGB stowage (replaced last: 9/18). After ensuring good seals on the instrument’s base and no leaks around the installed filter, Yuri reactivated the GA and stowed the spent BF for disposal. IK0501 is an automated system for measuring CO$_2$, O$_2$, and H$_2$O in the air as well as the flow rate of the gas being analyzed.

In the course of his busy day, Yuri also –

- Conducted the regular task (currently daily) of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- & FGB-to-Soyuz tunnels, the DC1-to-Progress and FGB-to-Node-1 passageway (this is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons);
- Completed another radiation data monitoring & logging session for flow & dose power data with the Matryoshka-R radiation payload and its LULIN-5 electronics box (accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel);
- Terminated the nitrogen (N$_2$) gas transfer from Discovery to the ISS high-pressure storage tanks (at least 28 lbs of N$_2$ have been transferred as of last evening), and
- Performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables.

Clay Anderson worked on the IWIS (Internal Wireless Instrumentation System), reprogramming its RSUs (Remote Sensor Units) for the next data take.  

IWIS has RSUs in the Lab and Node-1 plus the NCU (Network Control Unit) in the Lab, all power-connected to UOPs (Utility Outlet Panels) instead of running on batteries.

Peggy Whitson performed the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload.  

The incubator is controlled from the ground with automatic video downlinked to Earth.

FE-1 Malenchenko and FE-2-16 Tani again had about 60 minutes each for general station familiarization and acclimatization, as is standard daily rule for the first two weeks after starting station residency.

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1. FE-2/full time), and RED resistive exercise device (FE-1).

Yuri transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:23am EDT, Paolo Nespoli conducted a ham radio exchange with students at IIS Deambrosis-Natta in Sestri Levante & the Engineering Faculty of the University of L’Aquila in L’Aquila, Italy. Questions to the crew were uplinked by ARISS (Amateur Radio on ISS) beforehand.  

“Perché hai deciso di intraprendere questo viaggio?”; “Quale è l’emozione più forte che si prova nel primo volo spaziale?”; “Dalla ISS è possibile riconoscere ad occhio nudo la catena montuosa del Gran Sasso?”; “E’ più una passione o un lavoro?”; ”Ogni quanti giorni bisogna correggere l’orbita della ISS?”

At ~1:45pm EDT, all crewmembers, except for Parazynski, Wheelock, Zamka & Nespoli (all being already busy with EVA-3 preps), supported another PAO TV event with three news media from the new “Harmony” module,- ABC News (Gina Sunseri), NBC News (Tom Costello), and CNN (T.J. Holmes).
In preparation for tomorrow’s EVA-3 by Scott Parazynski & Doug Wheelock, Scott worked in the Airlock (A/L), preparing their EMU/spacesuits and the A/L EL (Equipment Lock), swapping EMU batteries, replacing METOX (Metal Oxide) canisters and checking out the REBA powered suit equipment and tools.

After completing A/L EL configuration for the third spacewalk tomorrow and conducting a joint one-hour review of EVA-3 timeline & procedures with all crewmembers at ~12:40pm, the two spacewalkers, Parazynski (EV1) and Wheelock (EV2), began their “campout” in the “Quest” A/L, starting mask prebreathe at ~2:53pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi. Sleep for the ISS crew begins at 4:08pm, for the Shuttle crew at ~4:38pm.

EVA-3 begins tomorrow (Tuesday) at ~5:28am EDT and lasts an estimated 7h, nominally ending at 12:28pm. Paolo Nespoli and Peggy Whitson will again be IV-1 and IVA-2 (Intravehicular) crewmembers, assisting particularly with the Campout. [Main objectives of EVA-2 are:
  ● Attach P6 to P5 (with SSRMS);
  ● Connect P5 to P6;
  ● Remove SSU (Sequential Shunt Unit) Shroud;
  ● Release P6 outboard Radiator Cinches;
  ● Inspect portside SARJ (Solar Alpha Rotary Joint), [late timeline change];
  ● Transfer spare MBSU (Main Bus Switching Unit) with SRMS from Shuttle PLB to ESP-2 (External Storage Platform 2); and
  ● Reconfigure P1 & S1 SFUs (Squib Firing Units) after their use for the radiator deployments.]

Stbd SARJ Inspection Update: Because of yesterday’s discovery of metal shavings sticking to the Stbd SARJ’s race-ring, brackets and other areas under the #2 thermal cover (of 22 total), the IMMT (ISS Mission Management Team has decided to modify tomorrow’s EVA-3 timeline by adding an inspection of the identical SARJ on the opposite port side. Subsequent steps will depend on the findings of the ongoing investigation, up to and including possible R&R of the trundle bearing with an onboard spare, if required. New insight is also expected by the analysis of the “shaving” samples collected by EV3 Tani, after their return on STS-120.

Quick-Look of tomorrow’s (FD8) Events (EDT):
  ● 12:38am: Both crews wake
  ● 01:13am: EVA-3 preps resume
  ● 03:08am: SSRMS moves P6 truss to P5 pre-install position
  ● 05:28am: EVA-3 begin
  ● 06:03am: P5 installation on P6 & umbilicals mating begin
● 10:33am: P6 Thermal Radiator deploy
● 11:58am: P6 2B SAW (Solar Array Wing) redeploy begins
● 12:38pm: EVA-3 ends
● 01:28pm: P6 4B SAW redeploy begins
● 04:08pm: ISS Crew sleep
● 04:38pm: Shuttle Crew sleep
● 12:38am: Both crews wake up for FD9.

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 8:58am EDT [= epoch]):
Mean altitude -- 342.1 km
Apogee height -- 343.9 km
Perigee height – 340.2 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.00027
Solar Beta Angle -- -64.5 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude gain in the last 24 hours -- 170 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51197

Significant Events Ahead  (all dates Eastern, some changes possible):
● 10/30 (FD8) -- EVA-3  (5:28am-12:38pm; Parazynski/Wheelock)
● 10/30 (FD8) -- P6 install on P5 truss (~6:03am)
● 11/01 (FD10) -- EVA-4  (4:28am-9:13am; Parazynski/Wheelock)
● 11/02 (FD11) -- EVA-5  (3:58am-10:38am; Whitson/Malenchenko)
11/04/07 -- STS-120/Discovery/10A undocking (FD13/1:34am)
11/04/07 -- 2:00am: DST ends, ST begins
11/06/07 -- STS-120/Discovery/10A deorbit burn 3:47am EST
11/06/07 -- STS-120/Discovery/10A landing @ KSC (FD15/4:48am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.
ISS On-Orbit Status 10/28/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday - Day 143 for Clayton Anderson. Flight Day 6 for STS-120/10A; Day 4 of Joint Ops.

ISS/Shuttle crew wake-up: 1:08am EDT. Sleeptime: 4:08pm (ISS), 4:38pm (Shuttle).

The P6 truss segment was successfully detached from the Z1 truss element. It is now “parked” for overnight on the end of the SSRMS (Space Station Remote Maneuvering System). [The detaching, by Steph Wilson & Doug Wheelock at Canadarm2’s controls, took place at ~6:55am EDT. P6 will be installed at the far end of the P5 truss by the SSRMS on Tuesday (10/30), after having been temporarily handed off to the SRMS (Shuttle RMS) tomorrow to allow the SSRMS to change its base, moving on the MT (Mobile Transporter) an outboard work site (WS-8).]

EVA-2 went very well, lasting 6h 33m. Shuttle/MS1 Scott Parazynski (EV1) & FE-2-16 Dan Tani (EV-3) –

- Disconnected Z1-to-P6 fluid umbilical QDs (Quick Disconnects);
- Detached the P6 truss from Z1 truss element for its removal by SSRMS;
- Outfitted Node-2 (handrails, trunnion/keel pin, covers, gap spanners, caps, CBM restraints, WIFs);
- Inspected the CETA (Crew & Equipment Translation Aid) S1 handrail for two suspected MMOD (micrometeoroid/orbital debris) hits;
- Inspected the Stbd SARJ (Solar Alpha Rotary Joint), finding metal shavings (see Note below);
- Configured the SFU (Squib Firing Unit) on the S1 truss to “launch” condition for radiator deployment tomorrow;
- Reconnected MBSU (Main Bus Switching Unit) jumpers to support P6
startup on P5; and

● Structurally installed PDGF (Power & Data Grapple Fixture) on Node-2.

Tasks deferred for a subsequent spacewalk are:

- Completion of Node-2 PDGF installation by connecting power/data cables (however, PDGF is ready to support Node 2 relocation),
- Installation of one Node-2 handrail, and
- RPCM S04B-C R&R (Remote Power Controller Module Removal & Replacement).

[Official start time of the spacewalk was 5:32am EDT (~26 min ahead of schedule). It ended at 12:05pm. Total EVA duration (PET = Phase Elapsed Time) was 6h 33m. It was the 94th spacewalk for ISS assembly & maintenance and the 66th from the station (28 from Shuttle, 44 from Quest, 22 from Pirs) totaling 393h 25m. After today’s EVA, a total of 109 spacewalkers (79 NASA astronauts, 20 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 580h 49m outside the station on building, outfitting and servicing. It also was the 116th spacewalk by U.S. astronauts.]

Before breakfast, CDR Whitson and FE-2-16 Tani (camping out in the Airlock) collected their first saliva samples for the new INTEGRATED IMMUNE experiment payload. [This experiment integrates studies of neuroendocrine & immune responses in humans during and after long-term stay at ISS to provide an understanding for the development of pharmacological tools to countermeasure unwanted immunological side effects during long-duration missions in space (Moon & Mars). Immune protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature.]

After the 8-hr sleep period before the spacewalk, the Airlock Crewlock (A/L CL) hatch was cracked at ~1:43am EDT for a hygiene break/with mask prebreathe for Parazynski and Tani, after spending the night on 10.2 psi campout. Around 2:30am, the hatch was closed again by IV-2 Peggy Whitson for EVA preparations in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, Whitson supported CL depressurization and EV1/EV3 egress (5:32am).

Before spacewalk begin, FE-1 Malenchenko verified powerdown of onboard ham radio equipment (Kenwood in SM & Ericsson in FGB) to prevent RF interference with the EMUs.

Yuri also conducted the (currently) daily job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels,
and the FGB-to-Node passageway.  [This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons.].

Clay Anderson ran a check on the new EWIS NCU (External Wireless Instrumentation System/Network Control Unit).

Afterwards, the FE-2 worked in Node-1 & Node-2, installing hatch cover guide rings at Unity’s port hatch and Harmony’s aft hatch.

Also in Node-2, Clayton set up the CBCS (Centerline Berthing Camera System), to support the upcoming berthing of the PMA-2 (Pressurized Mating Adapter 2) prior to the transfer of the Node/PMA “stack” to the front end of the Lab module.

While the spacewalk went on, the FE-2 prepared DCS-760 digital still cameras for taking photographs of the spacewalker’s EMU gloves after ingress, to be downlinked for damage inspection.  [After EVA-1, inspection of downlinked glove photographs from Doug Wheelock’s right-hand glove showed excessive wear of the RTV (Room Temperature Vulcanizing) material. For EVA-3, Wheelock will replace one or both of his gloves with backups.]

CDR Whitson, assisted by Yuri as required, meanwhile unbolted and removed the no-longer-needed NPRV (Negative Pressure Relief Valve) from the “Harmony” Node’s port aft IMV (Intermodular Ventilation) flange on the bulkhead and installed the IMV valve instead.

Afterwards, Yuri and Clay installed the Node-2 internal hatch door window.

The FE-1 performed the routine task of taking two photos of the internal part of the FGB nadir port’s docking cone, used for the recent Soyuz TMA-11/15S docking. These images are used to refine current understanding of docking conditions. The pictures were then transferred to OCA for subsequent downlinking.  [The objective is to take photo imagery of the scratch or scuff mark left by the head of the docking probe on the internal surface of the drogue (docking cone) ring, now rotated out of the passageway. As other crewmembers before him, the FE-1 used the Nikon D1X digital still camera to take two pictures each with the hatch closed down.]
Yuri conducted the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the SM, including ASU toilet facilities systems/rechangeables plus the weekly collection of toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Malenchenko also gathered weekly data on total operating time and activity durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s Air Revitalization Subsystem (SOGS) for reporting to TsUP.

Later, the FE-1 worked on the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Peggy Whitson again assisted the spacewalkers when they returned, handling CL repress, joint A/L post-EVA ops, and later starting the downlink of EVA imagery.

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-2/full time), RED resistive exercise device (CDR), and VELO bike with bungee cord load trainer (FE-1).

Clayton copied the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). [Polar HRM developed a failure in its transmitter during the last few days. After some of her heart rate data were lost, CDR Whitson switched to a new spare, restoring the HRM.]

Stbd SARJ Inspection Update: During EVA-2, EV3 Tani removed thermal cover #12 on the starboard SARJ (Solar Alpha Rotary Joint), after an external 360-deg MLI (Multilayer Insulation) inspection did not find anything unusual. Underneath the cover Dan reported seeing magnetized metal filings or shavings sticking to the race-ring, brackets and other areas. In Tani’s words, the race-ring looks “corroded”. From the wireless video it looks like the race-ring has been damaged by sliding metal on metal contact over the bearing surface. EV3 was able take a sample of the shavings after getting some sticky “flycatcher” tape from the A/L. Still pictures were not taken of the damage due to problems with two DCS cameras. Helmet cam video was obtained however. For now, where possible the Stbd SARJ will be parked instead of Autotracking to reduce wear on the inboard race-ring. The SARJ will be positioned to protect the solar arrays during dynamic events (e.g., thruster firings).
**PGSC Update:** After replacement of all cables with Shuttle spares and some excess ISS PGCS equipment, the Shuttle PGSC computer network is working nominally.

**Quick-Look of tomorrow’s (FD7) Events (EDT):**
- 12:38am: Both crews wake
- 12:53am: S1 ETCS (External Thermal Control System) Radiator #1 deploy
- 01:23am: S1 ETCS (External Thermal Control System) Radiator #3 deploy
- 03:08am: SSRMS hands off P6 truss to SRMS
- 05:23am: SSRMS moves on MT/MBS from WS-4 to WS-8
- 09:08am: P6 handed off from SRMS back to SSRMS (install on P5 on FD8)
- 09:43am: Node-2 Avionics Rack preparations
- 02:53pm: Parazynski/Wheelock Campout begins for EVA-3
- 04:08pm: ISS Crew sleep
- 04:38pm: Shuttle Crew sleep
- 12:38am: Both crews wake for FD8.

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:
- [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**
ISS On-Orbit Status 10/27/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- Day 142 for Clayton Anderson. Flight Day 5 for STS-120; Day 3 of Joint Ops.

Flight Control to ISS/Shuttle crews: “Yesterday was such a super successful day!!! Who would have predicted that Node-2 would be attached to station, right on schedule, just as planned!!! It is a wonderful feeling when a plan comes together like it did yesterday!!!! Too bad you could not hear the cheering that went on down here when Node-2 was secured to Node-1!”

ISS crew wake-up: 2:08am EDT; sleeptime: 4:38pm.
Discovery crew wake-up: 1:38am; sleeptime: 5:08pm.

Crew ingress into Node-2 “Harmony” took place at 8:24am EDT, adding over 2500 cu.ft. (71 cubic meter) of living and working space to the ISS. [After CDR Peggy Whitson and MS4 Paolo Nespoli opened the hatches and floated into the new module, crewmembers followed and held a christening ceremony, acknowledging the six schools and students who submitted the name “Harmony”. Harmony will provide the docking ports for new research laboratories from ESA (European Space Agency) and JAXA (Japan Aerospace Exploration Agency).]

Early after her wakeup, CDR Whitson completed the important SODF (Station Operations Data File) Emergency Book deployment (had to be done prior to Node-2 ingress). [The deployment involved the 10A EMER 1 & 2 books, plus updating the Warning book.]

Prior to ingressing Node-2, Whitson & Nespoli collected tools for configuring the “vestibule” space between the Node-1 and Node-2 hatches, performing its outfitting necessary for the ingress (i.e., to provide power & data interfaces between the modules).
Also before entering “Harmony”, FE-1 Malenchenko set up the Russian AK-1M adsorber and IPD-CO (carbon monoxide) Draeger tube air sampling equipment. Immediately after ingress, Yuri performed the air sampling, joined by Peggy and Paolo, who collected air samples with the CSA-CP (Compound Specific Analyzer-Combustion Products) and GSC (Grab Sample Container) equipment. [For the first 2.5 hrs after initiation of air ventilation (via a newly installed ventilation duct) between Node-1 and Node-2, crewmembers wore PPE (Personal Protective Equipment) surgical masks and goggles. For the PAO event from “Harmony” later in the afternoon, the air inside Node-2 had to be renewed about five times.]

While ingress preparations went on, FE-1 Yuri Malenchenko conducted a run with the Russian MBI-21 PNEVMOKARD experiment, his first on-orbit session (which forbids moving or talking during data recording). The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. [PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember’s electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]

Afterwards, the FE-1 completed the periodic collection and logging of accumulated data of the MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/display of the RBO MATRYOSHKA-R payload in the DC1 Docking Compartment. [The reader automatically records radiation readings at strictly defined times (:00, :15, :30, :45 minutes). The complex Matryoshka payload suite is designed for sophisticated radiation studies. The payload collects radiation measurements every 15 minutes of each hour around the clock.]

Yuri also conducted his first run of the Russian "Diatomeya" ocean observations program, using the NIKON-F5 (85 mm lens) still camera and the Sony DSR PD-150P camcorder to obtain imagery of color contrasting blooms in oceanic waters as well as optical and morphologic cloud cover non-uniformities along the flight path from SM windows #7 & #8. [Photo targets were the Atlantic Ocean along the track
Later, Malenchenko performed the (currently) daily job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway.  *This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons.*

CDR Whitson returned the temporarily removed stowage bags to their place in Node-1 (panel P1-01) when the panel was re-installed after Node-2 ingress.

FE-2-16 Dan Tani unpacked the HMS DRK (Health Maintenance System/Defibrillator Resupply Kit), exchanging consumables and batteries in the defibrillator with new items from the DRK delivered on STS-120.  *Installed was battery #1021, with backup battery #1020 stored.*

Tani also set up and photo-documented the new INTEGRATED IMMUNE saliva collection payload, to be used later by himself and Peggy.  *For his use in connection with his EVA-2 spacewalk tomorrow, Dan carried the Immune saliva collection items with him into the Airlock (A/L) before Campout lockup.  Immune protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples will be stored at ambient temperature.*

In preparation for tomorrow’s EVA-2 by Scott Parazynski & Dan Tani, FE-2 Anderson prepared the DCS 760 digital still cameras for the spacewalk and charged the DCS batteries after their EVA-1 use.

Also working in the A/L, Scott and Dan prepared their EMU/spacesuits and the A/L EL (Equipment Lock), swapping EMU batteries, and checking out the REBA powered suit equipment and tools.

After completing A/L EL configuration for the first spacewalk tomorrow and conducting a joint one-hour review of EVA-2 timeline & procedures with all crewmembers at ~1:05pm, the two spacewalkers, Parazynski (EV1) and Tani (EV3), began their “campout” in the “Quest” A/L, starting mask prebreathe at ~3:28pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi.  Sleep for the ISS crew commenced at 4:38pm, for the Shuttle crew at ~5:08pm.

EVA-2 will begin tomorrow (Sunday) at ~5:58am EDT and last an estimated 6h 30min, nominally ending at 12:28pm.  Paolo Nespoli and Peggy Whitson will again be IV-1 and IVA-2 (Intravehicular) crewmembers.

*Main objectives of EVA-2 are:*
- Disconnect Z1-to-P6 fluid umbilical QDs (Quick Disconnects);
- Detach P6 truss from Z1 truss element;
- Outfit Node-2 (handrails, trunnion/keel pin, covers, gap spanners, caps, CBM restraints, WIFs);
- CETA (Crew & Equipment Translation Aid) S1 handrail inspection for suspected MMOD (micrometeoroid/orbital debris) impacts;
- Stbd SARJ (Solar Alpha Rotary Joint) inspection;
- Configure SFU (squib firing unit) on S1 truss to launch condition for radiator deployment;
- Reconnect MBSU (Main Bus Switching Unit) jumpers to support P6 startup on P5;
- RPCM R&R (Remote Power Controller Module Removal & replacement);
- Install PDGF (Power & Data Grapple Fixture) on Node-2.

The CETA S1 handrail inspection and S3/S4 SARJ inspection for potential damage will be performed by EV3 Tani, while EV1 Parazynski will concentrate on the critical Node-2 outfitting. It is expected that Dan will subsequently be able to assist in the installation of the PDGF. Background on SARJ: Starting on 9/2 the starboard SARJ has shown an increased current value to the drive motor (as high as 0.9A) whereas the portside SARJ has continued to operate nominally with a drive current around 0.3A. EVA-2 has been replanned to provide Dan an opportunity to inspect the SARJ for obvious visible problems.

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1), TVIS treadmill (FE-2), and RED resistive exercise device (CDR, FE-1).

Later, Yuri copied the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). [Polar HRM developed a failure in its transmitter during the last few days. After some of her heart rate data were lost, CDR Whitson switched to a new spare, restoring the HRM.]

Malenchenko also conducted the routine maintenance of the SOZhi system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. [Regular daily SOZhi maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier. Weekly SOZhi reports (on
Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.

Working on the IMS (Inventory Management System), FE-2 Anderson updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

FE-1 Malenchenko and FE-2-16 Tani again had about 60 minutes each for general station familiarization and acclimatization, as is standard daily rule for the first two weeks after starting station residency.

Troubleshooting continued on the Shuttle PGSC network which has had some issues. [A mini network was established for crew sleep last night. Today, all the network cables were to be replaced, using Shuttle spares and some excess ISS PGSC equipment.]

At ~2:03pm EDT, the combined crews supported a PAO TV event with three news media from the new “Harmony” module,- CBS News (Peter King, Bill Harwood), Fox News (Gregg Jarrett), and WHAM-TV, Rochester, NY (Pam Melroy’s hometown.

Quick-Look of tomorrow’s (FD6) Events (EDT):

● 01:08am: Crew wake
● 03:38am: SSRMS walkoff from Lab to MBS (Mobile Base System)
● 06:03am: EVA-2 begins
● 06:18am: Z1-to-P6 umbilicals disconnect begins
● 08:13am: P6 truss detachment from Z1
● 12:18pm: EVA-2 ends
● 04:08pm: ISS Crew sleep
● 04:38pm: Shuttle Crew sleep
● 12:53am: S1 ETCS (External Thermal Control System) Radiator #1 deployment.

Weekly Science Update (Expedition Sixteen -- 1st)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements will continue to be performed throughout the Increment 16..

ANITA: Completed.

AT-Space: Samples have been retrieved as part of early retrieval complement after 14S landing, and have been nominally delivered to science team for analysis.
**BCAT (Binary Colloidal Alloy Test):** Reserve.

**BIOKIN:** Samples have been retrieved as part of early retrieval complement after 14S landing, and have been nominally delivered to science team for analysis.

**CARDIOCOG-2:** Completed.

**CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):** “Clay, thanks for performing your final CCISS session. The PI appreciates your participation and looks forward to seeing you on the ground. Dan, we are working to get your first CCISS session listed as a Voluntary Science option during the PI’s FD14 to FD21 requirement.”

**CFE (Capillary Flow Experiment):** “Thank you so much Peggy and Clay for running the CFE Vane Gap-1 unit on GMT 295! For this operation, you performed a sweep of the vane angles in quadrant #3 (i.e. angles between 180 and 270 deg) of the vessel. As you probably surmised, we are most interested in the vane gap setting where a "finger" of fluid is drawn up the gap between the vane and wall of the test chamber. We feel we got some great data from this run! We were able to bracket the angles where critical gap wetting occurs and determine when the fluid reorients. The angles obtained are publishable and have furthered our understanding of the fluid dynamics, which we certainly appreciate. We realize that observing some of these test points are a little like "watching paint dry" and we certainly appreciate your patience in performing our run.”

**CHROMOSOME-2 (E14 SFP):** Completed.

**CIS (Malaysian SFP):** This experiment was targeted to focus on effects of microgravity and space radiation on gene mutations, expression of multi-drug resistance, and whole genome expression profiles (using the microarray approach) of eukaryotic cells compared to ground controls. Both adherent and non-adherent cells will be used and the former will also allow us to study the 3-dimensional cell growth in spaceflight compared to that grown on the ground using a rotating wall bioreactor.

**CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus):** In progress.

**CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):** Complete.

**CSLM-2 (Coarsening in Solid-Liquid Mixtures 2):** “After almost 32,000 orbits of the CSLM-2 ECUs around the earth, CSLM-2 and SAMS hardware were installed into the MSG WV on GMT 296 (ECU 1 and SPU 2). The vacuum vent leak test was
then successfully performed. Finally, the ECU was powered on to perform the re-
programming steps which configures the specific parameters for each SPU soak
time and delay. Upon completion of this activity, the log files were downlinked to
verify successful re-programming. The fact that this operation was a success also
verifies that the ECU booted properly after five+ years on orbit. CSLM-2 is now
awaiting crew time to perform the actual science runs.”

**EarthKAM (Earth Knowledge Acquired by Middle School Students):**  Complete.

**EMCH (Elastic Memory Composite Hinge):**  Complete.

**EPO (Educational Payload Operation) Kit C:**  Planned.

**ETD (Eye Tracking Device):**  First session for Yuri Malenchenko has been
performed nominally on 10/18.

**Integrated Immune: In Progress**

**IMMUNO (Saliva Sampling):**  Inc-15 first session samples are currently stowed in
MELFI Dewar #2. Inc15 second session samples (2 blood, 2 urine syringes and
saliva tubes) have been returned on 14S. Preliminary information indicates that
samples were not retrieved with other early items as planned. Science impact is
expected, but still under assessment.

**LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):**
Complete.

**MIS (Malaysian SFP):**  The goal of this experiment was specifically to study *A.
baumannii* (non-motile) and *E. cloacae* (motile) conducted in microgravity
environment and later, using genomic and proteomic tools to establish the gene
expression and protein profiles and mass spectrometry to identify the specific
proteins that are differently expressed.

**MISSE (Materials ISS Experiment):**  Ongoing.

**MOP (VC-13):**  In-flight questionnaires by SFP have been collected daily from 10/10
to 10/19. No negative reporting. Pre-flight questionnaires have been handed-over
to ESA.

**MTR-2 (Russian radiation measurements):**  Passive dosimeters measurements in
DC1 “Pirs”.

**MULTIGEN-1:**  Plants in B1 EC have unfortunately degenerated even more, and at
this stage science team does not expect anymore stem development for these plants in B1. Plant in the A2 EC is in a healthy state. Just before the planned power outage related to 10A docking on 10/25 (GMT298), science team has observed some peculiar motions of the leaves which should lead to imminent stem development. Should the stem appear, 2D then 3D-recordings of stem circumnutation will begin for several days, making use of any possibility to get additional science between the planned power outages during the 10A mission.

**MUSCLE (VC-13 SFP):** In-flight questionnaires by the SFP have been collected daily from 10/10 to 10/19. No negative reporting. Pre-flight questionnaires have been handed-over to ESA.

**MSG-SAME (Microgravity Science Glovebox):** Complete.

**NEOCYTOLYSIS (E14 SFP):** Complete.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION:** “Peggy, thanks for successfully completing your first Nutrition and Repository session.”

**PCS (Malaysian SFP):** The goals of the PCS experiment were to compare the crystal growth behavior of lipases on earth with that grown in microgravity; to characterize the effect of microgravity on the crystal growth behavior of lipases; to test conditions that will improve the protein crystallization process on earth as well on space; to compare the quality of protein crystal grown under microgravity to those of earth-grown; to compare the 3D crystal structures obtained on the earth and in space.

**P-KINASE:** Samples have been retrieved as part of early retrieval complement after 14S landing. These will be shipped to the US next week.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMPLE:** Samples of cosmonaut sessions #1 and #2, plus Surfaces and Cultures have been downloaded on 14S and handed-over to science team for analysis.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** n/a

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** “Peggy & Dan, thanks for donning your Actiwatch. We are working to get your first download initialization session added to the task list per your request.”
SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Planned.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observations): Ongoing.

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 9:50am EDT [= epoch]):
Mean altitude -- 341.7 km
Apogee height -- 343.5 km
Perigee height – 339.9 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.00027
Solar Beta Angle -- -59.7 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 100 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51166

Significant Events Ahead (all dates Eastern, some changes possible):

- 10/28 (FD6) -- EVA-2 (5:58am-12:38pm; Parazynski/Tani)
- 10/28 (FD6) -- P6 remove from Z1 truss (~8:13am)
- 10/30 (FD8) -- EVA-3 (5:28am-12:38pm; Parazynski/Wheelock)
- 10/30 (FD8) -- P6 install on P5 truss (~6:03am)
- 11/01 (FD10) -- EVA-4 (4:28am-9:13am; Parazynski/Wheelock)
- 11/02 (FD11) -- EVA-5 (3:58am-10:38am; Whitson/Malenchenko)

11/04/07 -- STS-120/Discovery/10A undocking (FD13/1:34am)
11/04/07 -- 2:00am: DST ends, ST begins
11/06/07 -- STS-120/Discovery/10A deorbit burn 3:47am EST
11/06/07 -- STS-120/Discovery/10A landing @ KSC (FD15/4:48am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**
ISS On-Orbit Status 10/26/07

All ISS systems continue to function nominally, except those noted previously or below. *Day 141 for Clayton Anderson. Flight Day 4 for STS-120; Day 2 of Joint Ops.*

**Node-2 “Harmony” was successfully installed on the Node 1 “Unity” portside dock, about one hour ahead of schedule.**

**Also, today’s EVA-1 was completed exceedingly successful.**  Shuttle Mission Specialists Scott Parazynski (EV1) & Doug “Wheels” Wheelock (EV2) –

- Retrieved the SASA (S-band Antenna Structural Assembly) from the Z1 truss and stowed it in the Shuttle PLB (Payload Bay) in the sidewall FSE (Flight Support Equipment) carrier,
- Prepared Node 2 for removal from PLB by loosening four special EDF (Expandable Diameter Fastener) bolts, releasing a PDGF (Power & Data Grapple Fixture) from its PLB sidewall carrier and stowing it temporarily on Node 2, then removing PCBM (Passive CBM) contamination covers & connector caps, disconnecting LTA (Launch to Activation) power cables, and closing & re-snapping an open Node-2 hatch window cover,
- Disconnected P6-to-Z1 fluid umbilicals, by removing SPDs (Spool Positioning Devices), closing valves, demating QDs (Quick Disconnects) & remating to dummy QDs,
- Deployed a thermal shroud on the retracted & cinched P6 aft PVR (Photovoltaic Radiator), and
- Installed thermal shrouds on the 2B/starboard & 4B/port SSUs (Sequential Shunt Units).

*[Official start time of the spacewalk was 6:02am EDT (~26 min ahead of schedule). It ended at 12:16pm. Total EVA duration (PET = Phase Elapsed Time) was 6h 14m. It was the 93rd spacewalk for ISS assembly & maintenance and the 65th from the station (28 from Shuttle, 43 from Quest, 22 from Pirs) totaling 386h 52m. After*
today’s EVA, a total of 107 spacewalkers (77 NASA astronauts, 20 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 574h 16m outside the station on building, outfitting and servicing. It also was the 115th spacewalk by U.S. astronauts.]

After the pre-berthing preps by Scott & Wheels, Node-2 grappling by Steph Wilson & Dan Tani with the SSRMS (Space Station Remote Manipulator System), transfer of “Harmony” out of the Discovery PLB to the ISS and berthing it at the Node-1 portside CBM went smoothly, finishing about an hour ahead of time (capture 1st stage: 11:35am, 2nd stage: 11:40am). [The Italian-built Node-2, measuring 23.6 ft (7.2 m) long, 14.5 ft (14.5 m) wide, with a mass of 31,500 lbs (14,288 kg), is a utility hub, providing air, electrical power, water and other systems essential to support life on the station. It will distribute resources from the ISS truss to the U.S. “Destiny” Lab, the ESA “Columbus” research module and the Japanese “Kibo” experiment module when the latter are added to the station. “Harmony” will act as an internal connecting port and passageway to additional international science labs and cargo spacecraft. The name “Harmony” was chosen from an academic competition involving more than 2200 kindergarten-through-high school students from 32 states. Six different schools submitted this name. A NASA panel selected “Harmony” because it symbolizes the spirit of international cooperation embodied by the ISS, as well as the module’s specific role in connecting the international partner modules. Winning schools were Browne Academy, Alexandria VA, Buchanan Elementary School, Baton Rouge LA, League City Intermediate School, Lubbock, TX, West Navarre Intermediate School, Navarre FL, and World Group Home School, Monona, WI.]

Post-docking activities yesterday included the important activation of the SSPTS (Station-to-Shuttle Power Transfer System). [For the second time in history, the ISS is transferring power to the Orbiter to allow it to remain docked longer. As per plan, three (of four) OPCUs (Orbiter Power Converter Units, #1A, 1B, & 2A) are currently active, transmitting up to 6.45 kW of power to the Shuttle PTUs (Power Transfer Units).]

After the 8.5-hr sleep period before the spacewalk, the Airlock Crewlock (A/L CL) hatch was cracked at ~2:18am EDT for a hygiene break/with mask prebreathe for Parazynski and Wheelock, after spending the night on 10.2 psi campout. Around 3:00am, the hatch was closed again by IV-2 Peggy Whitson for EVA preparations in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, Whitson supported the CL depressurization and EV1/EV2 egress (6:01am).

Before EVA start, FE-1 Malenchenko verified powerdown of onboard ham radio equipment (Kenwood in SM & Ericsson in FGB) to prevent RF interference with the
EMUs. He also turned on the CBCS (Centerline Berthing Camera System), which was previously set up at the Node-1 portside hatch for Node-2 berthing.

Malenchenko then started the transfer of nitrogen (N₂) gas from the Shuttle to the ISS hi-P storage tankage.

Afterwards, Yuri took care of the new Russian Sokol suits delivered on STS-120, performing leak checks on suits and gloves, then hanging them up for drying. Later, the Sokols were stowed in the Soyuz 15S Orbital Module.

Additionally, the FE-1 also serviced the ASU toilet system in the Soyuz TMA-11 by replacing its discolored collector unit with a new spare.

Yuri also conducted the (currently) daily job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway. [This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons.].

As part of ongoing handover activities, Clay Anderson introduced his successor, Dan Tani, to the use of the Russian SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System), which takes readings of potentially harmful contaminants in the Service Module (SM). The hardware was then returned to initial stowage. [The CMS uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip.]

As another handover activity, Clay and Dan spent some time on an overview of CMS (Crew Medical Systems) exercise equipment aboard the station, a standard requirement for “newcomers” before the first physical exercise session. [The review covered identification, stowage location and explanatory notes of physical exercise accessories, exercise prescriptions, and detailed instructions for using the TVIS treadmill, RED resistive exerciser, CEVIS cycle ergometer (in particular CEVIS control panel positioning in front of the bike user for HR/Heart Rate data reception, and the HRM heart rate monitor).]

While the spacewalk went on, CDR Whitson prepared DCS-760 digital still cameras for taking photographs of the spacewalker’s EMU gloves after ingress, to be downlinked for damage inspection.

The ISS crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle
ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR), and VELO bike with bungee cord load trainer (FE-1).

Later, Yuri copied the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). \[Polar HRM developed a failure in its transmitter during the last few days. After some of her heart rate data were lost, CDR Whitson switched to a new spare, restoring the HRM.\]

Malenchenko checked out and replaced the batteries of Shuttle-delivered CSA-CP (Compound Specific Analyzer- Combustion Products) units (one prime, 3 backup), then deployed two units at the SM Central Post and two in Node-1.

The CDR worked on the water supply system, offloading the Lab CCAA (Common Cabin Air Assembly) condensate tank to CWC (Contingency Water Container) for processing to be used in Elektron.

After the Node-2 was successfully berthed (11:40am) and the SSRMS had ungrappled, Malenchenko deactivated and removed the CBCS (Centerline Berthing Camera System) from Node-1 portside hatch and stowed it temporarily in Node-1. \[All cables and equipment were left connected for later use of the CBCS on the Node-2 forward port for berthing the PMA-2 (Pressurized Mating Adapter 2) prior to the transfer of the Node-2/PMA-2 “stack” to the Lab forward port after Discovery’s departure.\]

Peggy Whitson again assisted the spacewalkers when they returned, handling CL repress, joint A/L post-EVA ops and later starting the downlink of EVA imagery.

Also after EVA-1 ingress, Malenchenko conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. \[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.\]

Working on the IMS (Inventory Management System), FE-2 Anderson updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).
FE-1 Malenchenko and FE-2-16 Tani had about 60 minutes each for general station familiarization and acclimatization, as is standard daily rule for the first two weeks after starting station residency.

IWIS Thruster Test Update: The dedicated IWIS (Internal Wireless Instrumentation System) thruster test early this morning was successfully completed, with all objectives met. The total time in free drift for the test was 21 min. The port & starboard SARJs (Solar Alpha Rotary Joints) were successfully returned to Autotrack once the station was back under Momentum Manager attitude control (~1:05am EDT). The IWIS accelerometer on the Shuttle-side was installed yesterday near the Shuttle cycle ergometer and connected to the ISS IWIS with a drag-through cable. [Since the IWIS thruster test was performed earlier than originally planned due to RGS (Russian Ground Site) comm window constraints, no time remained for IMMT (ISS Mission Management Team) review of the overnight drag-through cable, as is normally required.]

SARJ Inspection: As a last-minute modification of the EVA-2 timelines on FD6 (Sunday, 10/28), specialists are considering an EVA inspection of the starboard SARJ as part of the ongoing root cause investigation of the recent SARJ drive motor current trends (vibrations/drag). The STBD SARJ inspection would be combined with a CETA (Crew & Equipment Translation Aid) cart rail inspection. The change was approved this morning by the IMMT (ISS Mission Management Team). [The inspection would cover the 22 MLI (multi-layer insulation) segments about the joint, MLI cover outboard & inboard swing bolts, exposed areas in between MLI cover gaps, and possible hardware interaction with MLI covers. If some outfitting tasks cannot be completed because of the EVA-2 timeline changes, they would be moved to a later spacewalk or a later flight.]

Smoke Detector Inhibit: The #2 smoke detector (SD-2) annunciation function in Node-1 was inhibited yesterday since it has been the source of many false-fire alarms in the past. A reoccurrence could impact 10A, EVA Campouts and other high priority activities. SD-2 remains powered for providing telemetry to the ground. SD-1 in the Node-1 is still fully active.

Discovery TPS Inspection: The Shuttle Program has found no requirement for a focused inspection of the Orbiter’s TPS (Thermal Protection System) tomorrow. After careful ground inspection, the TPS has been cleared. [A small gap filler near RCC panel #20 is exposed (~0.3 in.) but not in a critical area.]

Quick-Look of tomorrow’s (FD5) Events (EDT):
  ● 01:38am: Crew wake
  ● 05:08am: OBSS (Orbiter Boom Sensor System) handoff to SSRMS &
berthing in Shuttle PLB
- 06:33am: Node-2 Vestibule Outfitting
- 08:43am: Node-2 Ingress
- 09:33am: Transfers
- 01:03pm: EVA-2 Procedures Review
- 03:18pm: Campout begins (Parazynski/Tani)
- 05:08pm: Crew sleep.

No CEO (Crew Earth Observations) target uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 11:04am EDT [= epoch]):
Mean altitude -- 341.8 km
Apogee height -- 343.7 km
Perigee height -- 339.9 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002856
Solar Beta Angle -- -56.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 70 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51151

Significant Events Ahead (all dates Eastern, some changes possible):
- 10/27 (FD5) -- Node-2 Ingress
- 10/28 (FD6) -- EVA-2 (5:58am-12:38pm; Parazynski/Tani)
- 10/28 (FD6) -- P6 remove from Z1 truss (~8:13am)
- 10/30 (FD8) -- EVA-3 (5:28am-12:38pm; Parazynski/Wheelock)
- 10/30 (FD8) -- P6 install on P5 truss (~6:03am)
- 11/01 (FD10) -- EVA-4 (4:28am-9:13am; Parazynski/Wheelock)
- 11/02 (FD11) -- EVA-5 (3:58am-10:38am; Whitson/Malenchenko)
11/04/07 -- STS-120/Discovery/10A undocking (FD13/1:34am)
11/04/07 -- 2:00am: DST ends, ST begins
11/04/07 – 50-Year Anniversary of launch of female canine Laika, first living space passenger, into orbit
11/06/07 -- STS-120/Discovery/10A deorbit burn 3:47am EST
11/06/07 -- STS-120/Discovery/10A landing @ KSC (FD15/4:48am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation's Ares I-X Launch.
All ISS systems continue to function nominally, except those noted previously or below. Day 140 for Anderson. Flight Day 3 for STS-120; Day 1 of Joint Ops.

Shortly after orbital sunrise (8:33am EDT), STS-120/Discovery docked successfully at the PMA-2 (Pressurized Mating Adapter-2) port at 8:40am EDT, smoothly flown by Pam Melroy & George “Zambo” Zamka. The station now hosts ten occupants again as Mission 10A is underway. [All docking hooks were closed at 8:53am. The station was reoriented at ~9:00am as planned to minimize the risk of micrometeoroid/debris impacts upon the Shuttle (-x-axis in velocity vector, +z-axis in local vertical, i.e., turned around by ~180 deg). Hatches were open at 10:38am, and the new crew was welcomed aboard the ISS and given the mandatory safety briefing. Later, the OBSS was successfully unberthed in the Shuttle PLB (Payload Bay) with the SSRMS (Space Station Remote Manipulator System), and handed off to the SRMS (Shuttle RMS), while Clay Anderson and Stephanie Wilson maneuvered the SSRMS to EVA-1 support position.]

Preparatory to Shuttle arrival, ISS CDR Peggy Whitson –
- Closed the Lab science window shutter as protection against thruster plumes,
- Connected the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cables at the Lab & Cupola RWS (Robotics Work Stations) for the SSRMS video coverage,
- Configured the headset cable connections for the RPM (R-Bar Pitch Maneuver, completed at 7:43am), and later
- Activated camera timer & video equipment for Orbiter approach/docking coverage.

Also before the actual docking, FE-1 Malenchenko performed final STTS communications configuration checks for the docking. After the docking, Yuri switched USOS/RS (US Segment/Russian Segment) comm systems to their mated-
flight mode.

The regular installation of the IWIS (Internal Wireless Instrumentation System) hardware for measuring and recording structural dynamics during docking was completed by Whitson yesterday as a get-ahead task.

Anderson and Malenchenko conducted a final checkout of the photo/video equipment for the RPM (Rbar Pitch Maneuver) before Endeavour docking. They also verified the readiness of the communications configuration required for the photo shoot.

Shortly before the docking, the FE-2 configured the Russian MCS (Motion Control System) for the automatic “PMA-2 Arrival” mode, an operational sequence used to monitor Orbiter arrival at the PMA-2. [At “Capture Confirmed” (8:40am), ISS attitude was immediately set to “free drift” to allow dampening out relative motions of ISS and Discovery (with the ODS dampers/shock absorbers), then maneuvered to “Mated TEA” (Torque Equilibrium Attitude) to account for the new overall configuration with Discovery docked.]

Prior to final approach, Pam & Zambo took the Discovery through the scheduled RPM at ~600 ft distance under the ISS, a full-circle backflip to allow digital imagery of its TPS (thermal protection system) from the ISS by Flight Engineers Anderson & Malenchenko. [The ISS crew had about 100 seconds actual shooting time to photograph the Orbiter TPS. Yuri operated the 400mm-lens DCS (digital camera system) and Clayton wielded the long-barreled 800mm camera, each one attempting to obtain about 150 pictures. After the docking, the images were to be downlinked for further analysis.]

After the RPM, at a distance of ~575 ft, Discovery initiated TORVA (Twice Orbital Rate V-bar Approach). The final Go for Docking was given, and Discovery closed in at a slow rate for docking at 8:40am (all hooks closed: 8:53am).

After leak checks of the ODS (Orbiter Docking System) vestibule for about an hour, hatches were opened at ~10:38am. Hand shakes and hugs between the crews came 15 minutes later.

Before and during ISS/STS hatch opening, Yuri Malenchenko performed the standard collection of air samples with the Russian AK-1M sampler in the SM, FGB, Lab, and then also in the Orbiter.

Prior to the start of docked mission activities, CDR Whitson took care of the transfer of joint mission books from the Shuttle over to ISS. [The new books, contained in a Ziplock bag and CTB (Crew Transfer Bag), include the SODF (Station Operations
Yuri Malenchenko and Dan Tani transferred the Soyuz IELKs (Individual Equipment & Liner Kits, Russian: USIL), removing Anderson’s IELK from Soyuz TMA-11/15S for stowage and installing Tani’s IELK in the 15S Descent Module instead.

Also after the docking, Malenchenko conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables, and today also the (currently) daily job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway. [This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons.]

Working on the IMS (Inventory Management System), the FE-1 updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Joint crew activities after the Welcome Ceremony included –
- Safety briefing for all,
- Dan preparing the Orbiter approach imagery for downlink,
- Peggy setting up the transfer equipment for supplying Shuttle O₂ (oxygen) to the ISS to support the overnight “Campout” by Parazynski & Wheelock in the Airlock (A/L) for denitrogenation/pre-breathe,
- Scott, Peggy & Doug transferring the Shuttle EMU/spacesuits and EVA tools to the ISS,
- Clay preparing the DCS 760 digital still cameras for EVA-1 and charging the DCS batteries after their RPM use,
- Scott, Peggy, Doug & Paolo preparing the EMUs and the A/L EL (Equipment Lock), swapping EMU batteries, and
- Checking out the REBA powered suit equipment and tools.

After completing A/L EL configuration for the first spacewalk tomorrow and conducting a joint review of EVA-1 timeline & procedures with all crewmembers at ~2:00pm, the two spacewalkers, Scott Parazynski (EV1) and Doug Wheelock (EV2), will begin their “campout” in the “Quest” A/L, starting mask prebreathe, while configuring EVA tools, at ~3:53pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi. Sleep for the ISS crew will commence at 5:08pm, for the Shuttle crew at ~5:38pm.

EVA-1 will begin tomorrow at ~6:28am EDT and last an estimated 6h 30min,
nominally ending at 1:08pm. Paolo Nespoli will be IV (Intravehicular) crewmember.

Main objectives are:
- SASA (S-band Antenna Support Assembly) retrieval from Z1 truss & transfer to Shuttle cargo bay for stowage in SASA FSE (Flight Support Equipment);
- Node 2 preparation for unberthing from PLB;
- PDGF (Power & Data Grapple Fixture) removal from PLB & temp stowage on Node 2;
- Disconnect Z1 to P6 fluid umbilical QDs (Quick Disconnects);
- Install P6 Aft PVR (Photovoltaic Radiator) shroud; and
- Install P6 SSU (Sequential Shunt Unit) shroud, plus photo ops; and
- Monitor unberthing of Node 2 with SSRMS and its installation on Node 1 port CBM (Common Berthing Mechanism) by Steph, Clay & Dan.

Earlier today, the ISS crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

No exercise allowed on ISS or Shuttle while both arms are grappled (~12:55pm) or during tonight’s IWIS thruster test (~12:20am).

Later, Anderson copied the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Polar HRM developed a failure in its transmitter during the last few days. After some of her heart rate data were lost, CDR Whitson switched to a new spare, restoring the HRM.

FE-1 Yuri Malenchenko had 60 minutes for general station familiarization and acclimatization, as is standard daily rule for the first two weeks after starting station residency.

Later in the day (~1:40pm), the Elektron was reactivated at 32 amps, with Yuri monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating.

During nominal operations a gas analyzer is utilized to detect hydrogen (H$_2$) in the O$_2$ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.

IWIS Thruster Test: Early tomorrow morning, the station will briefly go into Free Drift again to support Flight Day 4 (FD4) IWIS thruster testing at 12:24am, with return to RS thrusters at 12:40am and handover back to US Momentum Management at 1:05am.
**SM Thermal Control System Update:** FE-1 Yuri Malenchenko yesterday successfully completed repairs on the SM thermal control loops (KOB-1,2). Currently three of the four 3SPN2 & 4SPN2 pump panels are functional, each panel with two operating pumps (ENAs). The 4th pump panel on KOB-1 has failed and both pumps were removed. Hardware is planned to be resupplied on a future Progress. The newly installed pumps were activated, checked out and are functioning nominally.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 6:09am EDT [= epoch]):
Mean altitude -- 341.9 km
Apogee height -- 343.8 km
Perigee height -- 340.0 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.000276
Solar Beta Angle -- -52.3 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 60 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51132

**Significant Events Ahead** (*all dates Eastern, some changes possible*):
- **10/26 (FD4)** -- EVA-1 (6:28am-1:08pm; Parazynski/Wheelock)
- **10/26 (FE4)** -- Node 2 install onto Node 1 (~12:33pm)
- **10/28 (FD6)** -- EVA-2 (5:58am-12:38pm; Parazynski/Tani)
- **10/28 (FD6)** -- P6 remove from Z1 truss (~8:13am)
- **10/30 (FD8)** -- EVA-3 (5:28am-12:38pm; Parazynski/Wheelock)
- **10/30 (FD8)** -- P6 install on P5 truss (~6:03am)
- **11/01 (FD10)** -- EVA-4 (4:28am-9:13am; Parazynski/Wheelock)
- **11/02 (FD11)** -- EVA-5 (3:58am-10:38am; Whitson/Malenchenko)
11/04/07 -- STS-120/Discovery/10A undocking (FD13/1:34am)
11/04/07 -- 2:00am: DST ends, ST begins
11/04/07 – **50-Year Anniversary of launch of female canine Laika, first living space passenger, into orbit**
11/06/07 -- STS-120/Discovery/10A deorbit burn 3:47am EST
11/06/07 -- STS-120/Discovery/10A landing @ KSC (FD15/4:48am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)

08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.
ISS On-Orbit Status 10/24/07

All ISS systems continue to function nominally, except those noted previously or below. *Day 139 for Anderson. “Discovery incoming.”*

**STS-120/Discovery continues its catch-up flight,** for tomorrow’s FD3 ISS docking at ~8:35am EDT, to begin ISS Stage 10A.

[Hatch opening: expected at ~10:33am, followed by: Safety Briefing, OBSS (Orbiter Boom Sensor System) handoff from SSRMS (Space Station Remote Manipulator System) to SRMS (Shuttle RMS) at ~11:23am, Soyuz seat liner transfer (for the Tani/Anderson exchange), and preparations for the first spacewalk, EVA-1, by EV1 Parazynski & EV2 Wheelock, on 10/26, preceded by their overnight Campout in the Airlock (A/L) for denitrogenation/pre-breathe. Objectives of the nominal 14-day mission: Delivering & installing Node 2 “Harmony” in a temporary spot on Node 1 “Unity” (later to be fitted with the PMA-2 {Pressurized Mating Adapter 2} and then moved to the Lab front end), returning the SASA (S-band Antenna Structural Assembly) from the Z1 truss to Discovery for Earth return, delivering new ISS-16 crewmember Dan Tani & bringing Clayton Anderson back home, moving the P6 truss segment to its permanent position at the left end of the ISS truss beam, deploy the P6 solar arrays and heat dispersal radiator, and conducting a total of five spacewalks, including one to test a shuttle tile repair technique. Landing will nominally take place at KSC on FD15 (11/6) at 4:50am EST.

**Esperia Background:** Crewmember Paolo Angelo Nespoli, who is shepherding the Italian-built Node 2, is the third Italian flying on the Shuttle (after Umberto Guidoni in 2001 and Roberto Vittori in 2002 & 2005). Paolo’s program “Esperia” (from the ancient Greek name for the Italian peninsula), involves his playing the key role as IVA (intravehicular activity) astronaut for three of the five spacewalks including the installation of Node 2, plus a joint ESA/ASI program of human physiology and biology experiments, as well as a number of educational activities.]

Before breakfast, CDR Whitson, FE-1 Malenchenko and FE-2 Anderson started the day with the periodic session of the Russian biomedical routine assessments PZEh-
MO-7/Calf Volume Measurement and PZEH-MO-8/Body Mass Measurement (first for CDR & FE-1, ninth for FE-2), using the IM mass measurement device which Yuri Malenchenko afterwards broke down for stowage. *Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember’s mass is calculated by the computer and displayed.*

Afterwards, Yuri had over 4 hrs on his schedule for tackling the critical & complex “plumbing” job of restoring both (redundant) Russian Thermal Control System (TCS) loops, STR KOB-1 & STR KOB-2, to some function. *Background: Each of the KOB loops contains 2 pump panels (3SPN2 & 4SPN2) with 2 pump assemblies (ENA) each (i.e., a total of 8 pumps between KOB-1 and KOB-2). After the pump failure on 10/22, the TCS software algorithm did not activate any of the 4 pump panels or their corresponding ENAs, triggering an “SM Heating Loops Failure-RS” caution alert. Ground controllers cleared the comm problem and activated the pump panels. On KOB-2, 3SPN2 is now operating nominally with both pumps. There are currently two spare pumps onboard, delivered on 15S, and two additional spares are to be brought up in December. Today, Yuri swapped one of the operational ENAs from KOB-2’s 4SPN2 and installed it in place of the failed pump assembly in 4SPN2 of KOB-1. The pump R&R was then tested and closed out. Thus, the SM now has at least one operational pump assembly for each TCS loop. Later both ENA pumps in the KOB-2 4SPN2 panel will be replaced with the 2 onboard spare pumps. Both the Vozdukh CO₂ removal system and the Elektron O₂ generator were turned off temporarily for the repair activities.*

FE-2 Anderson powered on the Cupola RWS (Robotic Work Station) and Airlock (A/L) A31p laptops in preparation for their support of the 10A docked mission.

CDR Whitson performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. Peggy also secured two condensate samples in sample bags for return to Earth on the Shuttle. *Estimated offload time before termination (leaving ~5.25 kg in the tank): ~30 min.*

Later, Malenchenko took the CWC #1064 to the Russian Segment (RS) for the
periodic (about twice a month) replenishing of the Elektron oxygen generator’s water supply for electrolysis, filling the KOV thermal loops’ EDV container. Once filled, the EDV was connected to the BPK transfer pump for processing.  

[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

Meanwhile, Whitson conducted the weekly 10-min. CWC audit as part of the continuing WDS (Water Delivery System) assessment of onboard water supplies.  

[Updated “cue cards” based on the crew’s water calldowns are sent up every other week.  The current cue card, to be updated with today’s data, lists 24 water containers (~934.7 liters total), including two unusable (~85.9 l), for the four types of water identified on board: technical water (579.3 l, for Elektron, flushing, hygiene), potable water (304.2 l), condensate water (32.2 l), waste/EMU dump and other (19.0 l).]

The FE-2 switched cooling on the starboard & portside CCAAs in the Lab, closing the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) flow to the first and initiating it on the second. This is a standard maintenance item.

Peggy and Clayton temporarily moved two EMU (Extravehicular Mobility Unit) spacesuits (#3006, #3018) with bags from the A/L CL (Crewlock) to the Node to make room for Friday’s first 10A EVA by Parazynski and Wheelock.  

[EMU 3018 will be used by Dan Tani during EVA-2 and by Peggy during EVA-5, whereas EMU 3006 will be Yuri’s spacesuit on EVA-5.]

After yesterday’s practice by Anderson and Malenchenko of taking photos during tomorrow’s Orbiter RPM (Radius Vector Pitch Maneuver), Clay today set up the Sony camcorder, equipped with fresh battery, to allow video recording of the RPM image-taking (for use in training). The FE-2 then configured the DCS still cameras with 400mm & 800mm lenses in the SM, to be used by himself and Yuri, equipping them with charged batteries and formatted memory cards.

Later, Clayton set up and checked out the Lab RWS and DOUG software for tomorrow’s (FD3) SSRMS (Space Station Remote Maneuvering System) operations.  

[The SSRMS will be used after docking tomorrow for unberthing the OBSS (Orbiter Boom Sensor System) and handing it off to the SRMS (Shuttle Remote Maneuvering System), which then maneuvers it for TV viewing of Node 2 in the cargo bay, while SSRMS maneuvers to EVA-1 setup position for supporting the first spacewalk on Friday.]

Also in support of 10A, CDR Peggy Whitson –

● Installed the ISS-side string of the BPSMU (Battery Powered Speaker Microphone Unit) [after Shuttle docking, cables connected to the Shuttle-half
of the dragthrough QD (quick disconnect) will be installed by the Shuttle crew,

- Performed, with some ground support, the pressurization process on the PMA-2 (Pressurized Mating Adapter #2), followed by leak checking and additional preparations of the PMA for the Shuttle’s arrival [the pressurization equipment was left connected for the post-docking leak checks], and
- Configured & connected the bypass cables of the VDS VTR (Video Distribution System/Video Tape Recorder) for passing video to and from the station on the Lab’s starboard side and allowing the station to receive video from the Orbiter on the Lab’s port side.

Meanwhile, FE-1 Malenchenko conducted the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) in the SM, including ASU toilet facilities systems/replaceables.

Later, working off his discretionary “time permitting” task list, Yuri updated/edited the IMS (Inventory Management System)’s standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Also from the voluntary task list, the FE-1 used the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System) to take readings of potentially harmful contaminants in the SM. The hardware was then returned to initial stowage. [The CMS uses preprogrammed microchips to measure Formaldehyde ($H_2CO$, methanal), Carbon Monoxide (CO) and Ammonia ($NH_3$), taking one measurement per microchip.]

Another task for Malenchenko is the periodic MLI (Multi-Layer Insulation) Nikon D2X photography on Soyuz TMA-11/15S, docked at the FGB nadir port, from the DC1 EVA hatch 2 window, to assess the condition of the spacecraft’s insulation.

Clay did the periodic check of running U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2), and VELO cycle with bungee cord load trainer (FE-
1).

Afterwards, Clayton transferred the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

As is standard procedure for newly arrived station residents, the E16 crew yesterday had their PMCs (Private Medical Conferences). For Yuri, this included filling out the questionnaire for the standard Russian biomedical Braslet-M/Anketa ("bracelet/questionnaire") test procedure. [If he so desires, Yuri may evaluate a number of "bracelet" cuffs for their usefulness in suppressing the adverse effects of micro-G for the "newcomer" aboard the station during the acute phase of adaptation to weightlessness, if there are such indications. The "bracelets" are compression cuffs attached to a belt and worn on the upper thighs over the coveralls, intended as countermeasures against the initial micro-G effects of blood filling (vascularity) in the upper torso (heaviness and blood pulsation in the head), facial puffiness, nasal stuffiness, painful eye movement, and vestibular disorders (dizziness, nausea, vomiting). They create artificial blood accumulation in the upper thirds of the thighs, causing some of the circulating blood volume to relocate from the upper body to the lower extremities, thereby (hopefully) correcting the adverse hemodynamic effect of micro-G and thus improving the crewmember's working capability. The actual compression cuff in the Braslet units is a combination of alternating multi-layer tensile and non-tensile elements, whose distension by body movements creates elastic forces that produce the necessary pressure on the body surface.]

At ~7:10am EDT, Yuri Malenchenko downlinked a TV PAO message of greetings to the Moscow Research & Development Institute of Radio Communications (MNIiIRC) via VHF over RGS (Russian Ground Site) on DO3. [“Our crew would like to extend our congratulations and best wishes to the members of your Institute on this remarkable day of its 80th anniversary! It is the hard work and dedication of your scientists, engineers, technicians, and workers that created communications hardware for manned vehicles and long-duration stations. From Yuri Alexeyevich Gagarin’s first comm session with his famous phrase “Off we go!” (Pojechalal!) and Sergei Pavlovich Korolev’s comm call “Cedar, Cedar, I’m Dawn One! (Kedr, Kedr, ya Zarya One!) to this day, we have reliable radio communications with Earth which we are using now to send this greeting message to your team…”]

With today’s temporary shutdown of the Elektron electrolysis system, oxygen (O₂) gas remaining in Progress M-61/26P is currently being used for daily cabin air refreshes as required to maintain proper ppO₂ (O₂ partial pressure).
No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: 
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit**  (as of this morning, 7:22am EDT [= epoch]):
Mean altitude -- 342.0 km
Apogee height -- 343.8 km
Perigee height -- 340.1 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002715
Solar Beta Angle -- -48.0 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 60 m
Revolution since FGB/Zarya launch (Nov. 98) -- 51117

**Significant Events Ahead**  (*all dates Eastern, some changes possible*):
10/25/07 -- STS-120/Discovery/10A docking (FD3/8:35am EDT) 5 EVAs, incl. Node 2 & PMA-2 external preps
- 10/26 (FD4) -- EVA-1 (6:28am-1:08pm; Parazynski/Wheelock)
- 10/26 (FE4) -- Node 2 install onto Node 1 (~12:33pm)
- 10/28 (FD6) -- EVA-2 (5:58am-12:38pm; Parazynski/Tani)
- 10/28 (FD6) -- P6 remove from Z1 truss (~8:13am)
- 10/30 (FD8) -- EVA-3 (5:28am-12:38pm; Parazynski/Wheelock)
- 10/30 (FD8) -- P6 install on P5 truss (~6:03am)
- 11/01 (FD10) -- EVA-4 (4:28am-9:13am; Parazynski/Wheelock)
- 11/02 (FD11) -- EVA-5 (3:58am-10:38am; Whitson/Malenchenko)
11/04/07 -- STS-120/Discovery/10A undocking (FD13/1:34am)
11/04/07 -- 2:00am: DST ends, ST begins
11/06/07 -- STS-120/Discovery/10A deorbit burn 3:47am EST
11/06/07 -- STS-120/Discovery/10A landing @ KSC (FD15/4:48am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis undocking
12/18/07 -- STS-122/Atlantis landing
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.
ISS On-Orbit Status 10/23/07

All ISS systems continue to function nominally, except those noted previously or below. Day 138 for Anderson. “Crew hit the deck running.”

STS-120/Discovery lifted off flawlessly right on time at 11:38am EDT on Mission ISS-10A and is currently catching up with the ISS, carrying the seven-member crew of Commander Pam Melroy, Pilot George Zamka and Mission Specialists Scott Parazynski, Doug Wheelock, Stephanie Wilson, Daniel Tani, and Paolo Nespoli (ESA/Italy). STS-120 is the 120th space shuttle flight, the 34th flight for the Discovery, and the 23rd flight to the station. It will include the most number of EVAs conducted while the shuttle is docked to ISS. Last not least, it is the first time both the Shuttle CDR and the ISS CDR are female. With other words: We are off to another great mission!

[Docking is scheduled for FD3 (Thursday, 10/25, at about 8:35am EDT, to begin ISS Stage 10A. After hatch opening (~10:33am), first tasks are safety briefing, OBSS (Orbiter Boom Sensor System) handoff from SRMS (Shuttle Remote Manipulator System) to SSRMS (Space Station RMS) at ~11:23am, Soyuz seat liner transfer (for the Tani/Anderson exchange), and preparations for the first spacewalk, EVA-1, by EV1 Parazynski & EV2 Wheelock, with overnight Campout of the two in the Airlock (A/L) for denitrogenation/pre-breathe. Objectives of the nominal 14-day mission include: Returning the SASA (S-band Antenna Structural Assembly) from the Z1 truss to the Discovery for Earth return, delivering & installing Node 2 “Harmony” in a temporary spot on Node 1 “Unity” (later to be moved to the PMA-2 (Pressurized Mating Adapter 2) where the Discovery will be docked), delivering a new ISS crewmember & bringing another one back to Earth, moving the P6 truss segment plus retracted solar arrays to their permanent position at the very end of the left side of the ISS truss beam, and conducting (with Peggy Whitson & Yuri Malenchenko) a total of five spacewalks, including one to test a shuttle tile repair technique. Landing will nominally take place at KSC on FD15 (11/6) at 4:50am EST.]
CDR Whitson set up and prepared the equipment for her first session with the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment, starting with inspection and activation of the MSG (Microgravity Science Glovebox). Further steps included installing ECU (Electronic Control Unit), the first SPU (Sample Processing Unit), and SAMS (Space Acceleration Measurement System) hardware into the MSG WV (Work Volume), connecting power & data cables from CSLM-2 hardware to MSG, followed by installing the experiment’s vacuum hose, checking it for leaks, later attaching CSLM-2 D/L Adapter and activating the experiment. Afterwards, Whitson disconnected the CSLM-2 D/L Adapter, secured MSG WV and powered down the MSG.

FE-1 Malenchenko and FE-2 Anderson undertook another standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, using DCS-760 digital still cameras in the SM, taking photos of an Orbiter cut-out as practice of the bottomside mapping of the Discovery, using the 400mm & 800mm telephoto lenses. The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-120/10A on Thursday. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.

Clay Anderson worked on recharging a total of 8 batteries for the DCS digital still cameras in two batches of four simultaneously. The batteries will be used for the Orbiter RPM photo shoot on Thursday. [Rbar = along the radius vector of the ISS, downward.]

Also for the upcoming high-pressure RPM P/TV (Photo/Video) activity, Clayton worked throughout the day on formatting the necessary P/TV storage devices. Formatted, in a Kodak DCS 760 camera on station power, were five 1GB EVA Flash Cards plus three PCMCIA 1GB Microdrives, each one taking ~20 minutes. Afterwards, the reformatted cards and microdrives were transferred to the SM (Service Module) for the DCS 760 camera configuration to get ready for the RPM documentation.

Peggy Whitson had ~2 hrs reserved for more preparations for the upcoming 10A spacewalks (the first one on Friday, 10/26), in the US Airlock (A/L). After first configuring the A/L and EMU (Extravehicular Mobility Unit)/spacesuits, the CDR completed the LAS (Load Alleviation Strap) “health” inspection on 55’ safety & waist tethers started on 10/18, then reviewed & self-studied background EVA refresher material on SAWs (Solar Array Wings), ACBM (Active Common Berthing
Mechanism) inspection, and MMOD (Micrometeoroid/Orbital Debris) shields.]

After the recent (10/7) R&R (Removal & Replacement) of three failed TVIS treadmill roller bearings, Whitson and Anderson today joined in a 30-min. “handover” session for Clay to familiarize the CDR with the difficulties and solutions of changing out the remaining forward roller bearings in the near future.

FE-1 Malenchenko set up the pumping equipment and initiated (later closed out) the periodic transfer of urine from 5 EDV-U containers in the Service Module (SM) to the Rodnik BV2 tanks of Progress M-61 (26P). [Leak checks performed by the crew on 10/8-9 on the membrane (expulsion bladder) of the Progress’ Rodnik BV1 tank showed that BV1 is unsuitable for liquid waste transfer due to a small leak in the tank’s bladder.]

The FE-1 also spent about 90 min of major equipment servicing in the ASU toilet facility, changing out all replaceable ASU parts with new components, viz., the separator, two receptacles (PR & MP), four hoses, a T-connector, an elbow fitting, an indicator, a filter insert (F-V), the pretreat container (E-K) with its hose. All old parts were discarded as trash. The ASU is now fully functional again. [E-K contains five liters of pre-treat solution, i.e., a mix of H2SO4 (sulfuric acid), CrO3 (chromium oxide, for oxidation and purple color), and H2O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]

Clay Anderson rearranged the P2 location in the Node, required for accessing Node 2 after berthing at its temporary location, by moving stowage equipment out of the way.

Peggy completed the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the SM.

Yuri conducted the daily updating/editing of the standard daily IMS (Inventory Management System) “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exerciser (CDR, FE-2), and VELO cycle with bungee cord load trainer (FE-1).

Afterwards, Clayton transferred the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM
(Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

At ~6:45am, the FE-2 powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 6:50am a ham radio exchange with students at Giosue’ Carducci, Santa Marinella, Italy, about 60 km northwest of Rome. Questions to the crew were uplinked by ARISS (Amateur Radio on ISS) beforehand. [“How long can you stay in space without getting any injuries to your body?”; “How do you wash yourself on board the ISS?”; “What kind of disadvantages does zero-gravity cause?”; “Is the ISS’s orbit preprogrammed or does it occur that astronauts have to steer it manually? If so, how is it done?”]

Yuri Malenchenko had 60 minutes for general station familiarization and acclimatization, as is standard daily rule for the first two weeks after starting station residency.

Early this morning, MCC-Houston conducted another BCC (Backup Control Center) dry run in test mode, with no involvement of the ISS crew or vehicle. The seven-hour exercise started at 1:00am EDT. [Purpose of this periodic exercise is to demonstrate BCC functionality under Russian assets while providing proficiency training for Moscow-HSG (Houston Support Group) personnel at the HSR (Houston Support Room) and TsUP-Moscow specialists.]

**Conjunction Update:** The possible conjunction identified yesterday for tomorrow evening is no longer a concern.

**Harmony Update:** Node 2 “Harmony” was named in a nationwide academic competition. Six different schools submitted the same name. Students from each school attended today’s Discovery launch.

**Trivia Update:** Luke Skywalker’s Lightsaber is onboard of Discovery in honor of the 30th anniversary of the Star Wars franchise.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

11/06/07 -- STS-120/Discovery/10A docking @ KSC (FD15/4:48am EST)  
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)  
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab  
11/14/07 -- US EVA-10  
11/18/07 -- US EVA-11  
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (NET)  
12/08/07 -- STS-122/Atlantis/1E docking  
12/15/07 -- STS-122/Atlantis undocking  
12/18/07 -- STS-122/Atlantis landing  
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry  
12/23/07 -- Progress M-62/27P launch  
12/25/07 -- Progress M-62/27P docking (DC1)  
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)  
01/31/08 -- 50-Year Anniversary of Explorer 1 (*1st U.S. satellite on Redstone rocket*)  
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS (NET)
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.
ISS On-Orbit Status 10/22/07

All ISS systems continue to function nominally, except those noted previously or below. Day 137 for Anderson. Underway: Week 1 of Increment 16. Crew rest day.

Crew wake/sleep cycle has “normalized”, Today’s wakeup - 1:00am, sleeptime – 4:30pm EDT.

By her voluntary choice, CDR Whitson conducted her first work with the CFE (Capillary Flow Experiment) payload, completing the detailed mapping of the CFE VG-1 Vane Gap 1) vessel. After a successful session, Peggy disassembled the equipment and stowed it. [CFE consisted of three experiments - CFE-CL (Contact Line), CFE-ICF (Interior Corner Flow), and CFE VG, for the study of different aspects of capillary flow of fluids in containers with complex geometries. Except for today’s run on the model of fuel tanks with locating vanes (to determine the maximum allowable vane gap and sensitivity to asymmetry), the CFE experiments have been concluded.]

In further preparation for the upcoming STS-120/10A docked period, the crew performed a 90-min. review of the 10A timeline, followed by a timeline teleconference with ground specialists via audio/S-band.

Peggy Whitson disconnected the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable from the Lab RWS (Robotics Work Station).

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exerciser (CDR, FE-2), and VELO cycle with bungee cord load trainer (FE-1).

Afterwards, Clay Anderson transferred the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

At ~7:45am EDT, the crew downlinked a PAO TV message of greetings for an upcoming Science Festival at Rice University, to be held on Saturday, 10/27, sponsored by Sally Ride, with Eileen Collins as keynote speaker. Special emphasis of the event will be on female
students at Rice and the importance of their pursuing a future in science and math.

At ~12:10pm, FE-2 Clay Anderson supported a “Crew Choice” linkup with Grade K students, college students and faculty at Hastings College, Nebraska (Clayton’s school). Questions for the FE-2 were uplinked beforehand. [“Did you know you wanted to be an astronaut when you were in 6th grade?”; “I’ve heard reports that astronaut food is “gross”. Any truth to this?”; “What are the possible risks for not following the work-out routine?”; “While a student at Hastings College, did you ever think that one day you would be an astronaut for NASA and is that what you were striving for while working toward your undergraduate/graduate degrees?”]

Later today, Whitson and Anderson will have their weekly PFCs via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Peggy at ~1:25pm, Clay at ~5:05pm.

**SARJ Anomaly:** At ~10:36am, Flight Controllers in Houston started a 3-hr. test on the starboard Solar Array Rotary Joint (STBD SARJ) in order to troubleshoot the cause of some vibration observed on the STBD side of the station’s truss structure when the SARJ on that side rotates, combined with some off-nominal readings on some STBD SARJ parameters. After the test, the STBD SARJ remains “parked” at 240 deg angle until the wing feathering prior to 10A docking. [Purpose of the TAS (Torque-As-Stepper) test, which torqued the array through 360 deg with small angular steps, was to help in characterization of the SARJ’s friction. Both BGAs (Beta Gimbal Assemblies) and TRRJ (Thermal Radiator Rotary Joint) remained in Autotrack mode. The regular BGA Bias setting (for drag reduction) was zero to maximize power generation during the test.]

**EWIS Update:** Most cables for EWIS (External Wireless Instrumentation System) were successfully installed by the crew last Saturday (10/20). Last step was not completed, but it is on the “job jar” task list to be finished when the crew has time.

**Conjunction:** A possible ISS conjunction with space debris on 10/24 (Wednesday) at 8:59pm EDT is currently being assessed by station and Shuttle teams. Early prediction of miss distance: 25 km.

**KOB-2 Heating Loop Pump Failure:** The Russian TCS (Thermal Control System) in the Service Module (SM) experienced an off-nominal automatic switch from KOB-2 (heating loop 2) to KOB-1. Checkouts determined that one of two pumps on the 4SPN2 pump panel is not working. The KOB-1 loop is running nominally with two pumps functioning on its pump panel and nominal software algorithms. Specialists are considering installing two new pumps (delivered on 15S) for restoring both panels with two pumps functioning on each.

**SRVK–2 Failure:** Also in the SM, channel 2 of the SRVK-2 water processing/supply system failed during the last four days. SRVK-1 is operating normally. Assessment by RSC-Energia specialists is underway.

**Correction:** Re yesterday’s item on the offnominal ballistic re-entry of Yurchikhin, Kotov & Shukor in Soyuz TMA-10: Bowersox, Budarin & Pettit, who re-entered ballistically on 5/3/03 in TMA-1, were ISS Expedition 6, not Expedition 3. *(See pictures from Kustanai yesterday, below)*
No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by
the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**STS-120/Discovery Launch Update:**  The launch window opens tomorrow, 10/23, at 11:33am
EDT and closes 10 min later, at 11:43pm. Optimal launch time is 11:38am.
Probability of KSC weather prohibiting 10/23 launch: 60% (cumulus clouds, showers, low-cloud
ceiling);
Probability of KSC weather prohibiting 10/23 tanking: 10%;
24-hour delay:
Probability of KSC weather prohibiting launch: 40%
Probability of KSC weather prohibiting tanking: 10%
48-hour delay:
Probability of KSC weather prohibiting launch: 40%
Probability of KSC weather prohibiting tanking: 10%

**ISS Orbit**  (as of this morning, 2:13am EDT [= epoch]):
Mean altitude -- 342.1 km
Apogee height -- 344.1 km
Perigee height -- 340.1 km
Period -- 91.38 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002994
Solar Beta Angle -- -38.8 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 95 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51082

**Significant Events Ahead (all dates Eastern, some changes possible):**
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to
P5 (11:38am EDT)
10/25/07 -- STS-120/Discovery/10A docking (FD3/8:35am EDT) 5 EVAs, incl. Node 2 & PMA-2
external preps)
10/26 (FD4) -- EVA-1 (6:28am-1:08pm; Parazynski/Wheelock)
10/26 (FE4) -- Node 2 install onto Node 1 (~12:33pm)
10/28 (FD6) -- EVA-2 (5:58am-12:38pm; Parazynski/Tani)
10/28 (FD6) -- P6 remove from Z1 truss (~8:13am)
10/30 (FD8) -- EVA-3 (5:28am-12:38pm; Parazynski/Wheelock)
10/30 (FD8) -- P6 install on P5 truss (~6:03am)
11/01 (FD10) -- EVA-4 (4:28am-9:13am; Parazynski/Wheelock)
11/02 (FD11) -- EVA-5 (3:58am-10:38am; Whitson/Malenchenko)
11/04/07 -- STS-120/Discovery/10A undocking (FD13/1:34am)
11/04/07 -- 2:00am: DST ends, ST begins
11/06/07 -- STS-120/Discovery/10A deorbit burn 3:47am EST
11/06/07 -- STS-120/Discovery/10A landing @ KSC (FD15/4:50am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking

SAR choppers approaching 14S touchdown site (10/21/07)
Fyodor Yurchikhin in Kustanai Reception of 14S Crew in Kustanai/Kazakhstan (10/21/07)
ISS On-Orbit Status 10/21/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday – first day alone for CDR Whitson, FE-1 Malenchenko and FE-2 Anderson. Day 136 for Anderson. Ahead: Week 1 of Increment 16 (Increment 15 lasted 26 weeks, four less than Inc-14).

Yest posadka! (We have Landing!) Welcome back home, Fyodor Yurchikhin, Oleg Kotov (Russia’s Cosmonaut No. 100) and Muszaphar Shukor! After 197 days in space (195 aboard ISS), Soyuz TMA-10/14S, carrying two-thirds of the Expedition 15 crew plus the Malaysian SFP, landed successfully this morning at 6:36am EDT in the steppes of Kazakhstan, with the crew in excellent condition. Touchdown occurred ~340 km short (west) of the intended site near Arkalykh. After arrival of the recovery forces, the crew was reported to be out of the spacecraft at about 6:55am. They were flown to Kustanai, Kazakhstan, with Star City near Moscow their next stop later today. Mission length for Yurchikhin & Kotov: 196d 17h 5m; for SFP Shukor: 10d 21h 14m. [Undocking from the ISS SM aft port was at 3:14am, deorbit burn from 5:47am-5:51am. According to TsUP/Moscow, the trajectory undershoot of the returning 14S Descent Module by about 340 km at touchdown was due to a switch of the on-board computer to the (secondary) Ballistic Descent Mode (BS), reported by the crew at 6:18am, instead of the lift-vector-controlled reentry using banking maneuvers (roll angle changes) commanded by the (primary) Automatically Controlled Descent Mode (AUS). An
official commission has been formed to investigate the computer glitch which appears similar to the one experienced during the re-entry of Soyuz TMA-1 with the Expedition 3 crew of Ken Bowersox, Nikolai Budarin and Donald Pettit on 5/3/03. Instead of flying on the closed-loop-guided trajectory designed to reduce peak deceleration & heating while extending the downrange, the ballistic mode results in a steeper trajectory, ~2g's higher deceleration forces on the crew (7g max instead of 5g), and an undershoot of around ~250 mi. The crew was never in any increased danger, and the SAR (Search & Rescue) personnel did not require any additional time to reach the capsule, which they reportedly had in sight during parachute descent from ~4600m altitude down.]

The ISS crew, currently asleep since ~7:00am EDT, has an unusual day: off-duty with wake-up tomorrow morning at 1:00am & bedtime at 4:30pm (to 1:00am Tuesday).

After Soyuz departure at 3:14am, FE-1 Yuri Malenchenko manually closed the PEV (Pressure Equalization Valve) between the Service Module (SM) and its docking port vestibule and later restored the onboard communications system (STTS) setup which had been configured for Soyuz undocking and descent, including the VHF comm link from the TMA-10 SA to TsUP via RGS (Russian Ground Site).

Peggy Whitson performed the daily maintenance of the SOZh (Environment Control & Life Support System, ECLSS) system in the SM, including the ASU toilet facilities systems/replaceables.

Working on the IMS (Inventory Management System), Whitson updated/edited its standard “delta file” on the Russian VKS (Auxiliary Computer System), including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The new ISS CDR also restored the onboard video configuration in the Lab by disconnecting the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable from the Lab RWS (Robotics Work Station) which was required for video coverage of the Soyuz departure.

During the undocking, structural dynamics data were taken (and subsequently downlinked via S-band) by the external S0 truss-mounted SDMS (Structural Dynamics Measurement System). [SDMS is ground controlled and can store only about 10 minutes of data before starting to overwrite its buffer; thus, SDMS took data only from 2 minutes prior to 3 minutes after the undocking.]

Shortly before bedtime this morning, Clay Anderson terminated the 24-hr data collection of the heart rate study of the CCISS (Cardiovascular & Cerebrovascular
Control on Return from ISS) experiment, downloading the Holter Monitor and Actiwatch data, then stowing the CCISS hardware.

No Science Summary today.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation's Ares I-X Launch.
ISS On-Orbit Status 10/20/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday - Day 9 (last) of joint E15/E16 operations. Day 197 in space for Yurchikhin & Kotov, Day 135 for Anderson.

Last day before Soyuz 14S undocking, with both E-15/E-16 crews on an irregular wake cycle:

- Wake-up this morning: 3:30am EDT;
- Pre-undocking rest period for all: 12:00pm-6:00pm;
- Sleep time for E-16 crew: 7:00am (10/21) -1:00am (10/22).

CDR Fyodor Yurchikhin, FE-1-16 Yuri Malenchenko and CDR-16 Peggy Whitson had about 60 min. of dedicated handover time between them. In addition, there were “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.

Before breakfast, Dr. Whitson completed the last day of her first session with the NASA/JSC experiment NUTRITION (her second session will be on her Flight Day 30). During today’s part, she collected another urine sample for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. [The current NUTRITION project expands the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

FE-2 Anderson completed his second CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS) session, started yesterday, by setting up and donning the Holter Monitor, donning the CBPD (Continuous Blood Pressure Device), performing the Baro Study, doffing the CBPD, and starting the 24-hr passive heart rate data collection. Data are recorded on a PCMCIA memory card, with the HRF
FE-2 Anderson performed the routine daily maintenance of the SOZh (Environment Control & Life Support System, ECLSS) system in the SM, including the ASU toilet facilities systems/replaceables.

Anderson also worked on the IMS (Inventory Management System), updating/editing its standard “delta file” on the Russian VKS (Auxiliary Computer System), including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~8:235am, Clay had a PFC (Private Family Conference) via S-band for audio and Ku-band for video.

Yurchikhin was in charge of final loading & stowing return equipment in the severely volume-limited Soyuz capsule, including dismantling remaining return payloads and transferring them to the TMA-10 Descent Module (SA). Before start of the 4-hr. pre-undocking crew rest period, Fyodor and FE-1-16 Yuri Malenchenko began transfers with P-KINASE, REGENERATION, CONJUGATION and STATOKONIA experiment hardware, kits and samples, packed in the BIOKIT-5 kit and Biocont-T container cold packs, while FE-1 Kotov took care of other equipment to be returned to Earth.

After the crew rest period (wake-up at ~6:00pm), additional experiment transfers to TMA-10 tonight will include gear, samples and data records of the IMMUNO, KUBIK-3, BIOEMULSION, SAMPLE, AT-Space and CONJUGATION payloads. CDR Yurchikhin will retrieve the Japanese experiment GCF-JAXA (Granada Crystallization Facility) from the Russian TBU-04 (Universal Bioengineering Thermostat 04) incubator and carry it to the Soyuz for return.

Additionally, CDR Yurchikhin will retrieve the Japanese experiment GCF-JAXA (Granada Crystallization Facility) from the Russian TBU-04 (Universal Bioengineering Thermostat 04) incubator and carry it to the Soyuz for return.

Also transferred for stowage in 14S will be SFP (Space Flight Participant) Sheikh Shukor’s VC-13 experiment data for CIS (Cells in Space), MIS (Microbes in Space),
PCS (Protein Crystallization in Space), TOP (Study of Torques in Microgravity) and the three previous ESA experiments – ETD (Eye Tracking Device), MOP (Motion Perception) and MUSCLE/LBP (Low Back Pain).

CDR-16 Whitson and FE-2 Anderson are to fill out the regular FFQ (Food Frequency Questionnaire), his 15th, her first, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

Malenchenko will perform the daily checkout/verification of IP-1 airflow sensors in the various Russian segment (RS) hatchways, including the SM-to-Soyuz tunnel, and the FGB-to-Node passageway. [This is important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners down (SKV-1).]

Whitson will work on the MELFI (Minus-Eighty Laboratory Freezer for ISS) facility, reconfiguring the MOOCE (MELFI On-Orbit Characterization Experiment) tray and inserting ICEPACs into the container module.

With Soyuz TMA-10 no longer available as emergency CRV (crew return vehicle) for the coming Increment, Malenchenko is to verify correct transfer of its three Emergency Procedures ODF (DAS EhP) books to the new CRV, TMA-11, docked at the FGB nadir port.

At ~10:45pm, Kotov and Malenchenko are scheduled to configure the onboard communications system (STTS) for the undocking, both working to set up, check and maintain the VHF comm link from the TMA-10 SA to TsUP/Moscow via RGS (Russian Ground Site) and the comm system for Soyuz undocking and descent.

Afterwards, at ~11:30pm, CDR Yurchikhin and FE-1 Kotov will be activating the spacecraft and also testing the S-band comm links from Soyuz. [The STTS comm system will be reset by Yuri to nominal configuration a few minutes after 14S departure (~3:35am).]

Clay Anderson will verify proper closure of the Lab science window shutter for protection from thruster plumes during undocking and power down the ham radio equipment in SM and FGB at ~7:30pm to prevent RF interference with the departing spacecraft.

Tomorrow at ~3:10am Peggy is scheduled for another routine daily maintenance of
the SOZh (Environment Control & Life Support System, ECLSS) system in the SM, including the ASU toilet facilities systems/replaceables.

Working on the IMS (Inventory Management System), Whitson is to update/edit its standard “delta file” on the Russian VKS (Auxiliary Computer System), including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

After Soyuz departure, Peggy will also disconnect the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable at the Lab RWS (Robotics Work Station) which was required for video coverage of the Soyuz departure.

The E-16 crewmembers are scheduled for their workout, on the CEVIS cycle ergometer (CDR-16, FE-2-16), and RED resistive exerciser (FE-1-16, FE-2).

After Soyuz ingress by the returning E15+SFP crew (~11:00pm), video-downlinked to TsUP/Moscow, and comm and suit leak checks, Kotov and Yurchikhin will remove the BZV QD (quick disconnect) clamps (~11:45pm) and close transfer hatches between 14S & SM aft port (~12:10am), followed by the standard one-hour hatch hermeticity check (Daily Orbit 13).  

Russian thrusters will be disabled during the 1h 40m period from start of BZV removal to leak check completion. Afterwards, ISS attitude control authority is handed over to Russian MCS (Motion Control System) with thrusters enabled, later to be returned to U.S. CMG momentum management. For the actual undocking at 3:14am, the station will briefly (9 min.) float in free drift.

If everything is nominal, the return to Earth of the TMA-10 spacecraft with Yurchikhin, Kotov and Shukor tomorrow morning will proceed along the following approximate event sequence (all times EDT; updated):

- Returning crew dons biomed harnesses & Kentavr (Centaur) suits --- 12:25am
- Crew ingresses Soyuz SA (Descent Module) from BO (Orbital Module) --- 1:25am
- ISS attitude control handover to RS --- 1:30am;
- SA/BO hatch closed --- 1:55am
- Spacesuit leak checks --- 1:55-2:20am
- SA/BO hatch leak check --- 2:20-3:00am
- ISS in free drift --- 3:10-3:19am;
- Hooks Open command --- 3:11am; automatic undocking from SM on DO15;
- Separation springs action (delta-V ~0.12 m/sec) --- 3:14pm; (retrograde to ISS flight)
- Manual separation burn (15 sec, ~0.65 m/sec) --- 3:17am;
- ISS attitude control handover to US --- 4:10am;
● Deorbit Burn start (delta-V 115.2 m/sec) --- 5:47:11am (115.2 m/s);
● Deorbit Burn complete --- 5:51:33am
● Tri-Module separation (140.1 km) --- 6:11:28am;
● Atmospheric entry (102.5 km, with ~170 m/sec) --- 6:14:20am;
● Max G-load (32.7 km alt) --- 6:20:57am;
● Parachute deploy command (10.6 km alt) --- 6:22:48am;
● 14S Landing --- 6:37:05am EDT; 4:37:05pm local Kazakhstan time;
● Local Sunset --- 8:27am (6:27pm local).

[Note: Kazakhstan time is GMT+6h; EDT+10h.]

**What will the Soyuz TMA-10 crew experience during their reentry/descent?**

For the reentry, Yurchikhin, Kotov and Shukor are wearing the Russian Kentavr anti-G suit. *[The Kentavr garment is a protective anti-g suit ensemble to facilitate the return of a long-duration crewmember into the Earth gravity. Consisting of shorts, gaiters, underpants, jersey and socks, it acts as countermeasure for circulatory disturbance, prevents crewmember from overloading during descent and increases orthostatic tolerance during post-flight adaptation. Russian crewmembers are also advised to ingest fluid-electrolyte additives, viz., three sodium chloride tablets during breakfast and after the midday meal, each time with 300 ml of fluid, and two pills during the meal aboard Soyuz before deorbit.]*

---

**Before descent:**
Special attention will be paid to the need for careful donning of the medical belt with sensors and securing tight contact between sensors and body.

During preparation for descent, before atmosphere reentry, crewmembers settle down comfortably in the Kazbek couches, fasten the belts, securing tight contact between body and the seat liner in the couch.

**During de-orbit:**
Dust particles starting to sink in the Descent Module (SA) cabin is the first indication of atmosphere reentry and beginning of G-load effect. From that time on, special attention is required as the loads increase rapidly.

Under G-load effect during atmosphere reentry the crew expects the following experience:
_Sensation of G-load pressure on the body, burden in the body, labored breathing and speech. These are normal sensations, and the advice is to "take them coolly". In case of the feeling of a lump in the throat, this is no cause to "be nervous". This is frequent and should not be fought. Best is to "try not to swallow and talk at this moment". Crew should check vision and, if any disturbances occur, create additional tension of abdominal pressure and leg muscles (strain abdomen by pulling in), in addition to the Kentavr anti-G suit._
During deployment of pilot (0.62 & 4.5 square meters), drogue (16 sq.m.) and main (518 sq.m.) parachutes the impact accelerations will be perceived as a "strong snatch". No reason to become concerned about this but one should be prepared that during the parachutes deployment and change ("rehook") of prime parachute to symmetrical suspension, swinging and spinning motion of the SA occurs, which involves vestibular (middle ear) irritations.

It is important to tighten restrain system to fasten pelvis and pectoral arch. Vestibular irritation can occur in the form of different referred sensations such as vertigo, hyperhidrosis, postural illusions, general discomfort and nausea. To prevent vestibular irritation the crew should "limit head movement and eyes movement", as well as fix their sight on motionless objects.

Just before the landing (softened by six small rocket engines behind the heat shield):
Crew will be prepared for the vehicle impact with the ground, with their bodies fixed along the surface of the seat liner in advance. "Special attention should be paid to arm fixation to avoid the elbow and hand squat" (instruction). Landing speed: ~9.9 m/sec.

After landing:  
Crew should not get up quickly from their seats to leave the SA. They were advised to stay in the couch for several minutes and only then stand up. In doing that, they should limit head and eyes movement and avoid excessive motions, proceeding slowly. They and their body should not take up earth gravity in the upright position too quickly.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/

**ISS Orbit**  (as of this morning, 8:58am EDT [= epoch]):
Mean altitude -- 342.3 km  
Apogee height -- 344.3 km  
Perigee height -- 340.3 km  
Period -- 91.38 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.0003041
Solar Beta Angle -- -29.1 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 65 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51055

Significant Events Ahead (all dates Eastern, some changes possible):
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:14am/6:38am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5 (11:38am EDT)
10/25/07 -- STS-120/Discovery/10A docking (FD3/8:35am EDT) 5 EVAs, incl. Node 2 & PMA-2 external preps)
10/26 (FD4) -- EVA-1 (6:28am-1:08pm; Parazynski/Wheelock)
10/26 (FE4) -- Node 2 install onto Node 1 (~12:33pm)
10/28 (FD6) -- EVA-2 (5:58am-12:38pm; Parazynski/Tani)
10/28 (FD6) -- P6 remove from Z1 truss (~8:13am)
10/30 (FD8) -- EVA-3 (5:28am-12:38pm; Parazynski/Wheelock)
10/30 (FD8) -- P6 install on P5 truss (~6:03am)
11/01 (FD10) -- EVA-4 (4:28am-9:13am; Parazynski/Wheelock)
11/02 (FD11) -- EVA-5 (3:58am-10:38am; Whitson/Malenchenko)
11/04/07 -- STS-120/Discovery/10A undocking (FD13/1:34am)
11/04/07 -- 2:00am: DST ends, ST begins
11/06/07 -- STS-120/Discovery/10A deorbit burn 3:47am EST
11/06/07 -- STS-120/Discovery/10A landing @ KSC (FD15/4:50am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch.**

*Happy Landing, Fyodor, Oleg and Muszaphar!*
ISS On-Orbit Status 10/19/07

All ISS systems continue to function nominally, except those noted previously or below. Day 8 of joint E15/E16 operations. Day 196 in space for Yurchikhin & Kotov, Day 134 for Anderson.

Aboard ISS, the E15/E16 crew rotation/handover period continues with full activity schedules for all six residents involved.

CDR Fyodor Yurchikhin and FE-1-16 Yuri Malenchenko had about 110 min. of dedicated handover time between them. In addition, there were “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.

Before breakfast, CDR-16 Whitson began her first session with the NASA/JSC experiment NUTRITION w/Repository, for which she had to forego exercising and food intake for eight hours. [After collecting an initial urine sample, Whitson, assisted by Clay Anderson, followed it with phlebotomy, i.e., drawing blood samples (from an arm vein) which she first allowed to coagulate in the Repository, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. The equipment was then stowed. NUTRITION activities today included the required 24-hour data urine collection by Anderson, by securing samples during the day, all stored immediately in MELFI. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing inflight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures]
exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.

Later, CDR Yurchikhin used the Russian IPD-NH₃ Draeger tubes, on a cartridge belt with a pump, to check the cabin air for NH₃ (ammonia, from possible urine spillage), followed by the periodic air sampling with the AK-1M adsorber around the Service Module (SM) work table. The samplers were stowed in the Soyuz 14S Descent Module for analysis on the ground.

FE-1-16 Malenchenko performed the MO-22 Sanitary-Epidemiological Status check, part of the Russian MedOps program. [To test for microflora, Yuri collected samples from surface areas of interior panels and hardware in the DC-1 Docking Compartment and on the SKV-2 air conditioner using cotton swabs and special test tubes which were then stowed in 14S for return to the ground.]

FE-2 Anderson performed the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. Two CSA-CP (CSA-Combustion Products) instruments recorded CO, HCN and HCl readings at the SM Central Post (#1060, prime) and in the Node (#1057, backup), while the CSA-O₂ units (#1063, #1042) looked for O₂ in the Lab and the CDMK (#1013) for CO₂ in SM and Lab. Also recorded were battery ticks. No battery changes required. The instruments were turned off afterwards, except for the prime CSA-CP #1060 unit, and returned to their regular locations. The two CSA-O₂ units, #1042 & #1063, were prepacked for return on 10A. The CSA-CPs also have O₂ sensors but they are out of calibration and their readings are currently omitted.]

Yurchikhin completed the (currently) daily job of checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway. [This is especially
important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners down (SKV-1).

Oleg Kotov and Fyodor Yurchikhin performed the third and last 1.5-hour “installment” of their fifth and final training session in the "Chibis" ODNT suit as standard preparation of cosmonauts for returning into gravity, assisting each other in turn as CMO (Crew Medical Officer) during their individual 90-min runs. For FE-1, vital body readings were downlinked to RGS (Russian Ground Site) via VHF at 11:02am EDT on DO1 (Daily Orbit 1). For the CDR, readings were obtained with the Tenzoplus sphygmomanometer for blood pressure. The exercise was supported by specialist tagup via S-band. [The below-the-waist reduced-pressure device ODNT (US: LBNP, Lower Body Negative Pressure) in the "Chibis" garment provides gravity-simulating stress to the body’s cardiovascular/circulatory system for reestablishing the body’s orthostatic tolerance (e.g., the Gauer-Henry reflex) after the six-month stay in zero-G. Fyodor’s and Oleg’s ODNT protocol today again consisted of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced (“negative”) pressure, set at -25, -30, -35 and -40 mmHg for five minutes each, then at -25, -30, and -40 mmHg, 10 minutes in each mode, and at -30 mmHg for 5 min, while shifting from foot to foot at 10-12 steps per minute. The body’s circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood and body fluids “down”.

Floating in the Soyuz TMA-10/14S Orbital Module (BO), FE-1 Kotov dismantled and removed the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry system, along with its PZU-1M ROM (read-only memory) unit, now no longer required since the BO is to be jettisoned before 14S reentry. [The electronics will be stowed on ISS for reuse in a future vehicle.]

Anderson, Whitson and Malenchenko joined up for about an hour to review the preliminary timelines for the 10A spacewalks. Later, they conducted a teleconference with MCC-Houston specialists to discuss details. [During the STS-120/10A docked period, starting on 10/25 (FD3) and ending on 11/4 (FD13), there will be five EVAs: 10/26 (FD4), 10/28 (FD6), 10/30 (FD8), 11/1 (FD10) and 11/2 (FD11). They will be conducted by three spacewalk teams: Parazynski & Wheelock (EVA-1, EVA-3, EVA-4), Parazynski & Tani (EVA-2), and Whitson & Malenchenko (EVA-5). Main activities during the EVAs will focus on transferring Node 2 “Harmony” to its temporary position on the portside CBM (Common Berthing Module) of Node 1 “Unity” and its partial outfitting, transferring the P6 truss segment from its present place on the Z1 truss to the P5 truss, and a DTO (Development Test Objective) session in the Shuttle cargo bay to test the T-RAD (Tile Repair Ablator Dispenser) system using STA-54 material, similar to a caulk gun.]
Preparatory to reviewing the Robotics operations required during the 10A docked period, Dr. Whitson connected the UOP DCP (utility outlet panel/display & control panel) power bypass cable for powering up the CUP RWS (Cupola Robotics Work Station) and Lab RWS. Afterwards, Peggy and Clay Anderson performed the usual DOUG (Dynamic Onboard Ubiquitous Graphics) software review before SSRMS (Space Station Remote Manipulator System) activities. DOUG setup for FD3 (OBSS Grapple, Node Unberth & Handoff, EVA-1 setup) is scheduled on FD2. Crewmembers operating the SRMS (Shuttle Remote Manipulator System) and SSRMS will be Clay Anderson, Stephanie Wilson, Dan Tani, Peggy Whitson and Pam Melroy. [DOUG is a special application running on the MSS (Mobile Service System) RWS laptops that provides a graphical birdseye-view image of the external station configuration and the SSRMS arm, showing its real-time location and configuration on a laptop during its operation.]

Yurchikhin had ~55 min reserved for stowing hardware designated for disposal in the Soyuz 14S Orbital Module. Later, Kotov transferred prepacked return cargo to the Soyuz for stowage in the spacecraft’s Descent Module.

Yuri Malenchenko undertook another standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, his third, using DCS-760 digital still cameras in the SM, today taking photos of an Orbiter cut-out as practice of the bottomside mapping of the Discovery, using the 400mm & 800mm telephoto lenses. Afterwards, Yuri downlinked the obtained images to the ground for analysis, to be discussed at a subsequent tagup. [The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-120/10A next week. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]

Clay Anderson conducted the routine maintenance of the SOZh (ECLSS/ Environment Control & Life Support System) in the SM, including ASU toilet facilities systems/replaceables.

Later, Peggy Whitson worked on the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 performed computer maintenance, doing the regular bi-weekly reboots of the SSC (Station Support Computer) File Server and OCA Comm Router laptops as
well as the weekly reboots of the PCS (Portable Computer System) A31p laptops.

For the SAMPLE experiment, Oleg performed the periodic culture sampling and later in a second session became the subject when Yuri collected specimens from him. All samples were secured in the MELFI (Minus Eighty Degree Celsius Laboratory Freezer for ISS). [Dewar 4 Tray C, Sect. 2/3.]

In the morning right after wakeup, Malenchenko terminated the new Russian SONOKARD (Sonocard) experiment by taking the recording device from his SONOKARD T-Shirt. Later, Yuri copied the measurements to the RSE-MED laptop for subsequent downlink to the ground. [SONOKARD is an interesting experiment for potentially improving the crew health monitoring system by using a contactless method of acquiring physiological data during the crewmember’s sleep. The method employs a device in a breast pocket of a Sonokard sports shirt, with the objectives to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight. This would be important not only from scientific, but also from a practical standpoint for the further development of the system for real-time crew health monitoring. Such a system may become an important element in manned space flight safety, since it will allow a continuous monitoring of crew health. In addition, continuous records of sets of physiological data will permit to gather new information about the state of different levels of physiological functions control, of their co-ordination, and the way they are related to the degree of the body’s adaptation to zero-gravity.]

Other major science activities in the RS by Fyodor, Oleg and Yuri today focused on –

- PGB (Portable Glovebox) teardown and stowage,
- KUBIK-1 refrigerator (setup & copy data to laptop, switch data cable, copy data again, then perform close-out operations and deactivate the refrigerator),
- CONJUGATION/Pairing experiment (again replacing cold packs in the Biocont-T container in the morning and evening to preserve samples),
- LACTOLEN, ARIL (transfer BIOEKOLOGIYA/Bioecology containers #6-1 & #18 to Soyuz for return),
- BIOTREK (dismantle & transfer container to Soyuz), and
- ANTIGEN (dismantle & transfer containers #13 & #16 to Soyuz).

Sheikh Shukor, the SFP (Space Flight Participant), had his two daily tagups with his
consultant team at TsUP-Moscow via VHF-1 and performed his eighth day of VC-13 activities, making his scheduled daily entries in the log/questionnaires for the MOP (Motion Perception, study of vestibular adaptation to gravity transition) and MUSCLE/LBP (Low Back Pain) experiments.

In addition, Muszaphar Shukor conducted more HDTV photo/video operations of “Life on the Station”, the “Malaysian Science Program on ISS RS”, and scenes of the Malaysian “angkasa” (astronaut) at work.

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR/full time, FE-1/full time, FE-2) and RED resistive exerciser (CDR-16, FE-2).

Afterwards, Peggy copied the crewmembers’ workout data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

At ~12:25pm, Yurchikhin and Malenchenko signed the usual formal Russian statements certifying RS handover/acceptance as specified in the RPS (handover) book, proper transfer of emergency procedures documents and placement of the Iridium/Motorola-9505 satellite phone in the Soyuz Descent Module, as well as the list of cargo stowed on Progress M-61/26P for deorbit.

Later, at ~2:15pm, the combined ISS crews conducted their traditional Changing-of-Command ceremony, as Expedition 15 (Fyodor Yurchikhin, Oleg Kotov) turned ISS operations over to Expedition 16 (Peggy Whitson, Yuri Malenchenko, Clay Anderson). The brief ceremony was transmitted to the ground via Ku- & S-band for broadcast on NASA TV. As usual, the form of the traditional event, which celebrates and commemorates the transition between station crews, was at the crew’s discretion. With this, stewardship of the space station is officially transferred to the new crew.

At ~3:30pm, Clay will have a private CDE (Crew Discretionary Event) via S-band for audio and Ku for video.

*Oxygen Repress Update:* $O_2$ gas remaining in Progress M-61/26P is currently being used for daily cabin air refreshes as required to maintain proper $pO_2$ ($O_2$ partial pressure). At the same time, the Russian Elektron electrolysis system is also supplying $O_2$. 
ISS/RS (Russian Segment) Experiment Plans: During the new Increment 16, the Russian partner plans to conduct 216 sessions of 48 experiments. Thirty nine experiments have been started during the previous increments. Nine experiments are new investigations (Sonocard, Lactolen, ARIL, OChB, Astrovakcina, Zhenshen-2, Bar, MATI-75, JAXA 3DPC-2).

Soyuz 14S Return to Earth: If everything is nominal, the return to Earth of the TMA-10 spacecraft with Yurchikhin, Kotov and Shukor on 10/21 (Sunday) will proceed along the following approximate event sequence (all times EDT; revised):

- ISS attitude control handover to RS --- 1:30am;
- ISS in free drift --- 3:10-3:19am;
- Hooks Open command --- 3:11am; automatic undocking from SM on DO15;
- Separation springs action (delta-V ~0.12 m/sec) --- 3:14pm; (retrograde to ISS flight)
- Manual separation burn (15 sec, ~0.65 m/sec) --- 3:17am;
- ISS attitude control handover to US --- 4:10am;
- Deorbit Burn start (delta-V 115.2 m/sec) --- 5:47:07am (115.2 m/s);
- Deorbit Burn complete --- 5:51:28am
- Tri-Module separation (140.1 km) --- 6:11:25am;
- Atmospheric entry (101.8 km, with ~170 m/sec) --- 6:14:15am;
- Max G-load --- 6:20:47am;
- Parachute deploy command --- 6:22:39am;
- 14S Landing --- 6:37:03am EDT; 4:37:03pm local Kazakhstan time;
- Local Sunset --- 8:27am (6:27pm local).

[Note: Kazakhstan time is GMT+6h; EDT+10h.]

Today’s CEO (Crew Earth Observation) photo targets were Mt. Kilimanjaro, Kenya (Kilimanjaro rises 4,600 m from its base and lies on the eastern branch of the Africa Rift Valley. Kilimanjaro is probably most famous for reports on the melting of the glaciers at its peak. Previous estimates were that all the glaciers would disappear by 2015. Other researchers have proposed that Kilimanjaro is returning to a previous state 11,000 years ago. Still others maintain that the glaciers are not melting because of global warming but because of solar radiation (Philip Mote of the University of Washington, Georg Kaser of the University of Innsbruck). Requested was photo documentation of the ice at the summit of Kilimanjaro), and Lake Poopo, Bolivia (lowering and rising of water levels in Lake Poopo give indications of short-term regional climate fluctuations. Lake Poopo is a large saline lake located in a shallow depression in the Altiplano Mountains in Bolivia. The water level in this lake is highly variable because it lacks any major outlet and it has a mean depth of no more than 3 m. Therefore, even small regional climate variations can have an impact on the appearance of the lake. There has been recent rain in the area).

CEO photography can be viewed and studied at the websites:
ISS Orbit (as of this morning, 8:35am EDT [= epoch]):
Mean altitude -- 342.4 km
Apogee height -- 344.3 km
Perigee height -- 340.4 km
Period -- 91.38 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002932
Solar Beta Angle -- -24.1 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 65 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51039

Significant Events Ahead (all dates Eastern, some changes possible):
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:14am/6:38am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5 (11:38am EDT)
10/25/07 -- STS-120/Discovery/10A docking (FD3/8:35am EDT) 5 EVAs, incl. Node 2 & PMA-2 external preps
  • 10/26 (FD4) -- EVA-1 (6:28am-1:08pm; Parazynski/Wheelock)
  • 10/26 (FE4) -- Node 2 install onto Node 1 (~12:33pm)
  • 10/28 (FD6) -- EVA-2 (5:58am-12:38pm; Parazynski/Tani)
  • 10/28 (FD6) -- P6 remove from Z1 truss (~8:13am)
  • 10/30 (FD8) -- EVA-3 (5:28am-12:38pm; Parazynski/Wheelock)
  • 10/30 (FD8) -- P6 install on P5 truss (~6:03am)
  • 11/01 (FD10) -- EVA-4 (4:28am-9:13am; Parazynski/Wheelock)
  • 11/02 (FD11) -- EVA-5 (3:58am-10:38am; Whitson/Malenchenko)
11/04/07 -- STS-120/Discovery/10A undocking (FD13/1:34am)
11/04/07 -- 2:00am: DST ends, ST begins
11/06/07 -- STS-120/Discovery/10A deorbit burn 3:47am EST
11/06/07 -- STS-120/Discovery/10A landing @ KSC (FD15/4:50am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/?/?/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.
ISS On-Orbit Status 10/18/07

All ISS systems continue to function nominally, except those noted previously or below. Day 7 of joint E15/E16 operations. Day 195 in space for Yurchikhin & Kotov, Day 133 for Anderson.

Aboard ISS, the E15/E16 crew rotation/handover period continues with full activity schedules for all six residents involved.

FE-1 Oleg Kotov and FE-1-16 Yuri Malenchenko had about 85 min. of dedicated handover time between them. In addition, there were “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.

CDR-16 Peggy Whitson and FE-2 Clay Anderson spent 3 hrs in the U.S. Airlock (A/L) to prepare for the 10A spacewalks by gathering and configuring EVA equipment & tools, going by an uplinked list of 62 individual items such as bags, caddies, tethers, etc. Part of the activities also involved verification of configuration and health status of LAS (Load Alleviation Strap) sheaths on safety and waist tethers. [During recent destructive load testing of an LAS on the ground, the strap failed to show the red warning indicator. Today’s inspection was to ensure that all tethers currently on-orbit are "GO" for EVA.]

Later in the day, Anderson had time reserved for recording video in the A/L, shooting a 20-min tour of the interior of “Quest” for ground viewing.

Fyodor Yurchikhin and Oleg Kotov performed the second (of three) 1.5-hour “installment” of their fifth and final training session in the "Chibis" ODNT suit as standard preparation of cosmonauts for returning into gravity, assisting each other in turn as CMO (Crew Medical Officer) during their individual 90-min runs. Vital body readings were downlinked to RGS (Russian Ground Site) via VHF at 6:41am EDT on DO1 (Daily Orbit 1) & 8:14am on DO2 and also obtained with the
Tenzoplus sphygmomanometer. A tagup/calldown with ground specialists via VHF supported the runs. There will be one more session tomorrow. [The below-the-waist reduced-pressure device ODNT (US: LBNP, Lower Body Negative Pressure) in the "Chibis" garment provides gravity-simulating stress to the body’s cardiovascular/circulatory system for reestablishing the body’s orthostatic tolerance (e.g., the Gauer-Henry reflex) after the six-month stay in zero-G. Fyodor’s and Oleg’s ODNT protocol today again consisted of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced ("negative") pressure, set at -25, -30, -35 and -40 mmHg for five minutes each, then at -25, -30, and -40 mmHg, 10 minutes in each mode, and at -30 mmHg for 5 min, while shifting from foot to foot at 10-12 steps per minute. The body’s circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood and body fluids “down”.

Peggy Whitson unstowed and set up the NUTRITION with Repository hardware for the blood draw and urine collection part of her first session with the NUTRITION experiment, beginning tomorrow, requiring Peggy to forego exercising & food intake for eight hours, i.e., starting tonight. Urine sample collection begins tomorrow morning and continues through Saturday morning. [The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts, collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing in-flight samples (plus an additional postflight sample), made possible by the MELFI/Minus Eighty Degree Celsius Laboratory Freezer for ISS).

CDR Yurchikhin used standard ECOSFERA equipment, set up yesterday, to perform microbial air sampling runs for the MedOps SZM-MO-21 experiment, taking samples in the DC-1 Docking Compartment, followed by the standard pre-return sanitary-epidemiological incubation status checks (MedOps SZM-MO-22), collecting samples from cabin surfaces along with specimens from crewmembers for sanitation and disease studies. The samples will be returned to Earth on Soyuz. [The MO-21 equipment, consisting of an air sampler set, a charger and power supply unit, provides samples to help determine microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies. The MO-22 equipment, similar to MO-21, complements the investigation.]

Fyodor also collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]
Crewmembers Anderson & Whitson, as part of handover activity, conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week.]

Yuri Malenchenko completed the (currently) daily job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway. [This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners down (SKV-1).]

Peggy & Clay had an hour set aside on their timeline for reviewing a draft copy of the STS-120/10A Resupply Transfer List, an 11-page first cut at the equipment transfers required during the 10A docked period, with quantities of items, initial & final stowage locations, masses, and procedures/constraints.

Yurchikhin & Kotov transferred and stowed return cargo in Soyuz TMA-10/14S, working their way through an extensive 6-page equipment list.

Clay Anderson conducted the routine maintenance of the SOZh (ECLSS/ Environment Control & Life Support System) in the SM, including ASU toilet facilities systems/replaceables. [Due to a failure of the ASU last night, crewmembers were advised by TsUP-Moscow to use the ASU in the Soyuz spacecraft in the interim until restoration of the SM facility to full operation.]

Later, Peggy Whitson worked on the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The CDR-16 continued the close-out of SAME (Smoke Aerosol Measurement Experiment), started yesterday by Anderson, first removing the numerous SAME hardware pieces from the MSG WV (Microgravity Science Glovebox/Work Volume) to intermediate stowage, then reconfiguring the MSG rack for the CSLM-2 (Coarsening in Solid-Liquid Mixtures-2) hardware scheduled next week for setup. While the ground did some checkout of the MSG LAN (Local Area Network) configuration, Dr. Whitson repacked the SAME gear for return to Earth and finally deactivated the MSG. [SAME measured the smoke properties, or particle size distribution, of typical particles that are produced from different materials that can be found onboard ISS and other spacecraft. SAME also tested the performance of ionization smoke detectors (currently in use on Space Shuttles) and evaluated the performance of the photoelectric smoke detectors (currently in use on ISS). The data will be used to develop a model that can predict smoke properties in space]
and to develop smoke detection requirements for Orion, the next generation crew exploration vehicle.

The three Russian crewmembers worked on the extensive Matryoshka-R radiation monitoring payload, from which Kotov first removed the 25P-delivered differential pressure indicator/dosimeter assemblies (SPD) for return on Soyuz 14S, followed by Yurchikhin and Malenchenko transferring a new set of TLD detectors and NTDP assemblies from 14S and placing them in the Matryoshka’s Anthropomorphic Phantom in the SM.  [The complex Matryoshka payload suite is designed for sophisticated radiation studies. Besides spherical containers in the SM, there is the “Phantom”, a human dummy torso assembled from individual horizontal slice-like (body cross-sectional) layers with 356 thermo-luminescent detectors (TLDs) and five nuclear radiation tracking detectors (NTDPs) between the layers. After the insertion of the detectors and re-assembly of the mannequin, the torso is “dressed” with a covering “poncho” and “hood” and used for studies of on-orbit radiation and long-term dose accumulation. The payload collects radiation measurements every 15 minutes of each hour around the clock. Note: Matryoshka is the name for the traditional Russian set of nested dolls.]

Other major science activities in the RS (Russian Segment) by Fyodor, Oleg and Yuri today focused on –

- AT-Space (transfer of containers from KUBIK-1 refrigerator to BKT1 kit),
- BIORISK (BIO-2; KM tray dismantling & transfer to Soyuz, -MCB container #7 transfer to Soyuz),
- BIOEKOLIGIYA/Bioecology (BTKh-12; Kit #10 removal from Bioecology Kit #3 and transfer to Soyuz),
- CONJUGATION (Pairing) experiment (again replacing cold packs in the Biocont-T container in the morning and evening to preserve samples), and
- Recording all activities for photo/video documentation.

In addition, Malenchenko set up the new Russian SONOKARD (Sonocard) payload and started the experiment, using T-Shirt 1-02 from the SONOKARD kit. Measurements are recorded on a data card for return to Earth.  [SONOKARD is an interesting experiment for potentially improving the crew health monitoring system by using a contactless method of acquiring physiological data during the crewmember’s sleep. The method employs a device in a breast pocket of a Sonokard sports shirt, with the objectives to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight. This would be important not only from scientific, but also
from a practical standpoint for the further development of the system for real-time crew health monitoring. Such a system may become an important element in manned space flight safety, since it will allow a continuous monitoring of crew health. In addition, continuous records of sets of physiological data will permit to gather new information about the state of different levels of physiological functions control, of their co-ordination, and the way they are related to the degree of the body’s adaptation to zero-gravity.]

Dr. Sheikh Shukor, the SFP (Space Flight Participant), had his two daily tagups with his consultant team at TsUP-Moscow via VHF-1 and performed his seventh day of VC-13 activities, making his scheduled daily entries in the log/questionnaires for the MOP (Motion Perception, study of vestibular adaptation to gravity transition) and MUSCLE/LBP (Low Back Pain) experiments.

VC-13 also assisted Yuri Malenchenko in a session of the ETD (Eye Tracking Device) experiment in the DC-1, first with target installation, distance measuring and making hardware connections, later by taking photo documentation of Yuri’s experimental session on a flash/memory card for subsequent downlinking to the ground.

In addition, Muszaphar Shukor conducted more HDTV photo/video operations of “Life on the Station”, the “Malaysian Science Program on ISS RS”, scenes of the Malaysian “angkasa” (astronaut) using the Russian UFS Operator Restraint System and a “Virtual 3D-Manual for the Angkasa” on the laptop.

At 11:35am EDT, the SFP held a ham radio session on the Kenwood equipment in the SM with students of Malaysian Group of Schools #4 at the National Planetarium in Kuala Lumpur. [“How does one get treated for sudden sickness in space?”; “Is there anything interesting that you have learned so far?”; “How hard is it to change your clothes in space?”; “Can you watch your favorite soap in space?”; “What language do you use to communicate between your fellow crew?”]

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR-16, FE-1/full time) and RED resistive exerciser (FE-2, FE-1-16), with CDR & FE-1 also putting in exercise as part of their Chibis LBNP/ODNT sessions.

Afterwards, Clay copied the crewmembers’ workout data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).
Working from the Russian discretionary “time permitting” task list, Oleg conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

At ~10:30am, CDR-16 Whitson and FE-2 Anderson supported two televised PAO interviews of 10 min each, one with the space.com website (Tariq Malik), the other with The Daily Nebraskan (Katie Steiner).

At ~2:45pm, Peggy & Clay had 30 min set aside for a teleconference with ground specialists to discuss 10A Shuttle prepack activities.

At ~4:40pm, Clay will also have his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

**Oxygen Repress Update:** O₂ gas remaining in Progress M-61/26P is currently being used for daily cabin air refreshes as required to maintain proper ppO₂ (O₂ partial pressure). At the same time, the Russian Elektron electrolysis system is also supplying O₂.

**ISS/RS (Russian Segment) Experiment Plans:** During the new Increment 16, the Russian partner plans to conduct 216 sessions of 48 experiments. Thirty nine experiments have been started during the previous increments. Nine experiments are new investigations (Sonocard, Lactolen, ARIL, OChB, Astrovakcina, Zhenshen-2, Bar, MATI-75, JAXA 3DPC-2).

**ATU Lockup Issue:** Yesterday, according to crew report ATU-6 (Audio Terminal Unit 6) in the US Airlock was “frozen” and could not be reconfigured or set to Transmit. After cycling the unit out & back into Public Calls mode, the ATU is functioning intermittently. Specialists are investigating.

**Soyuz 14S Return to Earth:** If everything is nominal, the return to Earth of the TMA-10 spacecraft with Yurchikhin, Kotov and Shukor on 10/21 (Sunday) will proceed along the following approximate event sequence (all times EDT; revised):
- ISS attitude control handover to RS --- 1:30am;
- ISS in free drift --- 3:10-3:19am;
- Hooks Open command --- 3:11am; automatic undocking from SM on DO15;
- Separation springs action (delta-V ~0.12 m/sec) --- 3:14pm; (retrograde to ISS flight)
• Manual separation burn (15 sec, ~0.65 m/sec) --- 3:17am;
• ISS attitude control handover to US --- 4:10am;
• Deorbit Burn start (delta-V 115.2 m/sec) --- 5:47:07am (115.2 m/s);
• Deorbit Burn complete --- 5:51:28am
• Tri-Module separation (140.1 km) --- 6:11:25am;
• Atmospheric entry (101.8 km, with ~170 m/sec) --- 6:14:15am;
• Max G-load --- 6:20:47am;
• Parachute deploy command --- 6:22:39am;
• 14S Landing --- 6:37:03am EDT; 4:37:03pm local Kazakhstan time;
• Local Sunset --- 8:27am (6:27pm local).

[Note: Kazakhstan time is GMT+6h; EDT+10h.]

Today’s CEO (Crew Earth Observation) photo targets were **Eastern Tien Shan, China** (glaciers on the crests of the Tien Shan ranges are being monitored by global change scientists as examples of lower latitude glaciers. Continental glaciers on high mountains hold a different history of environmental change than coastal glaciers. Crew was asked to shoot glacier tongues of the Tien Shan range, ISS orbit passed over the center of this range), and **Oasis Impact Crater** (Oasis impact crater is 18 km in diameter and is dated at less than 120 million years. CEO team has a few images of this crater taken with the 400 mm lens but no sharply focused views with the 800 mm lens. Thus, the crew was requested to acquire this image using the 800 mm telephoto lens).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 9:50am EDT [= epoch]):
Mean altitude -- 342.4 km
Apogee height -- 344.4 km
Perigee height -- 340.4 km
Period -- 91.38 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002989
Solar Beta Angle -- -19.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 88 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51024
Significant Events Ahead (all dates Eastern, some changes possible):
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:14am/6:38am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5 (11:38am EDT)
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- STS-120/Discovery/10A landing @ KSC (4:47am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch.
All ISS systems continue to function nominally, except those noted previously or below. Day 6 of joint E15/E16 operations. Day 194 in space for Yurchikhin & Kotov, Day 132 for Anderson.

Aboard ISS, the E15/E16 crew rotation/handover period continues with full activity schedules for all six residents involved.

CDR Fyodor Yurchikhin and FE-1-16 Yuri Malenchenko had about 60 min. of dedicated handover time between them. In addition, there were “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.

Yurchikhin, FE-1 Kotov and SFP Sheik Shukor spent three hours in the TMA-10 Descent Module (SA) to conduct the Soyuz descent drill, a standard training exercise for every crew returning on a Soyuz. The exercise, which strictly forbids any command activation (except for switching the InPU display), was supported by a tagup and discussions with ground instructor at TsUP/Moscow via S-band. [The session includes a review of the pertinent ODFs (operational data files), specifically the books on Soyuz Ascent & Descent Procedures, Emergency Descents, and Off-Nominal Situations, crew responsibilities when executing the flight program, visual crew recognition of SUS (Entry Control System) failures, spacesuit procedures, etc., with special emphasis on operations with the Neptune-ME cockpit console. The training uses a Descent Simulator application on the RSK1 laptop. During the actual descent, Yurchikhin, as Soyuz CDR, will occupy the middle couch, with Shukor in the right seat and Kotov in the Descent Module’s left Kazbek couch. Pending the final State Commission decision at about 3.5h before undocking, 14S return is expected for 10/21 (next Sunday), with undocking at 3:14am EDT and landing near Arkalyk/Kazakhstan at ~6:38am (4:38pm Kazakhstan time). See below for details.]
CDR-16 Peggy Whitson started her day by setting up the SAFER OBT (Simplified Aid for EVA Rescue Onboard Trainer) on an A31p laptop, reviewed procedures and then spent about three hours practicing flying on the SAFER as preparation for her 10A spacewalk (EVA-5 on STS-120 Flight Day 11). Afterwards, the SAFER was stowed again.

Later, Whitson and Malenchenko continued preparations for the 10A EVAs in the U. S. Airlock (A/L) for several hours. Specifically, Peggy and Yuri –

- Familiarized themselves with the EMU C&W (Extravehicular Mobility Unit Caution & Warning) system,
- Checked out their EMU/spacesuits,
- Terminated charging of the second EVA battery set in the BSA (Battery Stowage Assembly),
- Checked out the SAFER units,
- Installed the REBAs (Rechargeable EVA Battery Assemblies) in the EMUs,
- Checked out the REBA powered suit equipment and tools (EVA tool preparation is scheduled tomorrow), and
- Went through a review and drill of the procedures for aiding a crewmate incapacitated by decompression sickness and for using the BTA (Bends Treatment Adapter) hardware.

In preparation for the arrival of the Discovery next week (10/25, Thursday), FE-2 Anderson worked with three DCS-760 digital cameras (#1017, #1013, #1016), taking blank and white images with each on a PCMCIA 1GB microdrive. [After their downlink to MCC-Houston, the images will be analyzed to determine which two of the 760s to use for the STS-120 RPM (R-bar Pitch Maneuver) photography.]

Time again for one last recharge of the Motorola-9505 Iridium satellite phone to be returned with Soyuz 14S, a monthly routine job. CDR Yurchikhin, with FE-1-16 Malenchenko monitoring, took care of the recharge, completing the process and cleaning up at about 1:00pm EDT. [After retrieving it from its location in the Soyuz TMA-10/14S descent module (BO), Fyodor and Yuri initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion, the phone was returned inside its SSSP Iridium kit and stowed it back in the BO’s operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown. The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap.]

Oleg Kotov took the monthly sensor readings of the Russian “Pille-MKS” radiation dosimetry experiment, which has ten sensors placed at various locations in the
Russian segment (port cabin window, starboard cabin window, ASU toilet facility, control panel, etc.), then powering down the reader and replacing the flash card, afterwards stowing the removed memory card for return to Earth on 14S.

Malenchenko conducted the currently daily job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway. [This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners down (SKV-1).]

In support of upcoming payload data transferring from the BSPN payload server for subsequent downlink on OCA comm (via the Russian RSS1 laptop to a PCMCIA flash card), Yuri performed the periodic time synchronization between the RSS1 and the BSPN, after testing functionality by checking data comm between the two computers and synching RSS1 to station time. [Experiment control application is a payload file transfer program called ShellForKE.]

The FE-1 serviced the Service Module (SM) condensate water processor (SRV-K2M) system, replacing the BKV water conditioning unit’s BKO multifiltration/purification column with a new spare. The old unit was pre-packed for disposal. [The SRV-K2M, with its BKO multifiltration unit, removes dissolved mineral and organic impurities from the condensate. Downstream from it, the condensate water is treated in the BKV water conditioning unit with salts for taste and silver ions for preservation, before it flows to the KPV potable water container.]

Clay Anderson offloaded the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling a CWC (#1062) with the collected water slated for processing. [Estimated offload time before termination (leaving ~5.25 kg in the tank): ~23 min.]

Afterwards, Yurchikhin and Malenchenko took the CWC #1062 to the Russian Segment (RS) for the periodic (about twice a month) replenishing of the Elektron oxygen generator’s water supply for electrolysis, filling the KOV thermal loops’ EDV container. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

Whitson conducted the regular checkout of the HMS RSP (Health Maintenance System/Respiratory Support Pack).

Peggy also did the periodic check of running U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet and inspecting & filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5)
incubator payload.  [The incubator is controlled from the ground with automatic video downlinked to Earth.]

The FE-2 closed out the SAME (Smoke Aerosol Measurement Experiment) investigation which recently completed operations with excellent results. Final steps today consisted of powering up the MSG (Microgravity Science Glovebox) facility and removing the last sample carousel.  [Except for the alcohol wick, all items will be returned to Earth on 10A, including the thermal precipitator and digital video tapes.  SAME measured the smoke properties, or particle size distribution, of typical particles that are produced from different materials that can be found onboard ISS and other spacecraft.  SAME also tested the performance of ionization smoke detectors (currently in use on Space Shuttles) and evaluated the performance of the photoelectric smoke detectors (currently in use on ISS).  The data will be used to develop a model that can predict smoke properties in space and to develop smoke detection requirements for Orion, the next generation crew exploration vehicle.]

Yuri downlinked the data accumulated during Increment 15 in the RS by the ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) experiment that Fyodor closed down yesterday.  Space radiation spectrometry data were sent to Earth via U.S. OCA assets from two PCMCIA memory cards, #935 & #939 (which also will be returned on Soyuz 14S).

Other major science activities in the RS by Yuri Malenchenko today focused on –

- KUBIK-2 refrigerator (set-up & copying data, then switching its data cable and copying data again, followed by deactivation of thermostat and closing out the equipment,
- AT-Space experiment (finishing by fixating containers 1 thru 6 {#4 in PGB/Portable Glovebox}), and
- CONJUGATION (Pairing) experiment, again replacing cold packs in the Biocont-T container in the morning and evening to preserve samples.

In preparation for a microbial air sampling session scheduled tomorrow, CDR Yurchikhin unstowed the MedOps SZM-MO-21 ECOSFERA equipment and initiated charging on the Ecosphere power pack (BP).  [The equipment, consisting of an air sampler set, a charger, power supply unit, and incubation tray for Petri dishes, determines microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]

Besides participating in the Soyuz descent OBT, SFP (Space Flight Participant) Dr. Shukor had his two daily tagups with his consultant team at TsUP-Moscow via VHF-1 and performed his sixth day of VC-13 activities, making his scheduled daily
entries in the log/questionnaires for the MOP (Motion Perception, study of vestibular adaptation to gravity transition) and MUSCLE/LBP (Low Back Pain) experiments, and conducting the ETD (Eye Tracking Device) experiment of the VC-13 program, with Malenchenko again supporting him with photo documentation.

Shukor also conducted more HDTV photo/video operations of “Life on the Station”, the “Malaysian Science Program on ISS RS”, scenes of the Malaysian “angkasa” (astronaut) using the Russian UFS Operator Restraint System and a “Virtual 3D-Manual for the Angkasa” on the laptop.

Oleg Kotov conducted the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) in the SM, including ASU toilet facilities systems/replaceables.

Later, Yuri Malenchenko worked on the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The E15 crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/full time, FE-1/full time) and RED resistive exerciser (FE-2). CDR-16 Whitson also performed her second workout today, on RED (1 hr).

Later tonight, Peggy will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:35am, the E-16 crewmembers (Whitson, Malenchenko, Anderson) held a teleconference with the STS-120/10A crew to discuss details of next week’s 10A docking mission.

Afterwards (~11:15am), the E-15/E-16 crews shared in two televised PAO interviews of 10 min each, one with CBS News (Kimberly Dozier), the other with ABC News (Gina Sunseri).

**Oxygen Repress Update:** O₂ gas remaining in Progress M-61/26P is currently being used for daily cabin air refreshes as required to maintain proper ppO₂ (O₂ partial pressure). At the same time, the Russian Elektron electrolysis system is also supplying O₂.
Soyuz 14S Return to Earth: If everything is nominal, the return to Earth of the TMA-10 spacecraft with Yurchikhin, Kotov and Shukor on 10/21 (Sunday) will proceed along the following approximate event sequence (all times EDT):

- ISS attitude handover to RS --- 1:30am;
- ISS in free drift --- 3:10-3:19am;
- Hooks Open command --- 3:11am; automatic undocking from SM on DO15;
- Separation springs action (delta-V ~0.12 m/sec) --- 3:14pm; (retrograde to ISS flight)
- Manual separation burn (15 sec, ~0.65 m/sec) --- 3:17am;
- Deorbit Burn start (delta-V 115.2 m/sec) --- 5:47:17am;
- Deorbit Burn complete --- 5:51:39am
- Tri-Module separation (140.1 km) --- 8:05:37am;
- Atmospheric entry (101.8 km, with ~170 m/sec) --- 6:14:27am;
- Max G-load --- 6:20am;
- Parachute deploy command --- 6:22:49am;
- ISS attitude control handed back to US --- 4:10am;
- 14S Landing --- 6:37:49am EDT; 4:37:49pm local Kazakhstan time;
- Local Sunset --- 8:26am (6:26pm local).

[Note: Kazakhstan time is GMT+6h; EDT+10h.]

What will the Soyuz TMA-10/14S crew experience during their reentry/descent?

For the reentry, Yurchikhin, Kotov and Shukor will wear the Russian Kentavr anti-G suit. [The Kentavr garment is a protective anti-g suit ensemble to facilitate the return of a long-duration crewmember into the Earth gravity. Consisting of shorts, gaiters, underpants, jersey and socks, it acts as countermeasure for circulatory disturbance, prevents crewmember from overloading during descent and increases orthostatic tolerance during post-flight adaptation. Russian crewmembers are also advised to ingest fluid-electrolyte additives, viz., three sodium chloride tablets during breakfast and after the midday meal, each time with 300 ml of fluid, and two pills during the meal aboard Soyuz before deorbit.]

Before descent:
Special attention will be paid to the need for careful donning of the medical belt with sensors and securing tight contact between sensors and body.

During preparation for descent, before atmosphere reentry, crewmembers settle down comfortably in the Kazbek couches, fasten the belts, securing tight contact between body and the seat liner in the couch.

During de-orbit:
Dust particles starting to sink in the Descent Module (SA) cabin is the first indication
of atmosphere reentry and beginning of G-load effect. From that time on, special attention is required as the loads increase rapidly.

Under G-load effect during atmosphere reentry the crew expects the following experience:

*Sensation of G-load pressure on the body, burden in the body, labored breathing and speech. These are normal sensations, and the advice is to "take them coolly". In case of the feeling of a lump in the throat, this is no cause to "be nervous". This is frequent and should not be fought. Best is to "try not to swallow and talk at this moment". Crew should check vision and, if any disturbances occur, create additional tension of abdominal pressure and leg muscles (strain abdomen by pulling in), in addition to the Kentavr anti-G suit.*

During deployment of pilot (0.62 & 4.5 square meters), drogue (16 sq.m.) and main (518 sq.m.) parachutes the impact accelerations will be perceived as a "strong snatch". No reason to become concerned about this but one should be prepared that during the parachutes deployment and change ("rehook") of prime parachute to symmetrical suspension, swinging and spinning motion of the SA occurs, which involves vestibular (middle ear) irritations.

It is important to tighten restrain system to fasten pelvis and pectoral arch. Vestibular irritation can occur in the form of different referred sensations such as vertigo, hyperhidrosis, postural illusions, general discomfort and nausea. To prevent vestibular irritation the crew should "limit head movement and eyes movement", as well as fix their sight on motionless objects.

*Just before the landing (softened by six small rocket engines behind the heat shield):*

Crew will be prepared for the vehicle impact with the ground, with their bodies fixed along the surface of the seat liner in advance. "Special attention should be paid to arm fixation to avoid the elbow and hand squat" (instruction). Landing speed: ~9.9 m/sec.

*After landing:*

Crew should not get up quickly from their seats to leave the SA. They were advised to stay in the couch for several minutes and only then stand up. In doing that, they should limit head and eyes movement and avoid excessive motions, proceeding slowly. They and their body should not take up earth gravity in the upright position too quickly.

Today’s CEO (Crew Earth Observation) photo targets were **Dundee Ice Cap, China** *(the glaciers in this target area are prominent only on the north slopes on this east-west oriented range. This is a very arid continental region and ice persists at this latitude primarily because of the 16,500 to 17,500 ft elevations of the mountain)*
crests. These glaciers are currently under field investigation by Ohio State University where core samples have been taken for paleo-climate studies. Dundee Ice Cap should have been to the left [west] of this ascending orbit pass), Mt. Kilimanjaro, Kenya (Kilimanjaro rises 4,600 m from its base and lies on the eastern branch of the Africa Rift Valley. Probably what Kilimanjaro is most famous for recently is the melting of the glaciers at its peak. Previous estimates were that all the glaciers would disappear by 2015. Other researchers have proposed that Kilimanjaro is returning to a previous state of 11,000 years ago. Still others maintain that the glaciers are not melting because of global warming but because of solar radiation [Philip Mote of the University of Washington, Georg Kaser of the University of Innsbruck]. Requested is photo documentation of the ice at the summit of Kilimanjaro), Ouarkziz Impact Crater (Ouarkziz impact crater is 3.5 km in diameter and has been dated as less than 70 million years old. While there are 400 mm views of this crater in the CEO database, researchers would like to get more detailed views with the 800 mm lens [400 with doubler]. The crater should have been a little left of orbit track), and Mt. Ruapehu (Mt. Ruapehu is an active volcano at the southern end of the Taupo Volcanic Zone in New Zealand. It is located 40 km SW of the southern shore of Lake Taupo. Ruapehu is one of the world's most active volcanoes and the largest active volcano in New Zealand, the most recent major eruptions occurring in 1995 and 1996).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 9:24am EDT [= epoch]):
Mean altitude -- 342.5 km
Apogee height -- 344.6 km
Perigee height -- 340.4 km
Period -- 91.39 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003091
Solar Beta Angle -- -14.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 104 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 51008

Significant Events Ahead (all dates Eastern, some changes possible):
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:14am/6:38am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5 (11:38am EDT)
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- STS-120/Discovery/10A landing @ KSC (4:47am EST)
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 10/16/07

All ISS systems continue to function nominally, except those noted previously or below.  Day 5 of joint E15/E16 operations.  Day 193 in space for Yurchikhin & Kotov, Day 131 for Anderson.

Aboard ISS, the E15/E16 crew rotation/handover period continues with full activity schedules for all six residents involved.

CDR Yurchikhin, CDR-16 Peggy Whitson, FE-2-16 Clay Anderson, FE-1-15 Oleg Kotov and FE-1-16 Yuri Malenchenko had about 40 min. of dedicated handover time between them. In addition, there were “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.

Fyodor Yurchikhin also finished Part 2 of his second stress test plus saliva and blood sampling of the ESA/Russian biomed experiment “IMMUNO”, today completing remaining urine sample collections and conducting close-out ops. Specimens were stowed in a special urine containment bag in the KRIOGEM-3M refrigerator (blood samples were secured yesterday in the MELFI {Minus Eighty Degree Celsius Laboratory Freezer for ISS} in cold packs).  [IMMUNO is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit. Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end of the first day, based on the accompanying MO-3 stress test, performed during the subject’s physical exercise regimen.]

After his concluding “IMMUNO” session, Yurchikhin took air samples with the IPD-
NH₃ Draeger tubes sampler, testing for ammonia (NH₃) in the SM (Service Module), i.e., checking for spilled urine if any.

Yuri Malenchenko and Oleg Kotov set up the work area for the Russian science payload BIMS (MBI-22) and unstowed the hardware. For the subsequent experiment activity, Yuri was the subject, with Oleg (who has been through this before) assisting. Today’s runs included otoscopic, nasal, dental and dermatological exams for evaluating the skin and mucous membranes for any changes over long-duration space missions, based on video and digital photography to capture areas of skin, gums, nasal passages and the ear canal. [**BIMS objective is to conduct several experimental sessions in the RS (Russian segment) for filming skin portions and mucous membranes of crewmembers. It is part of a comprehensive research into using telemedical technologies for getting information from distant space crews for medical support of human space missions and information for life science flight studies.** The BIMS experiment uses image capturing (video & still photo), an otoscope (or auriscope - the familiar medical device for visualizing the outer & middle ear, nose and upper throat area), the RSEM-ed A31p laptop and PCMCIA memory cards, with data files downlink via BSR-TM to study small skin sites, conduct otorhinolaryngologic examinations (external acoustic meatus, eardrums, nasal passages), and do stomatologic (i.e., medical study of mouth and its diseases) examination of gums and teeth.]

Peggy Whitson spent about 45 min. on the periodic (~monthly) PEP (Portable Emergency Provisions) safety inspection. [**The IMS-supported inspection involves verification that PFEs (portable fire extinguishers), PBAs (portable breathing apparatus), QDMAs (quick-don mask assemblies) and EHTKs (extension hose/tee kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware.** In the U.S. segment (USOS), there are a total of 5 PFEs and 7 PBAs, plus 7 QDMAs and 4 EHTKs.]

Yuri Malenchenko performed IFM (in-flight maintenance) in the GA (Pressurized Adapter) section of the FGB, replacing a drive handle for the transfer hatch seal with a new handle delivered on Soyuz TMA-11/15S in its SSVP (Docking & Internal Transfer System) accessories kit.

In the SM, FE-1-16 Malenchenko conducted part of the periodic water sampling for return to Earth, using empty drinking bags (or food container) to collect condensate (KAV) samples upstream of the Water Purification Column Unit (SRV-K2M BKO). Later, Yuri replaced the water sampler.

Kotov used the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System) to take readings of potentially harmful contaminants in
the SM. The hardware was then returned to initial stowage. [The CMS uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip.]

CDR Yurchikhin conducted the currently daily job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway. [This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners down (SKV-1).]

As part of handover activities, Malenchenko joined Yurchikhin in the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator by measuring its internal pressure, which is being recharged in regular intervals with pressurized N₂ from a BPA Nitrogen Purge Unit. The last test pressurization was done by Yurchikhin on 10/4. [During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]

Yuri Malenchenko upgraded the Russian RSE-MED laptop with new software (Vers. 1.4) from a DVD disk brought up on Soyuz 15S. [Before the software installation, data accumulated on the laptop during Increment 15 were temporarily saved on a Flashcard and later restored on the RSE-MED (for the DYKHANIE, PNEVMOKARD, BIMS, CARDIOKASSETA and STIMUL experiments).]

In the U.S. Airlock (A/L), Peggy Whitson continued preparations for the 10A spacewalks, setting up the SCU (Service & Cooling Umbilical) gear for the standard EMU (Extravehicular Mobility Unit) “scrubbing” and then starting the ionic and particulate filtration process on the EMU and A/L cooling loops, for elimination of any biomaterial residues.

Whitson also installed EMU batteries (#2038, #2077) and METOX canisters (#0007, #0016) in support of the EMU loop scrub and tomorrow’s scheduled EMU checkout.

Later, Peggy and Clay configured the EVA systems for use, i.e., preparing the helmets with the Valsalva devices (for nose pinching & ear canal clearing) and Fresnel lenses, installing gloves and the “Snoopy” comm caps for the EMU checkout, plus doing some other get-ahead tasks. [The two spacesuits (#3006, #3018) for Peggy and Yuri required about one hour each with SCU connected. During the 10A docked period, a total of five spacewalks are planned, to be conducted by Scott Parazynski, Douglas Wheelock, Daniel Tani, Whitson and]
FE-1-16 Malenchenko removed the two passive dosimeters of the Russian BTN-M1 “Neutron” experiment from its BZ electronics box and transferred them to the Soyuz for return to Earth. [BTN-M1 “Neutron” was installed on 11/23/06 during EVA-17 by Tyurin and Lopez-Alegria on an external handrail. The payload measured the exposure of ISS to neutron and gamma radiation that come from solar flares. Its data are to be used to clarify current on-orbit radiation models and determine the complete radiation dose the astronauts and cosmonauts receive during EVAs.]

CDR Yurchikhin closed out the current operations of the ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) experiment, collecting its dosimeters and memory cards with data obtained during Increment 15 and prepping them for return to Earth on Soyuz. Afterwards, Fyodor relocated the AST spectrometer and its hardware accessories to a new exposure location, installing them, along with fresh 15S-delivered dosimeters, in the DC-1 Docking Compartment. [ALTCRISS uses the AST spectrometer to monitor space radiation in the Russian segment (RS).]

FE-1 Kotov meanwhile closed out the RS radiation payload suite “Matryoshka-R”, pre-packing its MOSFET (metal oxide semiconductor field-effect transistor) dosimeter detector unit, LULIN-5 electronics box, BUBBLE detectors & reader, and memory cards for return to the ground.

At the HRF1 (Human Research Facility 1) rack, Whitson deactivated the MedOps cardiac defibrillator and conducted its periodic checkout, which was to be recorded on video and later dumped to the ground (Last time done: 8/29/07). [This routine maintenance task is scheduled as soon as possible from Expedition start and every 60 days thereafter. For the checkout, the defib is connected to the 120V outlet, equipped with its battery (today #1018) and then allowed to charge, for about five seconds, to a preset energy level (e.g., 100 joules). After the button-triggered discharge, a console indicator signals success or failure of the test. The pacing signal is downlinked via S-band for 1 min. The HRF was powered down afterwards.]

The CDR-16 worked on the CEVIS (Cycle Ergometer with Vibration Isolation), preparing the exercise machine for the new E16 crewmembers by transferring their specific system files and protocols to the CEVIS PCMCIA memory cards.

As another handover activity, Kotov and Malenchenko spent study time on an overview of the CMS (Crew Medical Systems) exercise equipment aboard the station, a standard requirement for “newcomers” before the first physical exercise session. [The review covered identification, stowage location and explanatory
notes of physical exercise accessories, exercise prescriptions, and detailed instructions for using the TVIS treadmill, RED resistive exerciser, CEVIS cycle ergometer, and HRM heart rate monitor.]

Malenchenko undertook another standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, his second, using DCS-760 digital still cameras with 400 & 800mm lenses at Service Module (SM) windows 6 & 8 to take imagery of documented CEO Earth targets, today using auto focus and practicing mapping ground features with images having 40-50 percent overlap. Afterwards, Yuri downlinked the obtained images to the ground for analysis, to be discussed at a subsequent tagup. [The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-120/10A next week. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]

Oleg Kotov conducted the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) in the SM, including ASU toilet facilities systems/replaceables.

Later, Kotov also worked on the IMS (Inventory Management System), updating/editing its standard “delta file", including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The E15 crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/IMMUNO, FE-1/full time) and RED resistive exerciser (FE-2). E16 crewmembers also performed their first-day workout today, Peggy Whitson on TVIS (1 hr) and Yuri Malenchenko on RED (1 hr).

Later tonight, Peggy will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Major science activities in the RS by Yuri Malenchenko today focused on the biotechnological experiment CONJUGATION (Pairing), again replacing cold packs in the Biocont-T container.

SFP (Space Flight Participant) Sheik Shukor had his two daily tagups with his
consultant team at TsUP-Moscow via VHF-1 and performed his fifth day of VC-13 activities, making his scheduled daily entries in the log/questionnaires for the MOP (Motion Perception, study of vestibular adaptation to gravity transition) and MUSCLE/LBP (Low Back Pain) experiments, and worked his parts in the experiments CIS (Cells in Space), and MIS (Microbes in Space), with Malenchenko supporting him with photo documentation.

In addition, Shukor conducted more HDTV photo/video operations of “Life on the Station”, the “Malaysian Science Program on ISS RS”, scenes of the Malaysian “angkasa” (astronaut) using the Russian UFS Operator Restraint System and a “Virtual 3D-Manual for the Angkasa” on the laptop.

The SFP also held another ham radio session (~12:25pm EDT) from the Kenwood station in the SM with school children at the Malaysian National Space Agency’s Planetarium Hall, and spent about 1.5 hours, with CDR Yurchikhin and other crewmembers, in scheduled commemorative (Russian: “symbolic”) activities (a standard tradition for visiting guests and departing expedition crewmembers, doing photo/video recording activities with Malaysian Flags, national shirt, mission and UN patches, Malaysian Code of Principles, signing and stamping envelopes, etc.).

Working from the Russian discretionary “time permitting” task list, Oleg conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Clay Anderson had about two hours reserved for his own departure preparations for his return on STS-120/10A.

At ~7:55am EDT, The E15/E16 crewmembers joined in an abbreviated news conference with Russian media at TsUP-Moscow, followed by three TV PAO downlinks by Peggy, Yuri and Clay with messages of greetings to the Russian Chapter of the Red Cross, to the guests of the Second Festival of Science in Moscow on 10/19-21 at M.V. Lomonosov MGU, Russia’s first university, and to the Seventh International Scientific & Practical Conference on Manned Space Flights, to be held 11/14 at the Gagarin Cosmonaut Training Center (GCTC).

Afterwards (~9:05am), SFP Sheikh Shukor was scheduled for a “Telebridge” exchange with the Malaysian Prime Minister (Dato’ Seri) Dr. Jamaludin Jarjis (DSJJ) from Kuala Lumpur.

At ~10:55am, Peggy and Clay supported two PAO TV interviews, one with Radio
Iowa (Matt Kelley), the other with KETV-TV in Omaha, Nebraska. [Peggy hails from Iowa, Clayton from Nebraska.]

Soyuz 14S Thruster Firing: After attitude handover to the Russian MCS (motion control system) this morning at 5:40am EDT, the ISS went into free drift for the standard pre-undock burn test of the Soyuz thrusters at 6:00-6:17am. The hot fire test on the KDU Combined Propulsion System Section 2 and KDU Tank Section 2, was successfully conducted. Attitude authority was returned to USOS momentum management at 6:40am. For the test, the ISS audio was configured for the crew’s entry into the Soyuz, the solar arrays were feathered to mitigate structural loads and contamination issues, and certain electrical loads were powered down due to the decreased power availability. All systems have since been successfully returned to nominal configurations.

Weekend Voluntary Science: Three optional activities for the voluntary “Saturday Science” program for next weekend (10/20-21) were suggested to Peggy and Clay for their choice. Selection is required by tonight. [The three choices are: (1) BCAT-3 (Binary Colloidal Alloy Test-3) Magnet Unstick, using the CGBA-4 (Commercial Generic Bioprocessing Apparatus-4), powered up 12 hrs before; (2) CFE VG1 (Capillary Flow Experiment – Vane Gap 1): voice & video of another run of to complete the CFE-VG1 experiment; and (3) SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), flying two & three satellites, requiring CDRA (CO2 Removal Assembly) to be running.]

Oxygen Repress Update: O2 gas remaining in Progress M-61/26P is currently being used for daily cabin air refreshes as required to maintain proper ppO2 (O2 partial pressure). At the same time, the Russian Elektron electrolysis system is also supplying O2.

Today’s CEO (Crew Earth Observation) photo targets were S. Mozambique (this region of Mozambique has received an economic stimulus from oil and gas strikes that have just come on line in the last few years. ISS CEO imagery will be used in a country with almost no maps, to document the associated economic development [planned and unplanned] that surround oil areas. The crew was to shoot an overlapping series of images, looking right at about 45 deg, for about 45 seconds), and Jornada Basin, New Mexico (the Jornada Basin Long Term Ecological Research [LTER] project focuses on changes in the distribution of soil resources as an index of the impact of vegetation change--desertification--on semiarid lands. Specifically, it is hypothesized that a relatively homogeneous pattern of soil nutrients is found in areas of grassland. Various factors leading to vegetation change alter the distribution of soil resources, leading to the invasion and
persistence of shrubs and the development of a patchy distribution of soil nutrients. Nutrient-rich areas that develop under shrub canopies are known as "islands of fertility," while soil resources are lost from the adjacent inter-shrub spaces by wind and water erosion).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 4:40am EDT [= epoch]):
Mean altitude -- 342.6 km
Apogee height -- 344.8 km
Perigee height -- 340.5 km
Period -- 91.39 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003222
Solar Beta Angle -- -9.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 92 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50989

**Significant Events Ahead** *(all dates Eastern, some changes possible)*:
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 10/15/07

All ISS systems continue to function nominally, except those noted previously or below.  Day 4 of joint E15/E16 operations. Day 192 in space for Yurchikhin & Kotov, Day 130 for Anderson.  Underway: Week 26 of Increment 15 (last).

The crew’s work/sleep cycle has reverted back to the regular 2:00am-5:30pm EDT.

Aboard ISS, the E15/E16 crew rotation/handover period went underway with full activity schedules for all six residents involved.

CDR-16 Peggy Whitson, FE-2-16 Clay Anderson, FE-1-15 Oleg Kotov and FE-1-16 Yuri Malenchenko joined up for almost 4 hrs of dedicated handover time. In addition, there were “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.

After yesterday’s unstowing and setting up the necessary hardware for the ESA/Russian biomed experiment “IMMUNO”, including the KRIOGEM-03M refrigerator, Plasma-03 accessories, CARDIOSCIENCE and SALIVA-IMMUNO kits and wipes, CDR Yurchikhin today undertook the scheduled session (his second), starting with the first stress test (of two) plus saliva and blood sampling, assisted by FE-1 Kotov where required for venous blood collection and blood sample processing (smear and in the Plasma-03 centrifuge). Samples were then secured in the MELFI (Minus Eighty Degree Celsius Laboratory Freezer for ISS) in cold packs in their KB-03 container.  

[IMMUNO is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit. Also included is a stress-test questionnaire to be filled out by the subject at begin and end of IMMUNO and based on the accompanying MO-3 stress test, performed during the subject’s physical exercise regimen.]
For today’s scheduled Robotics activity, CDR-16 Whitson connected the UOP DCP (utility outlet panel/display & control panel) power bypass cable for powering up the CUP RWS (Cupola Robotics Work Station) and Lab RWS (to be disconnected again later tonight). [A small issue was encountered during Lab RWS power-up, with an attempted reboot of the laptop not successful. Subsequent RWS checkout proceeded nominally using files from 13A.1.]

Afterwards, Peggy Whitson and Clay Anderson performed the usual DOUG (Dynamic Onboard Ubiquitous Graphics) software review preparatory to SSRMS (Space Station Remote Manipulator System) activities and then took the RWS systems and the SSRMS through a 10A pre-launch checkout sequence. [The remotely controlled arm first performed a grapple on the MBS PDGF-3 (Mobile Base System/Power & Data Grapple Fixture 3) on its primary electronic string, then released the Lab PDGF with the other LEE (Latching End Effector) and regrappled the Lab PDGF using the redundant (secondary) string. Finally, the MBS was released and the SSRMS maneuvered to its final position for observing 10A docking. DOUG is a special application running on the MSS (Mobile Service System) RWS laptops that provides a graphical birdseye-view image of the external station configuration and the SSRMS arm, showing its real-time location and configuration on a laptop during its operation.]

FE-1-16 Malenchenko undertook the standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, his first, using DCS-760 digital still cameras with 400 & 800mm lenses at Service Module (SM) windows 6 & 8 to take imagery of documented CEO Earth targets using manual focusing only. Afterwards, Yuri downlinked the obtained images to the ground for analysis, to be discussed at a subsequent tagup. [The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-120/10A next week. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]

CDR Yurchikhin spent about 30 min of regular equipment servicing in the SM (Service Module)’s toilet facility (ASU), performing the monthly replacement of two urine receptacles (PR & MP) and a filter insert (F-V) with new spares (last time done: 9/17). The old units were trashed.

In addition to the ASU servicing, Fyodor completed today’s routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the SM.

Yurchikhin conducted the (currently daily) job of checkout/verification of IP-1 airflow
sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway. *This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners down (SKV-1).*

Peggy worked on the BSA (Battery Stowage Assembly) in the U.S. Airlock, terminating the charging of the first set of EMU (Extravehicular Mobility Unit) batteries for the 10A spacewalks and then initiating the recharge on the second set. *The entire charge cycle is expected to require approximately 40 hours.*

Whitson and Anderson worked together on a handover familiarization & checkout session with the US CMRS (Crew Medical Restraint System).

As another handover activity, Whitson and Anderson spent study time on an overview of CMS (Crew Medical Systems) exercise equipment aboard the station, a standard requirement for “newcomers” before the first physical exercise session. *The review covered identification, stowage location and explanatory notes of physical exercise accessories, exercise prescriptions, and detailed instructions for using the TVIS treadmill, RED resistive exerciser, CEVIS cycle ergometer, and HRM heart rate monitor.*

The E-15 crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/IMMUNO, FE-1/full time) and RED resistive exerciser (FE-2).

Later tonight, Peggy will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Yuri Malenchenko worked on the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Major science activities in the Russian segment (RS) by Yuri Malenchenko today focused on the biotechnological experiment CONJUGATION (Pairing), KRIOGEM-3M cooler and MELFI operations (for IMMUNO), and BIOEMULSION. *CONJUGATION: replace cold packs in Biocont-T container twice. BIOEMULSION: activate mixing mode Day 3; deactivate KT incubator, remove bioreactor and set up in cold Biocont-T near KRIOGEM; take documentary photographs of bioreactor setup.*
SFP Sheik Shukor tagged up twice with his consultant team at TsUP-Moscow via VHF-1 and conducted his fourth day of VC-13 activities, making his scheduled daily entries in the log/questionnaires for the MOP (Motion Perception, study of vestibular adaptation to gravity transition) and MUSCLE/LBP (Low Back Pain) experiments.

In addition, Shukor completed the head unit R&R (removal & replacement) of the ETD experiment and conducted a 2-hr. ETD session, supported by ground specialist tagup and documentary photography by Yuri.

The SFP (Space Flight Participant) also –

- Performed photo/video operations of “Life on the Station”, the “Malaysian Science Program on ISS RS”, scenes of the Malaysian “angkasa” (astronaut) using the Russian UFS Operator Restraint System and a “Virtual 3D-Manual for the Angkasa” on the laptop;
- Conducted (at ~12:00pm) a ham radio session from the Kenwood station in the SM, i.e., a “general contact” pass with school children of different age groups at the Malaysian National Space Agency’s Planetarium Hall, in Malay and English language (“In your first flight path over Malaysia, what were your feelings?”; “How do you sleep in zero gravity?”; “What made you want to become an astronaut?”; “This is Malaysia's 50th independence. What are your feelings?”; “Do you wear shoes in space?”); and
- Spent about two hours, with CDR Yurchikhin and other crewmembers, in scheduled commemorative (Russian: “symbolic”) activities, a standard tradition for visiting guests and departing expedition crewmembers, today signing and stamping several dozen 15S envelopes for Roskosmos, preparing a flag for A.G. Nikolayev High School in Cheboksary/Chuvash Republic, preparing pennants of the CIS Antiterrorist Center and the Russian National Antiterrorist Committee, etc. and making a photo/video record of everything.

At ~8:00am EDT, all six crewmembers joined in supporting a TV PAO news conference with media gathered at NASA centers (JSC & MSFC), NASA Headquarters and TsUP-Moscow.

At ~11:30am, Peggy Whitson (whose hometown is Beaconsfield, Iowa) and Clay Anderson were interviewed in a PAO TV event by the Associated Press (Marcia Dunn) and station WOI-TV in Des Moines, IA (Stephanie Angleson).

U.S. Science Update: Peggy took “POSSUM” payload photos (a standard payload photo activity that obtains electronic still shots of any subrack and locker payload that is moved or reconfigured). Clay replaced the failed ER4 (EXPRESS Rack 4) bulb. Oleg inserted his SAMPLE specimen into MELFI, with SAME equipment to be removed later this week as well as Clay’s final CCISS (Cardiovascular &
Cerebrovascular Control on Return from ISS) session. CSLM-2 (Coarsening in Solid-Liquid Mixtures-2) familiarization was completed ahead of schedule.

Oxygen Repress Update: $O_2$ gas remaining in Progress M-61/26P is currently being used for daily cabin air refreshes as required to maintain proper ppO$_2$ ($O_2$ partial pressure). At the same time, the Russian Elektron electrolysis system is also supplying $O_2$.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 4:18am EDT [= epoch]):
- Mean altitude -- 342.7 km
- Apogee height -- 344.9 km
- Perigee height -- 340.6 km
- Period -- 91.39 min.
- Inclination (to Equator) -- 51.64 deg
- Eccentricity -- 0.0003176
- Solar Beta Angle -- -4.2 deg (magnitude increasing)
- Orbits per 24-hr. day -- 15.76
- Mean altitude loss in the last 24 hours -- 84 m
- Revolutions since FGB/Zarya launch (Nov. 98) -- 50973

**Significant Events Ahead** (all dates Eastern, some changes possible):
- 10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
- 10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
- 10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
- 11/03/07 -- STS-120/Discovery/10A undocking
- 11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
- 11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
- 11/14/07 -- US EVA-10
- 11/18/07 -- US EVA-11
- 12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 10/14/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday -- Day 3 of joint E15/E16 operations. Day 191 in space for Yurchikhin & Kotov, Day 129 for Anderson. Ahead: Week 26 of Increment 15 (last).

The crew’s work/sleep cycle, today at 4:30am–5:30pm EDT, will be adjusted one more time tomorrow, reverting to the regular 2:00am-5:30pm.

Aboard ISS, the E15/E16 crew rotation/handover period went underway with full activity schedules for all six residents involved.

CDR-16 Peggy Whitson and FE-2-16 Clay Anderson joined up for about 1:20 h of dedicated handover time. In addition, there are “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.

The new E-16 crew (Peggy, Yuri, Clay) performed the mandatory two-hour OBT (onboard training) emergency egress drill for the case of rapid cabin depressurization, with Russian and US specialists standing by at both control centers for crew questions or comments. The rule is that the emergency egress exercise should be performed by every new station crew once within seven days after departure of the previous crew. [Background: Purpose of the drill is to (a) familiarize the station residents with the location of hardware and the positions of valves used in emergency situations, (b) work through the Russian Segment (RS) hardware deactivation procedures, (c) practice crew emergency joint activities, and (d) identify crew comments and suggestions that arise during training regarding crew procedures and equipment. In the RS, the crew translated along the emergency egress path to the FGB nadir port (where Soyuz TMA-11 is currently docked), checking hardware such as the Sokol suits, cable cutters, fire extinguisher]
Malenchenko worked in the Soyuz TMA-11/15S Descent Module, dismantling the two "Klest" (KL-152) TV cameras and their light units for return to the ground on 14S, temporarily stowing them in the SM (Service Module).

In preparation for their return to gravity next Sunday, Fyodor Yurchikhin and Oleg Kotov undertook their fourth preliminary session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the below-the-waist reduced-pressure device (ODNT, US: LBNP) on the VELO ergometer, assisting each other in turn as CMO (Crew Medical Officer). The one-hour assessment, supported by ground specialist tagup (VHF) and telemetry monitoring from Russian ground sites (at 9:52am & 1:01pm EDT), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body’s cardiovascular/circulatory system for evaluation of Yurchikhin’s and Kotov’s orthostatic tolerance (e.g., the Gauer-Henry reflex) after several weeks in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced (“negative”) pressure, set at -20, -25, -30, and -35 mmHg (Torr) for five minutes each while shifting from foot to foot at 10-12 steps per minute, while wearing a sphygmomanometer to measure blood pressure. The body’s circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian “Pinguin” suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.

For his second session of the ESA/Russian biomed experiment “IMMUNO”, scheduled tomorrow, Fyodor Yurchikhin set up the IMMUNO urine collection
hardware and took air samples with the IPD-NH$_3$ Draeger tubes sampler, testing for ammonia (NH$_3$) in the SM.  

IMMUNO is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit. Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.

Peggy Whitson worked on the MEC (Medical Equipment Computer), configuring its HRM (Hearth Rate Monitor) software for the new Expedition 16 crew, herself, Yuri Malenchenko and Dan Tani.  

E16-specific settings include birthday and height of each crewmember.

Oleg Kotov conducted the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Kotov also gathered weekly data on total operating time and activity durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s Air Revitalization Subsystem (SOGS) for reporting to TsUP.

Later, Oleg worked on the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

FE-1-16 Malenchenko performed the (currently daily) job of checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM- and FGB-to-Soyuz tunnels, and the FGB-to-Node passageway.  

This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners down (SKV-1).

FE-2-16 Anderson filled out the regular FFQ (Food Frequency Questionnaire), his 14th, on the MEC.  

By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.

Major science activities in the Russian segment (RS) by Yuri Malenchenko today
focused on the biotechnological experiment CONJUGATION (Pairing), KUBIK refrigerator, KRIOGEM-3M cooler, and MELFI operations, BIOEMULSION, SAMPLE, BIOKIN 4, and P-KINASE. [CONJUGATION: removal of the Recomb-K hybridization experiment from the KRIOGEM-03M cooler and setting up in Biocont-T container, later replacing cold packs in Biocont-T. KRIOGEM-3M set to -22 degC & installed cold packs. BIOEMULSION: activation of mixing mode - Day 2 and photo documentation during mixing. SAMPLE: collect specimen from FE-1 Kotov and set up in MELFI. KUBIK-3: deactivate incubator in Soyuz, transfer & hook up in SM. BIOKIN 4: set KUBIK-3 to +6 degC. P-KINASE: set up 8 new containers in KUBIK-3 at +6 degC.]

SFP Shukor was scheduled to tag up twice with his consultant team at TsUP-Moscow via VHF and to conduct his third day of VC-13 activities, making his scheduled daily entries in the log/questionnaires for the MOP (Motion Perception, study of vestibular adaptation to gravity transition) and MUSCLE/LBP (Low Back Pain) experiments.

In addition, Shukor conducted his daily science program, today the MIS (Microbes in Space) experiment, TOP (Torques in Micro-G) study, and FIS (Malaysian Food in Space) demonstration, assisted and photo/video-recorded in action by Yuri Malenchenko and Fyodor Yurchikhin as required.

The SFP (Space Flight Participant) also –
- had a live-downlink HDTV (High Definition Television) session from the RS at ~8:05am, assisted by CDR Yurchikhin,
- followed later (~1:15pm) by a ham radio session from the Kenwood station in the SM, a “general contact” pass with Malaysian school children of different age groups at the Malaysian National Space Agency’s Planetarium Hall, in Malay and English language.

Working from the Russian discretionary “time permitting” job list, Oleg conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

The E-15 crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/+MO-15, FE-1/+MO-15) and RED resistive exerciser (FE-2).

Later Clay transfers the crewmembers’ exercise data file to the MEC for downlink,
as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 3:55am EDT [= epoch]):
Mean altitude -- 342.8 km
Apogee height -- 344.9 km
Perigee height -- 340.7 km
Period -- 91.39 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003164
Solar Beta Angle -- 0.7 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 90 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50957

**Significant Events Ahead** (*all dates Eastern, some changes possible*):
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**
ISS On-Orbit Status 10/13/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- Day 2 of joint E15/E16 operations. Day 190 in space for Yurchikhin and Kotov, Day 128 for Anderson.

The crew’s work/sleep cycle, today at 9:30am–8:00pm EDT, will be adjusted once more tomorrow (4:30am–5:30pm).

Aboard ISS, the E15/E16 crew rotation/handover period went underway with full activity schedules for all six residents involved.

CDR Yurchikhin and FE-1 Kotov each were scheduled for another run with the Russian MBI-21 PNEVMOKARD experiment, their fifth on-orbit session (which forbids moving or talking during data recording). The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. The FE-1 took documentary photography of his crewmate as subject for downlinking via BSR-TM or OCA. [PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember’s electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the return to ground.]
In the Soyuz TMA-11/15S Habitation Module, FE-1-16 Yuri Malenchenko installed the LKT local temperature sensor commutator (TA251M1B) of the BITS2-12 onboard telemetry system and its ROM/read-only memory unit (PZU TA765B), both kept in storage from an earlier Soyuz.

CDR-16 Peggy Whitson and FE-2-15 Clay Anderson have about three hours of dedicated handover time. In addition, there are “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.

The ISS RODFs (Russian Operations Data Files) are being updated by Yurchikhin and Malenchenko with new books, sheets and CD-ROMs delivered on 15S, including a special “VC13” book. [TMA-10/14S is now set up for Yurchikhin, Kotov and Shukor, while TMA-11/15S has become the contingency CRV (crew return vehicle) for Whitson, Malenchenko and Anderson.]

Later today, Oleg Kotov will conduct the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various Russian segment (RS) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway. [This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners off (SKV-1).]

In the SM, Yurchikhin will assist VC-13 Muszaphar Shukor in installing his own removable HDD (hard disk drive) on the RSE-1 laptop for his SFP (Spaceflight Participant) activities.

CDR-16 Peggy Whitson started in on her SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment by donning her Actiwatch. [The black-banded Actiwatch was initialized by Clay Anderson on 10/9. Data collection began yesterday (10/12)m and a download session will be added to Peggy’s “job jar” task list within the month. If she takes off the watch, she is to document the duration. SLEEP is supported by the HRF1 (Human Research Facility 1) laptop. To monitor the CDR’s sleep/wake patterns and light exposure, her special Actiwatch device measures the light levels encountered by her as well as her patterns of sleep and activity throughout the Expedition.]

To support subsequent ground activation of the ER-1 (EXPRESS Rack 1), FE-2 Anderson connected the rack’s cooling jumper to the Lab ITCS (Internal Thermal Control System) at the LAO2 RIP (Rack Interface Panel).

Later, Anderson activated the SAMS ICU (Space Acceleration Measurement
System/Interim Control Unit) in the LAB1PS rack (Drawer 2), in support of ground activities with the structural dynamics monitoring system.

CDR Yurchikhin was to do the routine daily maintenance of the SOZh (Environment Control & Life Support System, ECLSS) system in the SM, including the ASU toilet facilities systems/replaceables.

Working on the IMS (Inventory Management System), FE-1-15 Kotov will update/edit its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

CDR-16 Whitson performed the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. Two CSA-CP (CSA-Combustion Products) instruments recorded CO, HCN and HCl readings at the SM Central Post (#1060, prime) and in the Node (#1057, backup), while the CSA-O₂ units (#1063, #1042) looked for O₂ in the Lab and the CDMK (#1013) for CO₂ in SM and Lab. Also recorded were battery ticks. No battery changes required. The instruments were turned off afterwards, except for the prime CSA-CP #1060 unit, and returned to their regular locations. The CSA-CPs also have O₂ sensors but they are out of calibration and their readings are currently omitted.]

Later, the FE-2-15, monitored by Whitson, will conduct the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout on the prime unit (#1060) and backup unit (#1057). [The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Clay changed out the prime unit’s battery, then zero-calibrated both instruments (to eliminate drift in the combustion sensors). Following zero calibration, the backup unit was stowed, while the prime unit’s datalogger function was turned on to collect data at the SM Central Post as a spot check. After one hour, the datalogger was deactivated, with the prime CSA-CP remaining on for continuous passive sampling.]

In the U.S. Airlock, Clay is scheduled to troubleshoot the battery charging equipment, to determine whether BC-2 ch.3 (Battery Charger 2/channel 3) is functional. Afterwards, the FE-2 will begin the recharging of EMU (Extravehicular Mobility Unit) batteries in the BSA (Battery Stowage Assembly) for the 10A spacewalks later this month.
Major science activities in the Russian segment (RS) by FE-1-16 Malenchenko today are focusing on the biotechnological experiment CONJUGATION (Pairing), KUBIK refrigerator and MELFI operations, BIOEMULSION, SAMPLE, P-KINASE and AT-Space. [CONJUGATION: removal of the Recomb-K hybridization experiment from the KRIOGEM-03M cooler, process activation at ambient temperature, photography of Recomb-K hardware, completing activation and returning to KRIOGEM at +4 degC. BIOEMULSION: activation of mixing mode - Day 1. SAMPLE: collect specimen from FE-1-16 and set up in MELFI, P-KINASE: second fixation of another 4 containers, set up containers in BIOK. AT-Space: wetting and set up of 8 containers in centrifuge KUBIK-1 at +22 deg.]

SFP Shukor is scheduled to tag up twice with his consultant team at TsUP-Moscow via VHF and to conduct his second day of work, making the his scheduled daily entries in the log/questionnaires for the MOP (Motion Perception, to study vestibular adaptation to gravity transition) and the MUSCLE/LBP (Low Back Pain) MUSCLE experiments.

Shukor is also working his part of the CIS (Cells in Space) and MIS (Microbes in Space) experiments, assisted and photo/video-recorded in action by Oleg Kotov.

At ~2:42pm EDT, Peggy and Yuri joined in downlinking generic PAO TV messages from the Expedition 16 crew for use at NASA Visitors Centers around the U.S. and video for use as promo “tease” on NASA TV and the nasa.gov website.

The E-15 crew worked out on an abbreviated (1-hr.) physical exercise program on the CEVIS cycle ergometer (FE-2-15) and TVIS treadmill (CDR-15, FE-1-15).

Later tonight, Clay will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

**Weekly Science Update** *(Expedition Fifteen – 25th)*

**ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):** ALTEINO instrument continues to acquire nominally radiation levels in the SM. A close-out session for this increment is planned on 10/16. Subsequent downlink is currently planned on 10/17. During the close-out session, the ALTEINO device will be relocated to the PIRS module, and radiation measurements will continue to be performed.

**ANITA:** “Clay, thank you for completing the ANITA non-local sampling protocol as
a Saturday Science activity. The ground team appreciates the wonderful video you provided. ANITA is now under EFO control and will continue to operate in the local sampling mode.”

**AT-Space:** Nominal preparatory activities occurred in Baikonur. Activation of the experiment is currently planned for today (10/13). The experiment will be performed in the RS.

**BCAT (Binary Colloidal Alloy Test):** Reserve.

**BIOKIN:** Nominal preparatory activities occurred in Baikonur. Activation of the experiment was planned before 15S docking, on 10/12. The experiment will be performed in Soyuz 15S after docking.

**CARDIOCOG-2:** Completed.

**CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):** Continuing,

**CFE (Capillary Flow Experiment):** Reserve.

**CHROMOSOME-2 (E14 SFP):** Completed.

**CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus):** In progress.

**CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):** Complete.

**EarthKAM (Earth Knowledge Acquired by Middle School Students):** Next scheduled operation is 10/29-11/3.

**EMCH (Elastic Memory Composite Hinge):** Complete.

**EPO (Educational Payload Operation) Kit C:** Planned.

**ETD (Eye Tracking Device):** First session for Yuri Malenchenko is currently scheduled on 10/18 (GMT291). For the Angkasa (Malaysian astronaut), repair activity of ETD is currently planned on 10/14-15. Subsequent ETD sessions with him as a test subject are planned on 10/15 and 10/17.

**IMMUNO (Saliva Sampling):** Second session currently planned for 10/14-16.

**LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):**
Complete.

**MISSE (Materials ISS Experiment):** Ongoing.

**MTR-2 (Russian radiation measurements):** Passive dosimeters measurements in DC1 “Pirs”.

**MULTIGEN-1:** Plants continue to grow in B1 and A2 Experiment Containers (EC’s). During the last week, plants in B1 EC showed a slower growth and some aging phenomena unexpected at this stage, which scientists attribute to physiological stress conditions in space. An unexpected additional set of leaves have appeared, leading to a delay of the stems’ apparition in the observation zone. “We have observed a vigorous growth for the plant in the A2 Container. Our science assessment is that all the plants are now approximately in the same morphological development stage, despite the initial delayed germination of plant in A2. Regular video monitoring of the plants continue, awaiting now the stem apparition in both Containers.” Upon stem apparition, 2D- then 3D-recordings of stem circumnutation will begin for several days. An extension of the total duration of the experiment (from 75 days to 90 days) has to be anticipated at this stage, in order to retrieve the next generation seeds at the end of the plant growth cycle.

**MUSCLE (VC-13 SFP):** In-flight questionnaires are currently scheduled daily from 10/10 to 10/19.

**MSG-SAME (Microgravity Science Glovebox):** SAME completed experiment operations last week and the remaining steps are sample removal and de-integration from the MSG. The tests involved 5 carousels each with 6 samples selected from 5 different sample materials. Overall the tests were very successful. Good measurements of the smoke properties were made by all of our diagnostics and the results indicate consistent particle size measurements for each material. “We have seen substantial variation in the smoke particle size and the smoke aging tests were very successful. In general, the Teflon and Kapton particles were quite small (approximately 100 nm) and the silicone and lampwick particles were somewhat larger. These results will be further corroborated by the transmission electron microscope images we will obtain of the smoke particles captured by the Thermal Precipitator assemblies when they are returned to Earth. Thanks to all for getting our tests conducted so expeditiously.”

**NEOCYTOLYSIS (E14 SFP):** Completed.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION:** This week’s Nutrition blood draw and urine collection marks the
completion of the experiment objectives for Increment 15. The Nutrition PI and team wish to extend their thanks for your dedication in completing the experiment objectives.

**P-KINASE:** Nominal preparatory activities occurred in Baikonur. Activation of the experiment was planned before 15S docking (completion TBC), on 10/12 (GMT285). The experiment will be performed in the ISS-RS.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMPLE:** First crew sampling session for Malenchenko was planned for today (10/13). ISS sampling currently planned on 10/14. SAMPLE cultures will be collected on 10/19.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** n/a

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** “Clay, you have completed all of your Increment 15 Sleep tasks successfully. Thanks for initializing the I-16 CDR Actiwatch and agreeing to wear your Actiwatch down on the Shuttle. The PI really appreciates your continued support. Your last activity will be to doff the Actiwatch with the shuttle crewmembers before re-entry.”

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** Planned.

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** In progress.

**TRAC (Test of Reaction & Adaptation Capabilities):** Planned.

**CEO (Crew Earth Observations):** Through 10/10 the ground has received a total of 17,950 CEO images for review and cataloging for Increment 15. 1,257 frames were received in the last week. “We have identified and prioritized for review those frames with camera times corresponding to the request times of the following CEO targets: Antarctic Ice Pack; Kerguelen, South Indian Ocean; Iceberg A22A, South Atlantic Ocean; Patagonian Glaciers, South America; Rotor Kamm Impact Crater, Namibia; Perth, Australia; Jebel at Tair Eruption, Red Sea; South Mozambique; and Xianggang (Hong Kong), China. We’ll provide feedback as we work our way through these. We have already noted your incredibly detailed view of Rotor Kamm and a nice mapping of Perth. Your striking image on 9/25 of the whole of East Falkland Island with smoke plumes will be published on NASA/GSFC’s Earth Observatory website this weekend. Your view is the first time, in our collective memory, for photographic documentation of active fires in this part of the world. Thanks for noting this event and acquiring it for our collection!”
Today’s optional CEO (Crew Earth Observation) photo targets were Lake Poopo, Bolivia (weather was predicted to be clear for a near-nadir pass over Lake Poopo. High resolution images of the Lake shoreline were requested for tracking water level changes. The Lake was located slightly to the right of track), and Florida Coastal Everglades (this Long Term Ecological Research [LTER] site tracks changes to the Everglades wetland ecosystem. Such changes include reduction of water supply to the marshes and conversion of grassland to other land uses. The ISS overpass took the station directly south of the Miami metropolitan area. The crew was to look to the left of track as they approached Miami; overlapping frames of the Everglades to the SW of the urban area will be most useful).

CEO photography can be viewed and studied at the websites: 
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 5:07am EDT [= epoch]):
Mean altitude -- 342.9 km
Apogee height -- 345.1 km
Perigee height -- 340.7 km
Period -- 91.39 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003256
Solar Beta Angle -- 5.6 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 90 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50942

Significant Events Ahead (all dates Eastern, some changes possible):
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/07 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/07 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**
ISS On-Orbit Status 10/12/07

All ISS systems continue to function nominally, except those noted previously or below. Day 189 in space for Yurchikhin & Kotov, Day 127 for Anderson.

The crew’s work/sleep cycle, today at 7:00am – 12:30pm EDT, will be adjusted twice more: tomorrow (9:30am–8:00pm), and on 10/14 (4:30am–5:30pm).

**Yest kasaniya!** Soyuz TMA-11/15S docked smoothly at the FGB nadir port at 10:50am EDT, two minutes ahead of time, with Expedition 16 crewmembers Dr. Peggy Whitson (CDR) and Yuri Ivanovich Malenchenko (FE-1, Soyuz-CDR) plus Malaysian SFP (Space Flight Participant) Sheik Muszaphar Shukor. After about 1.5 hrs spent in Soyuz on pre-transfer activities, the crew opened hatches at 12:22pm, followed by crew transfer, the traditional joyful welcome event, and installation of the BZV QD (quick disconnect) clamps by Malenchenko and Yurchikhin. [After successful "kasaniya" (contact), automatic "sborka" (closing of Soyuz & Service Module {SM} port hooks & latches) took place shortly thereafter. Attitude control authority had been handed over to the Russian MCS (Motion Control System) at ~7:20am and was returned to US CMG control at ~12:00noon. For the 15S docking, the Russian SM thrusters were disabled during Soyuz volume pressurization & clamp installation and returned to active attitude control after sborka. Before hatch opening, the crew performed leak checks of the Soyuz modules and the Soyuz/ISS interface vestibule. They then doffed their Sokol suits and set them up for drying, deactivated the Atmosphere Purification Unit (BOA) in the Descent Module (SA), replaced the Soyuz ECLSS LiOH cartridges, equalized Soyuz/ISS pressures, and put the spacecraft into conservation mode on ISS integrated power.]

Before the docking, FE-2 Anderson prepared for the arrival by connecting the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the LAB1D6 rack, to support the ground-commanded
activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), and Houston lowered the temperature setpoint to the regular 9.4 degC.  [CDRA activation took place at 12:30pm-1:30pm.]

FE-1 Kotov prepared for time-critical payloads arriving on Soyuz by activating the ESA temperature-controlled incubator chambers KUBIK AMBER and KUBIK-2 in the FGB and setting the KRIOGEM-03M refrigerator for the BIOEMULSION payload in the SM to +4 degC. Later tonight, Oleg also activates KUBIK-1 in the FGB, at +22 degC.

Anderson turned on the A31p laptop in the FGB for the video/comm transmission from the Russian segment (RS), while Kotov configured station comm (STTS) for the docking, and CDR Yurchikhin set up and handled the video coverage of the visitor arrival and subsequent downlinking of the footage via US Ku-band. Upon docking, on TsUP Go, Kotov also switched hatch KVDs (pressure equalization valves) between FGB and Soyuz to electric control mode.

After the arrival and crew greetings (~12:25pm EDT), Kotov reestablished nominal STTS comm configuration in hardline mode (MBS), while FE-1-16 Yuri Malenchenko immediately began with payload transfers from Soyuz to ISS and setups, while CDR-16 Peggy Whitson went through the procedures of setting up and drying out the Sokol spacesuits and gloves worn by the three Soyuz travelers.

High-priority payload transfers to the SM for the E-15/E-16 crew rotation period involve

- BIOEMULSIYA bioreactor (to be set up in the KRIOGEM-03M cooler, with photography);
- KONYUGATSIYA in its Biokont-T container (also in KRIOGEM);
- REGENERATSIYA hardware, with photography;
- P-KINASE (8 containers inserted in KUBIK-3 at +37 degC);
- BIOTREK (with bio cultures);
- LAKTOLEN & ARIL;
- MICROBES IN SPACE (with VC13 SFP);
- PCS (Protein Crystallization in Space, with VC13 SFP); and
- CELLS IN SPACE (with VC13 SFP).

  - [BIOEMULSIYA (Bioemulsion, BTKh-14) investigates the design and improvement of a closed-type autonomous (thermostat-controlled) bioreactor for obtaining biomass of organisms and bioactive substances (BAV) without additional ingredients input or removal of metabolism products, for bacterial, enzymatic, and pharmaceutical preparations;
  - KONYUGATSIYA (Conjugation, BTKh-10) deals with the processes of genetic material transmission using bacterial conjugation, in the
Biokont-T container and Rekomb-K hardware in the KRIOGEM-03M;

- **REGENERATSIYA** (Regeneration, BIO-12) researches the impacts of micro-G on structural and functional recovery of damaged organs and tissues in Planaria (water flatworms) in the Cryogem-3M cooler/glove box;

- **P-KINASE** determines whether differentiation of monocytes into macrophages is disrupted due to the slowdown in signal exchange of an isoform of protein kinase C (PKC) in human monocytes in micro-G;

- **BIOTREK (BTkh-8)** studies the influence of heavy charged particles of space radiation on the generic properties of cells producing biologic active substances;

- **LAKTOLEN (BTkh-5), ARIL (BTkh-5):** Effects of space flight on cultures of Lactolen- and Interleukin ARIL producing cells;

- **MICROBES in Space (MIS):** to characterize the effect of micro-G and cosmic radiation on the gene growth kinetics of H. pylori (or P. aeruginosa) and Acinetobacter baumannii microbes;

- **PCS** studies the effects of micro-G on lipases crystallization and the differences in the spatial structures of protein crystals obtained on Earth and in micro-G; and

- **CELLS in Space (CIS),** with three areas of emphasis: Eukaryotic cells in space (ECIS), endothelial dysfunction and inflammation in micro-G (HUVEC), and function and transcriptional changes in osteoblasts (bone tissue cells) in micro-G (OSTEO).

All new arrivals received the obligatory standard Safety Briefing to familiarize them with procedures and escape routes in case of an emergency. [The Briefing included pointing out the location of the “Emergency Response/Visiting Crew” books, showed how to move about the station without getting hurt or accidentally disturbing air flow meters/sensors (PP IP-1) and familiarized the Malaysian SFP with his switch to a different Soyuz for return.]

CDR Yurchikhin also took Shukor on a one-hour guided tour of the ISS, acquainting him with both segments, his CIS & MIS work station in the DC1 Docking Compartment, other work locations, the sites for his scheduled VHF-1 and ham radio conferences, RSE-1 laptop, uplink printouts and camera equipment for his use, email ops, and private family conference using the IP (Internet Protocol) phone.

Later tonight, SFP Shukor is scheduled to tag up with his consultant team at TsUP-Moscow via VHF, set up his MIS & CIS hardware/containers in the KUBIK-AMBER temperature-controlled cooler, activate the PCS experiment and begin his first work on a laptop for email ops and on the IP phone for private conference.
Afterwards, as Greg Olsen, Anousheh Ansari and Charles Simonyi before him, the SFP will make the first of his scheduled daily entries in the log/questionnaires for the MOP (Motion Perception, to study vestibular adaptation to gravity transition) and the MUSCLE/LBP (Low Back Pain) MUSCLE experiments.

Oleg Kotov and Yuri Malenchenko will swap out Shukor’s and Anderson’s IELK (Individual Equipment & Liner Kit, Russian: USIL) between the two Soyuz vehicles, TMA-10/14S & TMA-11/15S, including their tailored Sokol spacesuits. The IELKs of Whitson and Malenchenko are already in the 15S spacecraft that has now become the Expedition 16 CRV (crew return vehicle), good for a maximum of 200 days in space. [A crewmember is not considered transferred until her/his IELK, AMP (Ambulatory Medical Pack) and ALSP (Advanced Life Support Pack) drug kit are transferred. After today’s installation of the VC13 IELK, SFP Shukor is now considered a 14S crewmember, and Expedition 16 has technically begun its residence aboard ISS. TMA-10 has been docked at ISS since 4/9/07. By the time of its return on 10/21, the spacecraft will have spent 198 days in space, 2 days short of its “warranty” life.]

FE-2 Anderson will relocate the three Emergency SODF (Station Operations Data Files) books from 15S into the 14S vehicle and later update the ISS EMER-1 SODF with new pages delivered on 15S.

Using an uplinked detailed E15/E16 crew handover procedures handbook, Peggy Whitson and Clay Anderson began the standard handover activities, to be continued through the docked period ahead. [Since both Whitson and Malenchenko are experienced ISS “veterans”, having already spent long duty watches on the station, their handover sessions will be considerably shorter than is the case for “rookies”, i.e., newcomers to the station.]

Malenchenko meanwhile will work on the transferred BIOEMULSIYA payload, placing the Bioreactor in the incubator (KT) and activating it to “culturing mode”. His activities are to be photographed by Kotov for documentation.

FE-2 Clay Anderson is scheduled for the routine daily maintenance of the SOZh (Environment Control & Life Support System, ECLSS) system in the SM, including the ASU toilet facilities systems/replaceables.

On the IMS (Inventory Management System), Clay will update/edit its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

With the increase in crew size from three to six placing more emphasis on ventilation, Fyodor Yurchikhin is to check later on the function of the important IP-1
airflow sensors in the various Russian segment hatchways, including the SM-to-DC1 (26P) tunnel, and the FGB-to-Node and FGB-to-Soyuz passageways.

Working from the Russian discretionary “time permitting” task list, Oleg is to do the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

The ISS-15 crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR/full time, FE-1/full time, FE-2) and RED resistive exerciser (FE-2).

Later tonight, Clay will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

**ATU Update:** Anderson’s R&R (removal & replacement) of ATU-6 (Audio Terminal Unit 6) in the US Airlock yesterday was successful, as evidenced by voice checks following the ATU activation. [During the R&R, it was noted that the unit is seated on the cold plate with only one fastener out of seven. It has been determined it was launched in this configuration. Analysis is underway to determine how many additional fasteners need to be installed to ensure adequate heat transfer.]

Today’s CEO (Crew Earth Observation) photo targets were Nile River Delta *(the crew has done an excellent job of photographing the eastern edge of the Nile delta as well as Lake Manzala. For this pass researchers requested that they concentrate on the western edge of the delta near Alexandria which should have been under ISS orbit track)*, and Mississippi Delta Region *(the Mississippi River Delta is an area of the land built up by alluvium deposited by the Mississippi River as it slows down and enters the Gulf of Mexico. Requested were contextual views of the delta. The Mississippi delta was left or west of orbital track)*.

CEO photography can be viewed and studied at the websites:
- [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

- [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)
ISS Orbit (as of this morning, 6:18am EDT [= epoch]):
Mean altitude -- 343.0 km
Apogee height -- 345.2 km
Perigee height -- 340.8 km
Period -- 91.40 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0003297
Solar Beta Angle -- 10.4 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 65 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50927

Significant Events Ahead (all dates Eastern, some changes possible):
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 10/11/07

All ISS systems continue to function nominally, except those noted previously or below.

The crew’s work/sleep cycle, currently at 5:00am–8:30pm EDT, will be adjusted a few more times: tomorrow (7:00am–12:30am), on 10/13 (9:30am–8:00pm EDT), and on 10/14 (4:30am–5:30pm).

Soyuz TMA-11/15S, with Expedition 16 crewmembers Dr. Peggy Whitson (CDR) and Yuri Malenchenko (FE-1, Soyuz-CDR) plus Malaysian Sheik Muszaphar Shukor Al Masrie, 13th Visiting Crewmember (VC) to spend time on the station, continues to catch up with the ISS for the docking tomorrow morning at ~10:52am EDT. As per TsUP/Moscow report this morning, all systems aboard the ship are nominal, and the crew is in great shape. [FD1 activities yesterday included the first two maneuver burns, DV1 (12:57pm) & DV2 (1:42pm). FD2 activities, started this morning with Soyuz crew wakeup at ~2:30am on Orbit 12, include systems & crew health status reports to TsUP, preparation of the Soyuz Habitation Module (SA) workspace, building attitude for and executing the DV3 burn at ~10:28am, placing Soyuz back in its sun-spinning "barbecue" mode (ISK), and swapping CO₂ absorption cartridges (LiOH) in the BO. On FD3, the crewmembers will put on their Sokol suits and PKO biomed harnesses, transfer to the SA, activate its air purification system (SOA) and close the hatch to the Descent Module (BO). After the DV4 burn, activation of the active Kurs-A system on Soyuz and of the passive Kurs-P on the Service Module (SM), with a short Kurs-A/P test and up to three additional adjustment burns during automated rendezvous, station fly-around to align with the SM aft port will begin at ~400m range, followed by station keeping at ~160m and docking at the FGB nadir port. Whitson & Malenchenko will replace Expedition 15 CDR Yurchikhin & FE-1 Kotov. FE-2 Clay Anderson remains on the station, joining Expedition 16 until later this month when he is replaced by U.S. Astronaut Daniel Tani on STS-120/10A. Dr. Shukor, the 35-year old orthopedic
physician at the University Kebangsaan Malaysia Hospital in Kuala Lumpur, is Malaysia’s first “Angkasawan” (Astronaut), flying under the auspices of “Agensi Angkasa Negara”, the Malaysian National Space Agency, will return with Fyodor & Oleg on 10/21 in Soyuz TMA-10/14S (undocking 3:13am; landing 6:36am EDT, 4:36pm local).

In preparation of the guest cosmonaut’s onboard program, CDR Yurchikhin exercised the new HDTV (High Definition Television) system, set up and tested last Monday (10/8) in the RS (Russian Segment), conducting a downlink test of the camera system with Malaysia, relayed through Russian ground sites and VHF, plus S-band/audio, and supported by tagup with TsUP video distribution systems (BRTK-TVS) specialists.

FE-1 Kotov completed the periodic (about twice a month) replenishing of the Elektron oxygen generator’s water supply for electrolysis, filling the KOV thermal loops’ EDV container with water collected in CWCs (Contingency Water Containers) #1068, #1065, and #1064 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

The FE-2 meanwhile completed the weekly 10-min. CWC inventory/audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week.]

FE-2 Anderson had about 4 hrs of his work day assigned to a major IFM (inflight maintenance) in the U.S. Airlock (A/L), uninstalling a failed ATU (Audio Terminal Unit, #6) on the A/L Avionics Rack (F1) and replacing it with a new spare. [For the time-consuming R&R, the F1 rack needed to be rotated away from the cabin wall, requiring Clay to install two pivot fitting to allow the rotation. For clearance, EMU (Extravehicular Mobility Unit)/spacesuits and the EDDA (EMU Don Doff Assembly) in the A/L had to be moved temporarily out of the way, and the ATU connections needed to be safed by the ground beforehand. The EACP (EVA/EMU Audio Control Panel) Y-branched cable on the A/L ATUs was swapped with a new “low clearance” EACP Y-cable from the SPCE (Service, Performance & Checkout Equipment) maintenance kit. The failed ATU-6 will be returned on 10A. There are 3 ATUs in the A/L, one of which must be functional for EVAs, so long as the suited EVA crew has established UHF (Ultra High Frequency) radio communication.]

Clay also retrieved and stowed the two FMKs (Formaldehyde Monitoring Kits) deployed by him on 10/9 in the Lab (below CEVIS cycle) and SM (most forward handrail).
Kotov collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. \[GANK\] tests for Methane (\(\text{CH}_4\)), Ammonia (\(\text{NH}_3\)), Carbon Monoxide (\(\text{CO}\)), Formaldehyde (\(\text{HCHO}\)), Nitrogen Oxides (\(\text{NO, NO}_2\)), Hydrogen Chloride (\(\text{HCl}\)), Hydrogen Fluoride (\(\text{HF}\)), and Hydrogen Cyanide (\(\text{HCN}\)).

In addition, Oleg completed the daily routine maintenance of the SM’s SOZh system (Environment Control & Life Support System, ECLSS), with the regular insert replacements in its toilet system (ASU).

As part of Soyuz docking preparations, Anderson verified powerdown of onboard ham radio equipment (Kenwood in SM & Ericsson in FGB) to prevent RF interference during the proximity operations and also closed the protective shutters of the Lab science window.

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR/full time, FE-1/full time, FE-2) and RED resistive exerciser (FE-2).

Later tonight, Clay will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” job list, FE-1 Kotov conducted the regular downlinking of system data/log files of the Russian payload server (BSPN), prepared yesterday, from the RSS1 laptop and FlashCard to the ground via OCA for analysis.

At ~5:30pm EDT tonight, FE-2 Anderson is scheduled to conduct a private “handover” teleconference with his replacement, FE-2-16 Daniel Tani, to be launched on STS0-120/10A.

At ~6:30pm, Clay will also have his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

Today’s CEO (Crew Earth Observation) photo targets were Lonar Impact Crater (Lonar impact crater is unique in that it is the only well-preserved simple crater [simple crater being defined as having a crater diameter of <4 km] on Earth in
continental flood basalts. This is important as analogue for lunar impact craters. Currently CEO researchers have about nine images of this crater taken from ISS, none of them taken with the 400 mm lens with the doubler. The crater should have been slightly left [west] of the ascending pass. Lonar is 1.83 km in diameter but should have been visible because of its shape and the lake within the crater. It is a very young crater, dated at about 50,000 years), **Roter Kamm Impact Crater** (Roter Kamm impact crater is about 2.5 km in diameter and about 130 m deep. The crater was formed by the impact of an asteroid about 300 m in diameter. The interior of the crater is covered in thick sand deposits. This is a relatively young impact crater, dated at about 3.7 million years. The crater should have been slightly left of the orbital track), **Mt. Kilimanjaro, Kenya** (Mount Kilimanjaro is a renowned volcanic peak of eastern equatorial Africa. It is situated in northeastern Tanzania near the border with Kenya. At 19,341 feet the highest peak in Africa, it sustains a small icecap with glaciers which are under study as indicators of climate variations. Kilimanjaro should have been directly under track), **Lake Poopo, Bolivia** (lowering and rising of water levels in Lake Poopo give indications of short-term regional climate fluctuations. Lake Poopo is a large saline lake located in a shallow depression in the Altiplano Mountains in Bolivia. The water level in this lake is highly variable because it lacks any major outlet and it has a mean depth of no more than 3 m. Therefore, even small regional climate variations can have an impact on the appearance of the lake), and **Florida Coastal Everglades** (research focuses on understanding ecosystem processes along the two major drainage basins in Everglades National Park. The team is particularly interested in the area where freshwater and estuarine wetlands meet. This landscape change in response to changing freshwater inflow [with Everglades restoration], sea level rise [climate change responses], and disturbance [particularly hurricanes and fire] is of particular interest to science. Previous CEO imagery of this area has nicely documented the Florida Keys and the western side of Florida Bay [the area between the Keys and the mainland]. The crew was requested to focus on the northern side of Florida Bay [southern edge of the park]).

CEO photography can be viewed and studied at the websites:

- Soyuz hooks closed 11:12:26am
- Local Sunrise 11:24am
- RS to USOS MCS Handover 12:00 noon

Significant Events Ahead (all dates Eastern, some changes possible):
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~10:52am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 10/10/07

All ISS systems continue to function nominally, except those noted previously or below.

**Soyuz TMA-11 (15S) launched on time (9:22 am EDT)** at Baikonur Cosmodrome in Kazakhstan (see picture at bottom), carrying Expedition 16 crewmembers Dr. Peggy Whitson (CDR) and Yuri Ivanovich Malenchenko (FE-1) plus Malaysian Sheik Muszaphar Shukor Al Masrie, the 13th Visiting Crewmember (VC) to visit the space station, flying under a Russia/Malaysia government-to-government offset agreement. At launch time, the ISS was halfway between the coast of Argentina and the Falkland Islands, i.e., the launch was not visible to the ISS crew. 15S achieved orbital insertion at 9:31am after a nominal ascent, and all antennas and solar arrays were deployed ok. [Whitson and Malenchenko will replace Expedition 15 CDR Fyodor Yurchikhin and FE-1 Oleg Kotov who will return with Muszaphar Shukor on 10/21 in Soyuz TMA-10/14S (undocking 3:13am; landing 6:36am EDT, 4:36pm local). FE-2 Clay Anderson remains aboard, joining Expedition 16 until later this month when he will be replaced by US Astronaut Daniel Tani on STS-120/10A. It is the second ISS visit for both Whitson and Malenchenko, Peggy having been a crewmember of Expedition 5, arriving with STS-111 in 2002, while Yuri was on station with Ed Lu on Increment 7, arriving on Soyuz TMA-2 in 2003. In 2000, 46-year old Malenchenko had flown to ISS with STS-106/Atlantis (ISS-2A/2B), and in 1994 he flew on the Russian space station Mir (EC-16), as Soyuz TM-19 crewmember. Dr. Shukor, a 35-year old orthopedic physician at the University Kebangsaan Malaysia Hospital in Kuala Lumpur, is Malaysia’s first “Angkasawan” (Astronaut), flying under the auspices of the Malaysian National Space Agency “Agensi Angkasa Negara”.]

Before breakfast, FE-2 Anderson completed the last day of his fourth session with the NASA/JSC experiment NUTRITION. During today’s part, he collected another urine sample for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. [The current NUTRITION project
expands the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R +30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

CDR Yurchikhin serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated at ~3:30pm EDT. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]

Yurchikhin also completed his first session of the 24-hour of ECG (electrocardiogram) recording under the Russian MedOps MO-2 protocol. [For the ECG recording, the two Russian crewmembers took turns in donning the five-electrode Holter harness that read their dynamic (in motion) heart function from two leads over 24 hours and recorded data on the Kardioregistrator 90205 unit.]

Oleg Kotov used the Russian AK-1M adsorber and Draeger tubes, on a cartridge belt with a pump, to conduct the periodic sampling of cabin air for subsequent analysis on the ground. [Kotov started out by taking air samples in the SM and FGB and checking for leaked-out Freon in the SM, then switched to the IPD-CO Draeger tubes sampler to check for CO (carbon monoxide) in the SM.]

Later, Clay Anderson also collected air samples with a U.S. GSC (Grab Sample Container) at the center of the Lab and SM.

In preparation for their return to gravity, Yurchikhin and Kotov undertook their third training session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the below-the-waist reduced-pressure device (ODNT, US: LBNP) on the Russian VELO ergometer, assisting each other in turn as CMO (Crew Medical Officer). [The one-hour assessment, supported by ground specialist tagup (VHF) and telemetry monitoring from Russian ground sites (at 6:53am EDT & 8:25am), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Yurchikhin’s and Kotov’s orthostatic tolerance (e.g., the Gauer-Henry reflex) after several weeks in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced ("negative") pressure, set at -20, -25, -30, and -35 mmHg (Torr) for five minutes each while shifting from foot to foot at 10-12 steps per minute, while wearing a
sphygmomanometer to measure blood pressure. The body’s circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian “Pinguin” suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]

In the Service Module (SM), the FE-1 performed the second part of the periodic water sampling for return to Earth begun yesterday, using empty drinking bags (or food container) to collect condensate (KAV) samples upstream of the Water Purification Column Unit (SRV-K2M BKO), the water supply system (SVO-ZV) and the Water Distribution & Heating Unit (BRP-M-warm), then replacing the sampler for flushing the gear each time. [Later, he removed the sampler, disassembled the setup and dumped the flush water into a towel. Curiously, there is no really cold water on tap on ISS.]

After Anderson prepared the auditory test equipment, each crewmember took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC laptop application. It was Fyodor’s and Oleg’s third, Clay’s second session. [The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]

Fyodor and Clay set up and tested the television connections in the SM for covering the Soyuz 15S docking with US Ku-band assets, after putting in place the necessary cable hook-up of the UOP DCP (utility outlet panel/display & control panel) power bypass cable at the CUP RWS (Cupola Robotic Work Station). [With the video available on an SSC (Station Support Computer) A31p laptop in the SM, the feed can be routed by single cable through the FGB and then via OpsLAN to the US segment (USOS) and downlinked from the Lab to MCC-Houston via Ku-band for subsequent transmittal to TsUP-Moscow. The TV set-up concluded with a downlink test of the configuration via Ku-band, after which the A31p was
deactivated, with all cabling left intact until after the docking.]

In preparation for their return to Earth, Yurchikhin and Kotov transferred their collected photo images from digital cards to laptop (RSK1 for CDR, RSE1 for FE-1) and then to removable HDDs (Hard Disk Drives). New images taken for the remainder of their stay will also be saved on one of the HDDs, and all disks will be prepacked on 10/18 for return on Soyuz.

The FE-2 conducted the periodic status checkup & filter inspection of the running CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

Oleg completed the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the SM, including ASU toilet facilities systems/replaceables.

Working from his discretionary job list, Kotov also conducted the daily updating/editing of the standard daily IMS (Inventory Management System) “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The CDR and FE-1 had another ~2 hrs reserved between them for more equipment prepacking for return or disposal in the Soyuz TMA-10/14S spacecraft. [Excessed cargo and trash go into the Orbital Module (BO) for burning up in the atmosphere. Return cargo comes into the Descent Module (SA), for its landing in Kazakhstan on 10/21 (Sunday), at ~4:36pm local time in sunlight.]

The two Russian crewmembers continued their standard End-of-Increment reduced workdays, which gives each of them an hour per day for personal preparations for their return.

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR/MO-5, FE-1/MO-5).

Later Clay will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).
At ~2:25pm, Clay powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 2:30pm, a ham radio exchange with students at Isummasaqvik School, Quaqtag, Quebec/Canada.  

[The town of Quaqtag, population 333, is at the Northern tip of the Province of Quebec, near Ungava Bay. There are 125 students in Isummasaqvik School, with English and Inuktitut as languages. The community’s territory covers 225 sq. mi., with numerous archeological sites, traditional activities and handicrafts. To the east of the village, Île Akpatok has been long recognized as a polar bear and walrus hunting ground. “How do you eat and drink your food in space?”; “How and where do you sleep?”; “Can you see Arctic Canada and the Northern Lights from Space?”; “What is the most unusual event that you have seen?”; “Would you like to travel to Mars? Do you think that there are extraterrestrials there?”; “Have you ever seen or used the Canadarm?”; “How many liters of fuel does it take to go from Earth to the Space Station?”; “What is the first thing that you see in the morning when you wake up?”; “Is there a toilet? How do you use it?”.

Discretionary tasks on the coming week’s U.S. “job jar” for Clay Anderson or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified Aid for EVA Rescue) pyro valves, covering SSC (Station Support Computer) Firewire ports, and prepacking 10A return cargo.

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  

[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

VC13 Equipment Setup: For preparing the work place for VC13 Dr. Shukor, Yurchikhin and Kotov requested that they be allowed to set up the KUBIK-1, -2 & -3 refrigerator/thermostats and PGB (Portable Glovebox) in the FGB instead of the SM, as planned earlier, using FGB power outlets. Rationale: to reduce noise for the CDR and FE-1 in the SM habitation area prior to their departure on Soyuz.

Sleep Cycle Shift: Tonight, bedtime will be delayed by 2.5 hours (from 5:30pm to 8:00pm EDT) as the crew’s sleep cycle starts shifting to the right in preparation for 15S arrival on 10/12 and 14S departure on 10/21:

- Crew sleep/wake tonight: 8:00pm/5:00am,
- crew sleep/wake tomorrow: 8:30pm/7:00am,
- crew sleep/wake Fri-Sat: 12:30am/9:30am.
**Progress 26P Rodnik Update:** Leak checks performed by the crew on 10/8-9 on the membrane (expulsion bladder) of the Progress’ Rodnik BV1 tank indicated membrane damage. The leak check, as usual, was performed in two parts,- by using a pump to compress the bladder and later to pressurize it. Both parts confirmed a small membrane leak. The Progress Rodnik tankage therefore is unsuitable for urine transfer, and the crew was advised to use EDV containers for trashing the liquid waste on Progress.

Today’s CEO (Crew Earth Observation) photo targets were **Xianggang (Hong Kong), China** (the city of Hong Kong lies on the eastern side of the Pearl River Delta. In the 1990’s Hong Kong’s population increased sharply, reaching 6.99 million in 2006. Such rapid growth will no doubt cause dynamic changes in the city as it tries to accommodate this population growth. As one of the "mega cities" on the target list, requested was detailed mapping of the city and its boundaries. With the 400 mm lens the crew were not able to capture the entire city in one frame, however, they were able to document the infrastructure of the city at a finer detail), and **S. Mozambique** (this region of Mozambique has received an economic stimulus from oil and gas strikes that have just come on line in the last few years. ISS imagery will be used in a country with almost no maps, to document the associated economic development [planned and unplanned] that surround oil areas. This time of year imagery of this region is somewhat problematic and researchers could not promise a cloud free view, however this area is important enough for them to ask for it even if the weather may be marginal. The crew was to shoot an overlapping series of images of the area.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

12/25/07 -- Progress M-62/27P docking (DC1)
01/31/07 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch

Godspeed, Peggy, Yuri and Muszaphar!
Yuri in foreground, Peggy in back.
ISS On-Orbit Status 10/09/07

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, FE-2 Anderson began his fourth session with the NASA/JSC experiment NUTRITION, for which he had to forego exercising and food intake for eight hours. The assessment is scheduled for today and tomorrow. [After collecting an initial urine sample, Clay followed it with phlebotomy, i.e., drawing blood samples (from an arm vein) which he first allowed to coagulate, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. The equipment was then stowed. NUTRITION activities today included the required 24-hour data urine collection by Anderson, by securing samples during the day, all stored immediately in MELFI. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing in-flight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection...}
(made possible by MELFI), normative markers of nutritional assessment, and a
return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition
and implications for rehabilitation.]

Anderson also started his final session with the SLEEP (Sleep-Wake Actigraphy
and Light Exposure during Spaceflight) experiment, first downloading his data from
his Actiwatch into the software application on the HRF-1, then re-initializing and
donning his the Actiwatch, after changing the lithium battery and activating Peggy
Whitson’s Actiwatch for Increment 16 as well as changing the 9V battery in the Reader.  [Purpose of the experiment is to document the effects of long duration
spaceflight on sleep-wake activity patterns using the wrist-worn the Actiwatch. The
latter is a small light-weight activity & light recording device for the entire duration of
their mission. The sleep-wake activity and light exposure patterns obtained in-flight
will be compared with baseline data collected for two weeks between Launch (L)-
120 and L-75 and from L-11 through L-0. Recovery from spaceflight will also be
assessed from Return (R)+0 through R+7. These data should help in
understanding the effects of spaceflight on sleep as well as aid in the development
of effective countermeasures for both short and long-duration spaceflight.]

CDR Yurchikhin serviced the Russian BMP (Harmful Impurities Removal System),
starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable
dual-channel filtration system. The regen process will be terminated at ~4:45pm
EDT. Regeneration of bed #2 follows tomorrow.  [Regeneration of each of the two
cartridges takes about 12 hours and is conducted only during crew awake periods.]

In the Service Module (SM), the CDR performed the periodic water sampling for
return to Earth on Soyuz, using empty drinking bags (or food container) to collect
condensate (KAV) samples upstream of the Water Purification Column Unit (SRV-
K2M BKO). More samples, from the water supply system (SVO-ZV) and the Water
Distribution & Heating Unit (BRP-M-warm) will be taken tomorrow.  [Curiously,
there is no really cold water on tap on ISS.]  

FE-1 Kotov conducted the regular downloading of system data/log files from the
Russian payload server (BSPN) to the RSS1 laptop and onto a FlashCard, to be
dumped to the ground via OCA for analysis.  [The data transfer, required for
periodic analysis of server condition, was preceded by a comm check between the
RSS1 and the BSPN.]

After more leak checking on the Progress M-61 (26P) Rodnik BV1 water tank
bladder today, it was determined that the BV1 bladder is not leak tight and therefore
not suitable for urine storage.  [The pressurization of the collapsed bladder of the
Rodnik water storage tank was conducted as a leak check, lasting ~4h 30min,
preparatory to the liquid waste transfer to the tank for disposal. Each of the two
spherical Rodnik tanks, BV1 & BV2, consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane.

Fyodor completed the periodic computer network “pantry” audit, listing battery status & IDs, operational issues, floppy drive serial numbers and stowage locations for all Russian laptops (RSS1, RSS2, RSK1, RSE1, RSE-Med, TP2 and Laptop 3). On RSS1, Fyodor also changed/updated four icons for BSPN (Payload Server) and BSMM (Payload Matching Unit/computer) operation. [This task had been on the voluntary Russian job list up to now.]

FE-2 Anderson worked on the three onboard copies of the SODF (Station Operations Data File) Warning Book from the FGB, SM, and LAB, updating the section on ISS cabin hi-pressure warning with pen-&-ink changes and then restowing the books.

After last week’s successful operation of the U.S. OGS (Oxygen Generation System) and shutdown on Friday (10/5), Clay Anderson today accessed the OGS rack, demated the O₂ (oxygen) outlet QD (quick disconnect), performed an O₂ purge on the H₂ (hydrogen) sensor and reinstalled the WDS (Water Distribution System) on the rack front.

After tagging up with a medical specialist on the ground to discuss details of their Earth return on 10/21, Yurchikhin and Kotov had two hours set aside to conduct the standard Soyuz descent training exercise for each crew returning on a Soyuz. The exercise, which strictly forbids any command activation (except for switching the InPU display), was also supported by a tagup and discussions with a ground instructor at TsUP/Moscow via S-band. [The training session included a review of the pertinent ODF (operational data files), specifically the books on Soyuz Insertion & Descent Procedures, Emergency Descents, and Off-Nominal Situation Procedures, and it featured special emphasis on nominal operations with the Neptune-MEh cockpit console. During descent, Yurchikhin, as Soyuz CDR, will occupy the middle couch, with Sheikh Muszaphar Shukor Al Masrie in the left seat and Kotov in the Descent Module’s right Kazbek couch. Pending the final State Commission decision at about 3.5h before undocking, 14S return is expected for 10/21 (Sunday).]

Anderson performed the periodic deployment of two passive FMK (formaldehyde monitoring kit) sampling assemblies in the Lab (below CEVIS) and SM (most forward handrail) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.
Oleg performed the periodic data collection and downlink on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse. He then closed down the BIO-5 experiment, stowing the MIS Accessories kit and BKGA (Gas Analyzer Calibration Assembly) with racks.

FE-1 Kotov completed his first session of the 24-hour of ECG (electrocardiogram) recording under the Russian MedOps MO-2 protocol. After CDR Yurchikhin assisted him in doffing the harness, it was Fyodor’s turn for the 24-hour run of the MO-2 protocol, with Oleg lending a hand in his donning the five-electrode Holter harness. [The electrodes read his dynamic (in motion) heart function from two leads over 24 hours and record data on the Kardioregistrator 90205 unit.]

Yurchikhin completed the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the Service Module (SM), including ASU toilet facilities systems/replaceables.

Working from his discretionary job list, the CDR also conducted the daily updating/editing of the standard daily IMS (Inventory Management System) “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The two Russian crewmembers again had about one hour each for their personal preparations for their Soyuz 14S departure.

The FE-2 conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister cords and accessory straps as well as the canister bolts for re-tightening if required.

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR/full time, FE-1/full time, FE-2), and RED resistive exerciser (FE-2).

Later Clay transferred the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Discretionary tasks on the coming week’s U.S. “job jar” for Clay Anderson or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified
Aid for EVA Rescue) pyro valves, covering SSC (Station Support Computer) Firewire ports, and prepacking 10A return cargo.

**Soyuz TMA-11/15S Status Update:** At Baikonur, a meeting of the State Commission was held, with GCTC (Gagarin Cosmonaut Training Center) Director V. V. Tsibliev reporting about the crew readiness for the planned mission. Also reporting on the readiness of the Soyuz-FG launch vehicle and TMA-11 spacecraft was RSC-Energia President and General Designer V.A. Lopota. The State Commission approved the prime & backup crews for the 15S mission and the ISS-16 increment and also adopted a decision to continue preparation of the Soyuz-FG fueling and launch at the set time tomorrow morning, at 9:22am EDT (17:22 o’clock Moscow time). *(See below for photographs of today).*

**Consumables Update:** Consumables status was reported today by the IMMT (ISS Mission Management Team) to be good. All consumables are projected to be “Green” through Increment 16. Most restrictive consumables are food, toilet inserts and KTO waste containers, which all reach skip cycle around the same time in January of 2008. Food and potable water will be resupply by Progress 28P.

**Reboost Update:** US and RS ballistics specialists determined there is no need for reboost during 10A. Normally, a small delta-V boost is experienced during mated ops, but none is required this time.

Today’s CEO (Crew Earth Observation) photo targets were **Xianggang (Hong Kong), China** *(the city of Hong Kong lies on the eastern side of the Pearl River Delta. In the 1990's Hong Kong’s population increased sharply, reaching 6.99 million in 2006. Such rapid growth will no doubt cause dynamic changes in the city as it tries to accommodate this population growth. As one of the "mega cities" on the target list, requested was detailed mapping of the city and its boundaries. With the 400 mm lens the crew were not able to capture the entire city in one frame, however, they were able to document the infrastructure of the city at a finer detail), and S. Mozambique (this region of Mozambique has received an economic stimulus from oil and gas strikes that have just come on line in the last few years. ISS imagery will be used in a country with almost no maps, to document the associated economic development [planned and unplanned] that surround oil areas. This time of year imagery of this region is somewhat problematic and researchers could not promise a cloud free view, however this area is important enough for them to ask for it even if the weather may be marginal. The crew was to shoot an overlapping series of images of the area.)*

CEO photography can be viewed and studied at the websites:  
[http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) *(about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site)*;
ISS Orbit (as of this morning, 6:44am EDT [= epoch]):
Mean altitude -- 343.2 km
Apogee height -- 345.3 km
Perigee height -- 341.1 km
Period -- 91.40 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0003122
Solar Beta Angle -- 24.2 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 55 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50880

>>> Timeline for 15S Launch through Docking (as of 10/7, all times EDT):
15S Launch 10/10 09:22:37am
Orbital Insertion 09:31:22 am
DV1 (18.52 m/s) 12:58pm
DV2 (8.19 m/s) 01:42pm
DV3 (2.00 m/s) 10/11 09:28am
USOS to RS MCS Handover 10/12 07:20am
ISS mnr to dock attitude 08:10am
Soyuz Kurs-A Activation (T1) 09:18:54am
SM Kurs-P Activation (T1) 09:20:54am
Good Kurs-P data at 80 km 09:43:23am
Kurs-A & Kurs-P Short Test at 15 km 10:04:23am
Range = 9km - VHF-2 activation 10:10:43am
Range = 8km - Soyuz TV activation 10:12:03am
AR&D Flyaround mode start 10:29:44am
AR&D Stationkeeping start 10:38:44am
RGS AOS 10:39:44am
AR&D Final Approach start 10:43:26am
Local Sunset 10:48:11am
15S Docking at FGB nadir port 10/12 10:52am
Soyuz hooks closed 11:12:26am
Local Sunrise 11:24am
RS to USOS MCS Handover 12:00 noon

Significant Events Ahead (all dates Eastern, some changes possible):
10/10/07 -- Soyuz TMA-11/15S launch (9:22:37am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~10:52:30am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch

**Baikonur Launch Readiness Review by State Commission – 10/9/07**
God Speed, Peggy and Crewmates!
ISS On-Orbit Status 10/08/07

All ISS systems continue to function nominally, except those noted previously or below.  

*Columbus Day holiday: “slow ops” for ISS.  Underway: Week 25 of Increment 15.*

FE-1 Kotov started his first session of the Russian MedOps MO-2 protocol which calls for 24-hour recording of his ECG (electrocardiogram).  *[For the ECG recording, Oleg donned the five-electrode Holter harness that read his dynamic (in motion) heart function from two leads over 24 hours and record data on the Kardioregistrator 90205 unit.  CDR Yurchikhin assisted his crewmate in the harness donning (and tomorrow’s doffing).]*

FE-2 Anderson spent most of his day in the U.S. Airlock on get-ahead tasks for 10A, resizing EMUs (Extravehicular Mobility Units) and preparing PWRs (Payload Water Reservoirs) for Expedition 16 CDR Peggy Whitson and FE-1 Yuri Malenchenko, plus performing periodic maintenance.  *[After resizing the spacesuits for Peggy and Yuri, Clay consolidated water from PWR #1025 into #1024 and worked on degassing a total of three PWRs by manually removing gas bubbles in #1024 (contents 18 lbs), #1026 (21 lbs), #1027 (23 lbs).  Yearly maintenance water dump and refill was due for the primary and reserve water tanks of EMU 3018.  Afterwards, the FE-2 also replaced the UIA (Umbilical Interface Assembly) supply water biocide filter, which was approaching its end-of-life (520 lbs H2O processed), with a new unit (#1007).  The waste water filter remains unchanged.]*

In preparation for upcoming urine transfer to the Progress M-61 (26P) Rodnik BV1 water tank, Kotov conducted the regular six compressor test activations to inflate and pressurize the cargo ship’s BV1 tank bladder.  *[The pressurization of the collapsed bladder of the Rodnik water storage tank is conducted as a leak check, lasting ~4h 30min, preparatory to the liquid waste transfer to the tank for disposal.  Each of the two spherical Rodnik tanks consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic.  The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane.]*

The FE-1 completed the routine maintenance of the SOZh (ECLSS/Environment Control &
Life Support System) system in the Service Module (SM), including ASU toilet facilities systems/replaceables.

The daily updating/editing of the standard daily IMS (Inventory Management System) “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur), was conducted today by the CDR as a voluntary task from his “time permitting” job list.

Anderson conducted the microbial (bacterial & fungal) “T+5 Day” analysis of air samples collected on 10/3 with the MAS (Microbial Air Sampler) kit in Lab, Node and SM. [The sampling analysis is performed once per month for the first three months, and once every three months thereafter. Bacterial and fungal air samples are taken at two locations in each module. The colony growth on the sampling slides is analyzed after five days of incubation in four Petri dishes. For onboard visual analysis of media slides from SSK (Surface Sampling Kit), MCDs (microbial capture devices) from WMK (Water Monitoring Kit), coliform detection bags from MWAK (Microbial Water Analysis Kit), and Petri dishes from MAS, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods. Petri Dishes and SSK slides were stowed for return on 10A.]

FE-1 Kotov worked with the Russian BRTK-TVS video distribution system, running downlink tests with the Japanese HDTV camera (instead of the standard LIV camera) over RGS (Russian Groundsite) on Daily Orbit 13, with ground specialist tagup via S-band. [These tests are relevant to ATV (Automated Transfer Vehicle) arrival control.]

In preparation for the arrival of VC13 (Visiting Crewmember #13) Sheikh Muszaphar Shukor Al Masrie, Yurchikhin and Kotov set up the SM work area for the SFP (Space Flight Participant)’s planned experiments during his 9-day stay on the station. [Prepping the work area with the pre-delivered equipment is vital for the success of VC13 by reducing the SFP’s time spent on his program. For the VC13 experiments, the crew set up the ESA temperature-controlled incubator chamber KUBIK AMBER, KUBIK 1 and KUBIK 2, the PGB (Portable Glove Box) and the KRIOGEM-03 cooler for the BIOEMULSION equipment in the SM, the ETD (Eye Tracking Device) in the DC1 Docking Compartment, and also looked for a new stowage site for the ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) hardware. The Malaysian VC-13 onboard program itself will be performed from 10/10/07 to 10/21/07. The duration of VC-13 joint flight as part of the ISS RS (Russian Segment) is 9 days (from 10/12 through 10/21). The VC-13 program entails –

- Science experiments (CIS/Cells in Space, MIS/Microbes in Space, PCS/Protein Crystallization in Space, FIS/Malaysian Food in Space, TOP/Study of Torques in Microgravity, plus three previous ESA experiments - ETD, MOP & MUSCLE);
- Three real-time RS-TsUP/Moscow live TV links;
- Five ham radio sessions;
- Interior photo & video imagery aboard the ISS RS;
- Commemorative activities; and
- Talks with the Malaysian cosmonaut consultative team (via Russian communications systems) twice daily, in the morning and evening.]
Working off his discretionary job list, the CDR also conducted the fourth photo/video session preparatory to the arrival of VC-13. The task involved taking pictures of Malaysian sites (such as Kelang, Kuala Lumpur, Ipoh, George Town, Taiping, Alor Seta, and Kota Baru) using the Nikon D2X digital camera from SM window #9.  

The images are stored from flash card, without compression ("raw"), on the RSK1 laptop, later to be copied to RSE1, for return to Earth.

The CDR performed troubleshooting on the Onboard Complex Control System (SUBK), checking voltage continuity and fuses of a Common Power Switching timer (BSK DB2).

Afterwards, Fyodor supported the ground in reactivating the Elektron O2 (oxygen) generator, which had to be turned off to allow the temporary disabling of the BITS2-12 Onboard Telemetry Measurement System for the SUBK work.  

Reactivation was at 32 amps.  As usual Fyodor monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating.  During nominal operations a gas analyzer is utilized to detect hydrogen (H2) in the O2 line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.

FE-2 Anderson unstowed and set up the hardware for his fourth NUTRITION experiment session, scheduled tomorrow for urine collection and Wednesday.  

The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight.  NUTRITION expands this protocol by also capturing in-flight samples and an additional postflight sample.  Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests.  The results will help to better understand the impact of countermeasures (exercise & pharmaceuticals) on nutritional status and nutrient requirements.  The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire).  The current new NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI/Minus Eighty Degree Celsius Laboratory Freezer for ISS), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR/full time, FE-1/full time, FE-2), and RED resistive exerciser (FE-2).

Later Clay transferred the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).
Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

At ~7:45am EDT, the crew held another teleconference via Ku- & S-band with members of the next ISS crew, Expedition 16, at Baikonur.  [These exchanges have the purpose to begin the handover process prior to the arrival on orbit of the next crew, through videocons and data exchanges between the current crew and the upcoming crew.  Expedition 16 will involve Commander Peggy A. Whitson, Flight Engineers Yuri Malenchenko, Daniel M. Tani, Léopold Eyharts and Garrett E. Reisman, plus Malaysian SFP Sheikh Muszaphar Shukor for 9 days.]

Discretionary tasks on the coming week’s U.S. “job jar” for Clay Anderson or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified Aid for EVA Rescue) pyro valves, covering SSC (Station Support Computer) Firewire ports, and prepacking 10A return cargo.

**TVIS Update:** By a concerted Sunday effort of the crew and ground specialists, the TVIS treadmill was successfully repaired yesterday, with three new roller bearings (#6-8) installed on the starboard/forward side.  Bearings #6-8 on port did not need replacement.  Total time estimated for two crewmembers: 2.5 hrs per person.  A 20-min. Speed Characterization Test was to be conducted by Yurchikhin today.  Once TVIS engineers have analyzed these data, they will let the crew know when they are Go for TVIS exercise.

**Soyuz TMA-11/15S Status Update:** At Baikonur, preparations are on schedule for the launch of Soyuz TMA-11/15S.  This morning at 5:00am Moscow time (9:00pm EDT last night) the Soyuz spacecraft was moved from the Assembly-Test Facility to the launch site where the Soyuz-FG launch vehicle with the Soyuz TMA-11 transport spacecraft was erected.  Standard L-2 day countdown ops are underway (see photographs below).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 7:54am EDT [= epoch]):
Mean altitude -- 343.2 km
Apogee height -- 345.3 km
Perigee height -- 341.1 km
Period -- 91.40 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0003081
Solar Beta Angle -- 28.5 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 56 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50865

>>> Timeline for 15S Launch through Docking (as of 10/7, all times EDT):

- 15S Launch 10/10 09:22:37am
- Orbital Insertion 09:31:22 am
- DV1 (18.52 m/s) 12:58pm
- DV2 (8.19 m/s) 01:42pm
- DV3 (2.00 m/s) 10/11 09:28am
- USOS to RS MCS Handover 10/12 07:20am
- ISS mnvr to dock attitude 08:10am
- Soyuz Kurs-A Activation (T1) 09:18:54am
- SM Kurs-P Activation (T1) 09:20:54am
- Good Kurs-P data at 80 km 09:43:23am
- Kurs-A & Kurs-P Short Test at 15 km 10:04:23am
- Range = 9km - VHF-2 activation 10:10:43am
- Range = 8km - Soyuz TV activation 10:12:03am
- AR&D Flyaround mode start 10:29:44am
- AR&D Stationkeeping start 10:38:44am
- RGS AOS 10:39:44am
- AR&D Final Approach start 10:43:26am
- Sunset 10:48:11am
- 15S Docking at FGB nadir port 10/12 10:52:26am
- Soyuz hooks closed 11:12:26am
- RS to USOS MCS Handover 12:00 noon

Significant Events Ahead (all dates Eastern, some changes possible):
10/10/07 -- Soyuz TMA-11/15S launch (9:22:37am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~10:52:30am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch

Soyuz TMA-11/15S Rollout and Erection – 10/8/07
ISS On-Orbit Status 10/07/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday -- off-duty day for the crew except for daily housekeeping and voluntary work. Ahead: Week 25 of Increment 15.

CDR Fyodor Yurchikhin conducted the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the Service Module (SM), including ASU toilet facilities systems/replaceables plus the weekly collection of toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Fyodor also gathered weekly data on total operating time and activity durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s Air Revitalization Subsystem (SOGS) for reporting to TsUP.

TVIS Failure: The crew worked extensively on troubleshooting the TVIS (Treadmill with Vibration Isolation & Stabilization) which failed yesterday at ~3:30pm EDT while Oleg Kotov was running on it. Analysis is continuing. [Overnight, a six-page list of troubleshooting questions was prepared by specialists and uplinked, to investigate why the running belt reportedly “came to a grinding halt” and later stopped again after a brief restart by Oleg.]

The CDR conducted the third photo/video session preparatory to the arrival of Soyuz 15S with Malaysian SFP (Space Flight Participant) Sheikh Muszaphar Shukor Al Masrie as VC-13 (Visiting Crewmember 13). The task involved taking pictures of Malaysian sites (such as Kuching, Sibu, and Miri) using the Nikon D2X digital camera from SM window #9. More picture taking is scheduled for tomorrow. [The images are stored from flash card, without compression (“raw”), on the RSK1 laptop, later to be copied to RSE1, for return to Earth.]
The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR/full time, FE-1/full time, FE-2), and RED resistive exerciser (FE-2).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

As a second discretionary job, Kotov performed (in the morning) the regular status check on the long-term BIO-5 Rustenya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

At ~7:20am EDT, the FE-1 had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

Discretionary tasks on the coming week’s U.S. “job jar” for Clay Anderson or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified Aid for EVA Rescue) pyro valves, covering SSC (Station Support Computer) Firewire ports, and prepacking 10A return cargo.

No CEO (Crew Earth Observation) photo targets uplinked for today.

10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/?/?09 -- **Six-person crew on ISS**
04/15/09 -- Constellation’s Ares I-X Launch

*Have a nice and safe Columbus Day! (Respectively, a nice and safe Thanksgiving Day in Canada!)*
All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson except for housekeeping and voluntary work.

The crew conducted the regular weekly three-hour task of thorough station cleaning. "Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.

As part of the house cleaning, the CDR & FE-1 performed preventive maintenance cleaning on the V3, VPkhO, VdPrK, and VPrK fan screens in the DC1 (Docking Compartment) and on the TsV2 fan grille in the FGB.

In preparation for their return to gravity, Fyodor Yurchikhin and Oleg Kotov undertook their second preliminary session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the below-the-waist reduced-pressure device (ODNT, US: LBNP) on the VELO ergometer, assisting each other in turn as CMO (Crew Medical Officer). The one-hour assessment, supported by ground specialist tagup (VHF) and telemetry monitoring from Russian ground sites (at 6:52am EDT & 8:28am), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-
simulating stress to the body’s cardiovascular/circulatory system for evaluation of Yurchikhin’s and Kotov’s orthostatic tolerance (e.g., the Gauer-Henry reflex) after several weeks in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced (“negative”) pressure, set at -20, -25, -30, and -35 mmHg (Torr) for five minutes each while shifting from foot to foot at 10-12 steps per minute, while wearing a sphygmomanometer to measure blood pressure. The body’s circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian “Pinguin” suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.

CDR Yurchikhin conducted the second photo/video session preparatory to the arrival of Soyuz 15S with Malaysian SFP (Space Flight Participant) Sheikh Muszaphar Shukor Al Masrie as VC-13 (Visiting Crewmember 13). The task involved taking pictures of Malaysian sites (such as Kelang, Kuala Lumpur, Ipoh, George Town, and Taiping) using the Nikon D2X digital camera from SM window #9. More picture taking is scheduled for tomorrow through 10/8. [The Malaysian VC-13 onboard program itself will be performed from 10/10/07 to 10/21/07. The duration of VC-13 joint flight as part of the ISS RS (Russian Segment) is 9 days (from 10/12 through 10/21). The VC-13 program will entail –

- Science experiments (CIS/Cells in Space, MIS/Microbes in Space, PCS/Protein Crystallization in Space, FIS/Malaysian Food in Space, TOP/Study of Torques in Microgravity, plus three previous ESA experiments - ETD, MOP & MUSCLE);
- Three real-time RS-TsUP/Moscow live TV links;
- Five ham radio sessions;
- Interior photo & video imagery aboard the ISS RS;
- Commemorative activities; and
- Talks with the Malaysian cosmonaut consultative team (via Russian communications systems) twice daily, in the morning and evening.]

For his voluntarily performed “Saturday Science” session, FE-2 Anderson again worked with the new ANITA (Analyzing Interferometer for Ambient Air) payload. [After first switching the equipment via the ANITA user interface software from local sampling mode to non-local sampling, Clay used a hand pump and sample bags to collect two non-local ambient air samples, one from in front of the ANITA air flushing unit’s gas inlet and the other from the middle of the Node, for subsequent analysis in the ER4 (EXPRESS Rack 4) ANITA drawer. Developed by ESA, ANITA is a potential next-generation trace-gas analysis system that uses a Fourier-
Transform Infrared (FTIR) spectrometer to determine concentrations of up to 32 different trace gases in the cabin atmosphere (measuring absorbance vs. wavelength). ANITA provides continuous, automatic air sampling from its location in ER4, taking one local sample every 6 minutes, for medical personnel during the first ten days, later for environmental specialists. Data are stored on the ANITA laptop hard drive, with a representative data set downlinked daily by ground command.

At ~9:05am EDT, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

Clay Anderson filled out the regular FFQ (Food Frequency Questionnaire), his 13th, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

Fyodor Yurchikhin conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

In the SM, the CDR performed maintenance on the Onboard Equipment Control System (SUBA) by remating cable connectors behind a wall panel (#307) to deactivate a backup contact-separation flag in the Common Power Switching Unit (BSK-U). [The SUBA controls, monitors, and diagnoses SM systems status. It operates using sensor output signals and command radio link SM functional outputs, onboard computer system (BVS) units, SM control panels, and system relay outputs. Its software resides in the SM central computer (TsVM) and terminal computer (TVM). The BSKs are used to switch electrical power and protect electrical circuits with fuses against overloads.]

FE-2 Kotov serviced the Lab video distribution system by exchanging the video tapes in the #1 and #2 VTRs (Video Tape Recorders) against new ones.

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (CDR/MO-5, FE-1/MO-5).
Later Clay transferred the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:20am, Clay powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 5:25am, a ham radio exchange with students at the town of Anamizu, Housu-gun Ishikawa, Japan. [The town of Anamizu is located on the Noto Peninsula and is a place abundant with nature that is surrounded by mountains and the ocean. In 1889, Percival Lowell became interested in the Noto Peninsula and visited Anamizu, which he introduced in his book titled Noto. As a commemoration of the last point on Lowell’s journey, a monument was constructed and to commemorate Lowell himself, a telescope has been provided for this town with starry skies. At the end of March this past year, the nature-filled town of Anamizu was hit by the Noto Peninsula Earthquake and suffered a large amount of damage. The success of this dream project will most certainly give local citizens a sense of strength to help recover from the earthquake. “Do you have any free time?”; “What do shooting stars look like from space?”; “Can you see the forest destruction and desertification from space?”; “Can you tell when it is night or morning in space?”; “What does it smell like in the space station?”; “Do you miss your family?”; “How do you throw away trash from the space station?”; “Do raw foods get spoiled in space too?”; “Is it true that you will lose your balance after you come back from space?”; “Have you ever seen an UFO?”; “Is it possible for us to go to space without training?”]

At 3:10pm, Anderson conducted a second ham radio session, with the Prairielands Council, Boy Scouts of America, at the Space Jamboree Camp Robert Drake (Oakwood, IL), Champaign, Illinois. [Space Exploration and Radio Merit Badges form the core of their Space Jamboree program. Mars exploration, Moonbase design and studying the ISS are some of the things these Scouts are learning about. Pioneering skills are traditional Scouting activities, yet Science and Technology have always been at the forefront of exploration and “we are looking forward to a telebridge phone call from a modern pioneer on the edge of space exploration.” “We are taught about “Leave No Trace” here, on Earth. I hear about ‘space junk’ and ‘space trash’. How do astronauts deal with trash and ‘other stuff’ in space?”; “When you get back to Earth, do you ever dream that you are floating?”; “What do you like to do in your free time?”; “How did your parents react when you told them you were going into the space program?”; “What type of exercises do you have to do because of zero gravity?”; “Have you given any thought to what games we might play in space, like Harry Potter “Quidditch,” for instance?”; “How do you store stuff when you have no gravity?”; “What kinds of emergencies did you train to
Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Another job item on Kotov’s discretionary list for today was another radiation data monitoring & logging session for flow & dose power data with the Matryoshka-R radiation payload and its LULIN-5 electronics box. Accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel.

Other discretionary tasks on this week’s “job jar” for Clay or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified Aid for EVA Rescue Onboard Training) units, deconfiguring and removing MELFI MOOCE gear, and prepacking 10A return cargo.

IWIS DTF Thruster Firings Update: During the early-morning preparations for the planned IWIS DTF (Internal Wireless Instrumentation System/Dedicated Thruster Firing) tests, the starboard SARJ (Solar Array Rotary Joint) could not be positioned as necessary. The SARJ’s Runaway FDIR (Fault Detection, Isolation & Recovery) system was inhibited and the SARJ Drive Motor was selected successfully but with a “peculiar” signature. The thruster tests (five firings each with a 4-min recovery period in free drift) could not be performed and may be rescheduled. [For the DTF the IWIS RSUs (Remote Sensing Units) were installed by the crew in the RS (Russian Segment).- one in the SM, one in the FGB, with USOS sensors left in place. The goal of this test was/is not to excite the arrays by direct plume impingement like in past tests but to excite the arrays from their base via mechanical loads. The on-orbit data will be utilized to correlate math models utilized by structures & mechanism specialists.]

Weekly Science Update (Expedition Fifteen – 24th)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): ALTEINO instrument continues to acquire nominally radiation levels in the SM. Memory card was exchanged on 10/4. A close-out session for this increment is planned on 10/16. During this close-out session, the ALTEINO device would be relocated to the PIRS DC1 module.
ANITA: All planned collections for the experimental local sampling phase of ANITA have been completed. The ground looks forward to collection of the non-local experiment samples today (10/6). ANITA will now continue to gather data for use by the Environmental Factors Office.

BCAT (Binary Colloidal Alloy Test): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Continuing,

CFE (Capillary Flow Experiment): Reserve.

CHROMOSOME-2 (E14 SFP): Completed.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Next scheduled operation is 10/29-11/3.

EMCH (Elastic Memory Composite Hinge): Complete.

EPO (Educational Payload Operation) Kit C: Planned.

IMMUNO (Saliva Sampling): Second session currently planned for 10/14-16.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: From 9/27-29, observations of the leaves of the plants in B1 were recorded in 2D as per following scenario: 8hrs light + 0-g, 8 hrs light + 1-g, 8hrs dark + 1-g. Rotor A remained static. This was done with high frequency observation of A2/A4 and B1/B3 (1 image / 5 min). During this period, roots of plants of B1 were ventilated and A2 was watered. From then on Rotor-B has been spinning at 1-g for
optimal stem growth. Lock-ups of the VPU (Video Processing Unit) on 9/30, 10/1, 10/3 & 10/5 have led to loss of some imagery, but otherwise science data continue to be collected. From 10/2, the ACS (Atmospheric Control System) system has been used in EMCS to allow adding some GN2 to keep the PPO2 below the threshold value while OGS is active in US-Lab. On 10/3, hydration was performed in B1 and roots of plants were ventilated in both B1 and A2. Further confirmation is needed, but it looks like the stem for one of the B1 plants has started to appear. If confirmed, 2D then 3D-recordings of stem circumnutation can begin.

**MUSCLE (E14 SFP):** Completed.

**MSG-SAME (Microgravity Science Glovebox):** The SAME team has been busy this week completing ops and analyzing data and will report on results in next week’s WSS.

**NEOCYTOLYSIS (E14 SFP):** Completed.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION:** In progress.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMPLE:** Ongoing.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** n/a

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** “Clay, next week you have your last download/initialization session. You will also be changing the lithium battery and activating the I-16 CDR Actiwatch as well as changing the 9V battery in the reader. Thanks for your continued support.”

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** Planned.

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** In progress.

**TRAC (Test of Reaction & Adaptation Capabilities):** Planned.

**CEO (Crew Earth Observations):** Through 10/3 the ground has received a total of 16,693 CEO images for review and cataloging for Increment 15. 1,670 frames were received in just the past week! “We have identified and prioritized for review those frames with camera times corresponding to the request times of the following CEO
targets: Nile River Delta, Africa; B. P. Structure, Libya; Oasis Impact Crater, Libya; Tropical Storm Karen, Atlantic Ocean; Antarctic Ice Pack; Kerguelen, S. Indian Ocean; Iceberg A22A, S. Atlantic Ocean; Patagonian Glacier, S. America; Pilcomayo River Dynamics, N. Argentina; and Mt. Ruapehu, New Zealand. ["We'll provide feedback as we work our way through these. We have already spotted your excellent IPY (International Polar Year) images of Iceberg A22A that you acquired on 10/1 (see below). Thanks for your diligence and patience in spotting this challenging and elusive target! We also appreciate both the call-down feedback we are now receiving as well as the prompt downlink of your recent imagery. There are numerous striking, high-oblique, low-light views in your latest imagery showing nice composition and creativity on your part. However, we have also noticed some inconsistency in your long lens technique with several sessions having soft focus throughout. Remember also that if you use the science window that long lens photography is almost always soft. Your recent, grand, oblique view of western Nebraska including the confluence of the North and South Platte Rivers and the famous Sand Hills will be published on NASA/GSFC's Earth Observatory website this weekend."]

CEO (Crew Earth Observation) photo targets uplinked for today were S. Mozambique (this region of Mozambique has received an economic stimulus from oil and gas strikes that have just come on line in the last few years. CEO imagery will be used in a country with almost no maps, to document the associated economic development [planned and unplanned] that surround oil areas. Crew was to shoot an overlapping series of images [looking right at about 45 deg] for about 45 secs), Jebel at Tair volcano eruption (DYNAMIC EVENT: Jebel at Tair is a tiny,
dark-colored volcanic island in the southern Red Sea. On September 30, 2007, this volcano erupted spewing lava and ash hundreds of meters into the air. Reports of renewed activity were received on October 4. Although lighting is low, a mapping swath of views right of track, concentrating on the middle of the Red Sea, should record the island), and **Smoke pall, Argentina–S Brazil** (DYNAMIC EVENT: Thick smoke from extensive, dry-season biomass burning has dominated the lowlands of central South America for many days. Crew was asked document margins of the pall, especially right of track.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 7:10am EDT [= epoch]):
Mean altitude -- 343.3 km
Apogee height -- 345.5 km
Perigee height -- 341.2 km
Period -- 91.40 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0003185
Solar Beta Angle -- 36.3 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 55 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50833

>>> **Timeline for 15S Launch through Docking** (as of 10/4, all times EDT):
15S Launch 10/10 09:22:37am
Orbital Insertion 09:31:22 am
DV1 (18.52 m/s) 12:58pm
DV2 (8.19 m/s) 01:42pm
DV3 (2.00 m/s) 10/11 09:28am
USOS to RS MCS Handover 10/12 07:20am
ISS mnvr to dock attitude 08:10am
Soyuz Kurs-A Activation (T1) 09:18:54am
SM Kurs-P Activation (T1) 09:20:54am
Good Kurs-P data at 80 km 09:43:23am
Kurs-A & Kurs-P Short Test at 15 km 10:04:23am
Range = 9km - VHF-2 activation 10:10:43am
Range = 8km - Soyuz TV activation 10:12:03am
AR&D Flyaround mode start 10:29:44am  
AR&D Stationkeeping start 10:38:44am  
RGS AOS 10:39:44am  
AR&D Final Approach start 10:43:26am  
Sunset 10:48:11am  
15S Docking at FGB nadir port 10/12 10:52:26am  
Soyuz hooks closed 11:12:26am  
RS to USOS MCS Handover 12:00 noon  

**Significant Events Ahead** (all dates Eastern and subject to change):  
10/08/07 -- U.S. Holiday (Columbus Day)  
10/10/07 -- Soyuz TMA-11/15S launch (9:22:37am)  
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~10:52:30am)  
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)  
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5  
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)  
11/03/07 -- STS-120/Discovery/10A undocking  
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)  
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab  
11/14/07 -- US EVA-10  
11/18/07 -- US EVA-11  
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite  
12/08/07 -- STS-122/Atlantis/1E docking  
12/15/07 -- STS-122/Atlantis/1E undocking  
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry  
12/23/07 -- Progress M-62/27P launch  
12/25/07 -- Progress M-62/27P docking (DC1)  
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)  
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)  
02/06/08 -- Progress M-62/27P undocking  
02/07/08 -- Progress M-63/28P launch  
02/09/08 -- Progress M-63/28P docking  
02/14/08 -- ATV-1 docking (SM aft port)  
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS  
02/16/08 -- STS-123/Endeavour/1J/A docking  
02/27/08 -- STS-123/Endeavour/1J/A undocking  
04/08/08 -- Soyuz TMA-12/16S launch  
04/10/08 -- Soyuz TMA-12/16S docking (DC1)  
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)  
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch

Sputnik Celebration Update: On 10/4, the new Sputnik monument was officially unveiled at Korolev near Moscow, shown below. Middle picture: VIP section, with Prof. Natalya Koroleva, daughter of Sergey Pavlovich in the middle. Bottom picture: Rare shot of SP Korolev’s gravesite in the Red Wall near Lenins Mausoleum
Sputnik monument unveiling (VIPs on stage, with N.Koroleva)

S.P. Korolev’s burial place on Red Square.
ISS On-Orbit Status 10/05/07

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson conducted another session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (eleventh time for CDR & FE-1, eighth for FE-2), using the IM mass measurement device which Oleg Kotov afterwards broke down for stowage.  *Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember’s mass is calculated by the computer and displayed.*

Before breakfast & first exercise, CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson completed another session with the Russian crew health monitoring program's medical assessment MO-9/Biochemical Urinalysis. The FE-1 stowed the Urolux hardware afterwards.  *MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).*
Also before breakfast and exercise, Yurchikhin and Kotov, both assisted by FE-2, and Anderson, assisted by FE-1, also did the second part of the PHS/Without Blood Labs assessment. The MO-9 and PHS sessions concluded with the usual PHS Part 3, subjective clinical evaluation, guided by the MEC IFEP software. Subsequently, Clay closed out and stowed the PHS hardware. [The U.S. PFE w/o Blood Lab is a monthly 1.5-hr. procedure which checks up on blood pressure and electrocardiogram (ECG) during programmed exercise on the CEVIS (cycle ergometer with vibration isolation) in the Lab. Readings are taken with the BP/ECG (blood pressure/electrocardiograph) and the HRM (heart rate monitor) watch with its radio transmitter. BP/ECG provides automated noninvasive systolic and diastolic blood pressure measurements while also monitoring and displaying accurate heart rates on a continual basis at rest and during exercise.]

CDR Yurchikhin supported the ground in reactivating the Elektron O$_2$ (oxygen) generator, which was turned off on 10/1 for the subsequent OGS (Oxygen Generation System) test activation. [Reactivation was at 32 amps. As usual Fyodor monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. During nominal operations a gas analyzer is utilized to detect hydrogen (H$_2$) in the O$_2$ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

After the recent (10/1) Vozdukh BKV valve replacement, Yurchikhin today switched the CO$_2$ (Carbon Dioxide) removal system first to automatic mode and later back to manual mode 5.

In preparation for the arrival of STS-120/10A later this month (10/25) and the berthing of Node 2/Harmony on Node 1/Unity, Anderson first prepared for CBCS (Centerline Berthing Camera System) setup, then had an additional 90 min reserved for installation and checkout of the CBCS at the Node portside hatch. [For the installation, Clay freed up all UOP-1 (Utility Outlet Panel 1) plugs, moving the SSC9 (Station Support Computer 9) laptop’s power connector to UOP-2 and powered off UOP-1 (which will be used for CBCS and stays that way through 10A).]

For next week’s (10/12) arrival of Soyuz TMA-11/15S, FE-2 Anderson installed the IWIS (Internal Wireless Instrumentation System). A test of the setup with a dedicated thruster firing is scheduled for tomorrow. [IWIS measures structural dynamics data by means of its RSUs (Remote Sensor Units) in the SM (Service Module), FGB and Node during the Soyuz docking.]

Yurchikhin and Kotov conducted the periodic collecting of surface samples from specific equipment and structures in the station in the Biosamples Kit A2 of the
Russian BTKh-11 Biodegradation ("Biodegradatsiya") experiment, for subsequent stowage in the Soyuz TMA-10/14S Descent Module for microbial analysis on Earth. Fyodor documented Oleg’s activity with the Nikon D1X digital camera with SB 28DX flash attachment.

Anderson took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]

The FE-2 completed the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week.]

Clay also performed computer maintenance, doing the regular weekly reboot of all PCS (Portable Computer System) A31p laptops.

Later, Anderson serviced the ongoing SAME (Smoke Aerosol Measurement Experiment) investigation, conducting the daily shutdown of the MSG (Microgravity Science Glovebox) facility and MLC (MSG Laptop Computer).

Additionally, the FE-2 performed the regular monthly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

The two Russian crewmembers again had about one hour each for their personal preparations for their Soyuz 14S departure on 10/21, going by an uplinked “End of Expedition 15 Cleanup” list. [Items packed for return on Soyuz are to be reported in the IMS. Other contents of their personal bags, such as clothing, can be trashed in a KBO-M container. Some equipment, e.g., generic US clothing, can be restowed (in PMA-1).]

Preparatory to the arrival of Soyuz 15S with Malaysian SFP (Space Flight Participant) Sheikh Muszaphar Shukor Al Masrie as VC-13 (Visiting Crewmember 13), Yurchikhin reviewed an uplinked listing of VC-13 oriented photo/video shots, then took pictures of Malaysian sites using the Nikon D2X digital camera from SM window #9. More picture taking is scheduled for tomorrow through 10/8. [The
Malaysian VC-13 onboard program itself will be performed from 10/10/07 to 10/21/07. The duration of VC-13 joint flight as part of the ISS RS (Russian Segment) is 9 days (from 10/12 through 10/21). The VC-13 program will entail –

- Science experiments (CIS/Cells in Space, MIS/Microbes in Space, PCS/Protein Crystallization in Space, FIS/Malaysian Food in Space, TOP/Study of Torques in Microgravity, plus three previous ESA experiments - ETD, MOP & MUSCLE);
- Three real-time RS-TsUP/Moscow live TV links;
- Five ham radio sessions;
- Interior photo & video imagery aboard the ISS RS;
- Commemorative activities; and
- Talks with the Malaysian cosmonaut consultative team (via Russian communications systems) twice daily, in the morning and evening.]

Fyodor completed the daily routine maintenance of the SM’s SOZh system (Environment Control & Life Support System, ECLSS), with the regular insert replacements in its toilet system (ASU).

The CDR also updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR/ full time, FE-1/ full time, FE-2) and RED resistive exerciser (FE-2).

Later Clay transfers the crewmembers’ exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Clay tagged up with ground specialists to discuss the imagery resulting from his standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training on 10/3 where he used the DCS-760 digital still camera with 400 & 800mm lenses at SM windows 6 & 8 (facing in flight direction) to take CEO (Crew Earth Observations) target imagery with manual focusing only. [The RPM drill prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle (STS-120/10A next). During the RPM at ~600 ft from the station, the “shooters” have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]
At ~4:15am EDT this morning, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~5:45am, Fyodor and Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

The crew’s regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio will be conducted at ~4:40pm.

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

As a second discretionary job, Kotov performed (in the morning) the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

Another voluntary task from the Russian list for Yurchikhin was the periodic computer network audit, listing battery status & IDs, operational issues, floppy drive serial numbers and stowage locations for all Russian laptops (RSS1, RSS2, RSK1, RSE1, RSE-Med, TP2 and Laptop 3). On RSS1, Fyodor also changed/updated four icons for BSPN (Payload Server) and BSMM (Payload Matching Unit/computer) operation.

Other discretionary tasks on this week’s “job jar” for Clay or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified Aid for EVA Rescue Onboard Training) units, deconfiguring and removing MELFI MOOCE gear, and prepacking 10A return cargo.

Sputnik Celebration Update: Yesterday (10/4), the crew participated in two PAO TV events in observance of the 50th anniversary of the launch of Sputnik 1, one with greetings to MATI, the K.E. Tsolkovsky Russian State Engineering University (“…specialists trained at MATI have made a significant contribution in space exploration… It is your work that ensures steady reliable launches, successful
expeditions, and return to the ground.”), the other with greetings and best wishes from ISS to the Russian Ministry of Emergency Situations, dedicated to the 60th Anniversary of the Ministry’s Special Fire Fighting Forces (“…May your sleeves stay dry!”).

OGS Update: After a planned shutdown of the U.S. OGS (Oxygen Generation System) yesterday, a restart of the system failed. Software override limits (for “high quantity” setting) were adjusted, and OGS restarted OK and is running 100%. Teams are still analyzing data.

Soyuz 15S/14S Update: Moscow reported to be Go for 15S launch/docking and 14S undocking/landing.

**Timeline for 15S Launch through Docking (as of 10/4, all times EDT):**

- 15S Launch @ Baikonur 10/10 **09:22:37am**
- Orbital Insertion 09:31:22 am
- DV1 (18.52 m/s) 12:58pm
- DV2 (8.19 m/s) 01:42pm
- DV3 (2.00 m/s) 10/11 09:28am
- USOS to RS MCS Handover 10/12 07:20am
- ISS mnvr to dock attitude 08:10am
- Soyuz Kurs-A Activation (T1) 09:16:54am
- SM Kurs-P Activation (T1) 09:20:54am
- Good Kurs-P data at 80 km 09:43:23am
- Kurs-A & Kurs-P Short Test at 15 km 10:04:23am
- Range = 9km - VHF-2 activation 10:10:43am
- Range = 8km - Soyuz TV activation 10:12:03am
- AR&D Flyaround mode start 10:29:44am
- AR&D Stationkeeping start 10:38:44am
- RGS AOS 10:39:44am
- AR&D Final Approach start 10:43:26am
- Sunset 10:48:11am
- 15S Docking at FGB nadir port 10/12 **10:52:26am**
- Soyuz hooks closed 11:12:26am
- RS to USOS MCS Handover 12:00 noon

CEO (Crew Earth Observation) photo targets uplinked for today were **Roter Kamm Impact Crater** *(this target is located just inland in extreme southern Namibia. The Roter Kamm impact crater is about 2.5 km in diameter and about 130 m deep. The crater was formed by the impact of an asteroid about 300 m in diameter. The interior of the crater is covered in thick sand deposits. This is a relatively young impact crater, dated at about 3.7 million years. As ISS approached the coast from the SW in fair weather and afternoon sun, the crew was to look just left of track,*}
trying for detailed views with the long lens settings), **Mt. Kilimanjaro, Kenya** (Mount Kilimanjaro is a renowned volcanic peak of eastern equatorial Africa. It is situated in northeastern Tanzania near the border with Kenya. At 19,341 feet, it is the highest peak in Africa and sustains a small icecap with glaciers which are under study as indicators of climate variations. ISS pass was near-nadir in mid-afternoon sun with clouds expected in the lower elevations. Trying for detailed views of the icecap), and **Jebel at Tair Eruption** (DYNAMIC EVENT: Jebel at Tair is a tiny, dark-colored volcanic island in the southeastern Red Sea near 15.55N 41.82E. On September 30, 2007, this small dormant volcano erupted late in the day, with what one observer described as a “giant light show”, spewing lava and hurling an ash cloud hundreds of meters into the air. According to the Global Volcanism network, the 3-km-wide island is the emergent summit of a stratovolcano that rises from a 1,200 m depth in the south-central Red Sea. Explosive eruptions were last reported in the 18th and 19th centuries. ISS pass was in very late afternoon light and well to the SE of the target. Looking well left of track and try for high oblique, contextual views of the southeastern Red Sea area looking perhaps for a volcanic plume).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 8:21am EDT [= epoch]):
Mean altitude -- 343.4 km
Apogee height -- 345.6 km
Perigee height -- 341.2 km
Period -- 91.40 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0003255
Solar Beta Angle -- 39.7 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 71 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50818

**Significant Events Ahead** (all dates Eastern and subject to change):
10/08/07 -- U.S. Holiday (Columbus Day)
10/10/07 -- Soyuz TMA-11/15S launch (9:22:37am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~10:52:30am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation's Ares I-X Launch
All ISS systems continue to function nominally, except those noted previously or below.

CDR Yurchikhin and FE-1 Kotov set up the equipment for their fourth session with the Russian experiment DYKHANIE ("respiration", "breathing"), tagged up with ground specialists and conducted the session, first the CDR, later the FE-1, afterwards closing down and stowing the equipment. [Dykhanie-1 gear uses two belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]
FE-2 Anderson configured the OUM-PFE (Oxygen Uptake Measurement - Periodic Fitness Evaluation) equipment on the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), BP/ECG (Blood Pressure/Electrocardiograph), Mixing Bag System and GDS (Gas Delivery System), then ran the data collection session on himself on the CEVIS cycle ergometer according to protocol, with Oleg Kotov acting as OUM-PFE operator. [The operations were documented with photo and video. In closing out, Clay updated the evaluation protocol, deactivated & stored the gear, including photo/video equipment, and turned off the OUM-PFE laptop.]

Later Anderson unstowed and prepared AMP (Ambulatory Medical Pack) and ALSP (Advanced Life Support Pack) equipment for another set of PHS (Periodic Health Status)/Without Blood Lab and MO-9 Urinalysis sessions scheduled for tomorrow.

Performing the periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), Yurchikhin removed the PCMCIA memory card #932 from the AST spectrometer’s slot and copied the accumulated data for subsequent downlinking via OCA. Card 932 was then bagged for return to Earth and PCMCIA card 935 inserted to continue AST ops.

Kotov collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]

The CDR completed the daily routine maintenance of the SM's SOZh system (Environment Control & Life Support System, ECLSS), with the regular insert replacements in its toilet system (ASU).

Fyodor today also continued the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator by charging the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (#23). The last test pressurization was done by Yurchikhin on 9/14. [During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]

Clay Anderson updated/edited the standard daily IMS (Inventory Management System) “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).
The crew conducted an in-depth review of the planned science program of the next SFP (Space Flight Participant), VC-13 Sheikh Muszaphar Shukor Al Masrie from Malaysia, followed by a tagup with ground specialists to discuss details. [The Malaysian VC-13 program is performed from 10/10/07 to 10/21/07. The duration of VC-13 joint flight as part of the ISS RS (Russian Segment) is 9 days (from 10/12 through 10/21). The VC-13 program will entail –

- Science experiments (CIS/Cells in Space, MIS/Microbes in Space, PCS/Protein Crystallization in Space, FIS/Malaysian Food in Space, TOP/Study of Torques in Microgravity, plus three previous ESA experiments - ETD, MOP & MUSCLE);
- Three real-time RS-TsUP/Moscow live TV links;
- Five ham radio sessions;
- Interior photo & video imagery aboard the ISS RS;
- Commemorative activities; and
- Talks with the Malaysian cosmonaut consultative team (via Russian communications systems) twice daily, in the morning and evening.]

Reviewing an uplinked listing of return cargo items to be brought down on their Soyuz ship, Fyodor and Oleg tagged up with ground specialists to discuss stowage issues for the return on 14S on 10/21.

The two Russian crewmembers again had about one hour each for their personal preparations for their departure on 14S, going by an uplinked “End of Expedition 15 Cleanup” list. [Items packed for return on Soyuz are to be reported in the IMS. Other contents of their personal bags, such as clothing, can be trashed in a KBO-M container. Some equipment, e.g., generic US clothing, can be restowed (in PMA-1).]

Clay Anderson had time set aside for troubleshooting the IV-PDS (Intravehicular Particle directional Spectrometer) using the MEC (Medical Equipment Computer) laptop and a data cable obtained from the TEPC (Tissue Equivalent Proportional Counter) radiation measurement equipment.

The FE-2 tagged up with the EVA specialists to discuss details of the 10A spacewalk timelines.

Anderson also continued his support of the MELFI (Minus-Eighty Laboratory Freezer for ISS) facility. [Today, Clay removed the MOOCE (MELFI On-Orbit Characterization Experiment) cable from Dewar 2 for better access and installed a door bolt on the Dewar. He then moved the MOOCE tray from the -95 deg Dewar 2 into the +2 deg Dewar 4 (to allow the tray to warm up prior to touching it for deconfiguration).]
The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2/OUM), TVIS treadmill (CDR/full time, FE-1/ full time,) and RED resistive exerciser (FE-2).

Later Clay transferred the crewmembers’ exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Other discretionary tasks on this week’s “job jar” for Clay or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified Aid for EVA Rescue Onboard Training) units, deconfiguring and removing MELFI MOOCE gear, and prepacking 10A return cargo.

OGS Update: The U.S. OGS (Oxygen Generation System) testing is continuing successfully, to run through approximately the end of the week. This operation is scheduled approximately tri-monthly to ensure the system remains healthy.

RS Thermal Control System (STR) Update: After yesterday’s successful pump replacement using a pump assembly from KOB-1, KOB-2 is currently functioning with all four pumps and KOB-1 has two of its usual four pumps working.

OpsLAN Clean-up Update: Clay’s job yesterday of clearing out old OpsLAN (Operations Local Area Network) gear remaining after the recent ISL/JSL (Integrated Station LAN/Joint Station LAN) transition turned out to require considerably more time than the estimated 45 min for cleaning and stowing coax cabling. More time for removing old cabling needs to be scheduled for the crew.

MT Move Update: All systems performed nominally in yesterday’s checkout “drive” of the Mobile Transporter (MT). The Robotics Flight Control Team successfully commanded MT translation from WS4 (Worksite 4) to WS8 for Flight 10A pre-launch checkout in preparation for the P6 truss relocation. After confirming redundant power and data connectivity to the MRS MBS (Mobile Remote Servicer/ Mobile Base System) at WS8, the MT was translated back to WS4, the initial
CEO (Crew Earth Observation) photo targets uplinked for today were **Perth, Australia** (Perth is the capital of Western Australia with a population of 1,507,900 [Dec. 2006 est.]. This “megacity” is located on the Swan River along the coast of Western Australia. Detailed mapping of the city is requested), **S. Mozambique** (the interest in this rural site is to document rapid change. While most of Africa stagnates economically, extraction of Mozambique’s huge hydrocarbon reserves has started to spark economic development along a major transportation route to the interior. Detailed baseline/"pre-change" imagery is therefore requested to reveal styles of land use change, patterns that are probably new in a globalizing world. As with post-Soviet conditions in eastern Europe, remote sensing is suddenly one of the best ways to track change because collection of statistics either never existed, or has declined or disappeared. Requested was a mapping strip with the 400 mm lens), **Patagonian Glaciers** (from the ISS, seasonal, colored images of glaciers will provide valuable information about the area extent of the glacial ice and surface snows (or equilibrium line) on the glaciers. Looking towards the eastern side of the ice field. Previous ISS crews have done a great job in documenting the larger glaciers. The ground requested that the crew focus on documenting the smaller glaciers), and **High Central Andean Glaciers** (ISS had a pass that took it over the central axis of the Andes mountains. This area is usually cloud covered but for this day it appeared to be about as cloud free as it gets. The crew may still have seen popcorn cumulus clouds but that should not have inhibited them from seeing the glaciers. The ground recommended to look toward the southern Andes to document the extent of the glaciers).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit**  *(as of this morning, 7:58am EDT [= epoch]):*
Mean altitude -- 343.4 km
Apogee height -- 345.6 km
Perigee height -- 341.3 km
Period -- 91.40 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0003163
Solar Beta Angle -- 42.7 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 55 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50802

**Significant Events Ahead (all dates Eastern and subject to change):**

10/08/07 -- U.S. Holiday (Columbus Day)
10/10/07 -- Soyuz TMA-11/15S launch (9:22:37am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~10:53am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 10/03/07

All ISS systems continue to function nominally, except those noted previously or below.

In the Service Module (SM), CDR Yurchikhin performed a 2-hr IFM (inflight maintenance) on the Russian STR thermal control system’s KOB-2 loop to remove a replaceable unit (BS) with an electric pump (ENA) of the replaceable pump panel 4SPN1, and to replace it with a BS scavenged from an older pump assembly ORU (on-orbit replaceable unit, 3SPN1). The failed BS assembly and a second BS (N2) from 3SPN1 were to be trashed.

FE-1 Kotov unstowed the REFLotron-4 biomedical blood analyzer and conducted a health check on the instrument using the standard measuring strips. [Earlier Reflotron versions have operated already on space station Mir. The instrument determines clinical data from blood samples collected from the subject’s finger. Using various reagent tabs, the blood is tested with strips (KPI) for such parameters as hemoglobin, glucose, bilirubin, amylase, uric acid, triglycerides, urea, creatinin, cholesterol, etc. The tubes with blood samples are then temporarily kept cool for subsequent analysis. Reflotron-4 uses 40 W of power, supplied by the SM’s electrical system.]

Continuing his support of the MELFI (Minus-Eighty Laboratory Freezer for ISS) facility, FE-2 Anderson swapped box modules/trays in Dewars 2 & 3, to consolidate samples of the past NUTRITION experiment into the same dewar. [This makes Double Coldbag packing quicker and more efficient on 10A. Samples are most vulnerable to damage during bag packing while they are exposed to ambient air, so efficient packing is crucial to preserving science.]

The FE-2 also performed the daily assist of the ongoing SAME (Smoke Aerosol Measurement Experiment) investigation, powering up the MSG (Microgravity Science Glovebox) facility and MLC (MSG Laptop Computer). [Carousel #5 is
mounted in the WV (Work Volume), to be run tomorrow and Friday. This will end the SAME experiment. The hardware will be disassembled and removed during the docked period, and all items except for the alcohol wick will be returned to Earth on 10A.]

Using the MAS (Microbial Air Sampler) kit, Anderson gathered air samples in Lab, Node & SM for bacterial and fungal analysis in Petri dishes and stowed them for return to Earth on 10A. Later, Anderson collected surface sample swabs in Lab & Node for cultivation/incubation with the EHS SSK (Environmental Health Systems/ Surface Sample Kit). [The MAS sampling analysis is performed once per month for the first three months, and once every three months thereafter. Bacterial and fungal air samples are taken at two locations in each module. The colony growth on the sampling slides will usually (not this time) be analyzed on board after five days of incubation in 4 Petri dishes. As done for MAS, SSK sampling is performed once per month for the first three months that a module is on orbit and once every three months thereafter. Bacterial and fungal samples are taken at two locations in each module, with the prime site in the Lab being the air supply diffuser at the LAB1P5 rack. The colony growth on the 10 sampling slides will be analyzed after five days of incubation. For onboard visual analysis of media slides from SSK, MCDs (Microbial Capture Devices) from WMK (Water Monitoring Kit), coliform detection bags from MWAK (Microbial Water Analysis Kit), and Petri dishes from MAS, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]

The FE-2 also completed the visual “T+2 Day” microbial (bacterial & fungal) analysis of the Week 24 potable water samples, collected on 10/1 from the SRV-K hot tap and two CWC (Contingency Water Containers) specimens and processed on board with the MCDs (Microbial Capture Devices).

Oleg Kotov, assisted in part by the CDR, restored access to the Progress M-61/26P cargo ship which had been closed off for the Soyuz relocation. [After the obligatory 1-hr. Progress/DC1 interface leak check, Oleg opened the DC1-SU (vestibule) and Progress-SU transfer hatches, rigidized the link-up with the QD (quick release) screw clamps (BZV), deactivated the spacecraft and installed the ventilation air duct. 26P will remain docked at the “Pirs” module until late in December.]

After the 26P BZV clamps installation, the MT (Mobile Transporter) was commanded from the ground to translate from WS4 (Worksite 4) to WS8 and back to WS4. For the time before BZV installation and during the MT translation, Russian thrusters were inhibited (from 9:10am to 3:16pm EDT).

As part of the job of clearing out old OpsLAN (Operations Local Area Network) gear, remaining after the recent ISL/JSL (Integrated Station LAN/Joint Station LAN)
transition, Anderson had ~45 min reserved for cleaning and stowing coax cabling.

Clay also prepared an SSC (Station Support Computer) laptop for return on mission 10A.  [The old SSC Router shell was deployed as new SSC5 and the previous SSC5 shell was deconfigured, labeled and staged for transfer to the Shuttle for earth return.]

In preparation for another PFE/OUM (Periodic Fitness Evaluation/Oxygen Uptake Measurement) data collection session tomorrow, the FE-2 set up equipment on the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), BP/ECG (Blood Pressure/Electrocardiograph), Mixing Bag System and GDS (Gas Delivery System) and CEVIS cycle.

Fyodor completed the daily routine maintenance of the SM’s SOZh system (Environment Control & Life Support System, ECLSS), with the regular insert replacements in its toilet system (ASU), and today also conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the SM-to-DC1 (22P) tunnel, and the SM-to-DC1, FGB-to-Node and FGB-to-Soyuz passageways.

Oleg updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Anderson conducted the periodic status checkup & filter inspection of the running CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload.  [The incubator is controlled from the ground with automatic video downlinked to Earth.]

Clay also performed another standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, using the DCS-760 digital still camera with 400 & 800mm lenses at SM windows 6 & 8 (facing in flight direction) to take CEO (Crew Earth Observations) target imagery with manual focusing only.  Afterwards, the obtained OBT images were downlinked to the ground for analysis.  [The RPM drill prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle (STS-120/10A next).  During the RPM at ~600 ft from the station, the “shooters” have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment.  Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]
The two Russian crewmembers again had about one hour each for their personal preparations for their departure on Soyuz 14S on 10/21, going by an uplinked “End of Expedition 15 Cleanup” list. [Items packed for return on Soyuz are to be reported in the IMS. Other contents of their personal bags, such as clothing, can be trashed in a KBO-M container. Some equipment, e.g., generic US clothing, can be restowed (in PMA-1).]

Clay, who remains on board after 14S departure, also had another 40 min reserved for prepacking/staging cargo for return on 10A.

The FE-1 performed the periodic data collection and downlink on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

At 4:35am, FE-2 Anderson conducted the periodic VHF1 emergency communications check over NASA’s VHF (Very High Frequency) sites, talking with Houston/Capcom and Moscow/GLAVNI (TsUP Capcom) in the normal fashion via VHF radio from a handheld microphone and any of the U.S. segment ATUs (audio terminal units). [Purpose of the test is to verify signal reception and link integrity, and to ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2 hrs, FE-1/2 hrs, FE-2) and RED resistive exerciser (FE-2), with Fyodor’s and Oleg’s regimen reduced today to 2 hrs each.

Later Clay transferred the crewmembers’ exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

With CDRA (Carbon Dioxide Removal Assembly) deactivated and cooling no longer required, Anderson disconnected the LTL (Low Temperature Loop) jumper of the ITCS (Internal Thermal Control System) from the CDRA rack.

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]
As a second discretionary job, Kotov performed (in the morning) the regular status check on the long-term BIO-5 Rasteniya-1 (“Plants-1”) micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

Other discretionary tasks on this week’s “job jar” for Clay or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified Aid for EVA Rescue Onboard Training) units, deconfiguring and removing MELFI MOOCE gear, and prepacking 10A return cargo.

**OGS Update:** The U.S. OGS (Oxygen Generation System) was successfully activated yesterday in at the 25% production rate, to be then moded to 50%. OGS will run until its water supply is depleted (approximately 5 days). This is the second activation of OGS. The system was last activated and checked out in July 2007.

CEO (Crew Earth Observation) photo targets uplinked for today were **Roter Kamm Impact Crater** (*Roter Kamm impact crater is about 2.5 km in diameter and about 130 m deep. The crater was formed by the impact of an asteroid about 300 m in diameter. The crater interior is covered in thick sand deposits. This is a relatively young impact crater, dated at about 3.7 million years*), **Patagonian Glaciers** *(the weather was best towards the southern end of the Southern Patagonian Ice Field. This Ice Field is the third biggest extension of continental ice after the Antarctica and Greenland Ice Fields. Documenting extent of the large and small glaciers along your orbit track)*, and **Lake Poopo, Bolivia** *(lowering and rising of water levels in Lake Poopo give indications of short-term regional climate fluctuations. Lake Poopo is a large saline lake located in a shallow depression in the Altiplano Mountains in Bolivia. The water level in this lake is highly variable because it lacks any major outlet and it has a mean depth of no more than 3 m. Therefore, even small regional climate variations can have an impact on the appearance of the lake. Trying to capture the entire lake in one frame. Lake Poopo was right of track. Lake Titicaca is a larger lake to the left of track)*.

CEO photography can be viewed and studied at the websites: [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); [http://earthobservatory.nasa.gov](http://earthobservatory.nasa.gov) / [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)
ISS Orbit  (as of this morning, 7:49am EDT [= epoch]):
Mean altitude -- 343.5 km
Apogee height -- 345.6 km
Perigee height -- 341.5 km
Period -- 91.41 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0003049
Solar Beta Angle -- 45.2 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 53 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50786

Significant Events Ahead  (all dates Eastern and subject to change):
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/08/07 -- U.S. Holiday (Columbus Day)
10/10/07 -- Soyuz TMA-11/15S launch (9:22:37am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~10:52:30am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:13am/6:36am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 10/02/07

All ISS systems continue to function nominally, except those noted previously or below.

Yurchikhin and Kotov, assisting each other in turn, conducted another session with the biomedical protocol KARDIO-ODNT (MBI-5), an extensive cardiovascular test of human pericardium (heart muscle) activity as well as of primary parameters of central and regional blood circulation at rest and under the effect of lower body negative pressure (LBNP, Russian: ODNT). Later, Oleg Kotov also undertook the MedOps MO-4 orthostatic hemodynamic endurance test with the ODNT/Chibis suit in preparation for his return to gravity on 10/21, assisted by the CDR. [The Chibis provides gravity-simulating stress to the body’s cardiovascular/circulatory system for evaluation of Fyodor’s and Oleg’s orthostatic tolerance (e.g., the Gauer-Henry reflex) after 24 weeks in zero-G. The MBI-5 protocol again consisted of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced (“negative”) pressure, set at -25, -30, -35 and -40 mmHg for five minutes each, while shifting from foot to foot at 10-12 steps per minute. The body’s circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood and body fluids “down”. MBI-5 data output include blood pressure readings with the Tenzoplus Sphygmomanometer, today without telemetry data monitoring but reporting of heart rate and blood pressure to TsUP-Moscow.]

FE-1 Kotov performed the periodic O₂ sensor adjustment on the Russian IK0501 gas analyzer, with tagup support provided by ground specialists as necessary. [IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed.]

FE-2 Anderson worked on the RED (Resistive Exercise Device), replacing its pulley
cables with new ones after ground analysis showed cable life has expired. The canisters were then re-calibrated. [One of the fasteners on the bottom plate of the RED, reported by Yurchikhin recently as being almost completely failed, was removed and discarded. The subsequent calibration by Clay allows accurate execution of exercise protocol objectives. Upon receipt of the results of the calibration data, ground specialists review the data and, assuming favorable engineering analysis, give the crew a GO for their RED exercise session. Calibration of the load settings of the pulley cans is performed with an on-orbit calibration kit with a special calibration tool and steel handles.]

Clay Anderson supported the ground-commanded operation of the U.S. OGS (Oxygen Generation System) starting at 10:20am, by configuring the OGS rack (Lab1P1) for powering up from UOP3 (Utility Outlet Panel 3), removing protective Velcro squares from around the O₂ outlet port, followed by installing and activating the WDS (Water Delivery System) pump. [OGS will run for 24 hrs. With overrides in place, it will be commanded to shut down and restart to verify that an off-nominal shutdown can recover. The Russian Elektron O₂ generator was turned off yesterday in preparation for the OGS activation; it will be reactivated on 10/5.]

Afterwards, the FE-2 took three acoustic noise readings each before & after OGA pump activation in front of the OGS rack, using the SLM (Sound Level Meter), and later transferring the acoustic data to the MEC (Medical Equipment Computer)

Continuing his support of the MELFI (Minus-Eighty Laboratory Freezer for ISS) facility and preparing for the deconfiguration of the MOOCE (MELFI On-Orbit Characterization Experiment) and Double Coldbag packing activity during 10A, Anderson transferred the TROPI (Study of Novel Sensory Mechanism in Root Phototropism) sample from the MOOCE tray in Dewar 2 to another location. [Background: The MOOCE tests last year were designed to characterize the MELFI thermal environment. The MOOCE tray contains wires, sensors, thermocouples, and other temperature measuring equipment to support the MELFI Commissioning tests that were completed in July last year.]

The two Russian cosmonauts continued their personal preparations for their departure on Soyuz 14S on 10/21, going by an uplinked “End of Expedition 15 Cleanup” list. [Items packed for return on Soyuz are to be reported in the IMS. Other contents of their personal bags, such as clothing, can be trashed in a KBO-M container. Some equipment, e.g., generic US clothing, can be restowed (in PMA-1).]

Clay also had another 1.5 hrs reserved for prepacking/staging cargo for return on 10A.
Oleg conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Fyodor updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

CDR Yurchikhin supported the ground in an interesting scientific research experiment by mounting the geophysical GFI-1 Relaksatsiya (“relaxation”) spectroscopic video equipment at Service Module (SM) window #1 (port-side crew cabin) and later observing ionospheric luminance at an altitude of 300 km above the Russian Sura Ionospheric Heating Facility. [For the experiment, the ISS will be maneuvered to observation attitude by RS (Russian Segment) thruster firings at ~2:35pm EDT, for which ISS attitude control authority will be handed over to the RS MCS (Motion Control System) at 2:25pm, to be returned to USOS (US Segment) CMG momentum management at 3:05pm. The Sura Ionospheric Heating Facility, located near the small town of Velsilsursk about 100 km eastward from Nizhny Novgorod, is a laboratory for ionosphere research, capable of radiating about 190 Megawatt of effective power (ERP) on short waves (4.5-9.3 MHz). The facility is operated by the Radiophysical Research Institute NIRFI in Nizhny Novgorod. The Sura facility was commissioned in 1981. Using this facility, Russian researchers achieved extremely interesting results regarding the ionosphere behavior and discovered the effect of generation of low-frequency emission at the modulation of ionosphere current.]

At ~11:20am EDT, the crew participated in a PAO TV “Open Class” session with school children at TsUP-Moscow in Korolev, a joint project of Russian Federal Space Agency “Roskosmos” and the RF Ministry of Education & Science dedicated to the 50th Anniversary of the first man-made Earth’s satellite launch, broadcast live on TV Channel 24 “Vesti”. [Participating in the Q&A exchange between students and ISS crew were S. B. Ivanov (first Deputy Chairman of the Russian Federal Government), A. N. Perminov (Director of Roskosmos), representatives of Roskosmos, managers of TsNIIMASH (TsUP’s home), TsUP Flight Director V. A. Solovyov, and the student winners of the Space Olympiads. Ivanov and Perminov opened the live televised broadcast.]

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2) and RED resistive exerciser (FE-2), with Fyodor’s and Oleg’s regimen reduced today to 1 hr. each because of the ODNT training.
Later today, Clay will transfer the crewmembers’ exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Other discretionary tasks on this week’s “job jar” for Clay or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified Aid for EVA Rescue Onboard Training) units, deconfiguring and removing MELFI MOOCE gear, and prepacking 10A return cargo.

**Saturday Science Preview:** For next weekend’s Saturday Science, Clay has selected another session with the ANITA (Analyzing Interferometer for Ambient Air) experiment, taking a non-local air sample from another station location (pumped by hand into a sample bag) for subsequent analysis in the ER4 ANITA drawer.

**26P Fuel Transfer:** TsUP today performed transfer of remaining fuel from Progress 26 to SM tanks.

**Vozdukh Update:** After yesterday’s BVK-1 valve replacement, the Vozdukh CO₂ removal system is stable, running nominally.

**KURS Testing:** TsUP is scheduled to conduct remote standard 6-month tests of the automatic KURS rendezvous & docking system from the SM PkhO (Work Compartment) side, tonight for the DC1 (Docking Compartment), tomorrow for the FGB.

CEO (Crew Earth Observation) photo targets uplinked for today were A22A (IPY [International Polar Year] Dynamic Event. Cloud cover was still light in the region of ISS overpass, and may have allowed for sighting and photography of the fragmenting iceberg A22A. Looking to the left of track as the station began its ascending pass towards Africa for the iceberg. Satellite data acquired on September 24 indicated that the iceberg has split into two major fragments and the crew’s feedback from last week confirms this), and Patagonian Glaciers (Two passes today. ISS orbit took the crew over the southern end of the Patagonian ice
field. Looking towards the east half of the ice field and photo document the extent of the glaciers, including O'Higgins, Grey and Tyndall in Chile).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:28am EDT [= epoch]):
Mean altitude -- 343.6 km
Apogee height -- 345.6 km
Perigee height -- 341.6 km
Period -- 91.41 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0002999
Solar Beta Angle -- 47.1 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 53 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50770

Significant Events Ahead (all dates Eastern and subject to change):
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/08/07 -- U.S. Holiday (Columbus Day)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)**
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
05/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**
ISS On-Orbit Status 10/01/07

All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 24 of Increment 15.

Today’s crew activities began with the routine checkup of DC1 (Docking Compartment) circuit breakers and fuses by CDR Yurchikhin and FE-1 Kotov. [The monthly checkup in the “Pirs” DC1 looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in Fuse Panels BPP-30 & BPP-36.]

After the two cosmonauts had completed the periodic (monthly) functional closure test of spare emergency vacuum valves (AVK) for the Vozdukh, Kotov proceeded to remove & replace the BVK-1 vacuum valve of the CO2 scrubber which in the last few days exhibited offnominal performance. Oleg finished by re-connecting the subsystem to the BITS2-12 onboard measurement telemetry system for ground monitoring. [The change was logged in the IMS (Inventory Management System), and the out-of-lifetime BVK will be returned to the ground for analysis. The AVKs are critical because they close the Vozdukh’s vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO2 during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]

Yurchikhin meanwhile worked in the FGB, removing & replacing a second-string electronic program-logic control assembly (UPLU-2) with a new spare. The activity was supported by ground specialist tagup.

In preparation of the berthing of Node 2/“Harmony” during the 10A docked period later this month, FE-2 Anderson unlatched the port hatch of the Node 1/“Unity”.
Yurchikhin underwent his first session of the biomedical protocol KARDIO-ODNT (MBI-5), an extensive cardiovascular test of human pericardium (heart muscle) activity as well as of primary parameters of central and regional blood circulation at rest and under the effect of lower body negative pressure (LBNP, Russian: ODNT). The test was controlled from TsUP-Moscow by a biomed specialist via VHF over RGS (Russian ground site) comm window. FE-1 Kotov assisted Yurchikhin during the procedure. [The LBNP, generated by a specially designed Chibis suit (PVK), applies suction on the lower body ranging from 10 to 60 mm Hg, thereby exerting a functional loading roughly equivalent to 10-60 kg of force on the musculoskeletal system to test the body’s adaptation to prolonged exposure to microgravity. After an initial setup period, during which Oleg attached a large number of electrodes to Fyodor’s head, body and extremities, cardiographic readings on the oscilloscope of the Gamma-1M medical complex were taken during two RGS comm passes, first without, then with the Chibis suit.]

In preparation for the upcoming U.S. OGS (Oxygen Generation System) activation, Oleg Kotov powered down the Elektron-VM oxygen (O2) generator, safety-purging its BZh Liquid Unit with nitrogen (N2) at 0.65 kg/cm² via its KE3 and VN3 valves.

Afterwards, the FE-1 worked on the RS radiation payload suite “Matryoshka-R”, activating the Bubble-dosimeter reader and gathering the detectors, deployed on 9/24 in the RS, for reading and recording their accumulated data. The log sheet was then to be downlinked to TsUP via BSR-TM payload data channel. [Six of the new Bubble dosimeter detectors had been positioned at their exposure locations, near the “Phantom” unit on the DC1 panel and in the starboard crew cabin on both sides of the MOSFET (metal oxide semiconductor field-effect transistor) dosimeter detector unit. The complex Matryoshka payload suite is designed for sophisticated radiation studies. Note: Matryoshka is the name for the traditional Russian set of nested dolls.]

Clay Anderson completed his fourth run with the MedOps WinSCAT (Spaceflight Cognitive Assessment Tool) experiment by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. [WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR’s, crewmembers or flight surgeons request.]

The FE-2 performed the daily assist of the ongoing SAME (Smoke Aerosol Measurement Experiment) investigation, powering up the MSG (Microgravity Science Glovebox) facility and MLC (MSG Laptop Computer) and changing out the
SAME sample carousel, thermal precipitator, digital video tape, and alcohol wick. [Carousel #4 was replaced by #5, to be run on Thursday & Friday this week. This will end the SAME experiment. The hardware will be disassembled and removed during the docked period, and all items except for the alcohol wick will be returned to Earth on 10A.]

Continuing his support of the MELFI (Minus-Eighty Laboratory Freezer for ISS) facility, Anderson inserted two -32 degC Icepacs in the freezer, one belt in Dewar 2/Tray C (Section 4), a second into Dewar 2/Tray D (Section 4). [Icepacs are used as thermal mass to keep samples cold during return and during extended MELFI power downs, e.g. during the recent Soyuz relocation. During this period, MELFI was off for ~15 hrs, reaching a max temperature of -17.8 degC (-64.3 F), no problems. No more than 2 ambient Icepacs may be inserted at any given time into a Dewar that has samples in it, to protect the latter from warming up.]

The FE-2 undertook the monthly (Week 24) potable water sampling for inflight and post-flight chemical analysis, using jointly approved Russian sampling procedures with the U.S. WS&A (Water Sampler & Archiver) kit for collection. Today’s sampling activity was more extended than in the past. [Six samples were taken in the SM at the potable water SRV-K hot port and SRV-K warm port and two from CWCS (Contingency Water Containers) for the SVO-ZV water supply system. Five of the six port samples will return on 10A; the sixth sample and the two CWCS specimens are being processed on board with the MCDs (Microbial Capture Devices) and incubated for two days. The sixth port sample is also being processed for coliform detection.]

FE-1 Kotov conducted the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the SM, including ASU toilet facilities systems/replaceables.

Oleg also updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The two cosmonauts began with personal preparations for their departure on Soyuz 14S on 10/21, going by an uplinked “End of Expedition 15 Cleanup” list. [Items packed for return on Soyuz are to be reported in the IMS. Other contents of their personal bags, such as clothing, can be trashed in a KBO-M container. Some equipment, e.g., generic US clothing, can be restowed (in PMA-1).]

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR/full duration, FE-1/full duration, FE-2) and
RED resistive exerciser (FE-2).

Later today, Clay will transfer the crewmembers’ exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

As a second discretionary job, Kotov performed the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

As additional “get-ahead” activities, Fyodor’s and Oleg’s task reiterates four long-term tasks, viz., (1) a running an inventory behind panels in the RS when other activities are being performed, (2) photo/video imagery of “Life on the Station” scenes in the RS (e.g., sleep & post-sleep, behavior of water in zero-G, food preparation, RS interior architecture, cosmonauts at work controlling the station, housekeeping, clothing, medical exams, viewing videos for entertainment, (3) auditing/inventorying the current computer network supplies, and (4) conducting an audit of plug-in locations.

Other discretionary tasks on this week’s “job jar” for Clay or the other crewmembers in their free time include unpacking 26P-delivered U.S. items, replacing an ER4 (EXPRESS Rack 4) light bulb, checking out SAFER (Simplified Aid for EVA Rescue Onboard Training) units, removing remaining MELFI MOOCE (On-Orbit Commissioning Experiment) gear, and prepacking 10A return cargo.

**FGB SAW Update:** Both solar array wings of the FGB “Zarya” module are in nominal configuration, i.e., properly folded in accordion-wise. [Without additional heat rejection capability, the US segment (USOS) cannot support the ESA/“Columbus” and JAXA/“Kibo” modules, when attached. To provide this capability, the ISS starboard PVR will be deployed during Shuttle mission STS-120/10A, followed by the port PVR shortly after 10A. These activities require that the FGB SAWs must be completely retracted to avoid physical contact. With its SAWs no longer producing electricity, the FGB depends solely upon USOS power feeds (PMA-1 & PMA-2). In the event of some USOS electrical failures, a
contingency electrical jumper would be available to quickly reconnect USOS power to the FGB’s ARCU (American-to-Russian Converter Unit), or its backup, for converting from American 124V to Russian 28V. Currently, the six FGB batteries are fully charged.]

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** *(as of this morning, 8:37am EDT [= epoch]):*
Mean altitude -- 343.6 km
Apogee height -- 345.3 km
Perigee height -- 341.9 km
Period -- 91.41 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0002556
Solar Beta Angle -- 48.3 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 53 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50755

Significant Events Ahead *(all dates Eastern and subject to change):*
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**
10/08/07 -- U.S. Holiday (Columbus Day)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**
ISS On-Orbit Status 09/30/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday -- off-duty day for the crew except for daily housekeeping and voluntary work. Ahead: Week 24 of Increment 15.

CDR Fyodor Yurchikhin conducted the routine maintenance of the SOZh (ECLSS/Environment Control & Life Support System) system in the Service Module (SM), including ASU toilet facilities systems/replaceables plus the weekly collection of toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Fyodor also gathered weekly data on total operating time and activity durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s Air Revitalization Subsystem (SOGS) for reporting to TsUP.

The crewmembers worked out according to their regular daily 2.5-hr physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/full duration, FE-1/full duration) and RED resistive exerciser (FE-2).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second task on Oleg’s voluntary work list was another run of the Russian "Diatomeya" ocean observations program. Using the NIKON-F5 (85 mm lens) still camera and the Sony DSR PD-150P camcorder from SM window #7, Kotov worked on obtaining imagery of color bloom and cloud pattern anomalies. [Note: Today,
the ISS flight path extended along sub-arctic oceanic water and the largest bottom upwelling (including atolls), also above extra-tropical atmospheric jet stream areas above ocean, the most likely location for plankton color blooms, turbulent water, divergent areas in fields of turbulence and cloud cover pattern typical for spring time in Southern hemisphere. Photo targets in the Atlantic and Indian Oceans were along the path Brazilian offshore area – underwater mid-oceanic range in Atlantic Ocean – coastal waters of Kerguelen Island, and in the Pacific Ocean along the track Tuamotu Island – coastal area of Argentina.

As a third discretionary job, Kotov serviced the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, rebooting the computer and changing the operating mode of the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

Another voluntary task for Oleg was the periodic collection of the accumulated data of the "Matryoshka-R" MOSFET (metal oxide semiconductor field-effect transistor) dosimeters. [The complex Matryoshka payload suite is designed for sophisticated radiation studies. The payload collects radiation measurements every 15 minutes of each hour around the clock.]

CDR Yurchikhin’s discretionary task list for today called for another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on nature. [Photo targets were the Patagonian ice field, and icebergs in the Waddell Sea.]

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit  (as of this morning, 8:15am EDT [= epoch]):**
Mean altitude -- 343.7 km
Apogee height -- 345.3 km
Perigee height -- 342.0 km
Period -- 91.41 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0002512
Solar Beta Angle -- 48.8 deg (magnitude peaking)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 88 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50739

**Significant Events Ahead (all dates Eastern and subject to change):**

10/04/07 -- *50 Years of Spaceflight (Sputnik 1)*
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/29/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson except for housekeeping and voluntary work.

FE-2 Clay Anderson continued the NASA-JSC experiment SLEEP-LONG (Sleep-Wake Actigraphy & Light Exposure During Spaceflight) which calls for daily post-sleep monitoring of his sleep/wake patterns and light exposure with an Actiwatch. [To monitor the crewmember's sleep/wake patterns and light exposure, the special Actiwatch device measure the light levels encountered by him as well as his patterns of sleep and activity.]

The crew conducted the regular weekly three-hour task of thorough station cleaning. ["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

As part of the house cleaning, the CDR and FE-1 performed preventive maintenance cleaning on the V3 fan screen in the DC1 (Docking Compartment) and on the VPkhO, VdPrK, VPrK and TsV2 fan grilles in the FGB.

At ~5:45am EDT, the two Russian cosmonauts tagged up with ground specialists via S-band to discuss details of their physical reconditioning preparatory to their return to Earth next month (10/21).

Later, Yurchikhin and Kotov maneuvered the Canadian SSRMS (Space Station Remote Maneuvering System) robotarm to the position for video-surveying the
retraction of the FGB port solar array wing (SAW) at 8:59am-9:14am on DO13 over RGS (Russian Ground Site) for telemetry monitoring.  [The starboard SAW was successfully folded in yesterday. Without additional heat rejection capability, the US segment (USOS) cannot support the ESA/“Columbus” and JAXA/“Kibo” modules, when attached. To provide this capability, the ISS starboard PVR will be deployed during Shuttle mission STS-120/10A, followed by the port PVR shortly after 10A. These activities require that the FGB SAWs must be completely retracted to avoid physical contact. With its SAWs no longer producing electricity, the FGB depends solely upon USOS power feeds (PMA-1 & PMA-2). In the event of some USOS electrical failures, a contingency electrical jumper would be available to reconnect USOS power to the FGB’s ARCU (American-to-Russian Converter Unit), or its backup, for converting from American 124V to Russian 28V. Currently, the six FGB batteries are fully charged.]

After the port SAW retraction, FE-2 Anderson was to disconnect the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable at the Lab RWS (Robotics Work Station) which was required for video coverage of the retraction.

At ~9:00am EDT, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

Clay Anderson filled out the regular FFQ (Food Frequency Questionnaire), his 12th, on the MEC (Medical Equipment Computer).  [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

Fyodor Yurchikhin conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Clay disassembled and stowed the hardware of the EPO (Educational Program Operation) “Kit C” payload for return on STS-120/10A.  [The removal needed to be completed before the upcoming OGS (Oxygen Generation System) activation. The demo/experiment dealt with the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During its 20-day run, Clay took still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants were watered on all odd numbered days.]
At ~12:25pm, Clay powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 12:30pm, a ham radio exchange with students in a public event at the Smithsonian Air & Space Museum (NASM) in Washington, DC. [The ARISS (Amateur Radio in ISS) contact was part of the NASM Family Day events commemorating 50 Years in Space, supported by the Charles Simonyi Fund for Arts and Sciences. Students selected from the audience asked the questions, which therefore could not be uplinked beforehand.]

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second (periodic) task from the voluntary work list for Oleg was the use of the Nikon D1X (SIGMA 300-800mm telephoto lens) to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON). [KPT-3 photography has been a frequent earth observing experiment for ECON.]

Another job item on Kotov's discretionary list for today (in the morning) was the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

For CDR Yurchikhin, the discretionary task list today called for another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on nature. [Photo targets were the Andes and the Huascaran volcano in Peru, the ice field of Patagonia, and icebergs in the Waddell Sea.]

**Weekly Science Update** *(Expedition Fifteen -- 23rd)*

**ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):** ALTEINO instrument continues to acquire nominally radiation levels in the SM. Next memory card exchange is currently scheduled on 10/4.
ANITA: ANITA continues to operate nominally and the PI team is busy analyzing the data and updating calibration files based on the results. “We will uplink revised files via ground commanding in the future. One early result we can share with you is that ANITA has detected trace amounts of a gas used for the calibration of the PFS as part of your PFE/OUM.”

BCAT (Binary Colloidal Alloy Test): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Continuing,

CFE (Capillary Flow Experiment): Reserve.

CHROMOSOME-2 (E14 SFP): Completed.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Next scheduled operation is 10/29-11/3.

EMCH (Elastic Memory Composite Hinge): Complete.

EPO (Educational Payload Operation) Kit C: Planned.

IMMUNO (Saliva Sampling): First session samples are currently stowed in MELFI Dewar #2.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Since last report on 9/20, the EMCS (European Modular Cultivation System) facility has fully recovered all its functionalities. On 9/21 the EMCS MMU (Mass Memory Unit) has been successfully reformatted. During the weekend,
environmental controls (humidity, temperature, illumination) have been maintained. Only the 1-g stimulus of the B rotor could not be maintained. On 9/24, the application software has been re-installed with the help of the crew. Since then, EMCS is running nominally, and pictures are being downlinked on a regular basis. Science team assessment is that plants continue to grow in B1 and A2 EC’s (Experiment Containers). Plants have unfortunately wilted in the other EC’s. Additional germination may still be observed after additional watering. Science team is now concentrating on the circumnutation study of the plants’ leaves and stems in B1 and A2. Sequences of images will be taken under 0-g and 1-g conditions over the next couple of days.

**MUSCLE (E14 SFP):** Completed.

**MSG-SAME (Microgravity Science Glovebox):** “Thank you Clay for your work this week. We ran one Kapton sample today (9/28) and our preliminary findings are that the particles are growing larger. This is consistent with our hypothesis.”

**NEOCYTOLYSIS (E14 SFP):** Completed.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION:** In progress.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMPLE:** Ongoing.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** n/a

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** “Clay, thanks for completing your last set of sleep logging. Your next activity will include a data download and initialization for the Increment 16 Commander’s watch.”

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** Planned.

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** In progress.

**TRAC (Test of Reaction & Adaptation Capabilities):** Planned.

**CEO (Crew Earth Observations):** Through 9/21 the ground has received a total of 15,023 CEO images for review and cataloging for Increment 15. 796 frames were received in the past week, however no CEO target requests have yet been
identified. On 9/12 the crew acquired a four-frame sequence mapping most of the Dinosaur National Monument located on the northern Colorado/Utah border. These oblique, long-lens views are mosaic. The combination of low sun angle and oblique view angle yield a striking perspective of the Monument’s fossil-laden Yampa River valley and gorge. This mosaic product is being published on NASA/GSFC’s Earth Observatory website this weekend.

Today’s CEO (Crew Earth Observation) photo targets were Pilcomayo River dynamics, Northern Argentina (this dynamic river issues from the Andes Mountains to the west and drains an area of more than 270,000 square kilometers. ISS passed over the headwaters region of the river in the Andean foothills. Overlapping nadir frames, acquired along-track, were requested to record the current channel width and riverbank morphology for comparison to historical imagery), and Mt. Ruapehu, New Zealand (Mt. Ruapehu had a small eruption on 9/25 which produced minor amounts of ash and ballistic ejecta near the summit. Two lahars [mudflows] also occurred as a result of the eruption. Looking to the right of track as the station passed over the North Island of New Zealand for the volcano; overlapping frames of the NE summit and flanks of the volcano were requested).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 4:48am EDT [= epoch]):
Mean altitude -- 343.7 km
Apogee height -- 345.4 km
Perigee height -- 342.1 km
Period -- 91.41 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0002466
Solar Beta Angle -- 48.5 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 95 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50721

Significant Events Ahead (all dates Eastern and subject to change):
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/28/07

All ISS systems continue to function nominally, except those noted previously or below. Off-duty rest day for the crew, except for necessary maintenance and voluntary tasks.

After yesterday’s successful Soyuz TMA-10/14S transfer from FGB nadir port to Service Module (SM) aft port, the station residents went to sleep around 2:00am this morning. To make up for the late bedtime, the crew slept in, until ~10:30am EDT. Tonight, sleep/wake cycle moves back to regular hours (5:30pm – 2:00am).

For FE-2 Clay Anderson, the NASA-JSC experiment SLEEP-LONG (Sleep-Wake Actigraphy & Light Exposure During Spaceflight) is continuing, with daily post-sleep monitoring of Clay’s sleep/wake patterns and light exposure with an Actiwatch. [This special "watch" measures the light levels the FE-2 encounters as well as his patterns of sleep and activity throughout the Expedition.]

After wakeup, FE-1 Kotov supported the ground in reactivating the Elektron O₂ (oxygen) generator, which was turned off for the uncrewed relocation period. [Reactivation was at 32 amp. As usual Oleg monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

Anderson meanwhile set up the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the LAB1D6 rack in support of the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), and Houston lowered the temperature setpoint to the regular 9.4 degC. [CDRA activation took place at 12:30pm-1:30pm.]
CDR Yurchikhin performed the routine task of taking two photos of the internal part of the SM aft end port’s docking cone, used for yesterday’s Soyuz TMA-10/14S docking after the relocation, a standard practice after Russian dockings. These images are used to refine current understanding of docking conditions. The pictures were then transferred to OCA for subsequent downlinking. [The objective is to take photo imagery of the scratch or scuff mark left by the head of the docking probe on the internal surface of the drogue (docking cone) ring, now rotated out of the passageway. As other crewmembers before him, the CDR used the Nikon D1X digital still camera to take two pictures each with the hatch closed down.]

Anderson performed the daily start-up of the ongoing SAME (Smoke Aerosol Measurement Experiment) investigation, powering up the MSG (Microgravity Science Glovebox) facility and MLC (MSG Laptop Computer) after changing out the SAME sample carousel, thermal precipitator, digital video tape, alcohol wick, and today also the one-micron impactor (which may be losing its effectiveness, as indicated by data from recent runs). [All items except for the alcohol wick will be returned to Earth on 10A.]

The FE-1 collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]

Air samples were also taken by Clay Anderson for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]

Afterwards, Clay performed computer maintenance, doing the regular bi-weekly reboots of the SSC (Station Support Computer) File Server and OCA Comm Router laptops as well as the weekly reboots of the PCS (Portable Computer System) A31p laptops.

Oleg completed the daily routine maintenance of the SM’s SOZh system (Environment Control & Life Support System, ECLSS), with the regular insert replacements in its toilet system (ASU), and today also conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including
the SM-to-DC1 (22P) tunnel, and the SM-to-DC1, FGB-to-Node and FGB-to-Soyuz passageways.

All crewmembers worked out in an abbreviated (1-hr ea.) physical exercise program on the TVIS treadmill.

Afterwards Anderson transferred his, Fyodor’s and Oleg’s exercise data files to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, Kotov completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

FGB Solar Array Retraction (1): As scheduled, the FGB module’s starboard solar array wing (SB4) was retracted successfully by ground commanding at ~10:09am EDT over RGS (Russian Ground Site). Retraction of the port array is scheduled tomorrow. FGB wing retraction is required to provide clearance for P6 truss PVR (Photovoltaic Radiator) deployment. [Background: Without additional heat rejection capability, the US segment (USOS) cannot support the ESA/“Columbus” and JAXA/“Kibo” modules, when attached. To provide this capability, the ISS starboard PVR will be deployed during Shuttle mission STS-120/10A, followed by the port PVR shortly after 10A. These activities require that the FGB SAWs (solar array wings) must be completely retracted to avoid physical contact. With its SAWs no longer producing electricity, the FGB will depend solely upon USOS power feeds (PMA-1 & PMA-2). In the event of some USOS electrical failures, a contingency electrical jumper would be available to reconnect USOS power to the FGB’s ARCU (American-to-Russian Converter Unit) for converting from American 124V to Russian 28V.]

CEO (Crew Earth Observation) photo targets uplinked for today were Iceberg A22A, South Atlantic Ocean (International Polar Year [IPY] Dynamic Event. Cloud cover was still light in the region of the ISS overpass, and may have allowed for sighting and photographing the fragmenting iceberg A22A. Looking to the left of track for the iceberg as the station began the ascending pass towards Africa. Satellite data acquired on September 24 indicated that the iceberg has split into two major fragments), and Patagonian Glaciers, S. America (ISS passed over the southern tip of the N-S trending mountain ranges of Patagonia. The small glaciers near the mountain peaks are of interest as they are sensitive indicators of regional
climate change. The best opportunity for photography of the glaciers was on the eastern slopes of the mountains. Overlapping mapping frames along the eastern mountain slopes are requested.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/

ISS On-Orbit Status 09/27/07

All ISS systems continue to function nominally, except those noted previously or below. Off-duty rest day for the crew, except for necessary maintenance and voluntary tasks.

After yesterday’s successful Soyuz TMA-10/14S transfer from FGB nadir port to Service Module (SM) aft port, the station residents went to sleep around 2:00am this morning. To make up for the late bedtime, the crew slept in, until ~10:30am EDT. Tonight, sleep/wake cycle moves back to regular hours (5:30pm – 2:00am).

For FE-2 Clay Anderson, the NASA-JSC experiment SLEEP-LONG (Sleep-Wake Actigraphy & Light Exposure During Spaceflight) is continuing, with daily post-sleep monitoring of Clay’s sleep/wake patterns and light exposure with an Actiwatch. [This special "watch" measures the light levels the FE-2 encounters as well as his patterns of sleep and activity throughout the Expedition.]

After wakeup, FE-1 Kotov supported the ground in reactivating the Elektron O₂ (oxygen) generator, which was turned off for the uncrewed relocation period. [Reactivation was at 32 amps. As usual Oleg monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

Anderson meanwhile set up the regular ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) coolant jumper connection to the LAB1D6 rack in support of the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), and Houston lowered the temperature setpoint to the regular 9.4 degC. [CDRA activation took place at 12:30pm-1:30pm.]
CDR Yurchikhin performed the routine task of taking two photos of the internal part of the SM aft end port’s docking cone, used for yesterday’s Soyuz TMA-10/14S docking after the relocation, a standard practice after Russian dockings. These images are used to refine current understanding of docking conditions. The pictures were then transferred to OCA for subsequent downlinking. [The objective is to take photo imagery of the scratch or scuff mark left by the head of the docking probe on the internal surface of the drogue (docking cone) ring, now rotated out of the passageway. As other crewmembers before him, the CDR used the Nikon D1X digital still camera to take two pictures each with the hatch closed down.]

Anderson performed the daily start-up of the ongoing SAME (Smoke Aerosol Measurement Experiment) investigation, powering up the MSG (Microgravity Science Glovebox) facility and MLC (MSG Laptop Computer) after changing out the SAME sample carousel, thermal precipitator, digital video tape, alcohol wick, and today also the one-micron impactor (which may be losing its effectiveness, as indicated by data from recent runs). [All items except for the alcohol wick will be returned to Earth on 10A.]

The FE-1 collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]

Air samples were also taken by Clay Anderson for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]

Afterwards, Clay performed computer maintenance, doing the regular bi-weekly reboots of the SSC (Station Support Computer) File Server and OCA Comm Router laptops as well as the weekly reboots of the PCS (Portable Computer System) A31p laptops.

Oleg completed the daily routine maintenance of the SM’s SOZh system (Environment Control & Life Support System, ECLSS), with the regular insert replacements in its toilet system (ASU), and today also conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including
the SM-to-DC1 (22P) tunnel, and the SM-to-DC1, FGB-to-Node and FGB-to-Soyuz passageways.

All crewmembers worked out in an abbreviated (1-hr ea.) physical exercise program on the TVIS treadmill.

Afterwards Anderson transferred his, Fyodor’s and Oleg’s exercise data files to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, Kotov completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

**FGB Solar Array Retraction (1):**  As scheduled, the FGB module’s starboard solar array wing (SB4) was retracted successfully by ground commanding at ~10:09am EDT over RGS (Russian Ground Site).  Retraction of the port array is scheduled tomorrow.  FGB wing retraction is required to provide clearance for P6 truss PVR (Photovoltaic Radiator) deployment.  [Background:  Without additional heat rejection capability, the US segment (USOS) cannot support the ESA/“Columbus” and JAXA/“Kibo” modules, when attached.  To provide this capability, the ISS starboard PVR will be deployed during Shuttle mission STS-120/10A, followed by the port PVR shortly after 10A.  These activities require that the FGB SAWs (solar array wings) must be completely retracted to avoid physical contact.  With its SAWs no longer producing electricity, the FGB will depend solely upon USOS power feeds (PMA-1 & PMA-2).  In the event of some USOS electrical failures, a contingency electrical jumper would be available to reconnect USOS power to the FGB’s ARCU (American-to-Russian Converter Unit) for converting from American 124V to Russian 28V.]

CEO (Crew Earth Observation) photo targets uplinked for today were **Iceberg A22A, South Atlantic Ocean** (International Polar Year [IPY] Dynamic Event.  Cloud cover was still light in the region of the ISS overpass, and may have allowed for sighting and photographing the fragmenting iceberg A22A.  Looking to the left of track for the iceberg as the station began the ascending pass towards Africa.  Satellite data acquired on September 24 indicated that the iceberg has split into two major fragments), and **Patagonian Glaciers, S. 09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**
Soyuz TMA-10 (14S) relocation went smoothly. After a brief ride in their crew return vehicle, CDR Fyodor Yurchikhin (left seat), FE-1 Oleg Kotov (center) and FE-2 Clayton Anderson (right) docked at the Service Module (SM) aft end port at 3:47pm EDT, completing the spacecraft’s relocation from the FGB nadir port in just 27 minutes. [After undocking at 3:20pm, Soyuz CDR Yurchikhin backed away from the station 25-30 m, then translated the spacecraft to the right, flying sideways, along the ISS toward the tail before turning nose-forward and rotating (“indexing”) the Soyuz around its longitudinal axis to align its periscope with the docking target on the SM aft end, spending a short time in station-keeping mode. Final approach began at ~3:40pm, with docking at 3:47pm. After hooks and latches were engaged, the crew conducted leak checks and then reentered the station through the SM.]

For the relocation, crew wakeup was slipped by three hours to 5:00am EDT. Sleep time begins early tomorrow morning ~2:00am (until 10:30am).

After wakeup, before breakfast, Clay Anderson accessed the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Clay wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition.]

Preparing the US segment (USOS) for decrewing, FE-2 Anderson configured the ECLSS (Environment Control & Life Support System) and ITCS (Internal Thermal Control System), to be ready in the eventuality of a failed redocking of the crew. [The ER1 (EXPRESS Rack 1) was powered off. After installation of jumpers (fluid
hoses) for the racks by Clay, the ground transitioned TCS to Dual-Loop Mode and raised the LTL (Low Temperature Loop) set point (i.e., to higher temperature), in order to provide redundancy in the USOS for critical avionics, for the unlikely event that a leak in one of the loops causes that loop to shut down, and to minimize the impacts of a depressurization. However, the time between ITCS reconfiguration, including IMV (Intermodular Ventilation) termination, and hatch closure had to be kept at a minimum by the crew to prevent humidity buildup in the USOS.]

Anderson then configured the USOS OpsLAN (Operations Local Area Network) for uncrewed operation, including the two situation-monitoring Sony PD100 camcorders in the Lab and Node.

Afterwards, at ~7:50am, Clay closed the Lab, Node and Airlock (A/L) hatches, thus isolating the USOS from the Russian segment (RS). The Lab science window remains shuttered, due to the current SSRMS (Space Station Remote Manipulator System) position for observing FGB starboard array retraction.

After starting final preparations in the RS, FE-1 Kotov was joined by the CDR and FE-2 to complete systems reconfigurations for decrewing, including -

- Deactivation of
  - SOTR thermal control system,
  - Vozdukh CO₂ removal system (~7:40am)
  - ASU toilet system,
  - SKV air conditioner,
  - SRVK-2M water processing/supply system,
  - SOP food supply system,
  - PILLE radiation sensor system
  - FGB air ventilation fans
  - PSS Caution & Warning System in SM and FGB
  - PPS System Power Panel in the SM
  - DSD Pressure Alarm Sensor
  - Laptops & other plugged equipment,
  - TVIS treadmill, followed by
- Closing external shutters on SM windows (#6, 8, 12, 13, 14),
- Deactivation of DC1 Docking Compartment,
- Deactivation of SM ventilation system,
- Dismantling the VD1, VD2 air ducts and filters in the FGB,
- Powering down amateur/ham radio equipment in the FGB,
- Taking down air ducts between DC1 & SM,
- Closing GA-SU (PMA1) hatch in the FGB,
- Removing GA-PGO hatch frame ring in the FGB,
- Removing the RO-PrK hatch frame ring in the SM/DC1 vestibule,
- Powering down SM fans.

Hatches between DC1 & SM were closed at ~10:00am, between the FGB & Soyuz at ~11:00am. [During the relocation, both PCS (Portable Computer System) laptops in the FGB and the PSS Caution & Warning (C&W) panels in all Russian modules were powered off prior to ingressing the Soyuz. Thus, there was a period of time without C&W audio annunciations in the RS and without an active PCS.]

While locked out in TMA-10, the crewmembers donned their Sokol spacesuits, conducted Soyuz checkout operations and had their lunch break.

Next, Fyodor, Oleg and Clay conducted the standard fit check of the Kazbek couches, the contoured shock absorbing seats in the Soyuz Descent Module. [For the fit check, crew members removed their cabin suits and donned Sokol KV-2 suit and comm caps, getting into their seats and assessing the degree of comfort and uniform body support provided by the seat liner. Using a ruler, they then measured the gap between the top of the head and the top edge of the structure facing the head crown. The results were reported to TsUP. Kazbek-UM couches are designed to withstand g-loads during launch and orbital insertion as well as during reentry and brake-rocket-assisted landing. Each seat has two positions: cocked (armed) and noncocked. In cocked position, they are raised to allow the shock absorbers to function during touchdown. The fit check assures that the crewmembers, whose bodies gain in length during longer-term stay in zero-G, will still be adequately protected by the seat liners for their touchdown in Kazakhstan, either emergency or regular return.]

RS thrusters were disabled at ~12:45pm for the QD (quick disconnect) screw clamps removal and hook opening. [Thrusters re-enabled at 1:10pm.]

After Soyuz docking, leak checking and Sokol drying, the thrusters will again be disabled at ~5:00pm for the post-docking clamp installation, following Soyuz/SM hatch opening at ~6:15pm. At ~6:55pm, RS thrusters will be re-enabled.

For the relocation, ISS attitude control authority was handed over to RS motion control at 2:10pm. After relocation, control returns to US momentum management at ~4:40pm.

TMA-10 deactivation begins at about 8:40pm. Hatch opening to the USOS (Node, Lab, Airlock) is expected to start at ~8:55pm and ISL (Integrated Station OpsLAN) restoration should be accomplished by ~9:55pm.
After reconfiguring station comm to nominal mode, the crew will reactivate all station systems that had been switched to autonomous (unmanned) configuration. 

[Backout (reverse order) activation, generally requiring the crew only for monitoring, involves the PPS power system, PSS C&W panels in SM, FGB and DC1, DSD pressure alarm sensor, Central Post BVS computer/control systems (Wiener laptop, printer, InPU displays), ventilation systems and air ducts in SM, DC1 and FGB, SM ASU toilet facilities, time clock, Vozdukh CO2 scrubber, SKV air conditioner, SRVK-2M condensate water supply system & processor, SOTR thermal control system, SOP food systems, STTS onboard communications links, Pille radiation dosimeters, TVIS treadmill, etc.]

As part of RS post-docking activities, the crew will also complete the drying out of their Sokol suits and gloves.

Before turning in tomorrow morning at ~2:00am, FE-1 Kotov has two tasks on his discretionary “time permitting” job list: (1) the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator; and (2) the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload.

Due to the crowded timeline, requiring meticulous attention to detail, medical personnel had waived today’s physical exercise sessions for the crew.

CEO (Crew Earth Observation) photo targets uplinked for today were S. Georgia/S. Sandwich, S. Atlantic Ocean (S. Georgia/S. Sandwich, S. Atlantic Ocean (a large gap in cloud cover has opened to the SE of South America, providing an opportunity to photograph South Georgia Island. Looking to the right of track for this large, typically snow-covered island. Detailed photography of ice extent on the island is of particular interest; overlapping frames that cover the island were requested), Mt. Ruapehu, New Zealand (ISS had a partly cloudy pass close to Mount Ruapehu, one of New Zealand’s most active volcanoes - its last eruption was in 2006. Orbit track followed the Great Barrier Reef southeast; after the pass over the Reef, the crew was to look to the left of track for the North Island of New Zealand and Mt. Ruapehu. Detailed imagery of the peak and mountain flanks was requested), and Lake Eyre, Australia (the largest lake in Australia, Lake Eyre is of interest as an indicator of climate change, as water levels in the lake fluctuate in response to precipitation patterns and evaporation. Orbit pass took the ISS over the northeastern portion of the lake. Overlapping mapping frames around the perimeter of the lake were requested to record current water levels).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
ISS Orbit  (as of this morning, 8:46am EDT [= epoch]):
Mean altitude -- 343.9 km
Apogee height -- 345.7 km
Perigee height -- 342.2 km
Period -- 91.41 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0002602
Solar Beta Angle -- 45.8 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 40 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50692

Significant Events Ahead (all dates Eastern and subject to change):
09/28/07 – FGB starboard solar array retraction 1 (10:09–10:26am)
09/29/07 – FGB port solar array retraction 2 (8:59–9:14am)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch

ISS On-Orbit Status 09/26/07

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, FE-2 Clayton Anderson accessed the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Clay wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition.]

In preparation for tomorrow’s Soyuz relocation (and the unlikely possibility of an Earth return), the three crewmembers performed fit-checks and adjustments on the Russian Kentavr (“Centaur”) garments for their individual sizes. The suits are kept in the Habitation Module of the Soyuz TMA until undock day. The activity was supported by a tagup with ground specialists via S-band, as required. [The Russian Kentavr garment is a protective anti-g suit ensemble to facilitate the return of a long-duration crewmember into the Earth gravity. Sizing consists of adjusting lacing on the outer side of the shorts and on the inner side of the gaiters to achieve a tight fit.]

As required for the uncrewed relocation period, FE-1 Oleg Kotov powered down the Elektron-VM oxygen (O₂) generator, safety-purging its BZh Liquid Unit with nitrogen (N₂) at 0.65 kg/cm² via its KE3 and VN3 valves.

The FE-1 also collected water samples downstream of the Elektron’s BKO multifiltration/purification column unit, to be returned to the ground on Soyuz 14S for monitoring the quality of the water being fed to the Elektron near the end of a BKO’s service life.
Afterwards, Kotov removed the BKO unit, replaced it with a new spare from stowage and discarded the old unit.

CDR Yurchikhin set up Laptop 3 and the Russian “Relaksatsiya” (Relaxation) spectrometer & video camera at the SM PkhO (Service Module Transfer Compartment)’s window 12, followed by a session of the Plasma-ISS (Bridge-1) experiment, his second of the Increment. After configuring systems & modes, the CDR made calibrations, then conducted measurement operations at three time intervals. The hardware was later disassembled, closed out and stowed away.  

[To support the activity, the U.S. PCU1 (Plasma Contactor Unit 1) on the Z1 truss was turned on by MCC-H at 3:00am EDT (and deactivated at ~8:00am). Then, using the laptop and the “Relaksatsiya” spectrometer & video camera, the experiment registered luminosity values of the Xenon jet from the PCU1 when reaching the 2A/4A SAWs (Solar Array Wings).]

In preparation for the spacecraft relocation, Oleg Kotov and Fyodor Yurchikhin completed final close-out activities on the Progress M-61/26P cargo ship, docked at the DC1 Docking Compartment, to enable its potential contingency separation by TsUP in the crew’s absence.  

[First, Oleg activated necessary vehicle systems on 26P, then the two cosmonauts removed the threaded quick-disconnect (QD) screw clamps of the SSVP docking & internal transfer system in the hatchway between Progress and DC1, which rigidize the mating surfaces. The interface was visually inspected and videotaped to ensure that there is no damage to the cords, snap hooks or rings on the latches and to the slots for the clamps in the SSVP’s internal flanges. Finally, the crew closed hatches between Progress and DC1, followed by depressurization of the DC1-to-Progress vestibule for the mandatory one-hour leak checking. RS (Russian segment) thrusters, which were inhibited at ~8:40am EDT, i.e., prior to the QD clamps removal, were then re-enabled (~10:20am). After the relocation, all the aforementioned steps will be reversed, to restore accessibility and connectivity of the Progress, which is to remain docked for another twelve weeks.]

Further preparations by FE-1 Anderson for the uncrewed period were –

- Setting up two Sony PD100 camcorders in the Lab and Node for situational awareness during the unoccupied time;
- Transferring US hardware (CDs, SODF/Procedures Books) from the US segment (USOS) to the RS, and
- Relocating a PCS (Portable Computer System) laptop to the RS, i.e., the Cupola RWS A31p to the FGB, set up as backup PCS).

Clay also had another 1.5 hrs reserved for prepacking/staging cargo for return on 10A.
Fyodor conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Kotov performed the periodic data collection and downlink on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1/full duration), and RED resistive exerciser (CDR, FE-2).

Later today, FE-2 Anderson transfers the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

At ~11:30am EDT, Yurchikhin, Kotov and Anderson joined in downlinking four Russian TV messages of greetings dedicated to the 50th Anniversary of the first artificial Earth satellite launch, Sputnik 1. The addresses were directed to (1) a science forum in St. Petersburg dedicated to the 50th Anniversary of the Space Era (“…The launch of the first Earth satellite on October 4, 1957, signaled the beginning of the space era in the history of mankind, opened the gate for exploration of near and deep space for study of solar and other constellations, and served as the first step for permanent human presence in space…We are sending our space greetings to the residents of the city on the Neva River where national rocket industry was born, where in the past century’s twenties the famous Gas Dynamics Laboratory was actively involved in its work…”); (2) personnel and veterans of the Space Forces, (3) participants of the opening ceremony of the First Satellite monument in Korolev (“…the first steps in space were made in Kaliningrad near
Moscow by our remarkable compatriots under the leadership of Sergey Pavlovich Korolev, whose name your wonderful city is bearing…”), and (4) Ulyanovsk State Engineering University (“…your university, just like the launch of the first Earth satellite, is turning 50. That’s why, despite the distance, we couldn’t miss your anniversary… Learn and venture! The Universe is in front of you. Roskosmos plans to send a cosmonaut to the Moon by 2025 and to Mars by 2030. Your participation will be needed for training and implementation of these expeditions…”).

At ~12:45pm, Clay powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 12:50pm a ham radio exchange with students at Art & Pat Goforth Elementary School in League City, Texas. Questions to the crew were uplinked by ARISS Amateur Radio on ISS beforehand. Clay Anderson is the parent of one of Goforth Elementary’s first grade students, and his daughter asked the first question during the contact. [“What’s it like to live in space?”; “How does it feel when you are lifting off?”; “Why can’t you bring regular food that we eat on Earth into space?”; “Do you enjoy doing flips in zero gravity?”; “How does earth and all the other planets look from the space station?”]

With the BITS2-12 onboard telemetry measurement system and VD-SU control mode turned off, TsUP/Moscow conducted testing on the primary LKTs2B36 unit in the BITS LKTs (local digital commutator/switch) container. [On 7/13, Oleg and Fyodor had installed a new TA250 temperature sensor on the LKTs2B36.]

**Soyuz 14S Relocation Timeline Preview (9/27, EDT):**
- **09:25am:** Soyuz 14S activation (until 09:40am)
- **11:20am:** Hatch closure and leak check (until 12:20pm)
- **02:10pm:** USOS to RS MCS (Motion Control System) handover
- **03:17pm:** Undocking command sent manually
- **03:14pm:** ISS in free drift (until 03:23pm)
- **03:20pm:** Physical separation (sep spring delta-V ~0.12 m/s)
- **03:26pm:** Commence fly-around to SM aft end (until 3:36pm, range ~30m)
- **03:41pm:** Orbital sunset
- **03:42pm:** Commence final approach (with headlight)
- **03:45pm:** Docking to SM aft end port (on DO1)
- **04:13pm:** Orbital sunrise
- **04:40pm:** RS to USOS MS handover
- **05:00pm:** Start leak check (until ~6:15pm)
- **06:15pm:** Soyuz/SM hatch opening.

**Soyuz 14S Relocation Crew Activities Preview:** There will be a sleep cycle shift for
the ISS crew tomorrow, with wake-up delayed by about three hours to 5:00am (sleep 2:00am). ISS systems will be configured by crew & ground for unmanned ops for the unoccupied period during relocation. After the relocation and post-ingress, all systems will be reconfigured to nominal ops in reverse order. [This includes deactivation of SOTR thermal control system, Vozdukh CO₂ removal system, ASU toilet system, SKV air conditioner, SRVK-2M water processing/supply system, SOP food supply system, PILLE radiation sensor system, FGB air ventilation fans, PSS Caution & Warning System in SM and FGB, PPS System Power Panel in the SM, DSD Pressure Alarm Sensor, laptops & other plugged equipment, plus disconnecting OpsLAN cables running through hatches, and shutting off the TVIS treadmill. After closing external shutters on the Lab science window and SM windows (#6, 8, 12, 13, 14), the crew also deactivates the DC1 Docking Compartment, SM ventilation system, dismantles air ducts, disconnects the VD1 &VD2 air duct filters in the FGB, removes the GA-PGO hatch frame ring in the FGB and the RO-PrK hatch frame ring in the SM/DC1 vestibule, and powers down SM fans.]

Today’s CEO (Crew Earth Observation) photo targets were Antarctic Ice Pack, S. Indian Ocean (weather patterns continue to provide patchy cloud cover over the southern Indian Ocean. Looking to the right of track as ISS approached Antarctica for opportunities to photograph icebergs and smaller ice fragments on the sea surface), and Tropical Storm Karen, Atlantic Ocean (Dynamic Event. Looking to the left of track for this storm system as the station passed over the eastern Caribbean and approached Brazil. Sunrise should have illuminated the cloud tops, and shadowing may have caused sharp relief on cloud banding features).

CEO photography can be viewed and studied at the websites:

http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** *(as of this morning, 8:22am EDT [= epoch])*:
Mean altitude -- 343.9 km
Apogee height -- 345.8 km
Perigee height -- 342.1 km
Period -- 91.41 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0002814
Solar Beta Angle -- 43.5 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 70 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50676

**Significant Events Ahead (all dates Eastern and subject to change):**
09/27/07 -- Soyuz TMA-10/14S relocate to SM aft port (~3:20-3:45pm)
09/28/07 -- FGB solar array retraction 1 (10:09–10:26am)
09/29/07 -- FGB solar array retraction 2 (8:59–9:14am)
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)

08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**
ISS On-Orbit Status 09/25/07

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, FE-2 Clayton Anderson accessed the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging, completing questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmember’s sleep/wake patterns and light exposure, Clay wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition.]

In preparation for the FGB solar array (SA) retraction on 9/28 (Friday), Anderson connected the UOP-DCP (Utility Outlet Panel-to-Display & Control Panel) bypass power cable at the Lab RWS (Robotics Work Station) and later maneuvered the Canadian SSRMS (Space Station Remote Maneuvering System) robotarm to the position for video-surveying the SA retraction.

The FE-2 also closed the Lab science window shutter in support of the subsequent Soyuz 14S thruster test firing as protection against jet plume contaminants.

For the Soyuz TMA-10/14S relocation on 9/27 (Thursday), the three crewmembers conducted a review of flight procedures and completed the standard 3-hr. training drill for the mission, supported by ground specialists via tagup on S-band/VHF-audio. [The OBT (on-board training) included Soyuz procedures and data analysis for ascent/descent, orbital flight and relocation as contained in RODF (Russian Operations Data File) books, tag-up with instructor, and OBT simulator work on the RSK1 laptop. For the relocation, the crew has to be prepared for a return to Earth in the event of a no-docking contingency, and the station has to be configured for uncrewed operation (see Preview, below).]
Also in preparation for the spacecraft relocation, Flight Engineer Kotov spent an hour in the 14S Descent Module (SA) supporting a ground-commanded checkout of the Soyuz motion control system (SUD, Mode 2/“Docked”) which included pressurization of the Combined Propulsion System (KDU) Section 1 and Tank 1, a test of the pilot’s translational hand controller (RUD), and a hot firing of the DPO braking thrusters. KDU maneuver thrusters and DPO lateral thrusters were not fired. [For the test, station attitude was handed over to Russian thruster control at 8:52am EDT, commanded to free drift at 8:57am, then back to LVLH XVV (Local Vertical Local Horizontal/x-axis in velocity vector) attitude. The one-minute firing started on Daily Orbit 12 at 9:05am. Attitude control was returned to the U.S. segment (USOS) at 9:45am.]

As the Progress M-60/25P cargo ship is ending its independent six-day flight, CDR Yurchikhin will again support its scientific research activities today with the geophysical GFI-1 Relaksatsiya (“relaxation”) experiment, conducting spectroscopic video observation of the engine exhaust plume during and after the spacecraft’s 2.5-min. deorbit burn at 3:01pm EDT, executed with the main engine (SKD). Later, the GFI-1 hardware will be restowed. [After unpacking and setting up the equipment from six GFI-1 hardware kits, reconfiguring the payload Laptop 3 for the experiment and mounting the UV (ultraviolet) camcorder with its SP spectrometer unit at SM (Service Module) window #9, Yurchikhin initially records spectral imagery of radiation from the Earth surface and atmosphere, then again before, during and after the Progress engine firing at 3:01pm. Purpose of the experiment is to contribute to a space/time study of UV (ultraviolet) radiation patterns from the Earth and from engine burns at high altitude. Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth’s upper atmosphere.]

Using the vacuum cleaner and other tools, FE-2 Anderson performed the periodic one-hour US segment (USOS) hatch seal inspection (Node forward, aft & starboard, Lab aft, Airlock hatch) in support of ACS (Atmospheric Control System) maintenance (last time done: 7/11).

Anderson also completed the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout on the new prime unit (#1057) and backup unit (#1060). [The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Clay changed out the batteries on both units, then zero-calibrated both instruments (to eliminate drift in the combustion sensors). Following zero calibration, the backup unit was stowed in the Node (next to the
sampling pump), while the prime unit's datalogger function was turned on to collect data at the SM Central Post as a spot check. After one hour, the datalogger was deactivated, with the prime CSA-CP remaining on for continuous passive sampling.

Before sleep time tonight, Clay will disconnect ER1 (Express Rack 1) from the Lab ITCS (Internal Thermal Control System) at its RIP (Rack Interface Panel). [When deactivated (by ground commanding), the rack is preferably disconnected from ITCS to prevent increased quantity decay in the coolant accumulator.]

CDR Yurchikhin removed outdated pages in the Contingency Jumper Procedures SODF (Station Operations Data File) book and replaced them with printouts of a new procedures version.

Oleg Kotov completed the periodic (about twice a month) replenishing of the Elektron’s water supply for electrolysis, filling the KOV thermal loops’ EDV container with water collected in CWC (Contingency Water Container) #1068 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

On the CEVIS (Cycle Ergometer with Vibration Isolation), Clay Anderson performed the regular monthly maintenance, which deals mostly with an examination of the wire rope isolators for damage.

The FE-2 also conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister cords and accessory straps as well as the canister bolts for re-tightening if required.

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1/both full duration), and RED resistive exerciser (FE-2).

Later today, FE-2 Anderson will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Oleg conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The FE-1 also updated/edited the standard daily IMS “delta file”, including locations,
for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working from the Russian discretionary “time permitting” task list, Kotov completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second task from the voluntary work list for Oleg (in the morning) was the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

At ~3:15pm, Clay is scheduled for a crew-choice teleconference with colleagues via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on a laptop).

**Saturday Science Preview:** Three optional activities for the voluntary “Saturday Science” program for next weekend (9/29-30) were suggested to Clay for his choice. His selection is required by tonight. [The three choices are: (1) CFE VG1 (Capillary Flow Experiment – Vane Gap 1): voice & video of another run of to complete the CFE-VG1 experiment; (2) SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), flying two & three satellites, requiring CDRA (CO2 Removal Assembly) to be running; and (3) BCAT-3 (Binary Colloidal Alloy Test-3) Magnet Unstick, using the CGBA-4 (Commercial Generic Bioprocessing Apparatus-4), powered up 12 hrs before.]

**Reboost Update:** The ISS reboost yesterday by the twin SM main engines was successfully conducted on time (3:34pm EDT). Purpose of the ~2.5 minute long maneuver burn was to establish the correct phasing conditions for 15S launch, 14S landing, and the STS-120/10A launch season (FD3 rendezvous). The reboost produced a delta-velocity (delta-V) of 3.1 m/s (predicted: 2.9 m/s). Mean altitude increase (delta-H): 5.3 km (2.86 nmi).

**Soyuz 14S Relocation Timeline Preview (9/27, EDT):**
- 09:25am: Soyuz 14S activation (until 09:40am)
- 11:20am: Hatch closure and leak check (until 12:20pm)
- 03:16pm: Undocking command sent manually
03:14pm: ISS in free drift (until 03:23pm)

03:19pm: Physical separation (sep spring delta-V ~0.12 m/s)

03:25pm: Commence fly-around to SM aft end (range ~30m)

03:41pm: Orbital sunset & commence final approach (with headlight)

03:44pm: Docking to SM aft end port (on DO1)

04:13pm: Orbital sunrise.

Soyuz 14S Relocation Crew Activities Preview: There will be a sleep cycle shift for the ISS crew on 9/27, with wake-up delayed by about three hours to 5:00am (sleep 2:00am next morning). Since ISS remains unoccupied during relocation, it will be configured by crew & ground for unmanned ops. [This includes deactivation of SOTR thermal control system, Vozdukh CO₂ removal system, ASU toilet system, SKV air conditioner, SRVK-2M water processing/supply system, SOP food supply system, PILLE radiation sensor system, FGB air ventilation fans, PSS Caution & Warning System in SM and FGB, PPS System Power Panel in the SM, DSD Pressure Alarm Sensor, laptops & other plugged equipment, plus disconnecting OpsLAN cables running through hatches, and shutting off the TVIS treadmill. After closing external shutters on the Lab science window and SM windows (#6, 8, 12, 13, 14), the crew also deactivates the DC1 Docking Compartment, SM ventilation system, dismantles air ducts, disconnects the VD1 &VD2 air duct filters in the FGB, removes the GA-PGO hatch frame ring in the FGB and the RO-PrK hatch frame ring in the SM/DC1 vestibule, and powers down SM fans. After the relocation and post-ingress, all systems will be reconfigured to nominal ops in reverse order.]

Progress 25P Overview: After undocking on 9/18, 25P remained in orbit for six days to conduct science experiments of ground viewing/studying plasma particles in the exhaust from a series of thruster firings (one per day) at various stages of flight:

Timeline (today, 9/25, EDT):

- 3:01:00pm: Progress Deorbit burn start (SKD main engine, 170s, dV~85.3 m/s)
- 3:03:27pm: Deorbit burn complete
- 3:36:42pm: Entry Interface

Today’s CEO (Crew Earth Observation) photo targets were Kerguelen, S. Indian Ocean (looking to the right of track for the island of Kerguelen, located approximately midway between Africa, Australia, and Antarctica. Weather conditions were predicted to be partly cloudy, but the island should be clearly visible. General imagery of the entire island is requested to provide context for more detailed images of the summit glacier of the island), Antarctic Ice Pack (looking to the right of track as ISS approached Antarctica for opportunities to photograph ice fragments through the cloud cover. The crew had two overflight
opportunities), and **Palmerston Island reef, central S Pacific** *(weather was predicted to be clear over Palmerston Island at the time of the station overflight. Detailed photography of the island and reefs located in the central lagoon is useful for tracking changes to reef configuration and color - both factors that may indicate changes in the status of the reef ecosystem. Overlapping nadir frames along-track were requested)*.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit (as of this morning, 7:58am EDT [= epoch]):**
Mean altitude -- 344.0 km  
Apogee height -- 345.7 km  
Perigee height -- 342.4 km  
Period -- 91.42 min.  
Inclination (to Equator) -- 51.63 deg  
Eccentricity -- 0.0010184  
Solar Beta Angle -- 40.7 deg (magnitude increasing)  
Orbits per 24-hr. day -- 15.75  
Mean altitude gain in the last 24 hours -- 5300 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50660

**Significant Events Ahead (all dates Eastern and subject to change):**
09/25/07 -- Soyuz 14S thruster test (9:05am)  
09/25/07 -- Progress M-60/25P deorbit burn & entry over Pacific -- ~3:01pm  
09/27/07 -- Soyuz TMA-10/14S relocate to SM aft port (~3:20-4:00pm) – FRR: 9/24  
09/28/07 -- FGB solar arrays retraction  
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**  
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)  
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)  
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)  
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5  
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)  
11/03/07 -- STS-120/Discovery/10A undocking  
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)  
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**
ISS On-Orbit Status 09/24/07

All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 23 of Increment 15.

Before breakfast, FE-2 Clayton Anderson accessed the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software and completed questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for later downlink. [To monitor the crewmembers’ sleep/wake patterns and light exposure, the special Actiwatch device measure the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition.]

CDR Fyodor Yurchikhin and FE-1 Oleg Kotov continued the current round of periodic preventive maintenance of ventilation systems in the RS (Russian Segment). [Yurchikhin started out in the FGB, replacing the PS1,2 dust filters and cleaning the TsV1 fan screen, while Kotov worked in the DC1 (Docking Compartment) to replace the PF1,2 filter cartridges and clean the V1 & V2 fan grilles and VD1 & VD2 air ducts. Later, Oleg moved to the SM (Service Module) for changing out the PF1-4 dust collector filters and cleaning Group A fan grilles, as Fyodor finished up in the FGB by cleaning the ventilation screens of panels 201, 301 & 401.]

Anderson completed the daily assist of the ongoing SAME (Smoke Aerosol Measurement Experiment) investigation, powering up the MSG (Microgravity Science Glovebox) facility and MLC (MSG Laptop Computer) and changing out the digital video tape. [POIC (Payload Operation & Integration Center) was to be informed of the new videotape’s barcode ID. All items except for the alcohol wick will be returned to Earth on 10A.]

Yurchikhin undertook a checkout of an IDZ-2 smoke detector (#A6) of the FGB’s fire detection & suppression system (SPOPT), using the “Elektronika” MultiMeter for resistance measurements between connector pins.
Also in the FGB, the two Russian crewmembers performed troubleshooting on a temperature sensor of the SIT28 Temperature Measurement System, checking out resistances/continuity of the T97 sensor which has been giving false telemetry readings.

To access the Lab IMV (Intermodal Ventilation) to the Node and also prepare room for 10A, Anderson cleared and relocated stowage from the forward Lab port.

Afterwards, Clay completed the installation of an IMV valve of the THC (Temperature & Humidity Control) system in the Lab Forward Port Endcone (LAB1PO). [The 1-hr. activity included installing a missing hose clamp, tightening an RMO (Remote Manual Operator) fastener, and installing RMO identification labels. This activity had been deferred from the originally scheduled date (9/19).]

In the Node, the FE-2 inspected fastening screws on the port forward IMV valve installation.

Anderson also had a time slot of 2h 25m reserved for additional hardware staging/prepacking for return on Shuttle flight 10A.

Oleg Kotov set up new Bubble dosimeters for recording radiation traces as an additional component of the RS radiation payload suite "Matryoshka-R". [Of new Bubble dosimeter detectors supplied, six were initialized in the Bubble dosimeter reader and positioned at their exposure locations, near the "Phantom" unit on the DC1 panel and in the starboard crew cabin on both sides of the MOSFET (metal oxide semiconductor field-effect transistor) dosimeter detector unit. The activity was supported by ground specialist tagup. The setup was photo-documented. The complex Matryoshka payload suite is designed for sophisticated radiation studies. Note: Matryoshka is the name for the traditional Russian set of nested dolls.]

In preparation for the Soyuz TMA-10/14S relocation next Thursday (9/27), Fyodor and Oleg installed the StM Docking Mechanism between Progress M-61/26P and the DC1. [The StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1. 26P is being prepared for potential remote-commanded undocking in case of a docking contingency during the relocation of 14S, carrying the three crewmembers, from the FGB nadir port to the SM aft port.]

Clay and Oleg performed the CHeCS CMO (Crew Health Care Systems/Crew...
Medical Officer) on-board training drill, a 30-min. video & audio refresher course to hone the CMO’s acuity in emergency medical operations. [The proficiency drill focuses on re-familiarization with skills and techniques required in procedures related to medical issues arising on board and concludes with a self-assessment questionnaire. The HMS (Health Maintenance Systems) hardware, which includes ACLS (Advanced Cardio Life Support) equipment, may be used in contingency situations where crew life is at risk. To maintain proficiency, crewmembers spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS CBT (computer-based training) and the ACLS CBT.]

In the Lab, the FE-2 performed troubleshooting on the UOP-3 (Utility Outlet Panel 3) in a continuing effort (started on 9/14) to isolate the component that caused the RPC-3 (Remote Power Controller #3) overcurrent trip in RPCM (RPC Module) LA2A3B late on 9/11. [The troubleshooting procedure focused on the UOP, its PS-120 Junction Box, the Ku-Band Power Supplies and their associated cabling.]

CDR Yurchikhin performed the periodic inspection of the RED (Resistive Exercise Device) bottom plate fasteners.

In addition, Fyodor conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables.

The CDR also updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

For the station reboost tonight (see below), Anderson is scheduled to close the Lab window cover to protect against thruster plume deposits.

At ~3:55am EDT, Clay powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 4:00am a ham radio exchange with students at Heidelberg University for Applied Sciences, in Heidelberg, Germany. Questions to the crew were uplinked by ARISS Amateur Radio on ISS) beforehand. [The students are currently involved in building a CubeSat satellite called HeidelSat, for measuring cosmic rays. Its launch is planned for September 2009. They are also building a ground station for it with a 3.4-m diameter satellite dish. “How does a compass work on the ISS?”; “Has the International Space Station already rammed space scrap metal?”; “Do watches work in space? Does one have a feeling of time in space?”; “What does your safe haven look like if your resources come to an end, the oxygen is scarce or a vital part of the ISS is destroyed and you cannot be reached from the earth?”]
The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene); on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later today, FE-2 Anderson will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

As additional “get-ahead” activities, Fyodor’s and Oleg’s “job jar” reiterated two long-term tasks, viz., (1) a running inventorying behind panels in the RS when other activities are being performed, (2) photo/video imagery of “Life on the Station” scenes in the RS (e.g., sleep & post-sleep, behavior of water in zero-G, food preparation, RS interior architecture, cosmonauts at work controlling the station, housekeeping, clothing, medical exams, viewing videos for entertainment.

ISS Reboost: Later today, at 3:34pm EDT, the ISS will be reboosted by the twin SM main engines (SM aft docking port currently being unoccupied) for the purpose of establishing the correct phasing conditions for 15S launch, 14S landing, and the STS-120/10A launch season (FD3 rendezvous). Expected delta-V of the burn: 2.9 m/s (9.5 ft/s); delta-H: 4.9 km (2.7 nmi).

Soyuz 14S Relocation: The ISS Mission Management Team (IMMT) today gave the formal Go-ahead on the 14S relocation on 9/27. There will be a sleep cycle shift for the ISS crew, with wake-up delayed by about three hours, similarly as for 13S relocation on 10/10/06.

Progress 25P Timeline Overview: After undocking on 9/18, 25P is remaining in orbit for six days to conduct science experiments of ground viewing/studying plasma particles in the exhaust from a series of thruster firings (one per day) at various stages of flight:

------ Today, 9/24 ------
4:26pm: Progress Burn #7 (DPO, 5s, dV~0.85 m/s, posigrade)

------ Tuesday, 9/25 ------
3:13pm: Progress Deorbit burn start (SKD, 170s, dV~85.3 m/s)
3:15:30pm:  Deorbit burn complete
3:48:12pm:  Entry Interface

[SKD = Main Engine; DPO = Approach & Attitude Control thrusters]

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit (as of this morning, 7:37am EDT [= epoch]):**
Mean altitude -- 338.9 km
Apogee height -- 345.8 km
Perigee height -- 331.9 km
Period -- 91.31 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0010184
Solar Beta Angle -- 37.4 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 75 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50644

**Significant Events Ahead (all dates Eastern and subject to change):**
09/24/07 -- ISS reboost (3:34pm, dV=2.9 m/s; set-up f/Soyuz launch & 10A FD3 rendezvous)
09/25/07 -- Soyuz 14S thruster test (~9:00am)
09/25/07 -- Progress M-60/25P deorbit burn & entry over Pacific -- ~3:48pm
09/27/07 -- Soyuz TMA-10/14S relocate to SM aft port (~3:20-4:00pm) – FRR: 9/24
09/28/07 -- FGB solar arrays retraction
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/23/07

All ISS systems continue to function nominally, except those noted previously or below.  Sunday -- off-duty day for the crew except for housekeeping and voluntary work.  Ahead: Week 23 of Increment 15.

CDR Fyodor Yurchikhin conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Fyodor also gathered weekly data on total operating time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s SOGS air revitalization subsystem for reporting to TsUP.

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later today, FE-2 Anderson will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]
A second task from the voluntary work list for Oleg was another run of the Russian "Diatomeya" ocean observations program, using the NIKON-F5 (85 mm lens) still camera and the Sony DSR PD-150P camcorder to obtain imagery of color bloom and cloud pattern anomalies from SM window #7. [Photo targets in the Atlantic was the track from Cape Verde Islands water area over the Senegal river junction to the Cape of Good Hope, plus from the Florida coastal area over the Caribbean Sea to the Venezuelan coast, and in the Pacific Ocean along the track covering fishing-production regions in middle- and tropical-equatorial latitudes on both semi-spheres from California to Chile.]

As a third discretionary job, Kotov performed the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

For CDR Yurchikhin, the discretionary task list for today called for another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on nature. [Photo targets were the Andes and the Huascaran volcano in Peru, the Patagonia ice field, and icebergs in the Waddell Sea.]

At ~4:07pm EDT, Clayton Anderson will have his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop).

**ISS Reboost:** Tomorrow (Monday, 9/24) ISS will be reboosted by the twin SM main engines (SM aft docking port currently being unoccupied). Purpose of the reboost is to establish the correct phasing conditions for 15S launch, 14S landing, and the STS-120/10A launch season (FD3 rendezvous). Time for the burn: 3:34pm EDT; delta-V: 2.9 m/s (9.5 ft/s); delta-H: 4.9 km (2.7 nmi).

**Progress 25P Timeline Overview:** After undocking on 9/18, 25P is remaining in orbit for six days to conduct science experiments of ground viewing/studying plasma particles in the exhaust from a series of thruster firings (one per day) at various stages of flight:

-------- Today, 9/23 --
4:06am:  Progress Burn #6 (DPO, 5s, dV~0.85 m/s, posigrade)
-------- Monday, 9/24 --
4:26pm:  Progress Burn #7 (DPO, 5s, dV~0.85 m/s, posigrade)
-------- Tuesday, 9/25 --
3:13pm: Progress Deorbit burn start (SKD, 170s, dV~85.3 m/s)
3:15:30pm: Deorbit burn complete
3:48:12pm: Entry Interface

[SKD = Main Engine; DPO = Approach & Attitude Control thrusters]

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:48am EDT [= epoch]):
Mean altitude -- 338.9 km
Apogee height -- 345.8 km
Perigee height -- 332.1 km
Period -- 91.31 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0010184
Solar Beta Angle -- 33.8 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 70 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50629

Significant Events Ahead (all dates Eastern and subject to change):
09/24/07 -- ISS reboost (3:34pm, dV=2.9 m/s; set-up f/Soyuz launch & 10A FD3 rendezvous) new time
09/25/07 -- Soyuz 14S thruster test (~9:00am)
09/25/07 -- Progress M-60/25P deorbit burn & entry over Pacific -- ~3:48pm
09/27/07 -- Soyuz TMA-10/14S relocate to SM aft port (~3:20-4:00pm) – FRR: 9/24
09/28/07 -- FGB solar arrays retraction
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/22/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson except for housekeeping and voluntary work.

The crew conducted the regular weekly three-hour task of thorough station cleaning. "Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.

As part of the house cleaning, the CDR and FE-1 performed preventive maintenance cleaning on the V3 fan screen in the DC1 (Docking Compartment) and on the VPkhO, VdPrK, VPrK & TsV2 fan grilles in the FGB.

For his voluntary “Saturday Science” session, FE-2 Anderson worked with the new ANITA (Analyzing Interferometer for Ambient Air) payload. [After first switching the equipment via the ANITA user interface software from local sampling mode to non-local sampling, Clay used a hand pump and sample bags to collect two non-local samples, one from in front of the ANITA air flushing unit’s gas inlet and the other from the middle of the Node, for subsequent analysis in the ER4 (EXPRESS Rack 4) ANITA drawer. Developed by ESA, ANITA is a potential next-generation trace-gas analysis system that uses a Fourier-Transform Infrared (FTIR) spectrometer to determine concentrations of up to 32 different trace gases in the cabin atmosphere (measuring absorbance vs. wavelength). ANITA provides continuous, automatic air sampling from its location in ER4, taking one local sample every 6 minutes, for medical personnel during the first ten days, later for environmental specialists. Data are stored on the ANITA laptop hard drive, with a]
representative data set downlinked daily by ground command.]

At ~9:10am EDT, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

Time again for recharging the Motorola-9505 Iridium satellite phone brought up on Soyuz 14S, a monthly routine job. FE-1 Kotov took care of the recharge, completing the process and cleaning up at about 12:45pm EDT. [After retrieving it from its location in the Soyuz TMA-10/14S descent module (BO), Oleg initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion, the phone was returned inside its SSSP Iridium kit and stowed it back in the BO’s operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown. The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap.]

After lunch (~10:30am), Clay Anderson filled out the regular FFQ (Food Frequency Questionnaire), his eleventh, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

The FE-2 performed the daily assist of the ongoing SAME (Smoke Aerosol Measurement Experiment) investigation, powering up the MSG (Microgravity Science Glovebox) facility and MLC (MSG Laptop Computer) and changing out the SAME sample carousel, thermal precipitator, digital video tape, and alcohol wick. [All items except for the latter will be returned to Earth on 10A.]

Fyodor Yurchikhin conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).
Later, the FE-2 will copy the crew’s exercise data files to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second task from the voluntary work list for Oleg was the periodic use of the Nikon D1X (SIGMA 300-800mm telephoto lens) to make observations and take aerial KPT-3 photography of environmental conditions for Russia’s Environmental Safety Agency (ECON). [KPT-3 photography has been a frequent earth observing experiment for ECON.]

Another job item on Kotov’s discretionary list for today was another radiation data monitoring & logging session for flow & dose power data with the Matryoshka-R radiation payload and its LULIN-5 electronics box. Accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel.

For CDR Yurchikhin, the discretionary task list for today called for another session of the Russian “Uragan” (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on nature. [Photo targets were the Panama Canal, Patagonia ice field, and the Waddell Sea with observation of icebergs.]

The CDR and FE-1 had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop), Fyodor at 7:00am EDT, Oleg at 8:15am.

At ~9:50am, Yurchikhin and Kotov also conducted a private crew-choice conference with colleagues at TsUP on S-band/audio and Ku-band/video.

**Vozdukh Valve Failure:** Yesterday morning the Vozdukh apparatus stopped with an indication of a failed #1 vacuum valve (BVK1). The crew checked valve positions and successfully restarted the CO₂ scrubber. Russian specialists have confirmed that the BVK1 is near end of its life and will be used as long as it can be
recovered. A spare valve is onboard. ppCO₂ (Carbon Dioxide Partial Pressure) was acceptable at 3 mmHg, and Vozdukh is operating.

Progress 25P Timeline Overview: After undocking on 9/18, 25P is remaining in orbit for six days to conduct science experiments of ground viewing/studying plasma particles in the exhaust from a series of thruster firings (one per day) at various stages of flight:

-------Today, 9/22--
3:45am: Progress Burn #5 (DPO, 5s, dV~2.6 m/s, posigrade)
-------Sunday, 9/23--
4:06am: Progress Burn #6 (DPO, 5s, dV~0.85 m/s, posigrade)
-------Monday, 9/24--
4:26pm: Progress Burn #7 (DPO, 5s, dV~0.85 m/s, posigrade)
-------Tuesday, 9/25--
3:13pm: Progress Deorbit burn start (SKD, 170s, dV~85.3 m/s)
3:15:30pm: Deorbit burn complete
3:48:12pm: Entry Interface

[SKD = Main Engine; DPO = Approach & Attitude Control thrusters]

Weekly Science Update (Expedition Fifteen -- 22nd)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): On 9/17, the CDR nominally performed a memory card exchange. ALTEINO instrument continues to nominally acquire radiation levels in the SM.

ANITA: “Clay, thanks for a successful ANITA set-up session in week 21. The video tour you provided was fantastic and much appreciated by the ground team.”

BCAT (Binary Colloidal Alloy Test): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Continuing,

CFE (Capillary Flow Experiment): Reserve.

CHROMOSOME-2 (E14 SFP): Completed.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): Images from CHab show good Yeast growth on Side 1. Images from Cell Culture Hab show good plant cell growth on Side 1 as well. The seeds in Plant
Hab have not germinated yet after 14 days. Options for increasing moisture to the seeds are being tested on the ground units.

**CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):** Complete.

**EarthKAM (Earth Knowledge Acquired by Middle School Students):** Next scheduled operation is 10/29-11/3.

**EMCH (Elastic Memory Composite Hinge):** Complete.

**EPO (Educational Payload Operation) Kit C:** Planned.

**IMMUNO (Saliva Sampling):** First session samples are currently stowed in MELFI Dewar #2.

**LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):** Complete.

**MISSE (Materials ISS Experiment):** Ongoing.

**MTR-2 (Russian radiation measurements):** Passive dosimeters measurements in DC1 “Pirs”.

**MULTIGEN-1:** Since last report on 9/13, the EMCS (European Modular Cultivation System) facility experienced several issues with its VPU (Video Processing Unit), which led to several period of non availability of video recording capability. Moreover, EMCS situation got worse as its MMU (Mass Memory Unit) seems corrupted. This issue leads to additional lock-up events of the SPLC (Standard Payload Computer). A safety feature of EMCS, linked to sensors monitoring the partial pressure of O₂, also triggers sporadically the powering off of EMCS sub-systems. On 9/20, the VPU locked up again, and with the MMU corrupted state, N-USOC team has lost the capability to acquire any video. This might have a severe science impact if not restored in the next days. Assuming a full fix of the EMCS software problems (plan is in work between N-USOC and POIC), the science team expects to get back video capability to observe critical growth phases of the plants and their circumnutation. The assessment of the plant development is very difficult without images.

**MUSCLE (E14 SFP):** Completed.

**MSG-SAME (Microgravity Science Glovebox):** Ongoing.
**NEOCYTOLYSIS (E14 SFP):** Completed.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION:** In progress.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMPLE:** Ongoing.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** n/a

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** “Clay, thanks for completing your fourth Actiwatch download_INITIALIZATION. Monday you will start your last week of required sleep logging. Any additional logging is above and beyond and will be greatly appreciated. After completing the required sleep logging, you will only have one more download_INITIALIZATION session left for this increment. In that session, you will also be initializing an Actiwatch for Peggy before she arrives.”

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** Planned.

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** “Clay, thank you very much for your help troubleshooting the SWAB Air Sampling Device. Without your assistance, we would not have been able to successfully finish this session, which was the 8th and final SWAB Air and Surface Sampling Session! We can’t wait to get all of the samples you took back on the ground for analysis to see what you found us up there. Again, the SWAB team appreciates all you have done to help us complete our experiment.

**TRAC (Test of Reaction & Adaptation Capabilities):** Planned.

**CEO (Crew Earth Observations):** Through 9/15 the ground has received a total of 14,227 CEO images for review and cataloging for Increment 15. From the 512 frames of new imagery received this week by the ground team, images identified for prioritized review were those whose camera times were corresponding to the request times for the following CEO targets: Andrews Forest, Washington; Arkenu Impact Site, Libya; and Mt. Whitney, California. “We are pleased to report your success in acquiring imagery of Kabul, Afghanistan that meets or exceeds our requirements for this target and we can retire it. Your 9/5 view of one of the “Palm Islands” on the coast of the United Arab Emirates made the Top Ten List of images hits on our external website [http://eol.jsc.nasa.gov/](http://eol.jsc.nasa.gov/) with just over 1,000 downloads.”
Today’s CEO (Crew Earth Observation) photo targets were **Antarctic Ice Pack** *(looking to the right of track as ISS approached Antarctica for opportunities to photograph ice fragments through the cloud cover. There were two overflight opportunities)*, and **Hurricane Ivo, Pacific Ocean** *(Dynamic Event. The crew had a near-nadir pass over Hurricane Ivo, predicted to still be at Category 1 strength at the time of their approach. The storm is compact, and is predicted to be located near the southern tip of Baja California. Cloud banding is likely to be the most obvious feature of the storm, as it will be beginning to weaken)*.

CEO photography can be viewed and studied at the websites:
[http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov)  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
[http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/) 
[http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** *(as of this morning, 8:28am EDT [= epoch]):*
Mean altitude -- 339.0 km  
Apogee height -- 345.7 km  
Perigee height -- 332.3 km  
Period -- 91.32 min.  
Inclination (to Equator) -- 51.63 deg  
Eccentricity -- 0.0009964  
Solar Beta Angle -- 29.9 deg (magnitude increasing)  
Orbits per 24-hr. day -- 15.77  
Mean altitude loss in the last 24 hours -- 58 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50613

**Significant Events Ahead** *(all dates Eastern and subject to change):*
09/24/07 -- ISS reboost (2:05pm, dV=3.4 m/s; set-up f/Soyuz launch & 10A FD3 rendezvous)  
09/25/07 -- Soyuz 14S thruster test (~9:00am)  
09/25/07 -- Progress M-60/25P deorbit burn & entry over Pacific -- ~3:48pm  
09/27/07 -- Soyuz TMA-10/14S relocate to SM aft port (~3:20-4:00pm) – FRR: 9/24  
09/28/07 -- FGB solar arrays retraction  
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**  
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)  
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)  
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)  
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite in orbit, on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson conducted another session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (tenth time for CDR & FE-1, seventh for FE-2), using the IM mass measurement device which Oleg Kotov afterwards broke down for stowage.  [Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures.  For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants.  By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember’s mass is calculated by the computer and displayed.]

Clay Anderson performed the standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, using the DCS-760 digital still camera with 400 & 800mm lenses at SM windows 6 & 8 (facing in flight direction) to take CEO (Crew Earth Observations) target imagery with manual & auto focusing.  Afterwards, the obtained OBT images were downlinked to the ground for analysis.  [The skill training prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle (STS-120/10A next). During the RPM at ~600 ft from the station, the “shooters” have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photogs and the Shuttle pilot.]
Concluding yesterday’s on-board observations of Progress M-60/25P thruster plumes with the geophysical GFI-1 Relaksatsiya (“relaxation”) experiment, Yurchikhin disassembled the GFI-1 hardware and returned it to stowage. Observations of the Progress engine firings are continuing from the ground. The 25P cargo ship is continuing its independent flight until 9/25 (timeline see below) in support of a space/time study of UV (ultraviolet) radiation patterns of engine burns at high altitude. The spectroscopic observations deal with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth’s upper atmosphere.

CDR Yurchikhin and FE-1 Kotov each performed the Russian MBI-21 PNEVMOKARD experiment, their fourth on-orbit session (which forbids moving or talking during data recording). The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. The FE-1 took documentary photography of his crewmate as subject for downlinking via BSR-TM or OCA. PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember’s electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.

FE-2 Anderson successfully completed the last day (of 4) of the ITCS (Internal Thermal Control System) coolant remediation in the US Segment. Clay removed the Buffer Delivery Applicator (BDA) from its LAB1O5 location, relieving pressure with a spare ITCS Coolant Sampling Adapter, and the Fluid System Servicer (FSS), draining its Fluid Control Pump Assembly (FCPA) & jumpers and purging them to vacuum. The FSS was then stowed and the BDA packed for return on 10A. Background: In order to reduce or prevent precipitate formation, corrosion & microbial growth, the ITCS coolant fluid is being checked regularly for staying within desired chemistry and pH level constraints. After the failure of an MTL pump in
2003 due to nickel phosphate deposits, the ITCS coolant remediation plan includes removal of these elements, started with the temporary installation of Nickel Removal Assemblies (NiRA-1 & NiRA-2) earlier on Expeditions 14/15, and on 9/18 of the Phosphate Removal Assembly (PhosRA), removed again on 9/19. The BuDA was installed on 9/19 for raising the system pH, and the FSS on 9/18 to support the coolant fillings.

Afterwards, Anderson reconfigured deployed items (i.e., laptops) and stowage on the LAB1S6 (starboard) & LAB1P6 (port) racks which had to be cleared off on 9/18 for the ITCS remediation activities. [Laptops remain powered and connected to the network.]

Yurchikhin and Kotov performed a major maintenance job in the SM and FGB, removing four sets of faulty IP-1 flow meters and replacing them with new spares. [The work involved R&R of associated flow converters (PP) & voltage converters (PN), disconnecting & reconnecting cabling, temporarily turning off the BITS2-12 onboard measurement telemetry system & VD-SU control mode, taking photographs of each IP-1 set for downlinking via OCA, and updating hardware relocations in the IMS (Inventory Management System). The four IP-1 locations are at the RO-PkhO (Work Compartment-Transfer Compartment) hatch, PkhO-DC1 hatch & PkhO-FGB tunnel in the SM, and at the PGO-GA (Instrumentation Cargo Compartment-Pressurized Adapter) hatch in the FGB.]

Afterwards, the CDR supported the ground in reactivating the Elektron O₂ (oxygen) generator, which had to be turned off to allow the temporary disabling of the BITS2-12 Onboard Telemetry Measurement System. [Reactivation was at 32 amps. As usual Fyodor monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

Oleg Kotov conducted the periodic microbial sampling in the Russian Segment, using a special test tube kit for collecting surface swabs in FGB and SM. [Sampled sites were: in the FGB behind panels covering TCS pipes, the FGB hull, a GZhT gas-liquid heat exchanger outlet, a pump panel and soiled areas; and in the SM on the RO-PrK (Transfer Tunnel) endcone surface.]

Anderson had another 2 hrs reserved for prepacking cargo for return to Earth on 10A.

Later today, the FE-2 will perform the daily shutdown of the MSG SAME
(Microgravity Science Glovebox/Smoke Aerosol Measurement Experiment), closing the VES (Vacuum Exhaust System) and GN2 (Gaseous Nitrogen) valves in the MSG WV (Work Volume) and turning off the experiment’s power (120V).

CDR Yurchikhin conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

Fyodor is also scheduled to update/edit the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 did the regular bi-weekly maintenance reboot of the SSC (Station Support Computer) OCA Comm Router laptop.

Clay will also perform the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. Two CSA-CP (CSA-Combustion Products) instruments recorded CO, HCN and HCl readings at the SM Central Post (#1060, prime) and in the Node (#1057, backup), while the CSA-O₂ units (#1063, #1042) looked for O₂ in the Lab and the CDMK (#1008) for CO₂ in SM and Lab. Also recorded were battery ticks. The instruments were turned off afterwards, except for the prime CSA-CP #1060 unit, and returned to their regular locations. The CSA-CPs also have O₂ sensors but they are out of calibration and their readings are currently omitted.]

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-1, FE-2), and VELO cycle with bungee cord load trainer (CDR).

Later in the afternoon, Clay transfers the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). [Troubleshooting of the heart rate watches is underway on the ground for improving data transfer to the chest strap transmitters.]
Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second task from the voluntary work list for Oleg was the regular status check on the long-term BIO-5 Rasteniya-1 (“Plants-1”) micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

At ~4:20am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:35am, Fyodor and Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~11:00am, Clay powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 11:05am a ham radio exchange with students at Pueblo Magnet High School in Tucson, AZ. Questions to the crew were uplinked by ARISS (Amateur Radio on ISS) beforehand. [“Pueblo High School may be best described as a pueblo: an intimate village whose inhabitants most often learn about the larger world only as it comes to them. The bias of being a “south side school” has a negative effect on teen’s self-esteem, teachers’ morale and the potential for our program. A large percentage of the students are basically poor, coming from undereducated environments. Administration, teachers and staff at Pueblo Magnet High School work very hard to build a positive reputation that is challenged daily by the reality of neighborhood violence, dropout statistics, low socioeconomic status and low achievement. Touch the Sky is a project that has been underway for almost two years and that has as a primary objective, Pueblo Magnet High School students communicating, via amateur radio technologies, with astronauts aboard the International Space Station.” “How many times have you orbited earth since you boarded the ISS?”; “Based on your present space experiences, do you believe there is human life on another planet?”; “How does loss of gravity affect your digestive system and how do you eliminate bodily wastes?”; “What is your sense of awe and wonderment of nature in outer space?”; “Is it possible for people to build a station on the moon for people to live in?”; “Do cell phones work in outer space?”]
The crew’s regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio will be conducted at ~3:50pm.

Later, at ~4:20pm, the crew will also convene for their weekly teleconference with ISS Program Management at JSC/Houston via S-band/audio.

Potable Water Update: A second Contingency Water Container, CWC #1074, with 43L, has now been declared off-limits for crew consumption due to bacteria found in postflight analysis, as in CWC #1081 (42.9L). Ground teams are assessing the allowable uses for these CWCs.

Progress 25P Timeline Overview: After undocking on 9/18, 25P is remaining in orbit for six days to conduct science experiments of viewing/studying plasma particles in the exhaust from a series of thruster firings (one per day) at various stages of flight:

-------- Today, 9/21 – 
4:59pm: Progress Burn #4 (DPO, 5s, dV~2.6 m/s, retrograde)
-------- Saturday, 9/22 – 
3:45am: Progress Burn #5 (DPO, 5s, dV~2.6 m/s, posigrade)
-------- Sunday, 9/23 – 
4:06am: Progress Burn #6 (DPO, 5s, dV~0.85 m/s, posigrade)
-------- Monday, 9/24 – 
4:26pm: Progress Burn #7 (DPO, 5s, dV~0.85 m/s, posigrade)
-------- Tuesday, 9/25 –
3:13pm: Progress Deorbit burn start (SKD, 170s, dV~85.3 m/s)
3:15:30pm: Deorbit burn complete
3:48:12pm: Entry Interface
   [SKD = Main Engine; DPO = Approach & Attitude Control thrusters]

Today’s CEO (Crew Earth Observation) photo targets were Antarctic Ice Pack (looking to the right of track for breaks in cloud cover as ISS approached Antarctica. Large ice fragments from the retreating Antarctic ice pack may be visible through any gaps. The density of ice fragments on the sea surface, and morphology of the ice fragments themselves, is of interest for understanding ice pack dynamics), and Lake Poopo, Bolivia (cloud cover was predicted to be minimal for this morning pass close to Lake Poopo. The region has experienced significant rainfall over the past month, and water levels should be up in the Lake. Looking to the left of track for Poopo and smaller salars [dry lakes] in the vicinity; mapping of shorelines in water-filled lakes is of particular interest).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are
ISS Orbit  *as of this morning, 8:06am EDT [= epoch]*:
Mean altitude -- 339.1 km
Apogee height -- 345.8 km
Perigee height -- 332.3 km
Period -- 91.32 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0010049
Solar Beta Angle -- 25.8 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 50 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50597

Significant Events Ahead *all dates Eastern and subject to change*:
09/24/07 -- ISS reboost (2:05pm, dV=3.4 m/s; set-up f/Soyuz launch & 10A FD3 rendezvous)
09/25/07 -- Soyuz 14S thruster test (~9:00am)
09/25/07 -- Progress M-60/25P deorbit burn & entry over Pacific -- ~3:48pm
09/27/07 -- Soyuz TMA-10/14S relocate to SM aft port (~3:20-4:00pm) – FRR: 9/24
09/28/07 -- FGB solar arrays retraction
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)

09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**
ISS On-Orbit Status 09/20/07

All ISS systems continue to function nominally, except those noted previously or below.

In the “Pirs” Docking Compartment (DC1), CDR Yurchikhin and FE-1 Kotov replaced the BSS-4 Orlan Interface Unit with its BUS-MK Control Unit plus other equipment, as they had done yesterday in the SM PkhO (Service Module/Transfer Compartment) for similar EVA gear which had reached its service life of six years. A leak check concluded the activities.

FE-2 Anderson successfully completed Day 3 (of 4) of the ITCS (Internal Thermal Control System) coolant remediation in the US Segment. [Clay replaced the LTL & MTL (Low & Moderate Temperature Loop) fine filters and the LTL Gas Trap which was approaching its service life limit, topped off coolant, and collected a fluid sample as post-remediation “snapshot”. He also equalized the Buffer Delivery Applicator (BDA). Background: In order to reduce or prevent precipitate formation, corrosion & microbial growth, the ITCS coolant fluid is being checked regularly for staying within desired chemistry and pH level constraints. After the failure of an MTL pump in 2003 due to nickel phosphate deposits, the ITCS coolant remediation plan includes removal of these elements, started with the temporary installation of Nickel Removal Assemblies (NiRA-1 & NiRA-2) earlier on Expeditions 14/15, and on 9/18 of the Phosphate Removal Assembly (PhosRA), removed again yesterday. The BuDA, installed yesterday for raising the system pH, and the Fluid System Servicer (FSS) will be removed tomorrow (9/21).]

As the Progress M-60/25P cargo ship is continuing its independent flight until 9/25 (timeline see below), CDR Yurchikhin is supporting its scientific research activities today with the geophysical GFI-1 Relaksatsiya ("relaxation") experiment. GFI-1 will be torn down tomorrow, but spectroscopic observations of the engine plumes will be continued from the ground. [After unstowing and setting up the equipment from six GFI-1 hardware kits, reconfiguring the payload Laptop 3 for the experiment and
mounting the UV (ultraviolet) camcorder with its SP spectrometer unit at SM (Service Module) window #9, Yurchikhin initially records imagery of nocturnal radiation from the Earth surface and atmosphere at ~2:30pm EDT, then again before, during and after the Progress DPO thruster firing at 4:37pm EDT. Purpose of the experiment is to contribute to a space/time study of UV (ultraviolet) radiation patterns from the Earth and from engine burns at high altitude. Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth's upper atmosphere.]

Working in the starboard SM crew quarters, FE-1 Kotov checked out cabling and connections of an SD1-6 lighting unit and its power supply box, using the “Elektronika” multimeter for continuity checks. A short circuit was found, and the unit is to be replaced.

In the Lab module, FE-2 Anderson started the long-term operation of the ANITA (Analyzing Interferometer for Ambient Air) experiment, powering up the equipment in EXPRESS Rack (ER4) and initiating local sampling mode. [Developed by ESA, ANITA is a potential next-generation trace-gas analysis system that uses a Fourier-Transform Infrared (FTIR) spectrometer to determine concentrations of up to 32 different trace gases in the cabin atmosphere (measuring absorbance vs. wavelength). ANITA provides continuous, automatic air sampling from its location in ER4, taking one local sample every 6 minutes, for medical personnel during the first ten days, later for environmental specialists. Data are stored on the ANITA laptop hard drive, with a representative data set downlinked daily by ground command. For next weekend’s Saturday Science, Clay has selected to take a non-local air sample from another station location (pumped by hand into a sample bag) for subsequent analysis in the ER4 ANITA drawer.]

Continuing the current round of monthly preventive maintenance of RS (Russian Segment) ventilation systems, Fyodor Yurchikhin cleaned the four “Group B” fan grills (VT1, VT2, VTK1, VTK2) in the SM.

Anderson conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card, to be updated with today’s data, lists 29 water containers (~1099 liters total) for the four types of water identified on board: technical water (715.9 l, for Elektron, flushing, hygiene), potable water (351.2 l), condensate water (13.2 l), waste/EMU dump and other (19.0 l. CWC #1081 with potable water has been put off limits due to bacteria found in sample analysis, the
source of which is still not understood. Plans are to check the water on-orbit next month and to test the SRV-K sterilization procedures on the ground. CWC #1081 will be used as flush water. Impact of losing this potable CWC is negligible since there are sufficient drinking water supplies onboard.

With the U.S. CDRA (Carbon Dioxide Removal Assembly) deactivated by the ground earlier today (8:30am-1:30pm) and cooling no longer required, Clay Anderson demated and took down the ITCS LTL jumper at the CDRA-supporting LAB1D6 rack.

Oleg Kotov performed the periodic data collection and downlink on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

At ~10:00am, the FE-2 held a teleconference with ground specialists to discuss STS-120/10A return cargo preparations, based on IMS (Inventory Management System), and afterwards had 1h 25m reserved for prepacking/staging hardware for return on 10A.

CDR Yurchikhin conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

Fyodor also updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (CDR, FE-2), and VELO cycle with bungee cord load trainer (FE-1).

Later today, Clay will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). [Troubleshooting of the heart rate watches is underway on the ground for improving data transfer to the chest strap transmitters.]

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for
At ~12:15pm EDT, the crew conducted a PAO TV interview exchange with KPTM-TV (Scott Lea), Omaha, Nebraska. [Nebraska is Clayton Anderson’s home state.]

Later today, at ~2:05pm, the crew will convene for their weekly teleconference with ISS Program Management at JSC/Houston via S-band/audio.

**Propellant Transfer:** TsUP/Moscow was scheduled today to perform transfer of fuel (UDMH, unsymmetrical dimethyl hydrazine) from the Progress M-61/26P cargo ship’s BG1,2 refueling tanks to the SM’s BG1 tank, while pumping out N2 using the K2 compressor.

**Progress 25P Timeline Overview:**
After undocking on 9/18, 25P is remaining in orbit for six days to conduct science experiments of viewing/studying plasma particles in the exhaust from a series of thruster firings (one per day) at various stages of flight:

--- Today, 9/20 –
4:37pm: Progress Burn #3 (DPO thrusters, 5s, dV~2.6 m/s)

--- Friday, 9/21 –
4:59pm: Progress Burn #4 (DPO, 5s, dV~2.6 m/s, retrograde)

--- Saturday, 9/22 –
3:45am: Progress Burn #5 (DPO, 5s, dV~2.6 m/s, posigrade)

--- Sunday, 9/23 –
4:06am: Progress Burn #6 (DPO, 5s, dV~0.85 m/s, posigrade)

--- Monday, 9/24 –
4:26pm: Progress Burn #7 (DPO, 5s, dV~0.85 m/s, posigrade)

--- Tuesday, 9/25 –
3:13pm: Progress Deorbit burn start (SKD, 170s, dV~85.3 m/s)

3:15:30pm: Deorbit burn complete
3:48:12pm: Entry Interface

[SKD = Main Engine; DPO = Approach & Attitude Control thrusters]

Today’s CEO (Crew Earth Observation) photo targets were **B.P. Structure, Libya** (this young [<120 million years] impact structure is located to the west of a large dune field, between two roughly N-S mountain ranges comprised of dark materials. The crater is a small feature, therefore the crew was recommended to shoot a W-E mapping swath as ISS approached the target area to maximize coverage and photograph the crater), **Oasis Impact Crater, Libya** (the Oasis impact structure is much larger [18 km] than the nearby BP crater [previous target] but is approximately the same age. Oasis crater is located a little to the south of the BP structure, and the photographic strategy was the same - a mapping swath from W to E as ISS
passed over the target area should have captured the crater), **Khartoum, Sudan** (the station had a nadir pass over the capital of Sudan. Overlapping nadir frames, acquired along-track, were requested to minimize pixel smear in the resulting images. **Khartoum** is located at the confluence of the White and Blue Nile rivers. A rural-urban-rural transect across the city area [photography along-track will achieve this] would be most useful for quantitative land cover/land use analysis. The crew was to begin mapping as they approached the White Nile River, collecting frames as ISS flew over the city, then terminating photography as ISS entered the agricultural fields to the SE of the urban area), and **Antarctic Ice Pack** (looking to the right of track as the station approached Antarctica for breaks in the cloud cover. Drifting fragments of the Antarctic ice pack may have been visible through gaps in the clouds).

CEO photography can be viewed and studied at the websites:  
[http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov)  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);  
[http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/)  
[http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit  (as of this morning, 9:08am EDT [= epoch]):**  
Mean altitude -- 339.1 km  
Apogee height -- 345.8 km  
Perigee height -- 332.4 km  
Period -- 91.32 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.0010022  
Solar Beta Angle -- 21.5 deg (magnitude increasing)  
Orbits per 24-hr. day -- 15.77  
Mean altitude loss in the last 24 hours -- 52 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50582

**Significant Events Ahead  (all dates Eastern and subject to change):**  
09/24/07 -- ISS reboost (2:05pm, dV=3.4 m/s; set-up f/Soyuz launch & 10A FD3 rendezvous)  
09/25/07 -- Soyuz 14S thruster test (~9:00am)  
09/25/07 -- Progress M-60/25P deorbit burn & entry over Pacific -- ~3:48pm  
09/27/07 -- Soyuz TMA-10/14S relocate to SM aft port (~3:20-4:00pm) – FRR: 9/24  
09/28/07 -- FGB solar arrays retraction  
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**  
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)  
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/19/07

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Anderson continued with Day 2 of the ITCS (Internal Thermal Control System) coolant remediation in the US Segment (USOS). [Today Clay removed the PhosRA (Phosphate Removal Assembly) which he put in yesterday, installed the BuDA (Buffer Delivery Applicator), performed PhosRA pressure relief at the O5 rack, and was to replace the LTL fine filter if expected precipitate formation was clogging it. Background: In order to reduce or prevent precipitate formation, corrosion & microbial growth, the ITCS coolant fluid is being checked regularly for staying within desired chemistry and pH level constraints. After the failure of an MTL (Moderate Temperature Loop) pump in 2003 due to nickel phosphate deposits, the ITCS coolant remediation plan includes removal of these elements, started with the temporary installation of Nickel Removal Assemblies (NiRA-1 & NiRA-2) earlier on Expeditions 14/15, and yesterday of the PhosRA. BuDA (for raising the system pH) and the FSS (Fluid System Servicer) will be removed on Friday (9/21).]

Afterwards, Anderson completed the installation of an Intermodular Ventilation (IMV) valve of the Temperature & Humidity Control (THC) system in the Lab Forward Port Endcone (LAB1PO). [The 1-hr. activity included installing a missing hose clamp, tightening an RMO (Remote Manual Operator) fastener, and installing RMO identification labels.]

In the SM PkhO (Service Module/Transfer Compartment) and DC1 (Docking Compartment), CDR Yurchikhin and FE-1 Kotov worked on the Orlan EVA support equipment, removing & replacing major Orlan/spacesuit servicing hardware with new units, viz., the BSS-4 Orlan Interface Unit with BUS-MK control unit, oxygen line, Orlan hose bundles I & II, and Orlan emergency hoses. [Halfway through the R&R, the BITS2-12 onboard telemetry measurement system and associated VD-SU control mode were turned on to allow ground monitoring of the activity, which
concluded with a leak check of the BSS-4 and its hose bundles.]

Later, Kotov supported TsUP/Moscow in reactivating the Elektron oxygen generator, which had to be turned off for BITS2-12 and VD-SU deactivation during the preceding BSS-4 R&R. [Reactivation was at 32 amps, and as usual Oleg monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. During nominal operations a gas analyzer is utilized to detect hydrogen ($H_2$) in the $O_2$ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

Clay Anderson unstowed the equipment for the final NASA/U.o.Nevada SWAB (Surface, Water & Air Biocharacterization) sampling and at several times during the day collected air samples at four locations in the Node and Lab, followed by taking surface samples from several locations in Node, Lab and Airlock plus five random sites (e.g., air vents). [The samples were sealed in special SWAB tubes, labeled as to their location origins and prepared for return to Earth on 10A. SWAB started on Increment 13 before 12A docking.]

Oleg Kotov meanwhile collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane ($CH_4$), Ammonia ($NH_3$), Carbon Monoxide (CO), Formaldehyde ($HCHO$), Nitrogen Oxides (NO, NO$_2$), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]

For Day 2 of the new KL-211 MPEG-2 Encoder end-to-end testing, Yurchikhin and Kotov activated the RSS1 A31p laptop (for monitoring the digital video) and the U.S. SSC (Station Support Computer) laptop (for converting analog TV from Russian PAL mode to U.S. NTSC), set up the video hardware and conducted the transmission tests with the KL-211 in the new JSL (Joint Station LAN) configuration, via U.S. OCA/Ku-Band. [Testing included launching the NViewer (NASA Viewer) application on the Central Post SSC (Station Support Computer) laptop and the VLC Media Player on the RSS1 laptop, linking KL-211 to various video cameras onboard, and checking the digital video transmission over JSL/Ethernet plus OCA/Ku-Band to MCC-Houston and from there to Moscow via the ESA Gateway at TsUP, versus same-scene analog video signals transmitted via Streambox to NISN (i.e., the Moscow Ostankino communication hub).]

The FE-2 performed the daily start-up of the ongoing SAME (Smoke Aerosol Measurement Experiment) investigation, powering up the MSG (Microgravity Science Glovebox) facility and MLC (MSG Laptop Computer) and changing out the SAME sample carousel, thermal precipitator, digital video tape, and alcohol wick.
[All items except for the latter will be returned to Earth on 10A.]

Clay also conducted the periodic status checkup & filter inspection of the running CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

CDR Yurchikhin completed the periodic (about twice a month) replenishing of the Elektron’s water supply for electrolysis, filling the KOV thermal loops’ EDV container with water collected in CWC (Contingency Water Container) #1056 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

As part of the regular preventive maintenance of RS (Russian Segment) ventilation systems, Oleg worked in the Soyuz TM-10/14S spacecraft on cleaning the screen of its BVN fan/heater assembly. [14S is to be relocated by the three crewmembers to the SM aft port on 9/27.]

Anderson disconnected the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable at the Lab RWS (Robotics Work Station), required earlier for 25P undocking video coverage.

With SAMS (Space Acceleration Measurement System) no longer active for the moment, Clay also disconnected the ITCS MTL (Moderate Temperature Loop) cooling jumper QD (quick disconnects) at ER1 (EXPRESS Rack 1).

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exerciser (CDR, FE-1, FE-2).

Later today, Clay will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). [Troubleshooting of the heart rate watches is underway on the ground for improving data transfer to the chest strap transmitters.]

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This
A second task from the voluntary work list for Oleg (in the morning) was the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

**Progress 25P Timeline Overview:**
After undocking last night, 25P is remaining in orbit for five more days to conduct science experiments of viewing/studying plasma particles in the exhaust from a series of thruster firings (one per day) at various stages of flight:

------**Today, 9/19** --
5:52pm: Progress Burn #2 (SKD, 5s, dV~1.5 m/s, retrograde)

------**Tomorrow, 9/20** --
4:37pm: Progress Burn #3 (SKD, 5s, dV~2.6 m/s, posigrade)

------**Friday, 9/21** --
4:59pm: Progress Burn #4 (AR&D thrusters, 5s, dV~2.6 m/s, retrograde)

------**Saturday, 9/22** --
3:45am: Progress Burn #5 (SKD, 5s, dV~2.6 m/s, posigrade)

------**Sunday, 9/23** --
4:06am: Progress Burn #6 (AR&D thrusters, 5s, dV~0.85 m/s, posigrade)

------**Monday, 9/24** --
4:26pm: Progress Burn #7 (AR&D thrusters, 5s, dV~0.85 m/s, posigrade)

------**Tuesday, 9/25** --
3:13pm: Progress Deorbit burn start (170s, dV~85.3 m/s)
3:15:30pm: Deorbit burn complete
3:48:12pm: Entry Interface

[SKD = Main Engine; AR&D = Automated Rendezvous & Docking]

**Belated Anniversary Recognition:** Last month, on 8/21, was the 50th anniversary of the first successful launch of the Soviet R-7 ICBM at Tyuratam (today's Baikonur), developed at the Special Design Bureau No.1 (now S.P.Korolev RSC-Energia). Original mission of this first Soviet-Russian long-range two-stage missile was to carry a nuclear warhead to any point on a potential enemy's territory. Line drawings of the rocket were approved by the Chief Designer, Sergey Pavlovich Korolev, on 3/11/1955. First successful launch, with successful target impact on Kamchatka Peninsula, took place on 8/21/57. Key developers, designers and researchers for the missile at the Special Design Bureau No.1 included B.Ye.Chertok (memoirs being published by NASA), P.I.Yermolaev, K.D.Bushuyev, and many others. The R-7 “Semyorka” became the basis for developing the first space launch vehicle
Sputnik, which put the world’s first Earth artificial satellite into orbit 50 years ago next month (10/4/57) and for numerous modifications for space launches, including the Vostok and today’s Molniya and Soyuz launch vehicles. Further development of this rocket’s design (Soyuz-2 project and others) is currently underway.

Today’s CEO (Crew Earth Observation) photo targets were Nile River Delta, Africa (orbit track took ISS over the western edge of the Nile delta. This region of the delta is currently the focus of urban expansion in the region. Overlapping nadir frames, acquired along-track, were requested to record land cover and land use patterns), and Kwanza Basin, Angola (while most of Africa stagnates economically, extraction of Angola’s huge hydrocarbon reserves has started to spark economic development. In the Kwanza basin all kinds of infrastructure are planned, so that present patterns of natural vegetation, animal migration routes and human settlement will all change. Detailed baseline/pre-change imagery is therefore requested. Overlapping nadir frames, acquired along-track, of the SW portion of the site area will be most useful for quantitative analysis of current landscape patterns).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:46am EDT [= epoch]):
Mean altitude -- 339.2 km
Apogee height -- 345.8 km
Perigee height -- 332.5 km
Period -- 91.32 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0009891
Solar Beta Angle -- 17.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 48 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50566

Significant Events Ahead (all dates Eastern and subject to change):
09/24/07 -- ISS reboost (2:05pm, dV=3.4 m/s; set-up f/Soyuz launch & 10A FD3 rendezvous)
09/25/07 -- Soyuz 14S thruster test (~9:00am)
09/25/07 -- Progress M-60/25P deorbit burn & entry over Pacific -- ~3:48pm
09/27/07 -- Soyuz TMA-10/14S relocate to SM aft port (~3:20-4:00pm) – FRR: 9/24
09/28/07 -- FGB solar arrays retraction
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)

11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/18/07

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Anderson prepared for his first seven-day SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) session, setting up the HRF1 (Human Research Facility 1) laptop and the Actiwatch Reader for subsequent data download, initializing the Actiwatch for himself, and strapping it on. [The NASA/JSC experiment investigates the effects of long and short duration spaceflight on sleep, objectively evaluates sleep through measurement of sleep-wake activity, subjectively evaluates crewmembers’ satisfaction with the amount and quality of sleep, and measures crewmembers’ light exposure during spaceflight to investigate association with sleep disruption. To monitor Clay’s sleep/wake patterns and light exposure, his special Actiwatch device measures the light levels encountered by her as well as her patterns of sleep and activity throughout the Expedition.]

CDR Yurchikhin serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated at ~5:00pm EDT. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]

The two Russian crewmembers each completed the 2-hr Part 2 of their third onboard “Profilaktika” (MBI-8, “Countermeasures”) preventive health maintenance fitness test series, including ECG (Electrocardiogram), blood tests and subjective rating, assisting each other in turn. [Today’s fitness test was performed on the TVIS treadmill in unmotorized (idle) mode, with free choice of speeds within the range permitted. The test investigates the action mechanism and efficiency of various countermeasures (currently VELO and TVIS) aimed at preventing locomotor system disorders in weightlessness. The test differs from the normal TVIS session]
by the use of the TEEM-100 gas analyzer (via a mask equipped with a pneumotachometer sensor), measurement of blood lactate level and subjective evaluation of physical exertion levels during the test. The lactate blood samples were taken twice at the end of the session, using the ACCUSPORT analyzer and REFLOTRON-4 accessories. Results were entered on a log sheet. TEEM and ECG (electrocardiograph) data were transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results were also called down to specialists standing by at TsUP.

After having set up the Russian video equipment and connected the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable at the Lab RWS (Robotics Workstation) for undock coverage and transmit via US Ku-band for video coverage, Yurchikhin and Kotov supported ground specialists at TsUP/Moscow in a pre-undocking test of the recently installed KL-211 MPEG-2 TV Encoder in the new JSL (Joint Station LAN) configuration, via U.S. OCA. Testing included launching the NViewer (NASA Viewer) application on the Central Post SSC (Station Support Computer) laptop and the VLC Media Player on the RSS1 laptop, linking the KL-211 to various video cameras onboard, and checking the digital video transmission via JSL/Ethernet plus OCA/Ku-Band to MCC-Houston and from there to Moscow via the ESA Gateway at TsUP, versus same-scene analog video signals transmitted via Streambox to NISN (i.e., the Moscow Ostankino communication hub).

FE-2 Anderson began a major task of U.S. ITCS (Internal Thermal Control System) coolant remediation, scheduled to extend over several days (to 9/21). Today’s work involved taking a pre-remediation ITCS fluid sample for return on STS-120/10A, adding coolant, and installing a Phosphate Removal Assembly (PhosRA). Background: In order to reduce or prevent precipitate formation, corrosion & microbial growth, the ITCS coolant fluid is being checked regularly for staying within desired chemistry and pH level constraints. After the failure of an MTL (Moderate Temperature Loop) pump in 2003 due to nickel phosphate deposits, the ITCS coolant remediation plan includes removal of these elements, started with the temporary installation of Nickel Removal Assemblies (NiRA-1 & NiRA-2) earlier on Expeditions 14/15, and today of the PhosRA. A Buffer Delivery Applicator (BuDA) for raising the system pH will be installed tomorrow. Both PhosRA and BuDA will be removed afterwards.

Oleg Kotov had 2h 20m reserved for conducting an inventory/audit of the Russian SVO Water Supply System, checking off ~56 individual items against an uplinked listing and the IMS (Inventory Management System), such as BRPK condensate processor gear, filters, adaptors, hoses, sample containers, water bags, etc.

Fyodor Yurchikhin also conducted an inventory/audit, of unopened food containers
In preparation for tonight’s Progress 25P undocking, Clay Anderson activated the SAMS ICU (Space Acceleration Measurement System/Interim Control Unit) in Rack LAB1P2 for collecting microgravity acceleration and disturbance data of the undocking for structural and mechanical analysis, and later closed the Lab science window shutter as protection against thruster plumes.

For tonight’s operation of SAMS, Clay also configured the ER1 (EXPRESS Rack 1) by connecting its MTL (Moderate Temperature Loop) cooling jumper QDs (quick disconnects) to the nearby LAB1O2 UIP (Utility Interface Panel, “Z-panel”).

Fyodor took the periodic sensor readings of the Russian “Pille-MKS” (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (port cabin window, starboard cabin window, ASU toilet facility, control panel, etc.). Nine of the ten dosimeters are read manually (last time done: 8/20).

Working in the Node, the CDR removed a closeout panel, took a reading with the CSA-CO$_2$ instrument to verify no ventilation concern, and cleaned the Node IMV (Intermodular Ventilation) fan at Starboard Aft. [In addition, Yurchikhin retrieved the Gas Trap Fill Fixture from behind the panel for use by Anderson on his extended ITCS servicing task (see above), leaving the panel open until after the ITCS work.]

Later, Yurchikhin conducted the periodic verification of IMV airflow between U.S. and Russian segment modules by taking air flow measurements using the Velocicalc meter. [There is no direct measurement of airflow except as reflected by differences in atmosphere partial pressures measured between the RS and USOS. ppCO$_2$ (carbon dioxide partial pressure) is a good yardstick since an increasing ppCO$_2$ in the Lab not reflected in the SM would indicate that Vozdukh is not receiving the air from the Lab at an efficient rate. Periodic air flow degradation checks support establishing a most effective fan cleaning schedule.]

FE-1 Kotov worked on the SM’s IK0501 GA (gas analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System, deactivating the unit and replacing its CO$_2$ filter assembly (BF) with a new unit from FGB stowage (replaced last: 8/8). [After ensuring good seals on the instrument’s base and no leaks around the installed filter, Oleg reactivated the GA and stowed the spent BF for disposal.]
IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed.

The FE-1 conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

Oleg also updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene), the FE-2 on the TVIS treadmill and RED resistive exerciser, the CDR & FE-1 both on the TVIS as part of their MBI-8/Part 2 “Countermeasures” assessment (see above).

Later today, Fyodor will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Conjunction Update: The POC (Probability of Collision) for today’s ISS conjunction with an old “Strela” rocket body (~1:21pm EDT) was determined last night to be very low, and planning for a DAM (Debris Avoidance Maneuver) today was cancelled. [“Strela” was the Soviet ICBM UR-100, NATO Code SS-11 Sega.]

Saturday Science Preview: Five optional activities for the voluntary “Saturday Science” program for next weekend (9/22-23) were suggested to Clay for his choice. His selection is required by tonight. [The five choices are: (1) EPO (Educational Payload Operation) Kit C Plant Growth experiment, voice and video; (2) BCAT-3 (Binary Colloidal Alloy Test-3) Magnet Unstick, using the CGBA-4 (Commercial Generic Bioprocessing Apparatus-4), powered up 12 hrs before; (3) ANITA (Analyzing Interferometer for Ambient Air) – Non-Local Sampling, using a sample bag and hand pump; (4) CFE VG1 (Capillary Flow Experiment – Vane Gap 1): voice & video of another run of to complete the CFE-VG1 experiment; and (5)
SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), flying two & three satellites, requiring CDRA (CO$_2$ Removal Assembly) to be running.]

**Progress M-60/25P Undocking Update:** After separation tonight at ~8:37pm EDT from the SM aft port, the 25P cargo ship remains in orbit for five more days to conduct science experiments of viewing/studying plasma particles in the exhaust from a series of thruster firings (one per day) at various stages of flight.

**25P Separation/Entry Timeline (EDT):**

----- Today, 9/18 ----
- 6:40pm: USOS to RS Attitude Control Handover
- 8:33pm: ISS to Free Drift
- 8:34pm: 25P Undock Command
- **8:37pm:** **Physical Separation** (dV~0.12 m/s)
- 8:40pm: 25P Separation Burn #1 (dV~0.62 m/s)
- 8:42pm: ISS maneuvers to LVLH Attitude
- 9:20pm: RS to USOS Attitude Control Handover.

----- Tomorrow, 9/19 ----
- 5:52pm: Progress Burn #2 (SKD, 5s, dV~1.5 m/s, retrograde)

----- Thursday, 9/20 ----
- 4:37pm: Progress Burn #3 (SKD, 5s, dV~2.6 m/s, posigrade)

----- Friday, 9/21 ----
- 4:59pm: Progress Burn #4 (AR&D thrusters, 5s, dV~2.6 m/s, retrograde)

----- Saturday, 9/22 ----
- 3:45am: Progress Burn #5 (SKD, 5s, dV~2.6 m/s, posigrade)

----- Sunday, 9/23 ----
- 4:06am: Progress Burn #6 (AR&D thrusters, 5s, dV~0.85 m/s, posigrade)

----- Monday, 9/24 ----
- 4:26pm: Progress Burn #7 (AR&D thrusters, 5s, dV~0.85 m/s, posigrade)

----- Tuesday, 9/25 ----
- 3:13pm: Progress Deorbit burn start (170s, dV~85.3 m/s)
- 3:15:30pm: Deorbit burn complete
- 3:48:12pm: Entry Interface

[SKD = Main Engine; AR&D = Automated Rendezvous & Docking]

Today's CEO (Crew Earth Observation) photo targets were **Polar Mesospheric Clouds**--PMC, **Northern Hemisphere** (*PMC are wispy, veil-like ice...*
clouds which can be single bands or clusters, straight or sinuous), **Antarctic Ice Pack** (cloud cover over the southern Indian Ocean diminished as ISS tracks approached Australia. Looking to the right of track [towards Antarctica] for icebergs and ice fragments on the sea surface. Clouds will tend to have variable brightness, whereas ice will have more homogeneous contrast. Images of sea ice will help track the breakup and rate of retreat of the Antarctic ice pack), and **Smoke Plumes, Brazil** (Dynamic Event. Weather satellite data indicates that extensive biomass burning and associated smoke plumes are ongoing in Central South America. Looking to the right of track after ISS passed over the Amazon river delta for smoke plumes).

CEO photography can be viewed and studied at the websites: [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);  
[http://earthobservatory.nasa.gov](http://earthobservatory.nasa.gov)  
[http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** *(as of this morning, 8:36am EDT [= epoch]):*  
Mean altitude -- 339.2 km  
Apogee height -- 345.7 km  
Perigee height -- 332.7 km  
Period -- 91.32 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.0009684  
Solar Beta Angle -- 12.7 deg (magnitude increasing)  
Orbits per 24-hr. day -- 15.77  
Mean altitude loss in the last 24 hours -- 62 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50550

**Significant Events Ahead** *(all dates Eastern and subject to change):*  
09/24/07 -- ISS reboost (2:05pm, dV=3.4 m/s; set-up f/Soyuz launch & 10A FD3 rendezvous)  
09/25/07 -- Soyuz 14S thruster test (~9:00am)  
09/25/07 -- Progress M-60/25P deorbit burn & entry over Pacific -- ~3:48pm  
09/27/07 -- Soyuz TMA-10/14S relocate to SM aft port (~3:20-4:00pm) – FRR: 9/24  
09/28/07 -- FGB solar arrays retraction  
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**  
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (~11:00am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- 50-Year Anniversary of Explorer 1 (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/28/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- **Six-person crew on ISS**
04/15/09 -- **Constellation’s Ares I-X Launch**
ISS On-Orbit Status 09/17/07

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 22 of Increment 15.*

CDR Yurchikhin serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated at ~7:10pm EDT. Regeneration of bed #2 follows tomorrow. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]

The two Russian crewmembers completed a 2-hr session each of Part 1 of their third onboard “Profilaktika” (MBI-8, “Countermeasures”) preventive health maintenance fitness test series, starting with the VELO stationary cycle ergometer. [Fyodor and Oleg will do the second part of the test tomorrow (9/18) on the TVIS treadmill. Test procedure for MBI-8 is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med Laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results were also called down to specialists standing by at TsUP.]

FE-1 Kotov spent about 30 min of regular equipment servicing in the SM (Service Module)’s toilet facility (ASU), performing the monthly replacement of two urine receptacles (PR & MP) and a filter insert (F-V) with new spares. The old units were trashed.

Later, Yurchikhin and Kotov reviewed procedural material and prepared equipment
for the upcoming (9/19) removal & replacement of major Orlan/spacesuit support hardware in the DC1 (Docking Compartment) and SM PkhO (Transfer Compartment) with new units, consisting of the BSS-4 Orlan Interface Unit with BUS-MK control unit, oxygen line, Orlan hose bundles I & II, and Orlan emergency hoses.

Performing the periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), Yurchikhin removed the PCMCIA memory card #934 from the AST spectrometer’s slot and copied the accumulated data for subsequent downlinking via OCA. Card 934 was then bagged for return to Earth and PCMCIA card 932 inserted to continue AST ops.

Oleg and Fyodor loaded final trash and excessed cargo on Progress M-60/25P, logging movements on the IMS (Inventory Management System).

In preparation for the undocking of 25P tomorrow evening (8:34pm EDT), the two Russian crewmembers then –

- Reported state of completion of 25P loading to TsUP-Moscow,
- Dismantled and removed the LKT local temperature sensor commutator/switch (TA251MB) of the BITS2-12 onboard telemetry system from 25P, along with its PZU-1M ROM (read-only memory) unit, stowing the avionics items on ISS for reuse in a future vehicle,
- Activated the cargo ship and tore down the ventilation air duct,
- Removed the threaded quick-disconnect (QD) screw clamps rigidizing the mating surfaces of the docking & internal transfer system (SSVP), for which the ground restricted thruster firings by the Russian segment (RS) in the time interval 11:45am–1:13pm,
- Closed the hatches between 25P and the transfer tunnel (PrK) to the SM after taking video of the mating surfaces/seals,
- Conducted the standard one-hour PrK-SU & SU-Progress vestibule leak check to verify hermeticity, and
- Downlinked the video imagery of the SM/Progress hatch interface.

In the US Segment (USOS), Oleg Kotov configured the A31p laptop normally used for the sophisticated SSRMS (Space Station Remote Manipulator System) trainer application “ROBoT” with a hard disk drive loaded with VSW (Video Streaming Workstation) software, to support testing of docking video activities. [The laptop will henceforth serve as both ROBoT and VSW machine and remains connected to the new Ethernet/OpsLAN.]

CDR Yurchikhin conducted the routine maintenance of the SOZh system
Environment Control & Life Support System, ECLSS) in the SM.

Fyodor also updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene), the FE-2 on the CEVIS cycle ergometer and RED resistive exerciser, the CDR and FE-1 both on the VELO cycle with bungee cord load trainer as part of their MBI-8/Part 1 “Countermeasures” exercise (see above).

Later today, Clay will transfer the crewmembers’ exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second task from the voluntary work list for Oleg was the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

As additional “get-ahead” activities, Fyodor’s and Oleg’s “job jar” added two long-term tasks, viz., (1) a running inventorying behind panels in the RS when other activities are being performed, and (2) photo/video imagery of “Life on the Station” scenes in the RS (e.g., sleep & post-sleep, behavior of water in zero-G, food preparation, RS interior architecture, cosmonauts at work controlling the station, housekeeping, clothing, medical exams, viewing videos for entertainment, etc.).

At ~9:35am EDT, Clay powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 9:40am, a ham radio exchange with students at Mitchell Elementary School in Ann Arbor, Michigan. Questions to the crew were uplinked by ARISS (Amateur Radio on ISS) beforehand. [Mitchell Elementary school is a NASA
Explorer School (NES), with science and math programs integrated units that are related to NASA projects. “Is it hard to be in space for so long?”; “How do you keep from floating around while sleeping?”; “Do you have a bedtime?”; “How do you keep yourself clean in space?”; “How do you communicate with your Russian crewmates?”; “What is the temperature in space?”

At ~10:30am, FE-2 Anderson led the crew in performing the traditional installation of a commemorative plaque for a recent Shuttle mission, today for STS-118/13A.1. The event was downlinked for PAO via TV/audio on S-band & Ku-band.

At ~11:15am, Anderson had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop).

At ~2:15pm, the FE-2 will be supporting a crew-choice TV interview with television station KHGI-TV in Kearney, Nebraska, and the Ashland, NE Gazette.

At ~6:40pm, Clay Anderson is also scheduled for a private crew-choice conference on S-band/audio.

Conjunction Advisory: Ground teams are working on improving predictions for an ISS conjunction with space debris tomorrow at ~1:21pm EDT (TOA/time of closest approach), with a currently predicted radial miss distance of ~140m and POC (probability of collision) of 10^-8. Preparations are underway for a DAM (debris avoidance maneuver) with Russian thrusters, to take place at ~9:30am tomorrow morning but to be called off if found unnecessary later today. Russian plans for propellant transfer from Progress M-61/26P are being put on hold until then.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 8:06am EDT [= epoch]):
Mean altitude -- 339.3 km
Apogee height -- 345.7 km
Perigee height -- 332.9 km
Period -- 91.32 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0009538
Solar Beta Angle -- 8.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 71 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50534

**Significant Events Ahead** *(all dates Eastern and subject to change)*:
09/18/07 -- Progress M-60/25P undocking (SM aft port) -- 8:34pm
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port) – FRR: 9/24
09/28/07 -- FGB solar arrays retraction
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (to SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** *(1st U.S. satellite on Redstone rocket)*
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
All ISS systems continue to function nominally, except those noted previously or below. Sunday -- off-duty day for the crew except for housekeeping and voluntary work. Ahead: Week 22 of Increment 15. Flight Control to Crew: “Congratulations on the successful transition of the US OpsLAN to the ISL!”

CDR Fyodor Yurchikhin conducted the routine maintenance of the SOZ individual ECLSS in the SM (Service Module), including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Fyodor also gathered weekly data on total operating time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s SOGS air revitalization subsystem for reporting to TsUP.

In support of the activation of the CDRA (Carbon Dioxide Removal Assembly) by ground command at ~10:30am EDT, FE-2 Anderson connected the ITCS LTL QD (Internal Thermal Control System Low Temperature Loop Quick Disconnect) jumper for the required cooling. [Earlier, the LTL temperature setpoint was lowered by the ground (to 9.4 degC).]

As a final step for the Progress M-60/25P undocking on Tuesday (9/18), Yurchikhin and Kotov installed the StM Docking Mechanism (Stykovochnovo mekanizma) between 25P and the SM aft port. [This task had originally been scheduled for 9/14. The StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress’ cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]
The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second task from the voluntary work list for Oleg was another run of the Russian "Diatomeya" ocean observations program, using the NIKON-F5 (85 mm lens) still camera and the Sony DSR PD-150P camcorder to obtain imagery of color bloom and cloud pattern anomalies from SM window #7. [Photo targets were the Indian Ocean along the track from offshore Mozambique over the Mozambique Channel to the Kerguelen underwater range area, and the Atlantic along the track from offshore Brazil to the “Roaring Forties” water area in the Western Winds Current.]

A voluntary task on Yurchikhin’s discretionary job list for today was the periodic photography of the SKK Removable Cassette Container payload’s cassette #9 through the DC1 (Docking Compartment) EVA window, and cassette #2 through window 6 in the SM, at maximum magnification. [The SKK containers on the outside of the station are holding various material samples for exposure to the space environment.]

At ~1:25pm EDT, Clay Anderson was scheduled for a private crew-choice conference on S-band/audio.

**ISL Transition Update:** Final tasks required today for a fully functional JSL/ISL (Joint Station LAN/Integrated Station LAN) network include getting the BRI Smart Switch Router in the Russian Segment (RS) recovered and the RS SSCs (Station Support Computers) and SM Printer on line.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
- [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
- [http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/)
- [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)
ISS Orbit (as of this morning, 7:51am EDT [= epoch]):
Mean altitude -- 339.3 km
Apogee height -- 345.7 km
Perigee height -- 333.0 km
Period -- 91.32 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0009437
Solar Beta Angle -- 3.6 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 64 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50518

Significant Events Ahead (all dates Eastern and subject to change):
09/18/07 -- Progress M-60/25P undocking (SM aft port) -- 8:34pm
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/15/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson except for housekeeping and voluntary work (plus ISL transition support).

The crew conducted the regular weekly three-hour task of thorough station cleaning. "Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.

Clay Anderson assisted ground specialists with the final transition of the old onboard OpsLAN (Operations Local Area Network), which uses coaxial cables, to the new ISL (Integrated Station LAN) system. Tasks requiring Clay’s support included –

- Switching the OCA comm Router to ISL;
- Transitioning sufficient SSC (Station Support Computer) components to ISL to enable operations;
- Migrating the SSC-10 laptop to JSL (Joint Station LAN) and deploying it in the Airlock;
- Disconnecting coax drag-through cables and temporarily stowing the ends outside of the hatchway (all coax cables to be cleaned and stowed in the following weeks);
- Modifying the RSC-E “PingMaster” program, used for network checkouts, with the new IP addresses for JSL; and
- Displaying a quick-reference diagram showing port mapping near the ISL interface panel.
[For troubleshooting an issue with powering up the WAP (Wireless Access Point), Clay was advised to try steps like checking connections at the WAP and ISL Interface Panel, power cycling WAP, and checking power cables. One SSC was temporarily left on coax to protect the option to configure via the old coax network. ISL is an upgraded onboard LAN utilizing Ethernet connectivity over the Router via cable or WAP. JSL is the designation for the overall network, including IP (International Partner) hardware and integration, while ISL refers to specifically US hardware. JSL/ISL integrates all ISS “user” devices, eventually including RS docking video distribution, payload comm & downlink (from IP modules, e.g., Columbus or Kibo), crew operations, procedures viewing, email, IP phone, etc. JSL/ISL eliminates drag-through cables in hatches, will be up to ten times faster than the current OpsLAN, and has provisions for future modules. Some installation tasks had been moved earlier to Increment 14.]

At ~9:00am EDT, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

Fyodor Yurchikhin conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene); on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Afterwards the FE-1 copied the crew’s exercise data files to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second task from the voluntary work list for Oleg was the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and
Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

Also on Oleg’s “job jar” task list was the periodic use of the Nikon D1X (SIGMA 300-800mm telephoto lens) to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON). [KPT-3 photography has been a frequent earth observing experiment for ECON.]

At ~6:30pm, Clay was scheduled for a private crew-choice conference on S-band/audio.

**Solar Array Efficiency Testing:** MCC-H has started the periodic US Solar Array Efficiency Test, with no crew involvement or onboard powerdowns required. Beginning at 8:14pm EDT, solar arrays were shunted for the last 10 minutes of three successive insolation passes to measure the total current being produced by the photovoltaics. The SAWs remain in autotrack, but with the drag-reduction bias removed. [Photovoltaic current (amperes) is measured with a shunt, i.e., a resistor of accurately-known resistance (ohms) placed in series so that all electricity to be measured flows through it. Because of Ohm’s Law (Current = Voltage divided by Resistance), the current flowing can be calculated by measuring the voltage drop across the resistor.]

**BSV-M A1 Failure:** After the recent work on the Russian BSV-M Frequency & Time Synchronization System in the SM, one of the two redundant units (BSV-M A1) remains failed. TsUP/Moscow specialists are investigating. [BSV-M provides timing signals to the Vozdukh CO2 removal system when the latter is in Manual Mode, as currently the case.]

**Weekly Science Update (Expedition Fifteen -- 20th)**

**ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):** Next and last session in Inc15 is for card exchange. This last session is scheduled on 9/17.

**ANITA:** Planned.

**BCAT (Binary Colloidal Alloy Test):** Reserve.

**CARDIOCOG-2:** Completed.

**CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):** Continuing,
CFE (Capillary Flow Experiment): Reserve.

CHROMOSOME-2 (E14 SFP): Completed.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): Images from CHab show good Yeast growth on Side 1. Images from Cell Culture Hab show good plant cell growth on Side 1 as well. The seeds in Plant Hab have not germinated yet after 14 days. Options for increasing moisture to the seeds are being tested on the ground units.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Next scheduled operation is 10/29-11/3.

EMCH (Elastic Memory Composite Hinge): Complete.

EPO (Educational Payload Operation) Kit C: Planned.

IMMUNO (Saliva Sampling): First session samples are currently stowed in MELFI Dewar #2.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Since last report on 9/6, MULTIGEN-1 continues to be performed in EMCS (European Modular Cultivation System). Arabidopsis plants are growing in the various EC’s (Experiment Containers), with the exception of ECs A3 & B3, where no germination has occurred yet. Before the Water Reservoir Exchange activity on 9/11, A3 and B3 were provided with more additional water than the other ECs, to improve the germination likelihood. From the initial set of plants, some have dried out but are now replaced by new ones. This staggered germination phase will have an impact on the circumnutation phase duration. On 9/13, 3D video recording of plants has started (for ECs A1 & B4).

MUSCLE (E14 SFP): Completed.

MSG-SAME (Microgravity Science Glovebox): “Clay, SAME wanted to let you
know how things have been going. We've been active every day since you completed the installation, and the testing has been going extremely well. We will have completed the first carousel (6 samples) by Friday morning, which included at least one of every sample type. The system has performed to the best of our expectations and we've had no trouble obtaining the data that we needed. It's still too soon to provide an analysis, but we have seen some results that we did not fully anticipate. Thanks for the great and speedy install. We're enjoying our ops and look forward to the next 4 sets of tests.”

NEOCYTOLYSIS (E14 SFP): Completed.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMPLE: Ongoing.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): n/a

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Planned.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observations): Through 9/11 the ground has received a total of 13,715 CEO images for review and cataloging for Increment 15. From the 723 frames of new imagery received this past week investigators have identified for prioritized review those images with camera times corresponding to the following CEO target request times: London, England; Tigris-Euphrates Delta; Aral Sea; GW Fire, Oregon; Cloud Plume, Texas; Kabul Afghanistan; and Mount Whitney, California. Kudos for excellent imagery of the Yellowstone National Park and Tigris-Euphrates Delta targets. Immediate imagery requirements for these sites have been met and they can be retired from the lists. “Kudos also for your striking view of the volcanic island of Simushir in the Kuril Archipelago northeast of Japan. It will be published on NASA/GSFC’s Earth Observatory website this week.”

Today’s CEO (Crew Earth Observation) photo targets were Tropical Storm Ingrid,
Atlantic Ocean (Dynamic Event. ISS orbit track passed directly over the predicted position of Tropical Storm Ingrid. Photography of the system during approach, pass-over and moving away was requested to record the general cloud structure and surrounding atmospheric environment), Navassa Island reef, Caribbean (weather was predicted to be mostly clear over Navassa island for nadir photography of the island and its fringing reefs. The island is located south of Cuba, east of Jamaica, and west of Haiti. Repeat photography of the reefs is important for monitoring of changes to structure and color resulting from natural and anthropogenic ecosystem stresses. Looking slightly to the left of track for the island), and Iceberg A22A, South Atlantic (Dynamic Event. Observers are tracking the breakup of an iceberg [designated A22A] as part of IPY [International Polar Year] activities. Its orbit track brought ISS over the area that the iceberg remnants were predicted to be, based on satellite imagery. Significant cloud cover was also predicted to be present along the orbit track, but the crew was to look for gaps that may allow for views of ice on the sea surface below).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 9:03am EDT [= epoch]):
Mean altitude -- 339.4 km
Apogee height -- 345.8 km
Perigee height -- 333.0 km
Period -- 91.32 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0009486
Solar Beta Angle -- -0.9 deg (magnitude bottoming out)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 44 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50503

Significant Events Ahead (all dates Eastern and subject to change):
09/18/07 -- Progress M-60/25P undocking (SM aft port) -- 8:34pm
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/17/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)

08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/14/07

All ISS systems continue to function nominally, except those noted previously or below.

After recently (9/11) testing the new external OpsLAN/Ethernet connection between Node and the BRI Smart Switch Router in the SM (Service Module), FE-1 Kotov today replaced software (i.e., the net configuration file) in the BRI, first loading it into the RSS1 laptop, then installing it from there on BRI. Afterwards, the network was tested again with the RSC-Energia “PingMaster” application.

As part of the regular monthly preventive maintenance of RS (Russian Segment) ventilation systems, CDR Yurchikhin spent time in the FGB (Funktsionalnyi-Grusovoi Blok), cleaning up and servicing the detachable VT7 fan screen guards (grilles) of the TCS/SOTR (Thermal Control System)’s gas-liquid heat exchangers (GZhT4).

Kotov and Yurchikhin had another ~3 hrs scheduled between them for finishing up stowing discarded equipment and trash in the Progress M-60/25P cargo ship-turned-trash container, keeping track of the movements in the IMS (Inventory Management System).

Afterwards, in preparation of next week’s (9/18) undocking of 25P, the FE-1 unbolted and removed the cargo ship’s US-21 matching unit in its container box, stowed it and recorded the stowage location in the IMS. [The BITS 2-12 onboard telemetry measurement system and VD-SU monitoring mode, turned off for the activity, were later reactivated. The US-21, with its associated commutator gear, provides the electronic interface between the SM and the Progress for SM computer control of Progress propulsion. When a Progress is undocked and jettisoned, the valuable electronics are retained in storage, to be recycled on a future vehicle.]
As next preparatory step for the undocking, the two Russian crewmembers installed
the StM Docking Mechanism (Stykovochnovo mekhanizma) between 25P and the
SM aft port. [The StM is the "classic" probe-and-cone type, consisting of an active
docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the
passive docking assembly (PSA) for initial soft dock and subsequent retraction to
hard dock. The ASA is mounted on the Progress’ cargo module (GrO), while the
PSA sits on the docking ports of the SM, FGB and DC1.]

Third day of onboard network transition: FE-2 Anderson printed out instructional
material for the ongoing upgrading of the OpsLAN network architecture of the ISS to
JSL/ISL (Joint Station LAN/Integrated Station LAN), then had about 3 hrs for final
ISL and EWIS (External Wireless Instrumentation System) hardware installations
and completion of cable connections. [Since the ISL Router power cable was
found to be only one-fault tolerant instead of the required two-fault tolerance, Clay
resolved the issue by installing a bonding strap on the Router, grounding it directly
to the ISS rack structure (the power source itself being grounded with a double-
redundant cable). ISL is an upgraded on-board LAN (Local Area Network) utilizing
Ethernet connectivity over the Router via cable or WAP (Wireless Access Point).
JSL is the designation for the overall network, including IP (International Partner)
hardware and integration, while ISL refers to specifically US hardware. JSL/ISL
integrates all ISS “user” devices, eventually including RS docking video distribution,
payload comm & downlink (from IP modules, e.g., Columbus or Kibo), crew
operations, procedures viewing, email, IP phone, etc. JSL/ISL eliminates drag-
through cables in hatches, will be up to ten times faster than the current OpsLAN,
and has provisions for future modules. Some installation tasks had been moved
earlier to Increment 14.]

Later today (~1:30pm EDT), Clay Anderson will tag up with Flight Controllers in
Houston to discuss tomorrow’s transition to the new OpsLAN architecture. [The
migration will proceed in priority order of OCA, SSC (Station Support Computer)
Client in the SM, File Server, SSC Client in the Lab, and printer. The remaining
OpsLAN devices will follow. At this time, payloads are not ready yet to utilize the
new network, requiring Clay to pre-position two connectors of the main ISL cable at
the base of AV-3 (Avionics Rack 3, LAB1D2).]

Afterwards, the FE-2 will load JSL/ISL OCA Router software on the backup hard
drive (#6070) of a 760XD SSC, then swap #6070 with #5007.

The FE-1 also performed troubleshooting on the Lab RWS PCS (Robotic
Workstation/Portable Computer System) laptop, a ThinkPad A31p that failed
yesterday. Two PCS machines remained operating, one in the SM, the other at the
Cupola RWS. [Today, Clay swapped the Cupola and Lab PCS HDDs (hard disk
drives) with each other to verify that all hardware is functioning at the Lab PCS
Afterwards, Oleg continued the crew support of the MELFI (Minus-Eighty Laboratory Freezer for ISS) facility for POC (Payload Operations Center) by inserting two more Icepac belts into a MELFI dewar (Dewar 2/Tray C), as Clay Anderson did yesterday.  

Icepacs are used as thermal mass to keep samples cold during return and during extended MELFI power downs (e.g. during Soyuz Relocate). No more than two ambient Icepacs may be inserted at any given time into a Dewar that has samples in it, to protect the samples from warm-up.

Clay unstowed and set up the hardware for the flight experiment ANITA (Analyzing Interferometer for Ambient Air), an ESA-developed technology demonstrator for monitoring the quality of the air inside manned space vehicles.

Background: The air quality of any crewed spacecraft needs to be continuously monitored in order to safeguard crew health. The astronauts have to respond rapidly to any accidental release of harmful gaseous contaminants or degradation of the ECLSS (Environmental Control & Life Support System). Air quality monitoring grows in importance as mission duration increases. ANITA is designed to monitor the cabin air for contaminants at concentrations down to the low ppm’s (parts per million) or high ppb’s (parts per billion) with high precision. Its fast measurement cycle allows the trend in air quality to be analyzed in near real-time, simultaneously identifying and quantifying 32 gaseous air contaminants. The experiment should demonstrate that ANITA FTIR (Fourier Transform Infrared) interferometer trace gas monitoring is effective in a real space environment, including the maintenance of calibration models from the ground, and thereby prove that modified commercial-off-the-shelf hardware provides a sound basis for ANITA.

A late-added 45-min. task for Anderson today dealt with the overcurrent trip of RPC-3 (Remote Power Controller 3) in RPCM (RPC Module) LA2A3B late on 9/11. For troubleshooting the event, Clay investigated the affected powerless UOP-3 (Utility Outlet Panel 3), first inspecting the equipment connected to it, then looking for the source of the trip by selective isolation of equipment, i.e., a process of elimination.

Afterwards the FE-2 was scheduled to work on the OGS (Oxygen Generation System), safing a Secondary Power connection by installing divider hardware at a cable/jumper connector interface, with the OGS rack temporarily powered down by ground commanding.

CDR Yurchikhin changed out the tape on the VDS VTR-2 (Video Distribution System/Video Tape Recorder 2) containing the data of the recent FPMU/PCU (Floating Potential Measurement Unit/Plasma Contactor Unit) activity (~9/11) for return to the ground. ISS FPMU data is critical for FPMU verification and
Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, Oleg charged the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (#23). The last test pressurization was done by Yurchikhin on 8/16. **[During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]**

After the recent work on the BSV-M Frequency & Time Synchronization System, whose temporary deactivation required setting the Russian Vozdukh carbon dioxide removal assembly on automatic Mode 1, the FE-1 today switched the CO₂ scrubber back to the standard manual Mode 5.

Kotov performed the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. **[Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. Two CSA-CP (CSA-Combustion Products) instruments recorded O₂, CO, HCN and HCl readings at the SM Central Post (#1060, prime) and in the Node (#1057, backup), while the CSA-O₂ units (#1063, #1042) looked for O₂ in the Lab and the CDMK (#1008) for CO₂ in SM and Lab. Also recorded were battery ticks. The instruments were turned off afterwards, except for the prime CSA-CP #1060 unit, and returned to their regular locations.]**

Oleg also updated/edited the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Fyodor conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).
Later in the afternoon, the FE-1 copies the crew’s exercise data files to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:15am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:40am, Fyodor and Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~9:55am EDT, Clay Anderson had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop).

At ~2:45pm, Clay will power up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 2:50pm a ham radio exchange with students at Westbrook Intermediate School, Clear Creek, TX. Questions to the crew were uplinked by ARISS (Amateur Radio on ISS) beforehand. [“What aspects of life are different in space?”; “After a Shuttle launch, the fuel tank and solid rocket boosters fall from space. What happens to them?”; “How does your body “act” in space? Example: Do you need haircuts?”; “Does seeing space from the scientific point of view spoil the “mystery” of space?”; “There are rumors that a meteor could hit earth in a few years. Is there a possibility that a meteor or space debris could hit ISS?”; “What question are you asked the most?”]

The crew’s regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio will be conducted at ~4:00pm.

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

*Propellant Transfer Update:* Tonight, TsUP/Moscow will conduct propellant line purging/venting of the prop transfer lines between Progress 25P and the SM. Before, Clay Anderson will verify closure of the protective Lab science window shutter (which can be opened again around midnight).
SSRMS Activities: CSA/Robotics specialists continue to work with the SSRMS (Space Station Remote Manipulator System), gathering engineering data from the robotarm’s wrist joint FMS (Force Moment Sensors). When finished, the SSRMS will be returned to the current park position.

Solar Array Drag Reduction: As previewed here on 9/6, the “night glider” BGA (Beta Gimbal Assembly) dual-angle bias setting in sun-pointing autotrack mode was initiated late on 9/11 and is currently maintained whenever possible and permitted by altitude management. [In this mode, the U.S. SAWs (Solar Array Wings) are offset (biased) toward the orbit plane, currently by 37 deg (the maximum Flight Rule-allowed amount) to decrease the surface area facing in flight direction (i.e., velocity vector) and thus the atmospheric drag. The benefit is potential prop savings of 50-60 kg of ISS propellant prior to 10A launch and on the order of two Progress flights per year, which should enable NASA to meet our balance of contributions commitment for 30% drag reduction overall. Flying with this configuration will also increase the expected number of consecutive launch attempts for 10A with FD3 docking from 11 to 15 days, as well as improve reboost planning by providing about a week to assess the drag reduction performance prior to designing the 9/24 reboost.]

Prelim. Timeline of Progress 25P Undocking from SM Aft Port:
Tuesday, 9/18 (EDT):
6:40pm: USOS to RS Attitude Control Handover
8:33pm: ISS to Free Drift
8:34pm: 25P Undock Command
8:37pm: Physical Separation (dV~0.12 m/s)
8:40pm: 25P Separation Burn #1 (dV~0.62 m/s)
8:42pm: ISS maneuvers to LVLH Attitude
9:20pm: RS to USOS Attitude Control Handover.

Today’s CEO (Crew Earth Observation) photo targets were Arkenu 1 and 2 Impact Craters, Africa (ISS had a nadir pass over this pair of impact craters, formed at approximately the same time by the same impact event. The circular features stand out from the surrounding desert and are located due west of two much larger, easily visible circular features; a sequence of overlapping nadir frames acquired along-track should capture the craters), Tropical Depression 8, Atlantic Ocean (Dynamic Event. Looking to the left of track as the station approached Puerto Rico for what is predicted to become Tropical Storm Ingrid. This compact weather system may exhibit good circulation features [cloud bands] by the time of ISS overflight), South American Fires (Dynamic Event. Biomass burning is occurring over much of eastern South America, and the crew had an opportunity to photograph smoke plumes and their sources. Looking to the right of track as they
crossed the Amazon River delta and begin to traverse Brazil for smoke plumes), and Upheaval Dome Impact Crater, Utah (this impact structure presents a classical "bulls eye" appearance from above, caused by the horizontal sedimentary layers exposed by the crater. ISS had a nadir pass over the Canyonlands of southern Utah; overlapping frames acquired along-track should capture the impact structure).

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);  
http://earthobservatory.nasa.gov/  
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit (as of this morning, 8:31am EDT [= epoch]):**
Mean altitude -- 339.5 km  
Apogee height -- 345.7 km  
Perigee height -- 333.2 km  
Period -- 91.32 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.0009329  
Solar Beta Angle -- -5.4 deg (magnitude decreasing)  
Orbits per 24-hr. day -- 15.77  
Mean altitude loss in the last 24 hours -- 62 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50487

Significant Events Ahead (all dates Eastern and subject to change):
09/15/07 -- U.S. Solar Array Efficiency Test  
09/18/07 -- Progress M-60/25P undocking (SM aft port) -- 8:34pm  
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous on FD3)  
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)  
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**  
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)  
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)  
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)  
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5  
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)  
11/03/07 -- STS-120/Discovery/10A undocking  
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/14/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
All ISS systems continue to function nominally, except those noted previously or below.

Working two hours in the DC1 (Docking Compartment), FE-1 Kotov performed FDS (Fire Detection System) maintenance by dismantling two of the three IDZ-2 smoke detectors (skipping #2), cleaning their ionizing needles and then reinstalling the sensors.

After yesterday’s ground-controlled test of the two BSV-M Frequency & Time Synchronization Unit (i.e., master clock) boxes A1 & A2 in the SM (Service Module), CDR Yurchikhin changed their cable connections back to the initial configuration, supported by ground specialist tagup.

FE-2 Anderson had two hours reserved for conducting the periodic inspection of the ELPS (Emergency Lighting Power Supply) units in the U.S. segment. After the inspection, Anderson installed a fastener missing from a handrail seat track on an associated Node closeout panel. [There are three ELPS units in the Node, two in the Lab, and one ELPS in the US Airlock.]

The FE-2 also performed Part 5 (of 5) of the periodic acoustic measurement protocol conducted during the past two days, by recording final data of the static dosimeters in the station, then stowing the hardware. [EHS (Environmental Health System) Acoustic Dosimeter data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]

Afterwards, Anderson had three hours allotted to complete work with the installation procedures for the new ISL (Integrated Station LAN) network, involving stringing cables, making all Router connections and concluding with the installation of the internal antenna of the EWIS (External Wireless Instrumentation System). On Saturday (9/15), the long-awaited OpsLAN transition will be performed from the
At completion today, the Lab ISL should be fully connected to the Node, Airlock and the Russian Segment (RS). ISL is an upgraded on-board LAN utilizing Ethernet connectivity over the Router via cable or wireless (WAP/Wireless Access Point). ISL integrates all ISS “user” devices, eventually including RS docking video distribution, payload comm & downlink (from IP modules, e.g., Columbus or Kibo), crew operations, procedures viewing, email, IP phone, etc. ISL eliminates drag-through cables in hatches, will be up to ten times faster than the current OpsLAN, and has provisions for future modules. Some installation tasks had been moved earlier to Increment 14, and although transition is scheduled for this weekend, payloads are not ready yet to utilize the new network, requiring Clay to pre-position two connectors of the main ISL cable at the base of AV-3 (Avionics Rack 3, LAB1D2).

In the Soyuz TMA-10/14S spacecraft, docked at the FGB nadir port, Yurchikhin turned off the spacecraft’s gas analyzer (GA) which was activated on 9/10, a periodic procedure to monitor the atmosphere of the CRV (Crew Return Vehicle).

Fyodor and Oleg had another ~6 hrs allotted between them for finishing up stowing discarded equipment and trash in the Progress M-60/25P cargo ship-turned-trash container, keeping track of the movements in the IMS (Inventory Management System).

The CDR worked on updating/editing the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Afterwards, Yurchikhin also performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Continuing his support of the MELFI (Minus-Eighty Laboratory Freezer for ISS) facility for POC (Payload Operations Center), Clay inserted two more Icepac belts into a MELFI dewar (Dewar 1/Tray B). [Icepac are used as thermal mass to keep samples cold during return and during extended MELFI power downs (e.g. during Soyuz Relocate). No more than two ambient Icepac may be inserted at any given time into a Dewar that has samples in it, to protect the samples from warm-up.]

Kotov conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week (currently: #15-0027X). The update records any changes in CWC status over the last few days and provides the data to MCC-Houston.]
Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second task from the voluntary work list for Oleg was the regular status check on the long-term BIO-5 Rasteniya-1 (“Plants-1”) micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (FE-1), TVIS treadmill (CDR, FE-2), RED resistive exerciser (FE-1, FE-2) and VELO cycle with bungee cord load trainer (CDR).

Later in the afternoon, the FE-2 copies the crew’s exercise data files to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Propellant Transfer Update: TsUP/Moscow was scheduled today to perform transfer of fuel (UDMH, unsymmetrical dimethyl hydrazine) from the Progress M-61/26P cargo ship’s BG1,2 refueling tanks to the SM’s BG2 tank, while pumping out N₂ using the K1 compressor. No crew action was required. [M-60/25P prop line purge/vent is scheduled tomorrow.]

SSRMS Activities: Today and tomorrow CSA/Robotics specialists on the ground are busy reconfiguring SSRMS (Space Station Remote Manipulator System) wrist joints in order to gather engineering data from the FMS (Force Moment Sensor). When finished, the SSRMS will be returned to the current park position.

Solar Array Drag Reduction: As previewed here on 9/6, the “night glider” BGA (Beta Gimbal Assembly) dual-angle bias setting in sun-pointing autotrack mode was initiated late on 9/11 and is currently maintained whenever possible and permitted by altitude management. [In this mode, the U.S. SAWs (Solar Array Wings) are offset (biased) toward the orbit plane, currently by 37 deg (the maximum Flight Rule-allowed amount) to decrease the surface area facing in flight direction (i.e., velocity vector) and thus the atmospheric drag. The benefit is potential prop savings of 50-
60 kg of ISS propellant prior to 10A launch and on the order of two Progress flights per year, which should enable NASA to meet our balance of contributions commitment for 30% drag reduction overall. Flying with this configuration will also increase the expected number of consecutive launch attempts for 10A with FD3 docking from 11 to 15 days, as well as improve reboost planning by providing about a week to assess the drag reduction performance prior to designing the 9/24 reboost.]

Prelim. Timeline of Progress 25P Undocking from SM Aft Port:
Tuesday, 9/18 (EDT):
6:40pm: USOS to RS Attitude Control Handover
8:33pm: ISS to Free Drift
8:34pm: 25P Undock Command
8:37pm: Physical Separation (dV~0.12 m/s)
8:40pm: 25P Separation Burn #1 (dV~0.62 m/s)
8:42pm: ISS maneuvers to LVLH Attitude
9:20pm: RS to USOS Attitude Control Handover.

Today’s CEO (Crew Earth Observation) photo targets were Afar Rift Zone, Ethiopia (looking to the right of track as ISS approached the "elbow" formed by the Red Sea and Gulf of Aden - the area to the west of the elbow is the Afar Rift Zone [also known as the Afar Triangle]. This geologically active region is a junction between the Arabian, Indian, and African tectonic plates - all of which are moving away from each other, producing frequent earthquakes and historically active volcanoes [such as Erta Ale in Ethiopia]. Overlapping frames of the Afar Triangle area will provide a useful record of the rift area, particularly surface expressions of faults and lava flows), and Shortgrass Steppe, Colorado (this LTER [Long Term Ecological Research] site is located in the western Great Plains near the front ranges of the Rocky Mountains. Land uses in the site area are varied, ranging from active grazing parcels to federally protected lands - leading to a dynamic range of ecosystem processes. Overlapping nadir frames, acquired along-track, were requested in order to document vegetation and land use patterns in the site area).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 8:15am EDT [= epoch]):
Mean altitude -- 339.5 km
Apogee height -- 345.6 km
Perigee height -- 333.4 km
Period -- 91.32 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0009066
Solar Beta Angle -- -9.9 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 62 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50471

**Significant Events Ahead (all dates Eastern and subject to change):**
09/13/07 -- Progress M-61/26P prop transfer (fuel) to ISS
09/14/07 -- Progress M-60/25P prop line purge/vent
09/18/07 -- Progress M-60/25P undocking (SM aft port) -- 8:34pm
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**
10/04/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
**new date**
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab **new date**
11/14/07 -- US EVA-10 **new date**
11/18/07 -- US EVA-11 **new date**
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/12/07

All ISS systems continue to function nominally, except those noted previously or below.

Right after wake-up FE-2 Anderson started Part 3 (of 5) of the periodic acoustic measurement protocol by recording post-sleep data of the crew-worn acoustic dosimeters, later deploying the dosimeters statically in the station for the duration of the day, then recording measurements this afternoon (~3:10pm EDT) and stowing the instruments.  [Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]

Afterwards, Anderson began a major three-day outfitting activity, totaling about 10 hrs, to complete hardware installations for the new ISL (Integrated Station LAN) network, with the long-awaited OpsLAN transition to be performed by the ground next Saturday (9/15).  [After powering up the SVG (Space Video Gateway) for its subsequent updating by the ground for the transition, the FE-2 went to work replacing the existing Router mount with new mounting hardware, swapped an AV-2 (Avionics Rack 2, LAB1D1) closeout panel with a new one, and installed the majority of new EWIS (External Wireless Instrumentation System) internal components (i.e., NCU/Network Control Unit & its base plate).  Tomorrow and on Friday, Clay’s work will involve completion of cable stringing plus making all Router connections.  At completion, the Lab ISL should be fully connected to the Node, Airlock and the Russian Segment (RS).  ISL is an upgraded on-board LAN utilizing Ethernet connectivity over the Router via cable or wireless (WAP/Wireless Access Point).  ISL integrates all ISS “user” devices, eventually including RS docking video distribution, payload comm & downlink (from IP modules, e.g., Columbus or Kibo), crew operations, procedures viewing, email, IP phone, etc.  ISL eliminates drag-through cables in hatches, will be up to ten times faster than the current OpsLAN, and has provisions for future modules.  Some installation tasks had been moved earlier to Increment 14, and although transition is scheduled for this weekend, payloads are not ready yet to utilize the new network, requiring Clay to pre-position...
two connectors of the main ISL cable at the base of AV-3 (Avionics Rack 3, LAB1D2).

After switching the COA (Atmosphere Purification System) Vozdukh CO2 scrubber to autonomous (automatic cycle control) mode, CDR Yurchikhin worked on the two BSV-M Frequency & Time Synchronization Unit (i.e., master clock) boxes A1 & A2, changing cable connections for a ground controlled test. The initial cable configuration will be restored tomorrow.

FE-1 Kotov meanwhile performed scheduled IFM (in-flight maintenance) on the SM (Service Module)’s condensate water processor (SRV-K2M) by removing and replacing its water-conditioning unit purification columns (BK BKV). The old unit was disposed of in Progress 25P. [The SRV-K2M converts collected condensate into drinking water and dispenses the reclaimed water (warm and hot) for drinking and preparation of food and beverages.]

Oleg Kotov also completed the periodic (about twice a month) replenishing of the Elektron’s water supply for electrolysis, filling the KOV thermal loops’ EDV container with water collected in CWC (Contingency Water Container) #1051 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

The CDR collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH4), Ammonia (NH3), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO2), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]

After Flight Controllers deactivated the CDRA (Carbon Dioxide Removal Assembly) early this morning (3:00-8:00am EDT), and cooling was no longer required, Yurchikhin demated and took down the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper.

The Russian crewmembers had 6 hrs allotted between the two of them for finishing up stowage of discarded equipment and trash in the Progress 25P cargo ship-turned-trash container, keeping track of the movements in the IMS (Inventory Management System).

In the U.S. Airlock, Clay Anderson supported the current periodic (50-day) maintenance/reconditioning cycle of U.S. EMU (Extravehicular Mobility Unit) batteries by terminating discharge on the final battery set (#2077, #2038) in the
BSA (Battery Stowage Assembly).  [Afterwards, the A31p SSC with its commercial DOS application for automated control of the process was reconfigured to its nominal settings.]

Oleg also performed the periodic data collection and downlink on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

Clay conducted the periodic status checkup & filter inspection of the running CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload.  [The incubator is controlled from the ground with automatic video downlinked to Earth.]

Working from the Russian discretionary “time permitting” task list, the FE-1 completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Kotov performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the periodic checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1.

Anderson conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) with canister cords and accessory straps as well as the canister bolts for re-tightening if required.

The crewmembers worked out according to their regular daily physical exercise program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2) and VELO cycle with bungee cord load trainer (FE-1).

Later in the afternoon, the FE-2 will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:05am EDT, the crew held a teleconference via Ku- & S-band with members of the next ISS crew, Expedition 16.  [These exchanges have the purpose to begin the handover process prior to the arrival on orbit of the next crew, through videocons and data exchanges between the current crew and the upcoming crew.  Starting in October, Expedition 16 will involve Commander Peggy A. Whitson, Flight
Engineers Yuri Malenchenko, Daniel M. Tani, Léopold Eyharts and Garrett E. Reisman, plus Malaysian SFP (Spaceflight Participant) Sheikh Muszaphar Shukor.

At ~10:55am, Clay powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 11:00am a ham radio exchange with students at King Academy (formerly Alexander Macomb Academy), Mount Clemens, Michigan. Questions to the crew were uplinked by ARISS (Amateur Radio on ISS) beforehand. [Mt. Clemens, Michigan, is located NE of Detroit and is the county seat of Macomb County. Originally settled in 1818, Mt. Clemens was widely known in the early 20th century for its pungent and therapeutic mineral baths. King Academy of Year-Round Education is one of three elementary schools under the jurisdiction of Mount Clemens Community Schools. “How do you eat? Does the food fly around?”; “Have you seen any different creatures in space?”; “How do you write to a friend?”; “How do you wash up?”; “Do you have a hard time putting on your clothes in space?”; “How do you stay mentally healthy?”]

Propellant Transfer Update: TsUP/Moscow was scheduled today to perform transfer of oxidizer (N₂O₄, nitrogen tetroxide) from the Progress M-61/26P cargo ship’s BG1,2 refueling tanks to the SM’s BO2 tank, and to pump out N₂ using the K2 compressor. No crew action was required. [Transfer of fuel (UDMH, unsymmetrical dimethyl hydrazine) from 26P is scheduled for tomorrow, followed by M-60/25P prop line purge/vent on Friday.]

Prelim. Timeline of Progress 25P Undocking from SM Aft Port:
Tuesday, 9/18 (EDT):
6:40pm: USOS to RS Attitude Control Handover
8:33pm: ISS to Free Drift
8:34pm: 25P Undock Command
8:37pm: Physical Separation (dV~0.12 m/s)
8:40pm: 25P Separation Burn #1 (dV~0.62 m/s)
8:42pm: ISS maneuvers to LVLH Attitude
9:20pm: RS to USOS Attitude Control Handover.

Today’s CEO (Crew Earth Observation) photo targets were S. Mozambique, Africa (detailed imagery along-track was requested to document the current ecosystem conditions in the region. Southern Mozambique is an active petroleum exploration/development target, and rapid urbanization is expected to occur in the region following petroleum industry infrastructure. ISS CEO imagery will allow for time-series comparison of changes to the landscape as development occurs), Milk River, Montana (this river was named by Meriwether Lewis during the famous Lewis and Clark Expedition due to its milky appearance - caused by a high
proportion of silty sediment in the water. ISS orbit track took the crew directly over the river; they were asked to look for the Bear Paw Mountains and Missouri River to the SW and S respectively as they approached the target area from the NW. Overlapping frames were requested along-track in order to build an image mosaic of this historic site), **Luquillo Forest, Puerto Rico** (weather was predicted to be mostly clear over NE Puerto Rico, the location of the Luquillo National Forest. The Forest is also the location of a Long Term Ecological Research [LTER] site. Overlapping nadir frames, taken along-track, were requested to document vegetation extent and shoreline morphology. The crew was to start image acquisition as ISS approached the NE tip of the island from the NW), and **Andrews Forest, Washington** (the Andrews Forest LTER site investigates forest stand dynamics due to both logging activities and fires – the major valley/agricultural fields of western Oregon, and three major Cascade Range volcanoes are good visual cues for the site area. Overlapping nadir frames, acquired along-track, were requested to map current canopy extent and vegetation regrowth patterns. Starting photography after ISS crossed the agricultural fields to the west, as soon as it passed over the crest of the Cascades).

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);  
http://earthobservatory.nasa.gov/  
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** *(as of this morning, 7:57am EDT [= epoch]):*
Mean altitude -- 339.6 km  
Apogee height -- 345.5 km  
Perigee height -- 333.7 km  
Period -- 91.33 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.0008755  
Solar Beta Angle -- -14.2 deg (magnitude decreasing)  
Orbits per 24-hr. day -- 15.77  
Mean altitude loss in the last 24 hours -- 75 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50455

**Significant Events Ahead (all dates Eastern and subject to change):**  
09/13/07 -- Progress M-61/26P prop transfer (fuel) to ISS  
09/14/07 -- Progress M-60/25P prop line purge/vent  
09/18/07 -- Progress M-60/25P undocking (SM aft port) -- 8:34pm  
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous
on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/05/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/07/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/19/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/?/?/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, FE-2 Anderson began Part 1 (of 5) of the periodic acoustic measurement protocol by deploying crew-worn acoustic dosimeters, to be carried for 24 hours (with a microphone on the shirt collar). (Last time done: 6/28). [Tonight, after about 15 hours of measurements, dosimeter data will be downloaded and the hardware power-cycled for another data take starting tonight after 8.5-hr. sleep. At that point, the crew will deploy the dosimeters statically in the station for the duration of the day, record measurements tomorrow noon and stow the instruments. Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]

CDR Yurchikhin and FE-1 Kotov had an hour reserved for removing and replacing 11 SD-17 power supplies for lighting units in the RS (Russian Segment). [The R&Rs involved 5 lights in the SM and 6 lights in the FGB. The new spares were delivered on Progress M-59/24P this year and M-57/22P in 2006.]

As part of the recent SUBA (Onboard Equipment Control System) outfitting in the SM (Service Module), Oleg Kotov made additional cable connections and used the “Elektronika” MMTs01 Multimeter for final connectivity testing of the newly installed PPS-31 System Power Panel and BSKN-25 Load Power Switching Unit, both required to support the installation of additional power outlets in the RS.

Afterwards, Kotov supported the ground in reactivating the Elektron oxygen generator, which had to be turned off for the preceding SUBA outfitting because it required temporary disconnection of the BiTS2-12 Onboard Telemetry Measurement System and VD-SU control mode. [Reactivation was at 32 amps, and as usual Oleg monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no
overheating. During nominal operations a gas analyzer is utilized to detect hydrogen \((H_2)\) in the \(O_2\) line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

After yesterday’s PCSR10U OBT (Onboard Training) session, Clay Anderson transitioned PCS (Portable Computer System) A31p laptops to new PCSR10U software. [Starting with the Cupola RWS (Robotic Workstation) and A/L (Airlock) laptops, the FE-2 swapped the PCS HDDs (Hard Disk Drives) with new plug-in drives containing the software; he also replaced the main batteries of the laptops with fresh ones. After verifying good connections to the C&C MDM (Command & Control Multiplexer/Demultiplexer), Clay then upgraded the other two PCS A31p machines (Lab & SM). The CUP and A/L PCSs were later powered down, and the ground will be loading software to the Node MDMs to complete the transition. The main change for the PCS R10U version is the addition of a CCS (Command & Control System) Restart Domain, used via the Node MDMs in the event that the legacy “Mighty Mouse” application, a special resident last-resort/fail-safe software package for recovering after C&C MDM failure, has failed to do so.]

To reflect the computer changes in the SODF (Station Operation Data File) Caution & Warning procedures, the FE-2 replaced relevant pages in the POC (Portable Onboard Computer) book, trashed the old pages and restowed the book.

In the A/L, Anderson supported the current periodic (50-day) maintenance/reconditioning cycle of U.S. EMU (Extravehicular Mobility Unit) batteries, terminating discharge on batteries #2063 & #2041 in the BSA (Battery Stowage Assembly) and initiating it on batteries #2077 & #2038. [Afterwards, the A31p SSC with its commercial DOS application for automated control of the process was to be returned to nominal configuration.]

Last day of the two-week testing of the Russian ASN-M Satellite Navigation Equipment by TsUP-Moscow, supported onboard by CDR Yurchikhin. [After a final transfer of accumulated raw data from the ASN application on Laptop 3 (LT3) to a 128MB flash card for subsequent downlinking via OCA/S-band for ground processing, Fyodor disassembled the hardware and stowed it along with LT3. ASN-M will be required for proximity operations and docking of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne” to the SM aft end, currently planned for 2/14/08. The ground-controlled testing simulated the ATV rendezvous phase using the ASN system, and its results are being used to assess the ASN-M equipment’s readiness for joint ATV operations.]

The FE-2 serviced the MULTIGEN experiment (Molecular & Plant Physiological Analyses of the Microgravity Effects on Multigenerations of Arabidopsis thaliana),
installed in the EMCS (European Modular Cultivation System), by first switching off the ER3 (EXPRESS Rack 3), then replacing the EMCS water reservoir in order to supply the plants with sufficient water for the upcoming months, and afterwards switching ER3 on again.  

*MULTIGEN was activated on 8/25. This ESA experiment evaluates the morphology of A. thaliana over three generations. The plants growing in EMCS right now are the First Generation of A. thaliana to be grown on ISS. A. thaliana, commonly know as Thale Cress, is a model organism to study genetic morphological events since its genome has been mapped and is widely used in genetic and molecular research. MULTIGEN studies the morphological and genetic effects of microgravity on plants, which will be grown to maturity (7-8 weeks) and then dried and stored for return to Earth. Some of the seeds that are returned will be used in ground studies and others will be returned to ISS for the Second Generation of growth. The Second Generation’s seeds will be analyzed genetically and also used for a Third Generation of plants on ISS. Ultimately, the data collected from this multigenerational experiment could be applied to future agriculture endeavors for long-duration space flight.*

Yurchikhin and Kotov had another two hours set aside for stowing discarded equipment on Progress 25P for disposal, keeping track of the movements in the IMS (Inventory Management System). In addition, Anderson had 1.5 hrs allotted for gathering U.S. trash for disposing on the cargo ship-turned-trash can.  

*[25P will be undocked next week, 9/18.]*

Oleg conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Afterwards, the FE-1 worked on updating/editing the standard daily IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

After last week’s major semi-annual maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), Anderson configured the video equipment in the SM for filming his and Fyodor’s subsequent TVIS workout, for biomechanical assessment of the hardware status by ground engineers. After downlinking the video at ~10:15am EDT, Clay dismantled and stowed the camera equipment.

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS (CDR, FE-1, FE-2), RED resistive exerciser (FE-1, FE-2), and VELO cycle with bungee cord load trainer (CDR).

Later today, Oleg will transfer the crewmembers’ exercise data file to the MEC
(Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  *This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.*

A second task from the Russian voluntary work list for Oleg was the regular status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

*Saturday Science Preview:*  Two optional activities for the voluntary “Saturday Science” program on the Sunday and Monday (9/16-17) were suggested to Clay for his choice.  His selection is required by tonight.  *The two choices are (1) EPO (Educational Payload Operation) Kit C Plant Growth experiment, voice and video; and (2) BCAT-3 (Binary Colloidal Alloy Test-3) Magnet Unstick, using the CGBA-4 (Commercial Generic Bioprocessing Apparatus 4), powered up 12 hrs before.*

*External OpsLAN Test:*  Yesterday, FE-1 Kotov confirmed connectivity of EVA-installed LAN (Local Area Network) cables between the Node and the SM.  Oleg relocated the SSC-3 laptop from the SM to the Node, connected it to OpsLAN (Operations LAN)/Ethernet in the Node and successfully “pinged” (i.e., sent a signal to) the Russian BRI Smart Switch Router in the SM.

*Propellant Transfer Update:*  TsUP/Moscow was scheduled today to perform Progress M-60/25P propellant transfer from the cargo ship’s KDU refueling system to the low-pressure fuel and oxidizer tanks (BNDG & BNDO) 1, 2, 3 in the FGB module.  No crew action was required.  *Propellant transfers from Progress M-61/26P are scheduled for tomorrow and Thursday.*

*BCC Checkout Update:*  Last night, the ground initiated the two-hour standard checkout of BCC (Backup Control Center) Swing and Activation procedures that would be necessary in the event of a flight control transfer from Houston to the HSG (Houston Support Group) at TsUP/Moscow.  The checkout, which did not involve the crew, included PPCP (PrePlanned Command Package) uplinks from MCC-H via RS ground station.
Today's CEO (Crew Earth Observation) photo targets were **Kabul, Afghanistan** (weather was predicted to be clear over the capital of Afghanistan. ISS orbit track was directly over the urban center, which is in a valley bounded by high mountain ranges to the W, NE, and SE. Overlapping nadir frames acquired along-track as the station approached, passed over, then left the urban center were requested. This will provide a rural-urban-rural land cover transect across the city), **Vredefort Impact Crater, S. Africa** (ISS had a nadir pass over this large impact structure. Regional context imagery of the impact structure [overlapping nadir frames along-track] with the 180 mm lens will complement earlier detailed imagery of the crater), and **Mt. Whitney, California** (the highest peak in the contiguous United States, Mt. Whitney is one of the peaks of the Sierra Nevada. Looking to the left of track as the station approached the Sierra from the WNW; overlapping frames acquired as ISS traversed the range were to include Mt. Whitney. Imagery of the Sierra Nevada taken now will help provide a baseline for estimation of this coming winter’s snowfall on the mountains).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** *(as of this morning, 8:59am EDT [= epoch]):*
Mean altitude -- 339.6 km
Apogee height -- 345.5 km
Perigee height -- 333.8 km
Period -- 91.33 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0008665
Solar Beta Angle -- -18.8 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 66 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50440

Significant Events Ahead *(all dates Eastern and subject to change):*
09/12/07 -- Progress M-61/26P prop transfer (oxidizer) to ISS
09/13/07 -- Progress M-61/26P prop transfer (fuel) to ISS
09/14/07 -- Progress M-60/25P prop line purge/vent
09/18/07 -- Progress M-60/25P undocking (SM aft port)
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous
on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- **50 Years of Spaceflight (Sputnik 1)**
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/19/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
01/31/08 -- **50-Year Anniversary of Explorer 1** (1st U.S. satellite on Redstone rocket)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- ATV-1 docking (SM aft port)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/10/07

All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 21 of Increment 15.

FE-1 Oleg Kotov continued the recently started dismantling of no-longer-needed SUD/MCS (Motion Control System) hardware in the FGB, to create new storage space, today focusing on CC-16A equipment. [The FGB SUD provided attitude control to the ISS until the SM (Service Module) arrived in July 2000 and took over that function.]

CDR Fyodor Yurchikhin supported ground specialists at TsUP-Moscow in a checkout of two Network Channel Controllers (KSK1,2) of the Russian Onboard Computer System (BVS), in preparation for ATV (Automated Transfer Vehicle) arrival next March. [BVS is the backbone of the BKU Onboard Control Complex which consists of BVS, SUDN (Motion Control & Navigation System) and SUBA (Onboard Equipment Control System). The two redundant KSK units are used to provide the electrical data signals for transmission through docking assemblies, i.e., beyond the normal physical limitations of a data bus (MKO, equivalent to U.S. 1553B standard).]

FE-2 Clay Anderson had another three hours reserved for unpacking equipment delivered by STS-118/13A.1, while the CDR spent about two hours on stowing discarded hardware on Progress M-60/25P for disposal, keeping track of the movements in the IMS (Inventory Management System). [25P will be undocked next week, 9/18.]
Yurchikhin set up the Russian biomedical "Pilot" experiment (MBI-15), which requires a table, ankle restraint system, electrodes, and two hand controllers (RUP) for testing piloting skill in "flying" simulations on a laptop (RSK1) under stopwatch control. He then conducted the experiment for the second time this Increment, supported by tagup with ground specialists via S-band. The Pilot-SMP-P gear was left in place, to be used next by FE-1 Kotov.  

[Fyodor had to perform three flight control modes (fixed, slow and fast free-flyer), each one at least five times, after checkout and calibration of the control handles.]

Anderson worked on ER4 (EXPRESS Rack 4), first swapping its older 760XD ELC (ER4 Laptop Computer) with a ThinkPad A31p machine, then upgrading the new ELC and the ER4 RIC (Rack Interface Controller) with a new software load (v. 2.030).

The FE-2 also completed the downloading of accumulated IWIS (Internal Wireless Instrumentation System) data from 13A and 13A.1 data takes, from RSUs (Remote Sensor Units) #1035 & #1028.

Yurchikhin used the CMS (Counter Measure System) to take readings of potentially harmful contaminants in the SM. The hardware was then returned to initial stowage.  

[The CMS uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip.]

In the Soyuz TMA-10/14S spacecraft, docked at the FGB nadir port, Yurchikhin turned on the spacecrafts gas analyzer (GA), a periodic procedure to monitor the atmosphere of the CRV (Crew Return Vehicle).

In preparation for storing FPMU (Floating Potential Measurement Unit) activity data, the CDR exchanged the tape on the VTR2 (Video Tape Recorder #2).  

[ISS FPMU data is critical for FPMU verification and calibration, an important backup to the external PCUs (Plasma Contactor Units) to gage EVA hazard.]

In the U.S. Airlock, Clay Anderson supported another periodic (50-day) maintenance/reconditioning cycle of U.S. EMU (Extravehicular Mobility Unit) batteries #2063 & #2041).  

[Instead of the earlier 760XD laptop, Clay switched to an A31p SSC (Station Support Computer) with a commercial DOS application from floppy boot disk for automatically controlling the discharge in the BSA (Battery Stowage Assembly), with the BCs (Battery Chargers) switched to
While in the Airlock, Clay performed an inspection of an EVA ratchet wrench after the STS-118 spacewalks, and also reviewed procedural OBT (Onboard Training) material for SAFER (Simplified Aid For EVA Rescue) troubleshooting.

The crew took reviewed OBT material to get acquainted with the advanced PCSR10U interface offered by their new PCS (Portable Computer System) laptop software upgrade which among else provides some improved functionality in dealing with controlling MDMs (Multiplexer/Demultiplexers).

Oleg Kotov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off the discretionary “time permitting” task list, Fyodor updated/edited the standard IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later this afternoon, the CDR will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” task list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

For Fyodor and Oleg, TsUP/Moscow also has designated two recurring tasks as “get-ahead” jobs, to be hard-scheduled at a later time: (1) an audit/inspection behind stowage panels in the ISS Russian segment (RS), to assess available
stowage room, and (2) to continue shooting photo/video footage of the RS modules’ interiors.

**Russian Thermal Control System Update:** Since the 8/29 failure of the N1 pump on pump panel 4SPN1 of the Russian KOB-2 heating loop, KOB-2 has been functioning on one pump, while on loop 1 (KOB-1), both pump panels continued to run nominally. But last Friday (9/7), pump N2 failed on KOB-1, similar to the KOB-2 failure. Thus, each of the two KOB loops has now only one pump functioning. RSC-Energia is working to manifest replacement pumps as early as the next Soyuz launch (15S, on 10/10).

No CEO (Crew Earth Observation) photo targets uplinked for today.

04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/09/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday -- off-duty day for the crew except for housekeeping and voluntary work. Ahead: Week 21 of Increment 15.

FE-1 Oleg Kotov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Kotov also gathered weekly data on total operating time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s SOGS air revitalization subsystem for reporting to TsUP.

CDR Fyodor Yurchikhin continued his support of TsUP/Moscow in the ongoing two-week testing of the Russian ASN-M Satellite Navigation Equipment. [As per standard procedure, Fyodor first temporarily closed down the data collection & saving application on Laptop 3, then copied the accumulated data to a 128MB flash card for subsequent downlinking via OCA/S-band for ground processing, and later re-started the application to continue collecting the raw ASN-M test data. ASN will be required for proximity operations and docking of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne” to the SM aft end, currently planned for 3/3/08. The ground-controlled testing simulates the ATV rendezvous phase using the ASN system, and its results will be used to assess the ASN-M equipment’s readiness for joint ATV operations.]

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).
Oleg Kotov has three voluntary jobs on the Russian “time permitting” task list for today:

1. The regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). 
   [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]
2. The standard health check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module; and
3. Another run of the Russian "Diatomeya" ocean observations program, using the NIKON-F5 (85 mm lens) still camera and the Sony DSR PD-150P camcorder to obtain imagery of color bloom and cloud pattern anomalies from SM window #7. 
   [Photo targets were the Western section of the Black Sea, with the Danube estuary and wakes of turbulent water area in plankton fields of the Anatolian coastal area of Turkey, the Indian Ocean along the track, with the Oman coastal area and the commercial-production area west of Australia; and the Atlantic along the track from Newfoundland to the Western Sahara coastal area.]

For CDR Yurchikhin, the discretionary task list for today called for another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on nature.

   [Photo targets were glaciers located to the north of Lake Issyk-Kul, the largest glaciers of Tien-Shan flowing to the west in Kirghizia, the Kalmyk Steppe in nadir on both sides of the track, the Delta branch of the Volga river, and, if detected, oil spills in the Caspian Sea.]

At ~4:07pm EDT, Clay Anderson is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop).

SAME Update: Clay was thanked by POC (Payload Operations Center, Huntsville) for his excellent work yesterday on the Smoke Aerosol Measurement Experiment payload. “We have completed our ground checkout and will be starting a SAME sample run today. We will keep you up to date on how it goes. Your next SAME activity is planned for next Friday after we have processed all six samples and are ready to power down the rack.”
No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/08/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson except for housekeeping and voluntary work.

The crew conducted the regular weekly three-hour task of thorough station cleaning. ["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

As part of the house cleaning, the CDR and FE-1 performed preventive maintenance cleaning on the VPkhO, VdPrK & VPrK grilles plus V3 fan in the DC1 (Docking Compartment).

Oleg also gathered weekly data on total operating time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s SOGS air revitalization subsystem for reporting to TsUP.

Getting one step closer to starting SAME (Smoke Aerosol Measurement Experiment) operations, FE-2 Anderson reviewed familiarization material for the experiment, then installed the equipment in the MGS (Microgravity Glovebox). [Preparations included setting up the video gear, performing a leak check on the MGS VES (Vacuum Exhaust System) and GN2 (Gaseous Nitrogen) connections, and installing the sample carousel, alcohol wick and thermal precipitator, as CDR Yurchikhin took documentary imagery. The first run of SAME will be performed tomorrow after an overnight six-hour checkout by ground specialists. SAME creates smoke from common spacecraft materials in micro-G and then measures]
three of the most significant aspects of the resulting aerosol: (1) the number count density, (2) the collective, summed diameter of the particles, and (3) the mass density. The responses of the smoke detectors currently in use on the Shuttle and the ISS will also be measured. The data will be used to verify a mathematical model that has been developed to predict the size, density and concentration of these and other materials in a similar environment as well as providing specific, empirical design criteria for the development of the next generation of space-based smoke detectors. SAME components in the MSG WV (Work Volume) include two mounting plates (Diagnostics Mounting Plate & Experiment Support Plate), Fluids Control Unit, Data Acquisition & Control Unit, Aging Chamber, Sample Carousel, cables, connectors, etc.

Anderson also provided the daily servicing of the EPO (Educational Program Operation) “Kit C” project, today taking photographs to document the growth of basil and lettuce plants in zero-G.

After lunch (~9:40am), Clay filled out the regular FFQ (Food Frequency Questionnaire), his tenth, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

Anderson undertook the periodic (~monthly) PEP (Portable Emergency Provisions) safety inspection which was deferred yesterday when the crew ran late on the timeline. [The IMS (Inventory Management System)-supported inspection involves verification that PFEs (portable fire extinguishers), PBAs (portable breathing apparatus), QDMAs (quick-don mask assemblies) and EHTKs (extension hose/tee kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware. In the U.S. segment (USOS), there are a total of 5 PFEs and 7 PBAs, plus 7 QDMAs and 4 EHTKs. Additionally, Clay used a piece of tape to mark a QDMA, which has an earpiece that failed during 13A.1/EVA-2 but is otherwise fully functional as breathing aid.]

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later in the afternoon, Clay will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the
HRM storage medium (done six times a week).

Working from the discretionary “time permitting” task list, Oleg Kotov completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second voluntary job for Kotov was to use the Nikon D1X (SIGMA 300-800mm telephoto lens) to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON). [KPT-3 photography has been a frequent earth observing experiment for ECON.]

Also as one of the “job jar” tasks for today, CDR Yurchikhin conducted another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on nature. [Today's Uragan photo targets were the Kursk Steppe, strip photography, pinpointed to nadir with overlapping shots, of farm lands to the south of Voronezh, the coast line of the northern part of the Lesser Aral Sea, the dam separating the Lesser Aral from the main body of the lake, the end of glaciers flowing toward Afghanistan and located to the west of Fedchenko Glacier, peaks of the Himalayas, the western slopes of the Carpathian mountains, the Kerch Strait and Taman peninsula, strip photography of the main Caucasus ridge forest cover and of glaciers near Teberda-Dambai, the Kolka glacier, woodlands on the northern slope of Lake Sevan, oil spills in the Caspian Sea, forest fires in Greece, the island of Lesbos in nadir, and cities of Israel.]

At ~9:10am EDT, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

The CDR and FE-1 had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop), Fyodor at 7:40am EDT, Oleg at 8:45am.

**FGB SAW Retraction Preview:** Integration & safety analyses are underway at Moscow and Houston for the upcoming retraction of FGB solar array wings before STS-118/10A. During 10A/docked, the ISS starboard radiators will be deployed, followed by the port radiators shortly after 10A. These radiators provide the increased heat rejection required to support the addition of the ESA Columbus and
JAXA Kibo modules, but to avoid physical contact with the radiators, the FGB arrays must be completely retracted. Since the FGB arrays provide two-failure-tolerant electrical power to the FGB, their retraction will make the FGB solely dependent upon USOS (U.S. Segment) power feeds, although there is also a contingency electrical jumper available to reconnect USOS power to the FGB ARCU (American-to-Russian Converter Unit, for converting from U.S. 124V to Russian Segment 28V), which may bypass some USOS electrical failure conditions.

**Weekly Science Update (Expedition Fifteen -- 19th)**

*ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):* Next and last session in Inc15 is for card exchange. This last session is currently planned on 9/18.

*ANITA:* Planned.

*BCAT (Binary Colloidal Alloy Test):* Reserve.

*CARDICOG-2:* Data files from last session on 8/31 received by the Science Team which provided positive feed-back..

*CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):* Continuing,

*CFE (Capillary Flow Experiment):* Reserve.

*CHROMOSOME-2 (E14 SFP):* Completed.

*CSI-1/CGBA (CGBA Science Insert #1/Commercial Generic Bioprocessing Apparatus):* Complete.

*CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):* Powered off.

*EarthKAM (Earth Knowledge Acquired by Middle School Students):* Next scheduled operation is 10/29-11/3.

*EMCH (Elastic Memory Composite Hinge):* Complete.

*EPO (Educational Payload Operation) Kit C:* Planned.

*IMMUNO (Saliva Sampling):* First session samples are currently stowed in MELFI Dewar #2.
LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Investigation ongoing. Watering needs of plants are higher than anticipated.

MUSCLE (E14 SFP): Completed.

MSG-SAME (Microgravity Science Glovebox): Planned.

NEOCYTOLYSIS (E14 SFP): Completed.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMPLE: Ongoing.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): n/a

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Planned.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observations): Through 9/3 the ground has received a total of 12,992 CEO images for review and cataloging for Increment 15. From over 1400 frames of new imagery received this past week researchers have identified for prioritized review those images with camera times corresponding to the following CEO target request times: Cairo, Egypt; Tenoumer Impact Crater, Mauritania; Andrews Forest, Washington; Yellowstone National Park, Wyoming; and the Tigris-Euphrates Delta. To crew: “Thank you for your prompt downlink of your images of
Hurricane Felix earlier this week. Three of these views were captioned and used by PAO and all have been cataloged and are available to the public on our website. We have noted a high frequency of long lens settings in your recent photography. Your focus technique is excellent now. Such photos show great detail of very small areas on the ground. Their usefulness is greatly increased when successive frames in such a session have sufficient overlap to allow mosaicking. This technique also improves the chances of the frame series to be located and cataloged. Please bear this in mind when using the long lens settings.”

Today’s CEO (Crew Earth Observation) photo targets were Harvard Forest, Vermont (the crew had a nadir pass over the Harvard Forest LTER [Long Term Ecological Research] site area. This forest site, located approximately 70 miles to the west of the Boston metro area, maintains one of the longest-term records of forest growth and climate change in the New England area. Overlapping mapping frames along track were requested for comparison to historical imagery of the region), Puerto Rico (weather was predicted to be mostly clear over Puerto Rico. ISS orbit track brought the station over the western coastline of the island. Mapping of the western coastline was requested to track shoreline changes and offshore sediment flow), and GW Fire, Oregon (Dynamic Event. The GW Fire has been burning since late August, and is currently 60% contained. Six thousand acres have been burned so far, and the ISS orbit track provides an opportunity to view smoke plumes and burned areas. Looking to the left of track after the station crossed the Oregon coast - the burned area is located directly to the east of the Cascade Range volcanoes.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 9:25am EDT [= epoch]):
Mean altitude -- 339.9 km
Apogee height – 345.7 km
Perigee height -- 334.1 km
Period -- 91.33 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0008638
Solar Beta Angle -- -30.1 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 97 m
Significant Events Ahead *(all dates Eastern and subject to change)*:
09/14/07 -- Progress M-60/25P propellant line purge/vent
09/18/07 -- Progress M-60/25P undocking (SM aft port)
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- **50 Years of Spaceflight** (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/19/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/04/08 -- ATV-1 undocking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/07/07

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, Yurchikhin, Kotov and Anderson conducted another session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (ninth time for CDR & FE-1, sixth for FE-2), using the IM mass measurement device which Oleg Kotov afterwards broke down for stowage.  

[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]

CDR Yurchikhin and FE-2 Anderson completed the second day of the regular six-month IFM (Inflight Maintenance) work on the TVIS (Treadmill with Vibration Isolation & Stabilization), including detailed chassis inspections, roller bearing assembly changeout, and flywheel & transfer case lubrication.  

[Today’s work entailed removal of the treadmill from the SM “pit”, disassembly of forward components such as the flywheel case and transfer case, lubrication of both of their splines and re-installation of the components, inspection of the gyroscope and aft TVIS components, replacement of the electronic box battery (for maintaining TVIS time & date), retrieval, lubrication & restowage of the SPD (Subject Positioning Device) Top Assemblies, replacing all four IRBAs (Isolation Restoration Bungee Assemblies), other general inspections, and reinstallation of the treadmill in the SM (Service Module) floor. An unmanned 20-min speed characterization test]
concluded the activities. On yesterday’s Part 1 work, two hours were lost due to
procedural problems in gaining access to the roller bearings underneath the belt. The TVIS team is investigating alternative methods for future IFMs.]

FE-1 Kotov completed the current Onboard Equipment Control System (SUBA)
outfitting by installing cables for connecting the newly installed PPS-31 System
Power Panel and BSKN-25 Load Power Switching Unit, both required to support the
installation of additional power outlets in the RS (Russian Segment).

The CDR continued his daily support of TsUP/Moscow in the ongoing two-week
testing of the Russian ASN-M Satellite Navigation Equipment.  [Fyodor first
temporarily closed down the data collection & saving application on Laptop 3, then
copied the accumulated data to a 128MB flash card for subsequent downlinking via
OCA/S-band for ground processing, and later re-started the application to continue
collecting the raw ASN-M test data. ASN will be required for proximity operations
and docking of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne”
to the SM aft end, currently planned for 3/3/08. The ground-controlled testing
simulates the ATV rendezvous phase using the ASN system, and its results will be
used to assess the ASN-M equipment’s readiness for joint ATV operations.]

Clay Anderson undertook the periodic (~monthly) PEP (Portable Emergency
Provisions) safety inspection.  [The IMS-supported inspection involves verification
that PFEs (portable fire extinguishers), PBAs (portable breathing apparatus),
QDMAs (quick-don mask assemblies) and EHTKs (extension hose/tee kits) are free
of damage to ensure their functionality, and to track shelf life/life cycles on the
hardware. In the U.S. segment (USOS), there are a total of 5 PFEs and 7 PBAs,
plus 7 QDMAs and 4 EHTKs. Additionally, Clay used a piece of tape to mark a
QDMA, which has an earpiece that failed during 13A.1/EVA-2 but is otherwise fully
functional as breathing aid.]

The FE-2 did the regular bi-weekly maintenance reboots of the SSC (Station
Support Computer) File Server and OCA Comm Router laptops as well as the
weekly reboots of the PCS (Portable Computer System) A31p laptops.

Continuing his support of the MELFI (Minus-Eighty Laboratory Freezer for ISS)
facility, Anderson swapped front and rear quarter box modules in Dewar 4 (powered
off before the activity, i.e., not freezing).  [Modules were exchanged between
Sections 1 & 4 in Trays A, B, C, & D, to place the Icepacs closest to the Dewar door
for keeping the samples colder in the back of the Dewar (there is a temperature
gradient from front to back of as much as 2 degC - which could mean the difference
between preserved and damaged samples.)

In support of SAME (Smoke Aerosol Measurement Experiment) operations
scheduled tomorrow, Clay also was to check and charge (as needed) the batteries of the scopemeter. [The latter will be required to help verify the integrity of the vacuum and nitrogen connections between SAME and the MSG WV (Microgravity Glovebox Work Volume).]

The FE-2 completed the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout on the prime unit (#1060) and backup unit (#1057). [The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Clay changed out the prime unit’s battery, then zero-calibrated both instruments (to eliminate drift in the combustion sensors). Following zero calibration, the backup unit was stowed, while the prime unit’s datalogger function was turned on to collect data at the SM Central Post as a spot check. After one hour, the datalogger was deactivated, with the prime CSA-CP remaining on for continuous passive sampling.]

Later today, Anderson is scheduled to do the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries are to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. Two CSA-CP (CSA-Combustion Products) instruments recorded O₂, CO, HCN and HCl readings at the SM Central Post (#1060, prime) and in the Node (#1057, backup), while the CSA-O₂ units (#1063, #1042) looked for O₂ in the Lab and the CDMK (#1008) for CO₂ in SM and Lab. Also recorded were battery ticks. The instruments were turned off afterwards, except for the prime CSA-CP #1060 unit, and returned to their regular locations.]

Yurchikhin completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Kotov is to work on the IMS (Inventory Management System) for the daily updating/editing of the standard IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exerciser (CDR, FE-1, FE-2) and VELO cycle with bungee cord load trainer (FE-1).
Later in the afternoon, the FE-2 will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the discretionary “time permitting” task list, Kotov completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second task from the Russian “job jar” list for Oleg was the standard health check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

At ~4:10am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:40am, Fyodor and Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~12:00pm, Fyodor and Oleg downlinked an audio message of greetings to Vyacheslav Petrovich Salnitsky, a Department Deputy Manager at Moscow’s IBMP (Institute of Bio-Medical Problems, Russian: IMBP/Institute of Medico-Biological Problems). [Salnitsky, a veteran of manned cosmonautics for over 40 years, is currently presiding over a scope of activities related to ISS crew psychological flight support (psycho-neurological monitoring, rest/work schedule, psychological support). “…You are known as a tireless worker who for many years has been dealing with professional activity of operators in the space area, involved in research of methods and tools for assessing professional adequacy, and, most importantly, in the quest for new methods to maintain this adequacy. The unique PILOT ground/space simulator that you created has served well for many years to flight crews in long-duration missions…”]

The crew’s regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio will be conducted at ~3:30pm.
Nitrogen Transfer: Transfer of gaseous nitrogen (N\textsubscript{2}) from the FGB fuel tanks is scheduled for today. Subsequently, the FGB tanks will be refueled with propellants from Progress 26P, currently planned for 9/11, followed by line purging/venting on 9/14. 26P undocking is scheduled for 9/18.

Today’s CEO (Crew Earth Observation) photo targets were Virginia Coast Reserve, Virginia (the crew had a nadir pass over this coastal LTER [Long Term Ecological Research] site. Overlapping nadir mapping frames along-track were requested. Features of interest for investigation of ecological change include developments along the Chesapeake Bay coastline that ISS passed directly over), and Santa Barbara Coast, California (the orbit took ISS over the E-W trending steep mountains that form the northern boundary of the Santa Barbara Coastal LTER site. High resolution photography of the mountain peaks, ridgelines, and south-facing slopes is useful to track land use and vegetation change that could affect water and sediment flow towards the coastline. The station approached the mountains from the NW, and the crew was advised to look to the right of track for the central spine of the mountains. The City of Santa Barbara was visible along the coastline, also to the right of track).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 7:50am EDT [= epoch]):
Mean altitude -- 340.0 km
Apogee height – 345.7 km
Perigee height -- 334.2 km
Period -- 91.33 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008586
Solar Beta Angle -- -33.5 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 95 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50376

Significant Events Ahead (all dates Eastern and subject to change):
09/14/07 -- Progress M-60/25P propellant line purge/vent
09/18/07 -- Progress M-60/25P undocking (SM aft port) new date
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- **50 Years of Spaceflight** (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/19/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/04/08 -- ATV-1 undocking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
All ISS systems continue to function nominally, except those noted previously or below.

After their detailed procedures review yesterday, CDR Yurchikhin and FE-2 Anderson today began the scheduled six-month IFM (inflight maintenance) work on the TVIS (Treadmill with Vibration Isolation & Stabilization), including detailed chassis inspections, roller bearing assembly changeout, and flywheel & transfer case lubrication.

[Today’s scheduled work, of >6 hrs, accomplished chassis inspection and replacement of 10 center roller bearings on each side of the truss after the belt was temporarily untensioned and the aft drum adjusted. Some issues involving tools, access to some roller bearings, and procedures execution had to be overcome. Afterwards, the TVIS was returned to its original “safe” configuration (so not to leave an inoperable TVIS in the event of a timeline change). Tomorrow, the work schedule will entail treadmill removal from the SM (Service Module) “pit”, disassembling forward components such as the flywheel case and transfer case, lubricating both of their splines and reinstalling the components, inspecting the gyroscope and aft TVIS components, replacing the electronic box battery, inspecting the SPDs (Subject Positioning Devices), other general inspections, and reinstalling the treadmill in the SM floor. An unmanned 20-min speed characterization test will conclude the activities. Total time for two days required for both Clay and Fyodor: 16 hrs.]

FE-1 Kotov continued the extensive SM outfitting with a new System Power Panel (PPS-31) behind panel 118 and the cabling to allow the installation of additional power outlets. Today’s work was divided into two parts, each for routing & connecting three cables. More to come tomorrow. [The spaces behind panel 118 had originally been explored by Sergei Krikalev on 5/30/05 preparatory to the PPS-31 installation planning and cable tree manufacturing.]

Yurchikhin cleared room behind SM panel 136 by removing three P-16 filter units.
and setting them up behind panel 129.

After installing, on 9/4, the new KL-211 MPEG-2 Encoder for the “Klest” television system to support ATV (Automated Transfer Vehicle) prox ops and docking, the CDR today used a new NASA MPEG2 viewer (NViewer 1.0) on the RSS1 A31p laptop for testing the KL-211 by verifying that it is sending correct data via OpsLAN.

Oleg Kotov performed the periodic data collection and downlink on the long-term BIO-5 Rasteniya-1 (“Plants-1”) micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

Anderson conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card, to be updated with today’s data, lists 31 water containers (~1190 liters total) for the four types of water identified on board: technical water (806.9 l, for Elektron, flushing, hygiene), potable water (351.2 l), condensate water (13.2 l), waste/EMU dump and other (19.0 l).]

Clay also provided the daily servicing of the EPO (Educational Program Operation) “Kit C” project, taking photos today to document the plant growth in zero-G. [The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

The CDR performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Yurchikhin also worked on the IMS (Inventory Management System), updating/editing the standard IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (FE-2), RED resistive exerciser (CDR, FE-1, FE-2) and VELO
cycle with bungee cord load trainer (CDR, FE-1).

Later in the afternoon, the FE-2 will download the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the discretionary “time permitting” task list, Kotov completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

**BCC Dry Run:** Early this morning, starting at 1:00am EDT and running for seven hours, MCC-Houston and its Moscow support group (HSG) conducted another BCC (Backup Control Center) dry run in test mode, with no involvement of the ISS crew or vehicle.  [Purpose of this periodic exercise is to demonstrate BCC functionality under Russian assets while providing proficiency training for HSG personnel at the HSR (Houston Support Room) and TsUP-Moscow specialists. The ISS EMCC (Emergency Mission Control Center), located in Russia, comprises TsUP/Moscow as the Lead Control Center, coupled with HSR at TsUP. The BCC facility provides a command & control capability from TsUP if the EMCC must be activated. This is the case in situations that render MCC-Houston unable to provide telemetry, voice, and command capability for extended periods. EMCC is also used when the threat of severe weather results in evacuation of the MCC-H building for extended periods. In such an emergency, both Russian servers (CMD/command & TM/telemetry) are transitioned from MCC-H connectivity to BCC configuration, after which only the BCC can connect to the CMD and TM ports. An actual contingency requiring switchover to the BCC occurred on 10/2/2002 when Hurricane Lili forced MCC-H to shut down at 4:00am EDT, and also two years ago during the Hurricane Katrina emergency.]

**Solar Array Drag Reduction:** Plans are being made for setting solar array BGA (Beta Gimbal Assembly) Autotrack mode (suntracking) to dual-angle (“night glider”) configuration biased for drag reduction (“night glider”), starting on 9/12.  [Purpose: (1) Save 50-60 kg of ISS propellant prior to 10A launch, (2) increase expected number of consecutive launch attempts with FD3 docking for 10A from 11 to 15 days, and (3) improve reboost planning by providing about a week to assess the drag reduction performance prior to designing the 9/24 reboost.]

**ASN-M Testing Update:** TsUP/Moscow is continuing the two-week tests of the Russian ASN-M Satellite Navigation Equipment. Testing will be finished on 9/11.
**Russian Thermal Control System Update:** After the failure, on 8/29, of the N1 pump on pump panel 4SPN1 of the Russian KOB-2 heating loop, KOB-2 continues functioning on one pump, until a spare can be delivered on the next Progress. On Loop 1 (KOB-1), both pump panels are functioning nominally.

**Rodnik Water Transfer Update:** Data received 9/4 during the transfer of water from the Rodnik BV2 tank of Progress 26P to the SM BV1 tank may be indicating a leak in the inner membrane of the Progress BV2 tank, needed for pushing the water out. Specialists are investigating. Should a leak be confirmed, the BV2 would be declared unavailable for receiving liquid waste (urine) before 26P jettisoning.

**Nitrogen Transfer:** Transfer of gaseous nitrogen (N₂) from the FGB oxidizer tank to the SM was successfully completed. N₂ transfer from the FGB fuel tank is scheduled tomorrow (9/7). Subsequently, both tanks will be refueled with propellants from Progress 26P, currently planned for 9/11, followed by line purging/venting. [26P undocking is now scheduled for 9/18, i.e., one day earlier].

Today’s CEO (Crew Earth Observation) photo targets were **Metropolitan Manila, Philippines** (nadir pass over this capital city on the east side of Manila Bay. Metro Manila is now home to more than 10 million people. Crew was to shoot the margins of this huge urban center), **Aral Sea, Kazakhstan, Central Asia** (a fraction of its former size, the Aral Sea continues its slow decline in area, fragmenting into a series of smaller water bodies. Water is extracted from the main feeder rivers for crops, especially cotton at the south end of the sea. Crew was to shoot margins of the main water bodies), and **Georgia Coastal Ecosystems, USA** (crew was asked to shoot a mapping swath of overlapping images a little right of track. This is an LTER [Long Term Ecological Research] site where land use and ecological changes around urban centers are monitored).

CEO photography can be viewed and studied at the websites: [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); [http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/) [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** *(as of this morning, 8:53am EDT [= epoch]):*
Mean altitude -- 340.1 km
Apogee height – 345.8 km
Perigee height -- 334.4 km
Period -- 91.34 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0008487
Solar Beta Angle -- -36.4 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 102 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50361

**Significant Events Ahead (all dates Eastern and subject to change):**
09/14/07 -- Progress M-60/25P propellant line purge/vent
09/18/07 -- Progress M-60/25P undocking (SM aft port) **new date**
09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- **50 Years of Spaceflight** (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/19/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/04/08 -- ATV-1 undocking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Constellation’s Ares I-X Launch
ISS On-Orbit Status 09/05/07

All ISS systems continue to function nominally, except those noted previously or below. A day of medical exams on board.

Before breakfast & first exercise, CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson completed another session with the Russian crew health monitoring program's medical assessment MO-9/Biochemical Urinalysis. The FE-1 stowed the Urolux hardware afterwards. [MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).]

Afterwards, Yurchikhin and Anderson, both assisted by FE-1, and Kotov, assisted by FE-2, also did the second part of the PHS assessment, without blood labs. Subsequently, Oleg completed data entry for both of them and stowed the PHS hardware. [The U.S. PFE w/o Blood Lab is a monthly 1.5-hr. procedure which checks up on blood pressure and electrocardiogram (ECG) during programmed exercise on the CEVIS (cycle ergometer with vibration isolation) in the Lab. Readings are taken with the BP/ECG (blood pressure/electrocardiograph) and the HRM (heart rate monitor) watch with its radio transmitter. BP/ECG provides automated noninvasive systolic and diastolic blood pressure measurements while also monitoring and displaying accurate heart rates on a continual basis at rest and during exercise.]

Fyodor and Oleg set up the work area for the Russian science payload BIMS (MBI-22) and unstowed the hardware. For the subsequent experiment activity, the two cosmonauts took turns as subject and assistant, supported by ground specialist tagup. Today’s runs included otoscopic, nasal, dental and dermatological exams.
BIMS objective is to conduct several experimental sessions in the RS (Russian segment) for filming skin portions and mucous membranes of crewmembers. It is part of a comprehensive research into using telemedical technologies for getting information from distant space crews for medical support of human space missions and information for life science flight studies. The BIMS experiment uses image capturing (video & still photo), an otoscope (or auriscope - the familiar medical device for visualizing the outer & middle ear, nose and upper throat area), the RSEMmed A31p laptop and PCMCIA memory cards, with data files downlink via BSR-TM to study small skin sites, conduct otorhinolaryngologic examinations (external acoustic meatus, eardrums, nasal passages), and do stomatologic (i.e., medical study of mouth and its diseases) examination of gums and teeth.

Later, Clay Anderson broke out and set up the OUM-PFE (Oxygen Uptake Measurement - Periodic Fitness Evaluation) equipment on the HRF-2 (Human Research Facility 2) rack to obtain measurements on himself on the CEVIS cycle ergometer according to protocol, with Oleg Kotov acting as OUM-PFE operator. The operations were documented with photo and video. In closing out, Clay updated the evaluation protocol, deactivated & stored the gear, including photo/video equipment, and turned off the OUM-PFE laptop.

The FE-1 had 30 min. reserved for completing another radiation data monitoring & logging session for flow & dose power data with the Matryoshka-R radiation payload and its LULIN-5 electronics box.

Clay retrieved and stowed the two FMKs (Formaldehyde Monitoring Kits) deployed by him on 9/3 in the Lab (below CEVIS cycle) and SM (most forward handrail).

Yurchikhin performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the periodic checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1.

Fyodor also spent an additional half hour in the ASU compartment for removal and replacement of the air/ventilation filter, discarding the old unit as trash.

Later, the CDR worked on the IMS (Inventory Management System), updating/editing the standard IMS “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

CDR Yurchikhin used the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system to collect the periodic cabin air readings. [GANK tests for
Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).

FE-1 Kotov completed the periodic (about twice a month) replenishing of the Elektron’s water supply for electrolysis, filling the KOV thermal loops’ EDV container with water collected in CWC (Contingency Water Container) #1021 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

Yurchikhin continued his daily support of TsUP/Moscow in the ongoing two-week testing of the Russian ASN-M Satellite Navigation Equipment. [Fyodor first temporarily closed down the data collection & saving application on Laptop 3, then copied the accumulated data to a 128MB flash card for subsequent downlinking via OCA/S-band for ground processing, and later re-started the application to continue collecting the raw ASN-M test data (see also Note below).]

Anderson conducted his regular daily servicing of the EPO (Educational Program Operation) “Kit C” project, today by checking the growth chamber for humidity. [The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

Clay also performed the periodic status checkup & filter inspection of the running CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

Working some more on the MELFI (Minus-Eighty Laboratory Freezer for ISS) facility, Anderson today inserted 12 Icepac belts in Dewar 3 to continue preparing it for future use. [After today’s big insert, several smaller inserts of two Icepacs each into Dewars 1 & 2 are scheduled for the near future. Icepacs are used as thermal mass to keep samples cold during return and during extended MELFI power downs (e.g. during Soyuz relocate). No more than two ambient-temperature Icepacs may be inserted at any given time into a Dewar that has samples in it, to protect the
samples from warming up.]

Yurchikhin and Anderson reviewed the uplinked procedures of tomorrow’s and Friday’s planned TVIS treadmill six-month maintenance which includes detailed chassis inspections, roller bearing assembly changeout, and flywheel & transfer case lubrication. Before sleep time tonight, the FE-2 will deactivate the TVIS power circuit breaker. [Preparations, chassis inspection and replacement of 10 center roller bearings on each side of the truss will be done on the first day, with the TVIS then to be returned to its original “safe” configuration (so not to leave an inoperable TVIS in the event of a timeline change). The second day will feature TVIS removal from the SM “pit”, disassembling forward components such as the flywheel case and transfer case, lubricating both of their splines and reinstalling the components, inspecting the gyroscope and aft TVIS components, replacing the electronic box battery, inspecting the SPDs (Subject Positioning Devices), other general inspections, and reinstalling the treadmill in the SM floor. An unmanned 20-min Speed Characterization Test will conclude the activities. The data from the test and the first exercise session will be downloaded for review immediately. Total time required for both Clay and Fyodor: 16 hrs.]

For the crew’s subsequent workouts on the RED (resistive exercise device), Anderson set up the video camcorder for filming the sessions. Afterwards, the video equipment was put in stowage again. [The RED video, showing the apparatus on the “ceiling” hatch of the Node, is periodically required to support biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection.

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene); on the CEVIS cycle ergometer (CDR/PFE, FE-1/PFE, FE-2/OUM-PFE), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later tonight, the FE-2 will download the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:45am EDT, the CDR tagged up with TsUP-Moscow specialists via S-band on the topic of the internal lighting system.

At ~2:35pm, Clay is scheduled to power up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 2:40pm a radio exchange with students at Gail Borden Public Library, Elgin, Illinois. Questions to the crew were uplinked by ARISS beforehand.
[Gail Borden Library is over 130 years old with a long history of providing materials and services to community members. The first library building was donated by the family of Gail Borden, the inventor of condensed milk. The Library has a history of being innovative. GBPL was the first library in the country to create a center for preschoolers, offering intellectual and social stimulation in a creative, hands-on environment. GBPL was one of the first libraries in the country to install a fiber optic network, linking the library with the City of Elgin and six area schools. Other distinguishing hallmarks include developing services for the Hispanic population with the addition of Spanish-language materials and formation of a steering committee which led to the creation of a literacy training organization. “Do you have to wear a lot of special equipment while in space?”; “What are your daily jobs up in space station?”; “Are you weightless in the ISS and if you are, how does it feel?”; “Is it hard to stay in space so long?”; “How good are the computers that you use?”; “How do you read in outer space and what books are you reading now?”; “Is it ever sort of scary or strange being in space?”]

Working from the discretionary “job jar” task list, Kotov completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second job from the Russian “at-choice” task list for Oleg was the regular health check on the long-term BIO-5 Rasteniya-1 (“Plants-1”) micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

ASN-M Testing Update: Yesterday’s ATV (Automated Transfer Vehicle) docking rehearsal, with the station held by Russian thruster control in the required attitude (Yaw/Pitch/Roll = 0,0,0), went well, except for somewhat greater than expected attitude errors on each axis (max ~1.8 deg instead of <1 deg). Uplinking missing dynamics loop coefficients, inadvertently left out during the 8/22 restart of the TVM navigation computer, corrected the issue. [The rehearsal consisted of (1) preparation of the estimated state vector which will be calculated for the actual ATV docking using the data received from the ASN-M, and (2) the attitude-hold test on RS thrusters for ATV docking until the estimated mechanical capture, for a period of approximately 4.5 hours. Proximity operations and docking of the European ATV-1 “Jules Verne” at the SM aft end are currently planned for 3/3/08. The ground-controlled testing simulates the ATV rendezvous phase using the ASN system, and its results will be used to assess the ASN-M equipment’s readiness for joint ATV
CMG Gimbal Characterization Test: Taking advantage of the vehicle being under RS thruster control for a sufficient period of time, MCC-H last night conducted a gimbal characterization test for the recently-installed CMG-3 (Control Moment Gyroscope #3). CMG-3’s inner and outer gimbals were separately rotated a full 360 deg in each direction. CMG-4 was added to the test and the gimbals for both were rotated such that the momentum vectors canceled, thus minimizing propellant usage. The spin motor current (an indicator of drag torque on the spin bearings) was observed, as well as other CMG health parameters. As expected, CMG-3 motor current showed little or no change for each gimbal motion, whereas CMG-4 current changed slightly depending on gimbal direction. No anomalous vibrations were observed and no fault flags for these two CMGs were set at any time. Telemetry data are under review.

Today’s CEO (Crew Earth Observation) photo targets were London, England (weather is finally clearing. Looking nadir and a touch left to shoot margins of the city in particular), Tigris-Euphrates Delta (crew was asked to shoot a mapping pass near nadir as they crossed the coast, in a repeat pass of a few days ago. Coastline detail was requested), Wild fires, Algeria (DYNAMIC EVENT: Aiming left of track along Algeria’s coastline for panoramic views of a major smoke event), and Cloud plume, Texas (DYNAMIC EVENT: A major cloud plume 1500 miles long, derived from Hurricane Henriette off Baja California, is spreading NE into the southern USA. Moisture from this plume will enhance rainfall over many already-wet states for the next couple of days. The crew was to shoot right of track towards Henriette as they crossed the plume, for wide-angle views of this weather maker).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:43am EDT [= epoch]):
Mean altitude -- 340.2 km
Apogee height – 345.8 km
Perigee height -- 334.5 km
Period -- 91.34 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008454
Solar Beta Angle -- -39.0 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 110 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50345

**Significant Events Ahead (all dates Eastern and subject to change):**

- 09/14/07 -- Progress M-60/25P propellant line purge/vent
- 09/19/07 -- Progress M-60/25P undocking (SM aft port)
- 09/24/07 -- ISS reboost (dV=3.4 m/s; setting up for Soyuz launch & 10A rendezvous on FD3)
- 09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
- 10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
- 10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
- 10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
- 10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
- 10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
- 10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
- 11/03/07 -- STS-120/Discovery/10A undocking
- 11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
- 11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
- 11/13/07 -- US EVA-10
- 11/19/07 -- US EVA-11
- 12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
- 12/08/07 -- STS-122/Atlantis/1E docking
- 12/15/07 -- STS-122/Atlantis/1E undocking
- 12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
- 12/23/07 -- Progress M-62/27P launch
- 12/26/07 -- Progress M-62/27P docking (DC1)
- 01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
- 02/06/08 -- Progress M-62/27P undocking
- 02/07/08 -- Progress M-63/28P launch
- 02/09/08 -- Progress M-63/28P docking
- 02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
- 02/16/08 -- STS-123/Endeavour/1J/A docking
- 02/27/08 -- STS-123/Endeavour/1J/A undocking
- 03/03/08 -- ATV-1 docking (SM aft port)
- 04/04/08 -- ATV-1 undocking (SM aft port)
- 04/08/08 -- Soyuz TMA-12/16S launch
- 04/10/08 -- Soyuz TMA-12/16S docking (DC1)
- 04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
- 04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
- 04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Ares I-X Launch
ISS On-Orbit Status 09/04/07

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 upgraded the software of SIGI-1 (Space Integrated GPS/Inertial Navigation System #1), updating its firmware load to version R3. [For accessing SIGI-1, Anderson had to rotate a Lab rack down (LAB1S6), which required powering off the active Lab CCAA (Common Cabin Air Assembly) air conditioner for the duration of the activity. The software upgrade enables SIGI1 to determine attitude using the only two remaining operational USOS GPS antennas. GPS-2 anomalies encountered on 8/30 (ref. 9/1 report) have been cleared with repeated power cycles and reinitializations.]

FE-1 Kotov worked on the Russian payload matching unit/computer (BSMM), upgrading both hard disk drive partitions with new software from the RSS1 laptop, after a successful payload server (BSPN) functionality test.

Afterwards, CDR Yurchikhin continued the latest outfitting of the RS (Russian Segment) “Klest” television system for ATV (Automated Transfer Vehicle) prox ops and docking, by removing two old commutator (switching) boxes (KU-110M, KU-120M) and replaced them with a new KL(Klest)-211 MPEG-2 Coder. [After completion of Kotov’s BSMM upgrade, the KL-211 was connected to the Ethernet OpsLAN.]

The FE-1 also prepared tools, cables and hardware for the upcoming extension of SUBA (Onboard Equipment Control System) and SBI (Onboard Data Measuring & Storage System) capability, through provision of additional power outlets in the Service Module (SM) and enabling vacuum cleaner use in the FGB and DC1 (Docking Compartment). [The SUBA/SBI outfitting activities are scheduled on 9/6, 9/7, 9/10, and 9/11.]
The CDR later supported the ground in reactivating the Elektron oxygen generator, which had to be turned off since the preceding KL-211 coder installation required temporary disconnecting the BITS2-12 Onboard Telemetry Measurement System. *Reactivation was at 32 amps, and as usual Fyodor monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.*

After Flight Controllers deactivated the CDRA (Carbon Dioxide Removal Assembly) early this morning, and cooling was no longer required, Anderson disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper.

Kotov used the Russian AK-1M adsorber and Draeger tubes to conduct the periodic sampling of cabin air for subsequent analysis on the ground. *Kotov started out by taking air samples in the SM and FGB and to check for leaked-out Freon in the SM, then switched to the IPD-CO Draeger tubes sampler to check for CO (carbon monoxide) in the SM.*

Later, Oleg also collected air samples with a U.S. GSC (Grab Sample Container) at the center of the Lab and SM.

After tagging up with payload specialists for a Periodic Fitness Evaluation (PFE) conference, Clay Anderson broke out and set up the PFE-OUM (PFE-Oxygen Uptake Measurement) equipment on the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). Data collection is scheduled tomorrow. *The Periodic Fitness Evaluation with Oxygen Uptake Measurement experiment demonstrates the capability of crewmembers to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during long-duration space flight.*

The FE-2 undertook the monthly (Week 20) potable water sampling for post-flight chemical analysis, using jointly approved Russian sampling procedures with the U.S. WS&A (Water Sampler & Archiver) kit for collection. *Samples were taken in the SM at the potable water SRV-K hot port and from the EDV container of the SVO-ZV*
water supply system. From each port, Clay collected two 225 mL microbial samples for on-board processing and two 750 mL chemical archival (post-flight) samples for return to Earth on 10A, using Russian collection procedures. The flush water, collected in a water bag, is to be reclaimed for technical use.]

After the leak-test compression of the SM’s Rodnik BV1 tank bladder on 8/18, Kotov hooked up the necessary “plumbing” for transferring potable water from the BV2 tank of Progress M-61/26P to the SM Rodnik BV1 water tank. [The water transfer, monitored by Oleg several times during the day, at first was by self-flow (under its own tank pressure), then using a compressor pump via a GZhS gas/liquid separator, to remove air bubbles in the water. Filling of the empty Progress BV1 & BV2 tanks with urine will be scheduled later.]

Clay completed his third run with the MedOps WinSCAT (Spaceflight Cognitive Assessment Tool) experiment by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. [WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR’s, crewmembers or flight surgeons request.]

The CDR conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Fyodor also did the daily IMS (Inventory Management System) updating, editing its standard “delta file” for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew performed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-1, FE-2), TVIS treadmill (CDR), and RED resistive exerciser (CDR, FE-1, FE-2).

Later, Yurchikhin will download the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:25am EDT, Yurchikhin, Kotov and Anderson joined in downlinking a TV message of greetings in connection with the 60th Anniversary of the Russian 38th Airborne Forces Special Signal Regiment. [“The legendary airborne infantry is among the armed forces elite troops. They have always been faithful to their
military duty, courageous and dedicated, highly professional and brave, imbued with fighting spirit, brotherly solidarity, and teamwork... The Y.A. Gagarin Cosmonaut Training Center has been your neighbor near Moscow for over 35 years. Over the years, we've become good friends. You are always dear and welcome guests at Star City...”]

At ~10:30am, the crew also supported a live TV/PAO event with students at Collier County Public Schools, Naples, FL, via S- & Ku-band. Questions to the crew were uplinked beforehand. [“What effect does Earth’s gravity have on the human body once someone returns from a long stay on the ISS?”; “What is the procedure if the ISS’s ventilation system failed?”; “Oleg, we read that you like photography, can you tell us about some pictures you have taken from space?”; “Have any seeds that have been exposed to space been planted here on Earth? And if so, what were the results?”; “Clay, we read that you write music, sing and play the piano, what is it like to do these things in space?”; “What is a “walkoff” with the robotic arm?”]

At ~3:50pm, Clay is scheduled to power up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), and at 3:55pm conduct a radio exchange with ham operators on the ground.

Working from the discretionary “job jar” task list, Kotov completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

ASN-M Testing Update: Satellite Navigation System (ASN-M) testing is going successfully, with no error messages or antennae switch-overs. The test runs through 9/11. A special test will be conducted tonight, requiring the ISS to maneuver to an attitude of YPR (yaw, pitch, roll) of 0,0,0, held by RS thrusters. Attitude control authority will be handed over to RS at 7:08pm EDT, with the maneuver following at 7:53pm. Return to LVLH +ZLV TEA (Local Vertical Local Horizontal/Z-axis in local vertical/Torque Equilibrium Attitude) will be at 11:38pm, followed by control return to U.S. CMG momentum management at 1:25am. For the test, the U.S. solar wings will be feathered at ~5:30pm, i.e., by locking the port and starboard SARJ (Solar Alpha Rotary Joint) at 0 deg, with post-test reset at ~8:00pm. [The ASN will be required for proximity operations and docking approach of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne” to the SM aft end, currently planned for early March 2008. The ground-controlled testing simulates the ATV rendezvous phase using the ASN system, and its results will be used to assess the ASN-M equipment’s readiness for joint ATV operations.]
Saturday Science Preview: Five optional activities for the voluntary “Saturday Science” program on the next weekend (9/8-9) were suggested to Clay for his choice. His selection is required by tonight. [The five choices are (1) Voice & video of another run of CFE VG1 (Capillary Flow Experiment – Vane Gap 1) to complete the CFE-VG1 experiment, (2) SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), flying two & three satellites, requiring CDRA (CO₂ Removal Assembly) to be running, (3) BCAT-3 (Binary Colloidal Alloy Test-3) Magnet Unstick, using the CGBA-4 (Commercial Generic Bioprocessing Apparatus 4), powered up 12 hrs before, (4) SAME (Smoke Aerosol Measurement Experiment) final configuration, with leak tests on vacuum and nitrogen connections between SAME and MSG, installation of the first sample carousel & alcohol wick, and systems checkout plus first SAME science run initiated by the ground, and (5) EPO (Educational Payload Operation) Kit C Plant Growth experiment, voice and video.]

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);  
http://earthobservatory.nasa.gov/  
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 8:19am EDT [= epoch]):
Mean altitude -- 340.3 km  
Apogee height – 345.8 km  
Perigee height -- 334.7 km  
Period -- 91.34 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.0008257  
Solar Beta Angle -- -41.0 deg (magnitude decreasing)  
Orbits per 24-hr. day -- 15.76  
Mean altitude loss in the last 24 hours -- 119 m  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50329

Significant Events Ahead (all dates Eastern and subject to change):
09/19/07 -- Progress M-60/25P undocking (SM aft port)  
09/24/07 -- ISS reboost (setting up for Soyuz launch & 10A rendezvous on FD3)  
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)  
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)  
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/28/08 -- STS-124/Discovery/1J docking
05/??/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-66/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Ares I-X Launch
ISS On-Orbit Status 09/03/07

All ISS systems continue to function nominally, except those noted previously or below. Labor Day Holiday – on the ground and in space. Underway: Week 20 of Increment 15.

FE-1 Kotov performed a checkout of the pressure sensor (PVK-D) in the Russian PVK-1 "Chibis" pressure suit, stepping through ground instructions. [The Chibis is a below-the-waist reduced-pressure device (ODNT; US: LBNP, lower body negative pressure), which provides gravity-simulating stress to the body’s cardiovascular/circulatory system for re-establishing the body’s orthostatic tolerance (e.g., the Gauer-Henry reflex) after long-duration stays in zero-G. The LBNP applies suction on the lower body in steps ranging from 10 to 60 mmHg, thereby exerting a functional loading roughly equivalent to 10-60 kg of force on the musculoskeletal system to test the body’s adaptation to prolonged exposure to microgravity. Chibis is also used by cosmonauts as part of their conditioning preparatory to returning into gravity.]

CDR Yurchikhin continued to support TsUP/Moscow in the ongoing two-week testing of the Russian ASN-M Satellite Navigation Equipment, first temporarily closing down the data collection & saving application on Laptop 3, then copying the accumulated data to a 128MB flash card for subsequent downlinking via OCA/S-band for ground processing, and later re-starting the application to continue collecting the raw ASN-M test data. [The ASN will be required for proximity operations and docking approach of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne” to the SM aft end, currently planned for early March 2008. The ground-controlled testing simulates the ATV rendezvous phase using the ASN system, and its results will be used to assess the ASN-M equipment’s readiness for joint ATV operations.]

FE-2 Anderson supported a ground-performed checkout on S-Band String 2 in LDR (Low Data Rate) which required a comm check with the crew to verify the LDR
Voice capability. [S-Band String 2 was upgraded on 13A.1, but the LDR Voice capability has not been checked out yet. Once String 2 LDR checkout was complete, the ground was to configure back to HDR (High Data Rate) and swap to String 1 in HDR. The ground then performed an LDR checkout on String 1, afterwards swapping back to String 2 and deactivating String 1.]

Oleg Kotov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables.

Anderson completed the periodic deployment of two passive FMK (formaldehyde monitoring kit) sampling assemblies in the Lab (below CEVIS) and SM (most forward handrail), to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

Clay also continued his daily servicing of the EPO (Educational Program Operation) “Kit C” project, today by checking the growth chamber for humidity. [The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later tonight, the FE-2 will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the Russian discretionary “time permitting” task list, Yurchikhin conducted the bi-weekly inspection of the space behind panels 406-420 in the SM where components of the condensate processing equipment are located, e.g., the BP pump (BP) and the GZhS air/liquid separator unit.

Also from the task list, the FE-1 performed the regular checkup on the Japanese
experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

An additional voluntary job from the Russian “job jar” for Oleg was the regular health check on the long-term BIO-5 Rasteniya-1 (“Plants-1”) micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

For the Russian crewmembers, TsUP/Moscow also has designated two recurring tasks as “get-ahead” jobs, to be hard-scheduled at a later time: (1) an audit/inspection behind stowage panels in the Russian segment (RS) of the ISS, to assess available stowage room, and (2) to continue shooting photo/video footage of the RS modules’ interiors.

Saturday Science Preview: Five optional activities for the voluntary “Saturday Science” program on the next weekend (9/8-9) were suggested to Clay for his choice. His selection is required by tomorrow night. [The five choices are (1) Voice & video of another run of CFE VG1 (Capillary Flow Experiment – Vane Gap 1) to complete the CFE-VG1 experiment, (2) SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), flying two & three satellites, requiring CDRA (CO₂ Removal Assembly) to be running, (3) BCAT-3 (Binary Colloidal Alloy Test-3) Magnet Unstick, using the CGBA-4 (Commercial Generic Bioprocessing Apparatus 4), powered up 12 hrs before, (4) SAME (Smoke Aerosol Measurement Experiment) final configuration, with leak tests on vacuum and nitrogen connections between SAME and MSG, installation of the first sample carousel & alcohol wick, and systems checkout plus first SAME science run initiated by the ground, and (5) EPO (Educational Payload Operation) Kit C Plant Growth experiment, voice and video.]

CDRA Run: Early tomorrow morning (~12:20am EDT), the ground will deactivate the U.S. CDRA (Carbon Dioxide Removal Assembly), running over the weekend for SPHERES payload ops. VOA (Volatile Organics Analyzer) will be powered on at 1:45am.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are
downloaded by the public each month from this “Gateway” site;
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** *(as of this morning, 8:01am EDT [= epoch]):*
Mean altitude -- 340.4 km
Apogee height – 345.9 km
Perigee height -- 334.9 km
Period -- 91.34 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008164
Solar Beta Angle -- -42.4 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 85 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50313

**Significant Events Ahead** *(all dates Eastern and subject to change):*
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1); probably requires SAW feathering;
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/24/07 -- ISS reboost (setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/28/08 -- STS-124/Discovery/1J docking
05/??/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Ares I-X Launch
ISS On-Orbit Status 09/02/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday -- off-duty day for the crew except for housekeeping and voluntary work. Ahead: Week 20 of Increment 15.

FE-1 Kotov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Kotov also gathered weekly data on total operating time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s SOGS air revitalization subsystem for reporting to TsUP.

In support of the activation of the CDRA (Carbon Dioxide Removal Assembly) by ground command at ~2:35pm EDT, FE-2 Anderson connected the ITCS LTL QD (Internal Thermal Control System Low Temperature Loop Quick Disconnect) jumper for the required cooling.

Clay will also provide the daily servicing of the EPO (Educational Program Operation) “Kit C” project, today by taking photos to document the plant growth in zero-G. [The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]
The crewmembers are completing their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second voluntary job for Oleg Kotov was another run of the Russian "Diatomeya" ocean observations program, using the NIKON-F5 (85 mm lens) still camera and the Sony DSR PD-150P camcorder to obtain imagery of color bloom and cloud pattern anomalies from SM window #7. [Photo targets were the Atlantic along the track, with Newfoundland Island, the South coast of the Bay of Biscay, the Gulf of Saint Lawrence, the Gulf of Guinea, the US coast and the Sargasso Sea.]

Also as one of the voluntary tasks for today, CDR Yurchikhin performed another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on nature. [Today’s Uragan photo targets were the Kursk Steppe, the Volga river delta, the Aral Sea, Pamir mountains, glaciers to the west of Fedchenko glacier, the Crimea, wild fires, the Black Sea coast, the Mzymta river valley from Adler to its upper reach and the future site of Olympic village near the airport and to the south.]

At ~6:25am EDT, Fyodor had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop).

**SKV-1 Checkout:** TsUP-Moscow is running a remote checkout of the SKV-1 air conditioner, after which the ISS will go back to SKV-2 as prime for the month of September.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/
ISS Orbit (as of this morning, 8:58am EDT [= epoch]):
Mean altitude -- 340.5 km
Apogee height -- 346.1 km
Perigee height -- 334.8 km
Period -- 91.34 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008438
Solar Beta Angle -- -43.2 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 62 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50298

Significant Events Ahead (all dates Eastern and subject to change):
09/03/07 -- Labor Day Holiday
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1); probably requires SAW feathering;
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/24/07 -- ISS reboost (setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/28/08 -- STS-124/Discovery/1J docking
05/??/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Ares I-X Launch
ISS On-Orbit Status 09/01/07

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for the crew except for housekeeping and voluntary work. Flight Control to crew: "Enjoy your long weekend. It is very well deserved!"

The crew conducted the regular weekly three-hour task of thorough station cleaning. ["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

As part of the house cleaning, Yurchikhin and Kotov performed preventive maintenance cleaning on the VPkhO, VdPrK & VPrK grilles plus V3 fan in the DC1 (Docking Compartment).

At ~9:10am EDT, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

After lunch (~9:40am), FE-2 Anderson filled out the regular FFQ (Food Frequency Questionnaire), his ninth, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]
The FE-1 conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

After a familiarization session with the new MSG-SAME (Smoke Aerosol Measurement Experiment) research investigation, Clay Anderson powered up the MSG (Microgravity Science Glovebox), set up the video gear, installed the bigger pieces of hardware and made the electrical connections; the remaining hardware will be installed at the next session. [SAME creates smoke from common spacecraft materials in micro-G and then measures three of the most significant aspects of the resulting aerosol: (1) the number count density, (2) the collective, summed diameter of the particles, and (3) the mass density. The responses of the smoke detectors currently in use on the Shuttle and the ISS will also be measured. The data will be used to verify a mathematical model that has been developed to predict the size, density and concentration of these and other materials in a similar environment as well as providing specific, empirical design criteria for the development of the next generation of space-based smoke detectors. SAME components in the MSG WV (Work Volume) include two mounting plates (Diagnostics Mounting Plate & Experiment Support Plate), Fluids Control Unit, Data Acquisition & Control Unit, Aging Chamber, Sample Carousel, cables, connectors, etc.]

The FE-2 also continued the daily servicing of the EPO (Educational Program Operation) “Kit C” project, today by checking the growth chamber for humidity.

CDR Yurchikhin continued to support TsUP/Moscow in the ongoing two-week testing of the Russian ASN-M Satellite Navigation Equipment, first temporarily closing down the data collection & saving application on the laptop, then copying the accumulated raw data to a 128MB flash card for subsequent downlinking during RGS (Russian Ground Site) passes for ground processing, and later re-starting the application to continue collecting the raw ASN-M test data. [The ASN will be required for proximity operations and docking approach of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne” to the SM aft end, currently planned for early March 2008. The ground-controlled testing simulates the ATV rendezvous phase using the ASN system, and its results will be used to assess the ASN-M equipment’s readiness for joint ATV operations.]

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Afterwards, the FE-2 downloaded the crew’s exercise data file to the MEC (Medical
Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second voluntary job for Kotov was to use the Nikon D1X (SIGMA 300-800mm telephoto lens) to make observations and take aerial KPT-3 photography of environmental conditions for Russia’s Environmental Safety Agency (ECON). [KPT-3 photography has been a frequent earth observing experiment for ECON.]

As a third discretionary task on his list, Oleg performed the regular health check on the long-term BIO-5 Rasteniya-1 (“Plants-1”) micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

Also as one of the voluntary tasks for today, Fyodor Yurchikhin performed another session of the Uragan Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on nature. [Today’s Uragan photo targets were Taiwan, the Ugra National Park (Kaluga), the Northern section of the Aral Sea, and Lake Issyk-Kul.]

At ~12:35pm EDT, Clay had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop).

**GPS-2 Anomaly:** Late on 8/30, SIGI-2 (Space Integrated Global Positioning Satellite/Inertial Navigation Systems 1) failed its time difference check. Software upgrade R3 was thought to have fixed this recurring failure which was recently also seen on GPS-1, which is still on R2 (ref. 8/25 report). As a result, there is currently no redundancy for vehicle state vector updates; but other sources of state determination (GPS-1 & Russian data) are available.

**KOB-2 Heating Loop Pump Failure:** The N1 pump on pump panel 4SPN1 of the Russian KOB-2 heating loop was declared failed (ref. 8/30 report). There is no
sparing on board. The KOB-2 loop is running nominally on the 4SPN2 pump panel.

RPCM R&Rs: Ground specialists are considered removal & replacement of three USOS RPCMs (Remote Power Control Modules), keeping a fourth as new spare.

Weekly Science Update (Expedition Fifteen -- 18th)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): On 8/28, ALTCRISS instrument was reoriented (on SM panel 326); photos were taken of new configuration and downlinked; PCMCIA card was exchanged. On 8/29, the file size was checked and appears nominal. Data were downlinked for analysis.

ANITA: Planned.

BCAT (Binary Colloidal Alloy Test): Reserve.

CARDIOCOG-2: Last session was performed yesterday (8/31).

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Continuing,

CFE (Capillary Flow Experiment): Reserve.

CHROMOSOME-2 (E14 SFP): Completed.

CSI-1/CGBA (CGBA Science Insert #1/Commercial Generic Bioprocessing Apparatus): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Next scheduled operation is 10/29-11/3.

EMCH (Elastic Memory Composite Hinge): Complete.

EPO (Educational Payload Operation) Kit C: Planned.

IMMUNO (Saliva Sampling): First session samples are currently stowed in MELFI Dewar #2.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.
**MISSE (Materials ISS Experiment):** Ongoing.

**MTR-2 (Russian radiation measurements):** Passive dosimeters measurements in DC1 “Pirs”.

**MULTIGEN-1:** MULTIGEN-1 hydration completed and rotor spin initiated on 8/25. On 8/30, germination in all 8 ECs (Experiment Containers) observed. From 8/28, a problem occurred on humidity control for one EC (position A2) which has effect on EC air ventilation. Work-around with uplinked script to restart humidity control has been put in place. Relative humidity increased in 6 of 8 ECs (all except A2 and B1) from 50% to 80% on 8/29. EC B1 is in bypass mode since 8/29. Impact on science as no airflow through the EC volume. Issue is under investigation.

**MUSCLE (E14 SFP):** Completed.

**MSG-SAME (Microgravity Science Glovebox):** Planned.

**NEOCYTOLYSIS (E14 SFP):** Completed.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION:** In progress.

**PMDIS (Perceptual Motor Deficits in Space):** Complete.

**SAMPLE:** Ongoing.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** n/a

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** In progress.

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** Planned.

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** Planned.

**TRAC (Test of Reaction & Adaptation Capabilities):** Planned.

**CEO (Crew Earth Observations):** Through 8/28 the ground has received a total of 11,507 CEO images for review and cataloging for Increment 15, nearly a thousand images in the past two days. In this set the ground has identified for prioritized review images with camera times corresponding to the following CEO target request times: Licancabur, Volcano, Chile; Eastern Tien Shan, China; Nile River
Delta, Egypt; High Central Andean Glaciers; Urumqi, China; and Yellowstone National Park, Wyoming. “Although we failed to help you acquire the glaciers of the Tien Shan, you did acquire excellent imagery of several of the ones in the High Central Andean Glacier site. These are now some of the best we have for these features. We will be providing feedback next week on the other targets as we catalog their imagery. Your spectacular image of the Shiveluch Volcano on the Kamchatka Peninsula acquired in July will be published on NASA/GSFC’s Earth Observatory website this weekend.”

Today’s CEO (Crew Earth Observation) photo targets were Wild fires, Algeria (DYNAMIC EVENT: Many wild fires are now raging on the wooded, sea-facing slopes of the Atlas Mts. Smoke is so thick that coastal towns are often obscured. Looking left of track for panoramic views), Tigris-Euphrates Delta (crew was asked to shoot a mapping pass left and right of track as they crossed the coast. The delta has been changing shape rapidly, partly as a result of marshland draining immediately upstream in the last two decades), and Toshka Lakes, Egypt (several new lakes have appeared in the desert west of the River Nile in the wake of government efforts to relocate population to southern Egypt. Looking right of track to document the latest status of these lakes whose levels appear to be dropping (after many years of continuous rise).

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ Study/AstronautPhotography

**ISS Orbit** *(as of this morning, 8:49am EDT [= epoch]):*

- Mean altitude -- 340.5 km
- Apogee height -- 346.1 km
- Perigee height -- 334.9 km
- Period -- 91.35 min.
- Inclination (to Equator) -- 51.63 deg
- Eccentricity -- 0.0008339
- Solar Beta Angle -- -43.3 deg (magnitude leveling off)
- Orbits per 24-hr. day -- 15.76
- Mean altitude loss in the last 24 hours -- 48 m
- Revolutions since FGB/Zarya launch (Nov. 98) -- 50282

**Significant Events Ahead (all dates Eastern and subject to change):**

- 09/03/07 -- Labor Day Holiday
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1); probably requires SAW feathering;
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/24/07 -- ISS reboost (setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/28/08 -- STS-124/Discovery/1J docking
05/05/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Ares I-X Launch
ISS On-Orbit Status 08/31/07

All ISS systems continue to function nominally, except those noted previously or below. Flight Control to station crew: “Awesome job moving and reattaching PMA3 yesterday!”

Fifth (and last) day of the week-long activities dealing with PMA-3 (Pressurized Mating Adapter 3) relocation from the Node 1 (Unity) port CBM (Common Berthing Module) to the Node nadir (earth-pointing) CBM to make room for the installation of Node 2 (Harmony) arriving with STS-120/10A in October (10/25). In Node 1 (Unity), FE-2 Anderson –

- Cleaned up by restowing cargo bags and reconfiguring stowage to keep the port hatch clear for access to Node 2 (Harmony) after 10A;
- Started moving numerous CWCs (Contingency Water Containers), stowed up to now as a “water wall” on the Node’s portside, and worked on rebuilding the entire water wall at another Node location (NOD1D2);
- Reconfigured UOPs (Utility Outlet Panels), with CBCS (Centerline Berthing Camera System) removed, by reconnecting cables for an IWIS RSU (Internal Wireless Instrumentation System Remote Sensor Unit), a vacuum cleaner, and SSC-9 (Station Support Computer 9);
- Reconfigured the electrical CPP (Connector Patch Panel) to have the Node power bus be fed from a DDCU (DC-to-DC Converter Unit) instead RACU 6 (Russian-to-American Converter Unit), i.e., all of Node 1 now being run on U. S. power; and
- Used a handheld CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) instrument to measure the O₂ percentage behind the closeout panel that was opened in the Node.

With the Elektron oxygen (O₂) generator switched off, then purged with N₂ (nitrogen) on TsUP/Moscow Go-ahead, FE-1 Kotov performed maintenance on the
BITS2-12 Onboard Telemetry Measurement System’s prime Central Processor system (PTsB), removing and replacing its PZU-A data storage unit (ROM-A = read-only memory A) with a new spare. [The subsystem’s PZU-A memory unit was replaced last by Mikhail Tyurin on 3/14/07.]

Afterwards, the FE-1 supported the ground in reactivating the Elektron at 32 amps, monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. [During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

After Clay’s CPP patch panel reconfiguration, Oleg Kotov updated SODS (Station Operation Data File) Emergency Book procedures accordingly.

CDR Yurchikhin set up the pumping equipment for transferring potable water from Progress M-61/26P’s BV1 tank to the Service Module (SM) water BV1 tank. [After hooking up the plumbing from BV1 to the SM Rodnik tank, Yurchikhin monitored the water transfer to the BV1 for several hours, at first in self-flow (under its own tank pressure), then using a compressor pump via a GZhS gas/liquid separator, to remove air bubbles in the water. Before its use, the GZhS was flushed for cleaning. Filling of the empty Progress BV1 & BV2 tanks with urine will be scheduled at a later date.]

Oleg Kotov had two hours allotted to unstow & set up the equipment for a closeout session with the BTC-10 CARDIOCOG experiment and then to perform the procedure on himself. [CARDIOCOG studies changes in the human cardiovascular system in micro-G, expressed in the peripheral arteries, and the vegetative regulation of arterial blood pressure (BP) and heart rate (HR) plus ECG (electrocardiogram). For the experiment, Oleg had to take his systolic & diastolic blood pressure measurements, heart rate data and ECG, using a finger cuff, the Cardionauka CAR 01 kit with PTP-10 Portapress power, an electrode vest, and the TENZOPPLUS sphygmomanometer. He then stored the data on the RSE1 laptop for subsequent copying to a PCMCIA card and downlinking to the ground via OCA. The hardware was temporarily put aside.]

After Anderson prepared the auditory test equipment, each crewmember took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC laptop application. It was Fyodor’s and Oleg’s second, Clay’s first session. [The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and
sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.

After the recent (8/8) replacement of the malfunctioning Russian Smart Switch Router (BRI) in the joint OpsLAN (Operations Local Area Network) with a new unit delivered on Progress 26P and the subsequent full-scale network testing on 8/9, Yurchikhin today routed and installed an Ethernet cable between the BRI and an MPEC Coder unit in the Russian Segment (RS). [During the installation, the BRI had to be deactivated, which temporarily interrupted all communications between U. S. Segment (USOS) and RS OpsLAN components. After BRI activation, the installation was tested by “pinging” (with the RSC-Energia PingMaster) while monitoring the network.]

The FE-1 performed the weekly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), checking the condition of the roller bearings and recording the treadmill’s time & date values.

The CDR conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) with canister cords and accessory straps as well as the canister bolts for re-tightening if required.

Yurchikhin also continued the current round of the monthly preventive maintenance of RS ventilation systems, today working in the Funktsionalnyi-Grusovoi Blok (FGB) to clean the mesh screens of its central ventilation fans (TsV1 & TsV2), followed by cleaning the detachable fan screens 1, 2, and 3 of its three SOTR (thermal control system) gas-liquid heat exchangers (GZhT4).

Clay Anderson continued supporting the EPO (Educational Program Operation) “Kit C” project, today by taking photos to document the plant growth in zero-G. [The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation,
it'll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

The FE-2 completed the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. Two CSA-CP (CSA-Combustion Products) instruments recorded O₂, CO, HCN and HCl readings at the SM Central Post (#1060, prime) and in the Node (#1057, backup), while the CSA-O₂ units (#1063, #1042) looked for O₂ in the Lab and the CDMK (#1008) for CO₂ in SM and Lab. Also recorded were battery ticks. The instruments were turned off afterwards, except for the prime CSA-CP #1060 unit, and returned to their regular locations. Note: Clay Anderson today suggested doing this trending check every two weeks instead of weekly. Under review.]

Clay also performed the regular bi-weekly maintenance reboot of the SSC (Station Support Computer) File Server and OCA Comm Router laptops.

Fyodor performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working on updating the IMS (Inventory Management System), Clay edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Oleg performed troubleshooting on the Russian long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, which has shown indications of off-nominal equipment operation. [The FE-1 modified laptop settings to change the humidity levels in the cells of the Lada-10/MIS (Module for the Investigation of Substrates).]

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2) and RED resistive exerciser (CDR, FE-1, FE-2).

Later tonight, the FE-2 downloads the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM.
storage medium (done six times a week).

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Conjunction Update: MCC-H ballistics specialists have been monitoring a conjunction with orbital debris (old Russian Strela ICBM body, NATO designation: SS-11 Sego), with TCA (time of closest approach) tonight at ~7:00pm EDT. Current predictions continue to show a miss distance of ~29.3 km. No DAM (Debris Avoidance Maneuver) required.

At ~4:15am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~9:10am, Fyodor and Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing transfer details and stowage locations. [Discussions today concerned the location of the discarded ASU collector, condition of a transferred light unit from the recent lamp audit, and state of completion of the Russian photo/video equipment audit/inventory.]

At ~10:30am, Fyodor and Oleg participated an audio/S-band interview with a correspondent from the Russian “Rossiyskiy Kosmos” magazine. [Main topic was the upcoming 50th Anniversary of the launch of the first Earth satellite on 10/4/57 which the cosmonauts are to spend on the station.]

The crew’s regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio was conducted at ~10:45am.

Today’s CEO (Crew Earth Observation) photo targets were Tin Bider Impact Crater, Algeria (this 6 km-diameter crater is known to be less than 70 million years old from the age of the rocks that it has impacted. Looking left for a prominent dark mass sandwiched between classic desert landscapes [wind streaks produced by strong southwesterly winds, and a megafan produced by a river exiting mountains in the foreground]. Relatively low sun angles should have revealed detailed morphology of this remote Saharan crater), Urumqi, China (looking left at the foot of the local mountains for this city), Taklimakan Desert Dust, China (DYNAMIC EVENT: Looking right for a regional dust storm, with dust blowing towards ISS ground track. Crew was asked to include surrounding mountain slopes in any
images. Winds regularly blow dust from this desert basin as far as Beijing and Japan), and **Yellowstone National Park, Wyoming** (a mapping swath of overlapping images, taken along track just left of nadir, was requested).

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 8:26am EDT [= epoch]):
Mean altitude -- 340.6 km
Apogee height – 346.3 km
Perigee height -- 334.9 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008484
Solar Beta Angle -- -42.7 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 76 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50266

**Significant Events Ahead** (all dates Eastern and **subject to change**):
09/03/07 -- Labor Day Holiday
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1); probably requires SAW feathering;
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/24/07 -- ISS reboost (setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/28/08 -- STS-124/Discovery/1J docking
05/??/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/??/09 -- Six-person crew on ISS
04/15/09 -- Ares I-X Launch
ISS On-Orbit Status 08/30/07

All ISS systems continue to function nominally, except those noted previously or below.

PMA-3 is now fully mated at the Node nadir docking port, and the port dock is ready to receive Node 2 (Harmony).

This was Day 4 of the week-long activities dealing with PMA-3 (Pressurized Mating Adapter 3) relocation from the Node 1 (Unity) port CBM (Common Berthing Module) to the Node nadir (earth-pointing) CBM to make room for the installation of Node 2 (Harmony) arriving with STS-120/10A in October (10/25):

- FE-2 Anderson, having verified proper closure of the protective Lab window shutter, checked on completion of the overnight PMA depressurization (to less than 2 mmHg for demating to proceed) and conducted a 30-min leak check.
- At ~5:35am EDT, flight controllers disabled the Russian thrusters for the duration of SSRMS (Space Station Remote Manipulator System) and CBM (Common Berthing Mechanism) operations (with safing and recovery procedures in place in case of an unlikely LoAC/Loss of Attitude Control event); next
- The FE-2 powered on the CBCS (Centerline Berthing Camera System) on the Node nadir hatch window;
- Anderson and Kotov then grappled PMA-3 with the SSRMS, as Yurchikhin initiated demate activities, i.e., worked with the CBM bolt mechanism;
- Demate ops were stopped for a while by a problem with two fault-indicating bolts (RBOLT #2-1, #2-4), and a third bolt (#3-4) showing intermittent failure. The faults were identified as a sensor issue of the bolts’ force load cells for measuring the torque applied (seen before, i.e.,
nothing physically wrong with the CBM mechanism). Since the known bolt-driving motor currents are also quantitative torque indicators, demating proceeded. More in-depth analysis work, already underway, to be performed before the planned temporary attachment of Node 2 to the port CBM on 10A).

• After nadir CBM was reconfigured by the ground, Clay and Oleg continued to maneuver PMA-3 through a quarter circle around the Node to the nadir port while Fyodor performed pre-mate verification on its CBM; then

• PMA-3 was successfully installed, with Fyodor completing first & second stage capture and subsequent ABOLT driving. Afterwards

• Clay and Oleg ungrappled the SSRMS from PMA-3 and maneuvered it to a stow position.

• Next, after finishing ABOLT loading from the ground, controllers deactivated & powered down the nadir CBM, then temporarily re-activated the port CBM, long enough for Fyodor to close its petals.

• At ~12:10pm, ground controllers re-enabled thruster control, while

• Clay reconfigured the SSRMS video setup, disconnecting the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable at the Cupola & Lab RWS (Robotics Work Station).

• The FE-2 then disassembled and restowed the CBCS, and

• Concluded activities by re-latching the Node 1 nadir hatch.

As part of regular maintenance of the Service Module (SM) water processing system, Oleg Kotov swapped the BRPK-1 (string-1 Air/Liquid Separation & Pumping Unit) of the SRVK-2M Condensate Water Processor with a spare unit, discarding the old unit for disposal. [The SRVK processes the condensate coming from the SKV air conditioner for the Elektron.]

CDR Yurchikhin continued to support TsUP/Moscow in the two-week testing of the Russian ASN-M Satellite Navigation Equipment, first temporarily closing down the data collection & saving application on the laptop, then copying the accumulated data to a PCMCIA (Portable Computer Memory Card International Adapter) CF 128MB storage card for subsequent downlinking during RGS (Russian Ground Site) passes for ground processing, and later re-starting the application to continue collecting the raw ASN-M test data. [The ASN will be required for proximity operations and docking approach of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne” to the SM aft end, currently planned for early March 2008. The ground-controlled testing simulates the ATV rendezvous phase using the ASN system, and its results will be used to assess the ASN-M equipment’s readiness for joint ATV operations.]
Yurchikhin also performed the periodic (about twice a month) replenishing of the Elektron’s water supply for electrolysis, filling the KOV thermal loops’ EDV container with water collected in CWC (Contingency Water Container) #1077 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

FE-2 Anderson updated the onboard SODF (Station Operation Data File) “Emergency” procedures books with new pages and pen & ink changes, both for the four EMER-1 books normally stowed in Lab, FGB, SM and Soyuz, and the three EMER-2 books from Lab, FGB and SM.

Clay continued preparing the MELFI (Minus-Eighty Laboratory Freezer for ISS) for future use, started by Oleg yesterday, removing Velcro straps from Dewar 3/Tray D (sections 1&2). [The straps were used as launch restraints for new ICEPACs. They were reported by Suni Williams to have obstructed Icepac insertion and removal unless taken off beforehand. Each Dewar should not be opened for more than ~1 minute, requiring quick work.]

Fyodor performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working to update the IMS (Inventory Management System), Oleg edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Clay conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card, to be updated with today’s data, lists 31 water containers (~1190 liters total) for the four types of water identified on board: technical water (806.9 l, for Elektron, flushing, hygiene), potable water (351.2 l), condensate water (13.2 l), waste/EMU dump and other (19.0 l].

As part of the current round of periodic preventive maintenance of Russian Segment (RS) ventilation systems, the CDR worked in the FGB to clean the vent screens of specific interior closeout panels (116, 231, 316, 431, 201, 301 & 401).

Clay continued supporting the EPO (Educational Program Operation) “Kit C” project, today by checking the growth chamber for humidity. [The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day
run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-1, FE-2), and VELO cycle with bungee cord load trainer (CDR).

Later tonight, the FE-2 downloads the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At 12:20pm, FE-2 Williams conducted the periodic VHF1 emergency communications check over NASA’s VHF (Very High Frequency) sites at Dryden (12:23-12:30pm), White Sands (12:25-12:32pm) and Wallops Island (12:33-12:37pm), talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator) and Moscow/GLAVNI (TsUP Capcom) in the normal fashion via VHF radio from a handheld microphone and any of the U.S. segment ATUs (audio terminal units).  [Purpose of the test is to verify signal reception and link integrity, and to ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Also as a task from the voluntary job list, Oleg performed the regular health check on the long-term BIO-5 Rasteniya-1 (“Plants-1”) micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

Conjunction advisory: MCC-H ballistics specialists are monitoring a conjunction
with orbital debris (old Russian Strela ICBM body, NATO designation: SS-11 Sego), with TCA (time of closest approach) tomorrow evening at ~7:00pm EDT. Current predictions show a miss distance of ~29.3 km. No DAM (Debris Avoidance Maneuver) considered.

**SKV-2 Update:** The Russian SKV-2 air conditioner experienced an off-nominal shutdown yesterday due to an unplanned automatic switchover from pump panel 4SPN1 to pump panel 4SPN2 on the KOB-2 heating loop. The KOB-2 loop was restarted on 4SPN2 and SKV-2 subsequently reactivated. It is now back on and operating nominally.

**EVA Glove Damage Update:** Ground inspection has now determined that the hole in the Vectran layer of Rick Mastracchio’s EMU glove was not caused by abrasion but is a cut caused by a sharp edge (these gloves were not the same lot as the glove damaged/cut on Curbeam’s 12A.1 EVA). Teams are assessing work site areas to try to isolate the source and are attempting to manifest additional sets of gloves for any crewmembers doing an EVA on 10A. The current terminate criteria for an EVA will remain as is. A program review will be performed prior to giving a GO for an EVA in this worksite area.

Today’s CEO (Crew Earth Observation) photo targets were **Tenoumer Impact Crater, Mauritania** (looking left of track [beyond a dark, linear ridge in the foreground] for this 2 km-diameter crater which is young and well-formed. An ejecta blanket can be discerned around the crater), **Bigach Impact Crater, Russia** (aiming at nadir for this 8-km-diameter crater. The visual cue is Lake Zaysan just downtrack, and a group of agricultural fields that lie within the crater rim), and **Andrews Forest, Washington** (looking left of track for this mountain forest and shooting a mapping swath. This is an LTER (Long Term Ecology Research) site in which rapid changes are occurring due to human activity. Repeat photography can help to document such change).

CEO photography can be viewed and studied at the websites: [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); [http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/) [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** *(as of this morning, 8:07am EDT [= epoch]):*
Mean altitude -- 340.7 km
Apogee height – 346.3 km
Perigee height -- 335.0 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008401
Solar Beta Angle -- -41.4 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 88 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50250

**Significant Events Ahead (all dates Eastern and subject to change):**
08/31/07 -- Clean-up after relocation, restow bags (enabling Node 2 access from Node 1);
09/03/07 -- Labor Day Holiday
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1); may require SAW feathering;
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/24/07 -- ISS reboost (setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/28/08 -- STS-124/Discovery/1J docking
05/??/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/15/09 -- Ares I-X Launch
ISS On-Orbit Status 08/29/07

All ISS systems continue to function nominally, except those noted previously or below.

Day 3 of the week-long activities dealing with PMA-3 (Pressurized Mating Adapter 3) relocation from the Node 1 (Unity) port CBM (Common Berthing Module) to the Node nadir (earth-pointing) CBM to make room for the installation of Node 2 (Harmony) arriving with STS-120/10A in October (10/25). Today, the crew took the following steps:

- FE-1 Kotov unlatched the Node 1 nadir hatch by taking the latch to its “hardstop” position (hatch remains sealed tight by 38,993 lbf of internal air pressure at 14.7 psi IVA); afterwards
- FE-2 Anderson set up the ISA (Internal Sampling Adapter) and VAJ (Vacuum Access Jumper), connecting it to the Node port MPEV (Manual Pressure Equalization Valve) in preparation for PMA depressurization; additionally
- Anderson installed the CBCS (Centerline Berthing Camera System) on the Node nadir hatch window, followed by a checkout.
- At ~2:15pm, the FE-2 will initiate depressurization of PMA-3, which will take place overnight (the original plan of performing the depress tomorrow morning was changed when new data showed that it will take several hours to get PMA pressure from currently ~20 mmHg down below 5 mmHg, as required).
- Also overnight, the ground will check out the two Node CBMs (port & nadir). In addition, the nadir CBM’s petals will be deployed for an inspection of the ACBM (Active CBM) sealing surface with the SSRMS (Space Station Remote Manipulator System). [A brief loss of the SSRMS Tip Elbow camera yesterday was quickly cleared by power cycling, restoring nominal ops.]

Before breakfast and exercise, CDR Yurchikhin, FE-1 Kotov and FE-2 Anderson completed their second (Clay’s first) session with the periodic Russian MedOps test
"Hematocrit" (MO-10), measuring red cell count of the blood. [The blood samples were drawn from a finger with a perforator lancet, then centrifuged in two microcapillary tubes in the M-1100 kit's minicentrifuge, and its hematocrit value was read off the tubes with a magnifying glass. It is a well-known phenomenon of space flight that red blood cell count (normal range: 30-45%) tends to go down over time. After the exam, the data were saved in the IFEP software (In-Flight Examination Program) on the MEC (Medical Equipment Computer), and Oleg Kotov stowed the equipment.]

Yurchikhin and Kotov also took the periodic (generally monthly) health test with the cardiological experiment PZEh MO-1 "Study of the Bioelectric Activity of the Heart at Rest" on the TVIS (Treadmill with Vibration Isolation System), assisting each other in turn. [During the 30-min. test, the crew tagged up with ground specialists on Russian ground site (RGS) passes via VHF (~7:40am EDT) and downlinked data from the Gamma-1M ECG (electrocardiograph) for about 5-6 minutes.]

Fyodor Yurchikhin serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system, deferred from yesterday. The regeneration process will be terminated at ~5:15pm EDT. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated last Monday.]

Clay Anderson worked in the U.S. Airlock, removing and replacing its three HEPA (high-efficiency particulate air) bacteria filters with new ones. [One of the old filters will be returned to the ground for analysis, the other two discarded as trash.]

At the HRF1 (Human Research Facility 1) rack, Anderson deactivated the MedOps cardiac defibrillator and conducted its periodic checkout. (Last time done: 7/2/07). [This routine maintenance task is scheduled as soon as possible from Expedition start and every 60 days thereafter. For the checkout, the defib is connected to the 120V outlet, equipped with its battery (today #1018) and then allowed to charge, for about five seconds, to a preset energy level (e.g., 100 joules). After the button-triggered discharge, a console indicator signals success or failure of the test. The pacing signal is downlinked via S-band for 1 min. To check on possible aging of the CRT (cathode ray tube) display screen, today’s maintenance included photo documentation by Clay. The HRF was powered down afterwards.]

Kotov prepared the MELFI (Minus-Eighty Laboratory Freezer for ISS) for future use, removing Velcro straps from Dewar 3/Tray D (sections 3&4). [The straps were used as launch restraints for new Icepac. They were reported by Suni Williams to have obstructed Icepac insertion and removal unless taken off beforehand.]
Anderson worked on the MSG (Microgravity Science Glovebox), removing and stowing its WV (Work Volume) leak test equipment to make room for setting up the new SAME (Smoke & Aerosol Measurement Experiment) payload, intended to determine size and distribution of smoke particles from different materials inside the MSG WV.

TsUP/Moscow continues preps for the two-week testing of the Russian ASN-M Satellite Navigation Equipment. There was no crew involvement scheduled today. [The ASN will be required for proximity operations and docking approach of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne” to the SM (Service Module) aft end, currently planned for early March 2008. The ground-controlled testing simulates the ATV rendezvous phase using the ASN system, and its results will be used to assess the ASN-M equipment’s readiness for joint ATV operations.]

The FE-1 continued the current round of periodic preventive maintenance of Russian Segment (RS) ventilation systems, today cleaning Group A fans in the SM.

Kotov also performed an extensive audit/inventory of all lights (SD) in the RS and their plug-in data (SD1-7 power supply units), supported by an uplinked detailed listing of 42 deployed lamps and another 55 spare lamps in FGB stowage bags.

Yurchikhin had another 2h 45m set aside for Progress M-61/26P unloading and cargo transfers, keeping track of movements in the IMS (Inventory Management System).

The FE-2 reconfigured three Lab UOPs (Utility Outlet Panels, #1,2,5) in preparing for the upcoming routing/connecting of the ISL (Integrated Station LAN) Router and EWIS NCU (External Wireless Instrumentation System/Network Control Unit). [ISL is an upgraded on-board LAN (local area network) utilizing Ethernet connectivity over an ISL Router via cable or wireless (WAP/Wireless Access Point). ISL integrates all ISS “user” devices, including RS docking video distribution, payload comm & downlink (from IP modules, e.g., Columbus or JEM), crew operations, procedures viewing, email, IP phone, etc. ISL eliminates drag-through cables in hatches, will be up to ten times faster than the current OpsLAN, and has provisions for future modules.]

The crew conducted the regular fire drill/OBT (on-board training), a mandatory periodic one-hr exercise (including ground debrief conference). Primary goal of this Russian-led interactive exercise is to provide the station residents with the most realistic emergency training possible. The drill is always conducted with the support of both MCCs in close coordination. It should be performed every 2.5 months, but not later than 1 month prior to end of Increment. [OBT objectives are to (a)
practice fire response procedures (FRPs) and all incorporated actions for the case of a software-detected fire to locate, extinguish, and verify extinguishing attempts; (b) browse through RS laptop and the Signal-VM fire detection system displays as well as the automated software (algorithms) response to the fire event; (c) practice crew communication necessary to perform emergency FRPs; (d) ensure familiarization with support equipment (CSA-CP compound specific analyzer-combustion products, PBAs portable breathing assemblies, PFE/OSP-4 portable fire extinguishers, and IPK-1M gas masks to be used for fire suppression. These exercises do not actually use any fire equipment but simulate such actions to the maximum extent possible. The Emergency Procedures OBT concluded with a 15-min. debrief with Russian/U.S. ground specialists at ~11:30am EDT via S-band."

The FE-2 opened the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) payload, accessing the incubator’s interior to perform the first set of CSI-02 (CGBA Science Insert #2) operations. Afterwards, CGBA-5 was closed again and cable-connected. [Ops included removing & stowing the Silica Garden Hab, sowing seeds in the Plant Development Hab, and flipping the CHab and Cell Culture Hab. The incubator is controlled from the ground with automatic video downlinked to Earth.]

Clay also continued supporting the EPO (Educational Program Operation) “Kit C” project, today by taking photos to document the plant growth in zero-G. [Today’s message to Clay: “The EPO Kit C images look good so far… We are working to put them up on the Engineering Design Challenge website. We have seen a good number of schools sign up already to participate in this challenge.” The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

On the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), Yurchikhin removed the PCMCIA memory card #934 from the AST spectrometer’s slot and copied the accumulated data for subsequent downlinking via OCA. Card 934 was then re-inserted to continue AST ops.

Oleg performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the periodic checkout/verification of IP-1 airflow sensors in the
various RS hatch openings (8) in the SM, FGB and DC1. [On 8/27, the crew reported a problem with the ASU toilet facility, indicated on one of its two control panels. Troubleshooting showed that the separator was failing. The crew replaced it yesterday with a new spare (#29), which restored nominal operations.]

Working to update the IMS, the CDR edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR/MO-1, FE-1/MO-1, FE-2), RED resistive exerciser (FE-1, FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later tonight, Yurchikhin downloads the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:50am EDT, Fyodor, Oleg and Clay downlinked a PAO TV “Space Lesson”, answering uplinked questions for a promotional event organized by “Rossiyskaya Gazeta”, a publication of the Russian government, for Russia’s “Days of Knowledge”. The event brings ISS cosmonauts, readers, high school students, school teachers and university professors together, with a competition for questions, the best to be rewarded with an invitation to TsUP-Moscow for a comm session. [“To Fyodor Yurchikhin: You have a PhD in Economics. Is it possible to make space flights profitable? If yes, then how?”; “To Clayton Anderson: Now we have US Orbiters and Russian Soyuz vehicles flying to space. What are the best features of both which should be implemented in manned spacecraft of the future? And which features should be unequivocally abandoned?”; “To Oleg Kotov: You have been waiting 13 years until your space launch. Unfortunately, many of your colleagues in a similar situation got disheartened and gave up. What three pieces of advice would you give to those who decide to choose the difficult profession of a cosmonaut?”; “To all: Whom among famous people would you like to be your guest at ISS as a tourist?”; “Can cosmonauts coordinate a fire-fighting effort among specialists on the ground, for example, like now in Greece?”]

At ~12:00pm EDT, the FE-2 powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), and at 12:05pm conducted a radio exchange with students at Ashland Greenwood High School, Ashland, Nebraska (Clay’s home state). Ashland, pop. 2262, is located in SE Nebraska between Lincoln, the state capital, and Omaha. Questions from the kids were uplinked beforehand by the ARISS (Amateur Radio on International
Space Station) organization. [“Did being in space make you nauseous at first?”; “How is physical activity affected while in space? Do you burn more calories? Do you have better stamina? How are your heart rate and blood pressure affected?”; “How well do you get along with the people you work with?”; “When you are on Earth and working with NASA, is it hard to maintain your personal life? Or is it like the military where you have no personal life?”]

At ~4:10pm, Anderson is scheduled for a CDF (Crew Discretionary Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on a laptop).

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Today’s CEO (Crew Earth Observation) photo targets were Cairo, Egypt (looking a touch left of track at the base of the Nile delta, on the East bank of the Nile for this great city. Remote sensing is one of the best means of measuring the growth of rapidly expanding Third World cities. The crew was asked to shoot the margins of the city where it expands into farmland on the west side and into the desert on the east side), and Mediterranean wild fires (DYNAMIC EVENT: Looking left for smoke plumes emanating from the North coast of Sicily; immediately thereafter aiming right for fires and plumes in Greece.)

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:38am EDT [= epoch]):
Mean altitude -- 340.8 km
Apogee height – 346.3 km
Perigee height -- 335.2 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008196
Solar Beta Angle -- -39.5 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 118 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50234

**Significant Events Ahead (all dates Eastern and subject to change):**

08/30/07 -- PMA-3 overnight depress & relocation (from Node 1 port to nadir, for Node 2 install);
08/31/07 -- Clean-up after relocation, restow bags (enabling Node 2 access);
09/03/07 -- Labor Day Holiday
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1)
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/24/07 -- ISS reboost (setting up for Soyuz launch & 10A rendezvous on FD3)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate from Z1 to P5
10/25/07 -- STS-120/Discovery/10A docking (4 EVAs, incl. Node 2 & PMA-2 external preps)
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation to Node 2 (PMA-2 umbilicals stowed on 10A EVA-4)
11/08/07 -- Node 2 (Harmony) plus PMA-2 relocation to front of Lab
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 -- Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/28/08 -- STS-124/Discovery/1J docking
05/??/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
04/15/09 -- Ares I-X launch.
ISS On-Orbit Status 08/28/07

All ISS systems continue to function nominally, except those noted previously or below.

Day 2 of the week-long activities dealing with PMA-3 (Pressurized Mating Adapter 3) relocation from the Node 1 (Unity) portside CBM (Common Berthing Module) to the Node nadir (earth-pointing) CBM to make room for the installation of Node 2 (Harmony) arriving with STS-120/10A in October (10/25). Today, the crew took the following steps:

- FE-2 Anderson verified closure of the Lab window shutter prior to SSRMS (Space Station Remote Manipulator System) ops; since SSRMS will continuously be in the window’s field of view, the window needs to be protected until the completion of SSRMS ops on 8/30); afterwards
- CDR Yurchikhin and FE-1 Kotov each had about an hour for familiarization with CBM (Common Berthing Module) operations by going through uplinked CBM CBT (Computer Based Training) material; additionally
- Anderson set up the ROBoT trainer and used it with Kotov to prepare for the SSRMS/Robotics ops [ROBoT uses DOUG (Dynamic Operations Ubiquitous Graphics) software, a hand controller and two laptops (one for graphics, one for the simulation) for on-orbit training of MSS (Mobile Service System) and SSRMS (Space Station Remote Manipulator System) operations]; and finally
- The FE-2 completed preparatory SSRMS set-up ops by releasing the PDGF-3 grapple fixture on the MBS (Mobile Base System) and maneuvering the robotarm’s end effector to the Node 1 nadir CBM survey position.

Oleg Kotov serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated at ~4:05pm EDT. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated]
Also in the SM (Service Module), Yurchikhin worked at the prime TsP (Central Post) area, making a backup copy of the KTsP1/CPC1 (Central Post Computer 1) software load on an MSD (mass storage device) cartridge. [For the activity, KTsP2 was activated and KTsP1 shut down. For the copying, KTsP1 was then activated from the ground, with disk formatting and data copying performed automatically. For removing the cartridge, KTsP1 was turned off by the ground and later re-activated, while KTsP2 was shut down.]

With the Airlock (A/L) CCAA air conditioner running, Clay Anderson set up SCU (Service & Cooling Umbilical) gear for the standard EMU (Extravehicular Mobility Unit) “scrubbing” and then starting the ionic and particulate filtration process of the EMU and A/L cooling loops, for elimination of any biomaterial residues. Tonight before sleep time, Clay is to support CCAA (Common Cabin Air Assembly) deactivation by moving the flexible air duct from the Conditioned Air Supply position to the IMV (Intermodular Ventilation) Air Return position. [The two spacesuits (#3006, #3008) required about one hour each with SCU connected.]

The CDR continued to support TsUP/Moscow in the two-week testing of the Russian ASN-M Satellite Navigation Equipment, beginning today, by connecting the ASN-M DDC adapter to the RS (Russian Segment) Laptop #3 and starting the application for collecting the raw ASN-M test data and subsequent downlinking to the ground during RGS (Russian Ground Site) passes for processing. [The ASN will be required for proximity operations and docking approach of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne” to the SM aft end, currently planned for early March 2008. The ground-controlled testing simulates the ATV rendezvous phase using the ASN system, and its results will be used to assess the ASN-M equipment’s readiness for joint ATV operations.]

The FE-1 continued the current round of periodic preventive maintenance of RS ventilation systems. In the DC1 (Docking Compartment), he first cleaned the VD1 & VD2 air ducts. Moving afterwards into the SM, Oleg replaced four dust filter cartridges (PF1-4).

Yurchikhin supported the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) by changing the position of its AST spectrometer, i.e., turning the instrument by 90 deg around its Z- and X-axes so that its windows now face the SM starboard and port panels. The CDR also replaced the spectrometer’s PCMCIA memory card (#933) with card #934. [The last position change was done on 5/16 when AST was moved from SM panel 126 to panel 325.]
Clay and Oleg performed the CHeCS CMO (Crew Health Care Systems/Crew Medical Officer) on-board training drill, a 30-min. video & audio refresher course to hone the CMO’s acuity in emergency medical operations. [The proficiency drill focuses on re-familiarization with skills and techniques required in procedures related to medical issues arising on board and concludes with a self-assessment questionnaire.]

Anderson continuing his support of the EPO (Educational Program Operation) “Kit C” project, today by checking the growth chamber for humidity. [The demo/experiment studies the growth of basil and lettuce plants in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities, in which students are designing their own growth chambers and growing basil seeds flown on STS-118/13A.1. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

The FE-2 conducted the periodic status checkup & filter inspection of the running CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

Later today, the FE-1 will unstow and install the equipment for the periodic Russian PZE-MO-10 "Hematokrit" testing that is scheduled tomorrow for all three crewmembers. [MO-10 measures the hematocrit (red blood cell mass) value of the blood (it is a well-known phenomenon of space flight that red blood cell mass {normal range: 30-45%} tends to go down over time).]

Oleg conducted the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Kotov is also scheduled to collect the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH\textsubscript{4}), Ammonia (NH\textsubscript{3}), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO\textsubscript{2}), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]
Clay will be working on the IMS, updating/editing the standard IMS (Inventory Management System) “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later tonight, Anderson downloads the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:22am EDT, the FE-2 powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), and at 4:27am conducted a radio exchange with students at Amagasaki Child Science Hall, Amagasaki, Hyogo/Japan. Questions from the kids were uplinked beforehand by the ARISS (Amateur Radio on International Space Station) organization. [“Do astronauts have decayed teeth?”; “Is food floating in the stomach in the zero gravity?”; “What is the most wonderful event these days?”; “What would you do if a solar battery ran out?”]

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Also as a task from the voluntary job list, Oleg performed the regular health check on the long-term BIO-5 Rasteniya-1 (“Plants-1”) micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

Saturday Science Preview: Three optional activities for the voluntary “Saturday Science” program on the upcoming three-day Labor Day weekend (9/1-3) 8/25 &26 were suggested to Clay for his choice. His selection is required by tonight. [The three choices are (1) voice & video of another run of CFE VG1 (Capillary Flow Experiment – Vane Gap 1) to complete the CFE-VG1 experiment, (2) SPHERES
(Synchronized Position Hold, Engage, Reorient, Experimental Satellites), flying two and three satellites, requiring CDRA (CO₂ Removal Assembly) to be running, and (3) BCAT-3 (Binary Colloidal Alloy Test 3) Magnet Unstick, using the CGBA-4 (Commercial Generic Bioprocessing Apparatus 4), powered up 12 hrs before.

Today’s CEO (Crew Earth Observation) photo targets were Smoke plumes, southern Greece (Southern Greece, especially the Peloponnese peninsula near the ancient city of Olympia, is experiencing widespread wild fires – possibly the worst since 1871. Shooting left: the smoke plumes are trending ever more directly south, nearer to the ISS track over Crete. Including coastlines in the images will assist viewers), Mullan-Buffalo Trails, Montana (for educational purposes, CEO requested a mapping swath of nadir images of trails in neighboring Montana wildernesses for student use. More detailed images may be requested later), and Milk River Trails, Montana (for educational purposes, CEO requested a nadir mapping swath of images of trails in neighboring Montana wildernesses for student use.)

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/ http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 7:17am EDT [= epoch]):
Mean altitude -- 340.9 km
Apogee height – 346.3 km
Perigee height -- 335.4 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008144
Solar Beta Angle -- -37.1 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 75 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 50218

Significant Events Ahead (all dates Eastern and subject to change):
08/29/07 -- Prep for PMA-3 depress, install CBCS, check out 2 CBMs (ground);
08/30/07 -- PMA-3 depress & relocation (from Node 1 port to nadir, for 10A Node 2 install);
08/31/07 – Clean-up after relocation, restow bags (enabling Node 2 access);
09/03/07 -- Labor Day Holiday
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1)
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/06/07 -- PMA-2 relocation
11/08/07 -- Node 2 (Harmony) relocation
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/06/08 – Progress M-62/27P undocking
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/03/08 -- ATV-1 docking (SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/26/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/28/08 -- STS-124/Discovery/1J docking
05/??/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port)
ISS On-Orbit Status 08/27/07

All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 19 of Increment 15.

First day of the week-long activities dealing with PMA-3 (Pressurized Mating Adapter 3) relocation from the Node 1 "Unity" portside CBM (Common Berthing Module) to the Node nadir (earth-pointing) CBM to make room for the installation of Node 2 "Harmony" arriving with STS-120/10A in October (10/25). FE-2 Anderson today took the following steps:

- Hooked up the UOP-DCP (Utility Outlet Panel-to-Display & Control Panel) bypass power cable at the Cupola RWS (Robotics Work Station) in support of SSRMS (Space Station Remote Manipulator System) video coverage; afterwards
- Reviewed, for one hour, the POC DOUG (Portable Onboard Computer Dynamic Ubiquitous Graphics) software for the subsequent SSRMS activities, then
- Conducted SSRMS operations by successfully maneuvering the robotarm through an inchworm-like double walk-off from MBS PDGF-2 (Mobile Base System Power & Data Grapple Fixture 2) to MBS PDGF-3 and then to Lab PDGF); after which he
- Cleaned out the Node as required by transferring & relocating/restowing cargo equipment, and finally
- Reconfigured the Node’s power outlet panel for connecting the CBCS (Centerline Berthing Camera System).

Later in the day, Anderson also completed an on-orbit debrief with the ground via S-band to discuss cargo transfers during the next Shuttle mission, STS-120/10A.

FE-1 Kotov started the periodic regeneration of the Russian Harmful Impurities Removal System (BMP) by initiating the "bake-out" cycle to vacuum on absorbent
bed #1 of the dual-channel filtration system. The bake-out will be terminated at ~4:15pm EDT. Regeneration of bed #2 follows tomorrow. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]

CDR Yurchikhin and FE-1 Kotov each performed the Russian MBI-21 PNEVMOKARD experiment, their third on-orbit session (which forbids moving or talking during data recording). The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENSOPPLUS sphygmomanometer to measure arterial blood pressure. [PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember’s electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]

Kotov conducted the Russian INFRASOUND experiment, taking noise measurements in the SM (Service Module) before and after replacing the regular Position VT1 ventilation fan (MO-2-5008) with a new low-noise fan (17KS.53Yu 5009-0). Measurements were taken with a mike-equipped sound level meter (SLM) at various positions in the cabin with and without the #2 DS-7A smoke detector and SKV-2 air conditioner running, as well with certain wall panels (#204-205) installed and removed. The SLM data were then transferred to the MEC (Medical Equipment Computer) for subsequent downlink. [INFRASOUND (Infrasvuk-M) compares the spectral (spectrum-specific) energy characteristics of extremely low and low electromagnetic frequency ranges and infrasonic fields in habitable compartments of the SM under operating conditions of the old and new ventilation fans. The experiment takes measurements of acoustic noise level inside the SM in full scope with a sound analyzer and laptop for subsequent downlink of the measured data. The results are expected to help resolve design issues regarding the rating and crew protection against harmful effects of acoustic and electromagnetic fields in the ISS living compartments.]

TsUP/Moscow started the scheduled testing of the Russian ASN-M Satellite
Navigation Equipment, to extend over the next two weeks. In support, CDR Yurchikhin configured Laptop 3 with the necessary software (i.e., scripts, new drivers, etc.) for collecting raw ASN-M test data and then connected it to the primary RS-1553B data bus of the onboard cabling system (BKS) for ground access via RGS (Russian Ground Site) passes. [The ASN will be required for proximity operations and docking approach of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne” to the SM aft end, currently planned for early March 2008.]

Oleg Kotov had another hour set aside for Progress M-61/26P unloading and cargo transfers, keeping track of movements in the IMS (Inventory Management System).

Fyodor Yurchikhin conducted the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Wearing protective gear, Yurchikhin performed routine service on the ASU toilet facility in the SM by replacing its pretreat container (E-K) plus hose with a new assembly and discarding the old one. [E-K contains five liters of pre-treat solution, - a mix of H2SO4 (sulfuric acid), CrO3 (chromium oxide, for oxidation and purple color), and H2O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]

Working on the IMS, the CDR also updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Clay Anderson continued his support of the EPO (Educational Program Operation) “Kit C” project, today by taking photos to document the plant growth in zero-G. [The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

The FE-2 also conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister cords and accessory straps as well as the canister bolts for re-tightening if required.

The crew completed their regular daily physical workout program (about half of
which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS (CDR, FE-1), RED resistive exerciser (FE-1, FE-2), and VELO cycle with bungee cord load trainer (CDR).

Later this afternoon, Fyodor downloads the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:25am EDT, the crew conducted two PAO TV interview exchanges,- one with KLKN-TV, Lincoln, Nebraska (Jon Jordan), the other with The Lincoln Journal Star (Al Laukaitis). [Nebraska is Clay Anderson’s home state.]

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A second voluntary job for the Russian crewmembers was the periodic inspection behind panels 206-220 in the SM, to check equipment, connectors and the shell for any residue or condensate.

Two recurring items appeared again on the discretionary task list for Fyodor: (1) an equipment audit in the Russian segment (RS) of the ISS, behind stowage panels in the FGB, supported by an uplinked comprehensive list, and (2) to continue shooting photo/video footage of the RS modules’ interiors.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: 
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); 
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit (as of this morning, 6:55am EDT [= epoch]):**
Mean altitude -- 340.9 km
Apogee height – 346.4 km
Perigee height -- 335.5 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.64 deg

07/29/08 -- ATV-1 undocking (from SM aft port)
08/11/08 -- Progress M-64/29P undocking (from DC1)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/13/08 -- Progress M-66/31P launch
09/15/08 -- Progress M-66/31P docking (DC1)
09/20/08 -- (NET) STS-126/Discovery/ULF2 launch – MPLM(P), LMC
10/01/08 -- (NET) STS-126/Discovery/ULF2 undocking.
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/14/08 -- Soyuz TMA-13/17S launch
10/16/08 -- Soyuz TMA-13/17S docking (SM aft port).
ISS On-Orbit Status 08/26/07

All ISS systems continue to function nominally, except those noted previously or below. *Sunday. Ahead: Week 19 of Increment 15.*

FE-1 Kotov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Kotov also gathered data on total operating time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s SOGS air revitalization subsystem for reporting to TsUP.

After the CDRA (Carbon Dioxide Removal Assembly) was deactivated by ground command overnight and cooling is no longer required, FE-2 Anderson disconnected the ITCS LTL QD (Internal Thermal Control System Low Temperature Loop Quick Disconnect) jumper.

Clay Anderson also continued his support of the EPO (Educational Program Operation) “Kit C” project by checking the growth chamber for humidity. *The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it'll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.*
At ~6:45am EDT, the FE-2 powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), and at 6:50am conducted a radio exchange with students at Nanjing No.3 High School, Nanjing, Jiangsu/P.R.China. Questions from the ham amateurs were uplinked beforehand by the ARISS (Amateur Radio on International Space Station) organization. ["Can you see the Great Wall from the ISS?"; “Do you sweat in space and how do you handle it?”; “If air leak happens in the ISS, what emergency actions will be taken?”; “On the ISS, in which direction will the plants grow?”]

At ~10:10am, Clay had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop).

The crewmembers completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

As another voluntary task, the CDR performed the second part of the new session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on nature. [Today’s Uragan photo targets were the Olympic village site in the delta of the Mzymta river between Adler airport and the Psou river, the upper region of the Mzymta river valley, mountain valleys in nadir, the entire stretch of the Katun river valley to Lake Teletsk (eastern shore), the Steppe on the left eastern shore of Volga river to the south of Saratov (Y. A. Gagarin’s landing site, Ugra National Park, the northern section of Aral Sea, and the decaying Hurricane Dean.]

A second voluntary job for Kotov was the periodic data collection and downlinking for the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

**PMA-3 Relocation Overview:** On 8/30 (Thursday), the Pressurized Mating Adapter #3 is scheduled to be relocated from Node 1 Unity’s portside CBM (Common Berthing Module) to the nadir port to make room for the installation of Node 2
(Harmony) on the port dock during Mission 10A/STS-120. Detailed procedural materials for Robotics & CBM proficiency training have been uplinked. Extensive activities are scheduled throughout next week:

- **Tomorrow (Monday, 8/27):** Reconfigure Node 1 (stowage, UOP outlet for CBCS install), plus initial SSRMS (Space Station Remote Manipulator System) ops: double-walk from MBS PDGF-2 (Mobile Base System Power & Data Grapple Fixture 2) to MBS PDGF-3 and then to Lab PDGF;
- **Tuesday (8/28):** Close Lab window shutter, do CBM & Robotic ops training, release SSRMS from MBS PDGF-3 and maneuver to Node nadir CBM survey position while remained based on Lab PDGF;
- **Wednesday (8/29):** Prepare for PMA-3 depressurization, open Node nadir hatch latch (door being kept sealed by ~38,993 lbf), install CBCS (Centerline Berthing Camera System), ground check out both CBMs overnight;
- **Thursday (8/30):** Power on CBCS, depressurize PMA-3, Clay grapple PMA-3, Fyodor unbolt PMA-3, SSRMS transfer PMA-3 to nadir CBM, SSRMS ungrapple after bolts secured, power down CBCS, re-latch Node hatch door.
- **Friday (8/31):** Cleanup, reconfigure Node 1 stowage, get-ahead relocate stowage for Node 2 (Harmony” ingress during 10A.

**ASN Testing:** Tomorrow (8/27), TsUP/Moscow begins two-week testing of the Russian Satellite Navigation Equipment (ASN), with data download to Laptop 3 for ground access via RGS (Russian Ground Site) passes. This is in preparation for the arrival of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne”, currently planned for early March 2008, which requires ASN for proximity operations and docking approach to the SM aft end.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
- [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
- [http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/)
- [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** (as of this morning, 6:34am EDT [= epoch]):
- Mean altitude -- 341.0 km
- Apogee height – 346.5 km
- Perigee height -- 335.6 km
- Period -- 91.36 min.
- Inclination (to Equator) -- 51.64 deg
- Eccentricity -- 0.0008066
Solar Beta Angle -- -30.9 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 65
Revolutions since FGB/Zarya launch (Nov. 98) -- 50186

**Significant Events Ahead** (all dates Eastern and subject to change):
08/29/07 -- ISS reboost (if required)
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1)
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/08/07 -- Node 2 “Harmony” relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/11/08 -- Progress M-62/27P undocking
02/12/08 -- Progress M-63/28P launch
02/14/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/02/08 -- ATV-1 docking (SM aft port)
03/04/08 -- ATV-1 undocking (from SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking.
All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for the crew except for housekeeping and voluntary work.

The crew conducted the regular weekly three-hour task of thorough station cleaning. ["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

At ~8:50am EDT, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners), via S-band/audio, reviewing upcoming activities and any concerns about future on-orbit events.

Before lunch (~9:20am), FE-2 Anderson filled out the regular FFQ (Food Frequency Questionnaire), his eighth, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

The CDR conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.
Clay Anderson continued his support of the EPO (Educational Program Operation) “Kit C” project by taking photos to document the plant growth in zero-G. [The demo/experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

In the “Quest” Airlock, the FE-2 terminated the regeneration process on the second set of METOX (Metal Oxide) CO₂ absorption canisters (#0020, #0021) started yesterday and stowed the cans.

The CDR and FE-1 had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on a laptop), Yurchikhin at ~6:30am EDT, Kotov at ~8:00am.

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later this afternoon, Clay downloads the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary “time permitting” job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Also as one of the voluntary tasks for today, the CDR performed another session of the Uragan Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D1X digital camera with 400 & 800 mm focal length lenses to take pictures of natural environment targets, including those showing man-made impacts on
nature. [Today’s Uragan photo targets were the Altai mountains, the entire stretch of Katun river valley, the Eastern shore of Lake Teletsk Lake, the Irkut river valley from Lake Khubsugul to Lake Baikal, the Baikal shore from its south point to Angara river and further, the Katun range and Belukha peak, Altai’s highest area (here Katun arches around the range at 330° in nadir), the Alps to the east of Lake Geneva, glaciers on the south shore of the Rhone river (near arched dams), Ugra National Park (Kaluga), the Steppe on the left eastern shore of Volga river to the south of Saratov: Yuri A. Gagarin’s landing site (at 45.98°E, 51.23°S), Peru, the Andes, the Huascaran volcano, Patagonia ice field, and the Waddell Sea.]

A second voluntary job for Kotov was to use the Nikon D1X (SIGMA 300-800mm telephoto lens) to make observations and take aerial KPT-3 photography of environmental conditions for Russia’s Environmental Safety Agency (ECON). [KPT-3 photography has been a frequent earth observing experiment for ECON.]

As a third discretionary task on his list, Oleg completed another data monitoring & calldown session with the Matryoshka-R radiation payload and its LULIN-5 electronics box.

A special voluntary task for the FE-1 today was to set up the equipment in the SM for a new Russian experiment called INFRASVUK-M (Infrasound) scheduled on 8/27 (next Monday), by replacing one of the nominal ventilation fans (VT1 MO-2-5008) with a new experimental low-noise fan (17KS.53Yu 5009.0). [INFRASOUND will compare the spectral (spectrum-specific) energy characteristics of extremely low and low electromagnetic frequency ranges and infrasonic fields in habitable compartments of the SM under operating conditions of the old and new ventilation fans. The experiment will perform measurements of acoustic noise level inside the SM in full scope with a sound analyzer and laptop for subsequent downlink of the measured data. The results are expected to help to resolve design issues regarding the rating and crew protection against harmful effects of acoustic and electromagnetic fields in the ISS living compartments.]

PMA-3 Relocation Update: On 8/30 (Thursday), the Pressurized Mating Adapter #3 is scheduled to be relocated from Node 1 Unity’s portside CBM (Common Berthing Module) to the nadir port to make room for the installation of Node 2 (Harmony) on the port dock during Mission 10A/STS-120. Detailed procedural materials for Robotics & CBM proficiency training have been uplinked. Extensive activities are scheduled throughout next week:

- **Monday (8/27):** Reconfigure Node 1 (stowage, UOP outlet for CBCS install), plus initial SSRMS (Space Station Remote Manipulator System) ops: double-walk from MBS PDGF-2 (Mobile Base System Power & Data Grapple Fixture 2) to MBS PDGF-3 and then to Lab PDGF;
- **Tuesday (8/28):** Close Lab window shutter, do CBM & Robotic ops training,
release SSRMS from MBS PDGF-3 and maneuver to Node nadir CBM survey position while remained based on Lab PDGF;

- **Wednesday (8/29):** Prepare for PMA-3 depressurization, open Node nadir hatch latch (door being kept sealed by ~38,993 lbf), install CBCS (Centerline Berthing Camera System), ground check out both CBMs overnight;

- **Thursday (8/30):** Power on CBCS, depressurize PMA-3, Clay grapple PMA-3, Fyodor unbolt PMA-3, SSRMS transfer PMA-3 to nadir CBM, SSRMS ungrapple after bolts secured, power down CBCS, re-latch Node hatch door.

- **Friday (8/31):** Cleanup, reconfigure Node 1 stowage, get-ahead relocate stowage for Node 2 (Harmony” ingress during 10A.

**GPS-1 Failure:** Ground specialists at MCC-Houston are investigating yesterday’s failure of SIGI-1 (Space Integrated Global Positioning Satellite/Inertial Navigation Systems 1) resulting in loss of redundancy for vehicle state vector updates, but other sources of state determination (GPS-2 & Russian data) are available.  
*[Failure signatures indicated a timing issue that has occurred before.]*

**ASN Testing:** On Monday (8/27), TsUP/Moscow will begin two-week testing of the Russian Satellite Navigation Equipment (ASN), with data download to Laptop 3 for ground access via RGS (Russian Ground Site) passes. This is in preparation for the arrival of the European ATV-1 (Automated Transfer Vehicle 1) “Jules Verne”, currently planned for early March 2008, which requires ASN for proximity operations and docking approach to the SM aft end.

**VOA Maintenance Update:** During yesterday’s OMI (On-orbit Maintenance Item) change-out on the CHeCS VOA (Volatile Organics Analyzer), the FE-2 discovered that the new 26P-delivered inlet nozzle filter has the wrong dimension for fitting on the inlet nozzle. Following ground advice, Clay reinstalled the old filter (certified lifetime expired on 7/24/07 but still OK).  
*[The VOA Maintenance was erroneously reported yesterday as having proceeded without issues.]*

**Weekly Science Update** *(Expedition Fifteen -- 17th)*

**ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):** Activity planned on 8/27 to exchange memory card 4.

**ANITA:** Planned.

**BCAT (Binary Colloidal Alloy Test):** Reserve.

**CARDIOCOG-2:** Next session currently scheduled for beginning of September (TBC).
CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Continuing,

CFE (Capillary Flow Experiment): Reserve.

CHROMOSOME-2 (E14 SFP): Completed.

CSI-1/CGBA (CGBA Science Insert #1/Commercial Generic Bioprocessing Apparatus): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Next scheduled operation is 10/29-11/3.

EMCH (Elastic Memory Composite Hinge): Complete.

EPO (Educational Payload Operation) Kit C: Planned.

IMMUNO (Saliva Sampling): First session samples are currently stowed in MELFI Dewar #2.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Samples were successfully uploaded on 13A.1 and transferred to ISS on 8/12. 56 Files required for the start of MULTIGEN-1 were uplinked successfully. Start of MULTIGEN-1 experiment will begins today, 8/25, after the 24 hour hydration period.

MUSCLE (E14 SFP): Completed.

MSG-SAME (Microgravity Science Glovebox): Planned.

NEOCYTOLYSIS (E14 SFP): Completed.

NOA-2 (Nitric Oxide Analyzer): Planned.
NUTRITION: “Clay, please pass on our enthusiastic thanks to Fyodor and Oleg for their last minute help packing Nutrition samples into the cold bag. They packed our samples perfectly. We received everything we expected and in perfect condition. This represents the first time that these types of samples have been returned from ISS. To us it’s a really big deal.”

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMPLE: Ongoing.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): n/a

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Clay, thanks for completing your third Actiwatch download.”

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Planned.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observations): Through 8/21 the ground has received a total of 10,555 CEO images for review and cataloging for Increment 15. After standing down from CEO support to the ISS in order to support imagery analysis for the Shuttle Mission on 8/8, CEO resumed ISS activities on 8/22. “Your dramatic views of the extensive forest fires in Montana and Idaho while the shuttle was docked on 8/13 were published last weekend on NASA/GSFC’s Earth Observatory website. Kudos to the crew noting and documenting this dynamic event amid all the activity of joint operations! This weekend your earlier, incredibly detailed view of the historic Spanish enclave of Ceuta on the northern coast of Africa will also be published on Earth Observatory. Nice work! Now that the shuttle mission is complete and your orbit tracks have returned to the Northern Hemisphere we are looking forward to more of your imagery of our targets.”

Today’s CEO (Crew Earth Observation) photo targets were Afar Rift Zone, Ethiopia (the volcanoes and numerous fault lines in the country rock of Ethiopia’s Afar region are a continuation of the Red Sea zone where the African and Arabian tectonic plates are slowly moving apart. Looking right just inland from the shoreline of the Red Sea. The Afar is one of the few places where geologists can study “sea-floor spreading” processes [active faulting and lava extrusion] on dry land), Wild fires, Sicily (late August wild fires have caused much damage and injury in northern Sicily. Looking left of track for fire source points, and oblique views of the
long smoke plumes. The crew may also have seen Mt. Etna smoking), and **Yellowstone National Park, Wyoming** (shooting a sequence of overlapping images at nadir to document the recovery of burned zones in the National Park).

CEO photography can be viewed and studied at the websites: [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); [http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/) [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**Current Life Support Status** *(as of late yesterday)*:
Elektron -- On (Nominal – 32 amp mode)
Vozdakh -- On (nominal)
SKV-1 (SM Air Conditioner 1) -- Off
SKV-2 (SM Air Conditioner 2) -- Off (nominal)
CDRA Carbon Dioxide Removal Assembly) -- Standby (nominal)
MCA (Major Constituent Analyzer) -- Operational (nominal)
OGA (Oxygen Generation Assembly) -- Off (nominal)

**ISS Orbit** *(as of this morning, 7:43am EDT [= epoch])*:
Mean altitude -- 341.1 km
Apogee height – 346.5 km
Perigee height -- 335.7 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.000802
Solar Beta Angle -- -23.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 60
Revolutions since FGB/Zarya launch (Nov. 98) -- 50171

**Significant Events Ahead** *(all dates Eastern and subject to change)*:
08/29/07 -- ISS reboost (if required)
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1)
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/08/07 -- Node 2 “Harmony” relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/11/08 -- Progress M-62/27P undocking
02/12/08 -- Progress M-63/28P launch
02/14/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/02/08 -- ATV-1 docking (SM aft port)
04/04/08 -- ATV-1 undocking (from SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking.
All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, Yurchikhin, Kotov and Anderson started out with another session of the Russian biomedical routine assessments PZEH-MO-7/Calf Volume Measurement and PZEH-MO-8/Body Mass Measurement (eighth time for CDR & FE-1, fifth for FE-2), using the IM mass measurement device which Oleg Kotov afterwards broke down for stowage. [Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]

For their 1.5-hr. TVIS workout, Yurchikhin and Kotov today each conducted the standard Russian PFE test MO-3, their second, using the treadmill in unmotorized mode and wearing the Kardiokassette KK-2000 belt with three chest electrodes. [The fitness test, controlled from the RSE-Med laptop, yields ECG (electrocardiogram) readings to the KK-2000 data storage device, later to be downlinked via U.S. OCA. Before the run, the KK-2000 was synchronized with the computer date/time readings. For the ECG, the crewmembers worked out on the treadmill, first walking 3 min. up to 3.5 km/h, then running at a medium pace of 6.5 km/h, followed by the maximum pace not exceeding 10 km/h, then walking again at gradually decreasing pace.]
In preparation for an extended upcoming session of the new MULTIGEN-1 experiment, FE-2 Anderson set up the EMCS (European Modular Cultivation System), switching out its power cable for a longer (23') cable at ER3 (to protect against start-up overcurrents), opening the EMCS gas mix valves, and exchanging the EMCS Reference ECs (Experiment Containers) with eight MULTIGEN ECs on the two RBLSS (Rotor Based Life Support System) modules, four on centrifuge rotor A, the other on rotor B. [The 298-kg EMCS, delivered on ULF1.1, is a multi-purpose combination centrifuge/growth chamber with eight small research containers that allows plant growth experiments to be carried out in controlled partial and microgravity conditions and under controlled pressure, light, temperature and humidity. The goal of these experiments is to enable growing plants in space that could serve as a basic nutrition source for astronauts on future long-duration missions to the Moon or Mars. MULTIGEN-1 is a plant growth payload studying the growth patterns of Thale Cress (Arabidopsis thaliana) under varying gravity effects. The experiment will run for 70-75 days and require very little crew involvement. Thale cress has a small genome, which makes it very useful for genetic mapping and sequencing. Its small size and rapid life cycle are also advantages, taking only about six weeks from germination to mature seeds and it produces many seeds.]

Continuing the current round of RS (Russian segment) ventilation system maintenance, Oleg Kotov worked in the DC1 (Docking Compartment), cleaning the PF1 & PF2 dust collectors and V1 & V2 fan grilles. He then replaced the PS1 & PS2 dust filters in the Funktsionalnyi-Grusovoi Blok (FGB).

The CDR and FE-1 had about 3 hours reserved for assembling and evaluating a new ergonometric operator’s seat attached to the floor of the SM (Service Module), unpacked yesterday by Oleg. At the end, the seat was taken apart again and stowed. [After the seat’s assembly and positioning, the crew took video and still photography of their subsequent ergonometric evaluation of the seat. They also assessed the times required for assembly, height adjustment and disassembly as well as the relative ease of transferring the partially disassembled and stowed (folded) seat from the SM to the FGB through the PkhO (Transfer Compartment). The seat’s suitability and comfort was tested when working with ODF (Operation Data File) books, laptop computer, photo-video equipment, during medical tests, meals and for any two-hand operations.]

Clay Anderson performed the IFM (In-flight Maintenance) on the VOA (Volatile Organics Analyzer) set up yesterday, first removing the analyzer from its location in the CHeCS (Crew Health Care Systems) rack, then replacing nine OMIs (On-orbit Maintenance Items) with new spares from 26P, afterwards reinstalling the VOA in the rack, activating it and checking it out. No problems were noted during the activity.
Kotov conducted troubleshooting on an IDZ-2 smoke detector (#6) in the FGB after its power-down by the ground and safing of fuses. The testing focused on the cabling and connectors of the unit, with circuit continuity being checked via resistance measurements with the “Elektronika” MultiMeter (MMTs-01).

Anderson continued his support of the EPO (Educational Program Operation) “Kit C” project by conducting today’s check-and-photo activity of the plant growth in zero-G. The demo experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. [During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

Clay completed the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. [Purpose of the 10-min. activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. Two CSA-CP (CSA-Combustion Products) instruments recorded O₂, CO, HCN and HCl readings at the SM Central Post (#1060, prime) and in the Node (#1057, backup), while the CSA-O₂ units (#1063, #1042) looked for O₂ in the Lab and the CDMK (#1008) for CO₂ in SM and Lab. Also recorded were battery ticks. The instruments were turned off afterwards, except for the prime CSA-CP #1060 unit, and returned to their regular locations.]

In the “Quest” Airlock, Anderson terminated the regeneration process on two METOX (Metal Oxide) CO₂ absorption canisters (#0016, #0019) started two days ago (8/22), and initiated the bake-out on the second set (#0020, #0021).

The FE-2 completed the regular bi-weekly maintenance reboot of the SSC (Station Support Computer) File Server and OCA Comm Router laptops.

Clay also worked on the Node “ceiling”, performing the periodic (every six weeks) bolt tightening on the RED (Resistive Exercise Device) canisters.
Fyodor Yurchikhin conducted the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working on the IMS (Inventory Management System), the CDR also updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS (CDR/MO-3, FE-1/MO-3), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later this afternoon, Oleg is to download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:25am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:40am, Fyodor and Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing transfer details and stowage locations. [Discussions today concerned a Medical Locker recess barcode, the actuality of a pipeline installed in DC1, the onboard availability of power supply units for sound level meter, stowage location of bonding straps after TsVM and TVM restoration, need for photo equipment lists, etc.]

At ~5:50am, Yurchikhin and Kotov conducted a telephone session via VHF over RGS (Russian Ground Sites) with the student-winners of a Russian space & aviation contest called "Fifth Ocean".

The crew’s regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio is scheduled at ~3:50pm.

Yesterday morning (~5:15am), the two Russian crewmembers downlinked PAO/TV greetings to the participants of the 5th International Conference “150th Birthday of K. E. Tsiolkovsky” on Cosmonautics, Radioelectronics and Geoinformatics, to take place on 9/5 at Ryazan. [“…We are paying homage and deep respect to the native son of Ryazan, the founder of cosmonautics theory, Konstantin Eduardovich Tsiolkovsky, whose 150th Anniversary will be marked on September 17.”]
Working from the Russian discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/ temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Also as a discretionary task from his and Fyodor’s “time permitting” job list, Oleg performed the regular health check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload, checking proper ventilation of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS (Module for the Investigation of Substrates) by using the hand to check for air flow of three control box fans and six fans of the MIS greenhouse module.

Today’s CEO (Crew Earth Observation) photo targets were **Urumqi, China (aiming right, at the foot of the mountain range, for China’s oil-boom city, one of the fastest growing in China)**, **Bigach Impact Crater, Russia** (looking a touch right for this 8-km-diameter crater. The visual cue is Lake Zaysan just dowstrack, and a group of agricultural fields that lie within the crater rim), and **Licancabur Volcano, Chile** (CREW REQUEST: Looking right of track. If the crew photographed a continuous mapping swath they got the volcano which lies on the edge of the Andes Mountains. Long, dark lava flows down the volcano flank, and bright green Laguna Verde nearby, are visual cues).

CEO photography can be viewed and studied at the websites:  
[http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);  
[http://earthobservatory.nasa.gov](http://earthobservatory.nasa.gov)/  
[http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** (as of this morning, 11:46am EDT [= epoch]):
Mean altitude -- 341.2 km  
Apogee height – 346.6 km  
Perigee height -- 335.8 km  
Period -- 91.36 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.0008042  
Solar Beta Angle -- -19.1 deg (magnitude increasing)  
Orbits per 24-hr. day -- 15.76  
Mean altitude loss in the last 24 hours -- 74  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50142
**Significant Events Ahead** (all dates Eastern and subject to change):

08/29/07 -- ISS reboost (if required)
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/04/07 -- Attitude Maneuver for ASN Testing (for ATV-1)
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/08/07 -- Node 2 “Harmony” relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/11/08 -- Progress M-62/27P undocking
02/12/08 -- Progress M-63/28P launch
02/14/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/02/08 -- ATV-1 docking (SM aft port)
04/04/08 -- ATV-1 undocking (from SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking.
ISS On-Orbit Status 08/23/07

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Clay Anderson had 3h 15m reserved for unpacking and stowing cargo delivered by STS-118/13A.1, guided by an uplinked detailed Unpack List.

CDR Yurchikhin performed the periodic inspection behind panel 301 in the DC1 (Docking Compartment) and panels 206-220 in the SM (Service Module), checking equipment, connectors and the shell for any residue or condensate. [If found, photographs were to be taken and transferred to OCA for downlink.]

FE-1 Kotov unstowed a new Russian operator’s seat for in-cabin use and prepared it for later assembly and installation, placing the unpacked components in a bag.

FE-2 Anderson retrieved new VOA OMIs (Volatile Organics Analyzer/On-orbit Maintenance Items) from Progress 26P and set them up for tomorrow’s scheduled IFM (In-flight Maintenance) work on the VOA, located in the CHeCS (Crew Health Care Systems) rack.

Yurchikhin prepared, routed and installed new, heavier SUBA (Onboard Equipment Control System) cables in the SM to upgrade a Russian power outlet used for USOS (US segment) equipment. [The upgrade, from 3 amps to 5 amps, is associated with the ongoing PCS (Portable Computer System) replacement of onboard IBM 760XD laptops with the newer A31p machines, which consume more power.]

Anderson and Yurchikhin had another 45 min for reconfiguring the U.S. Airlock (A/L) after the recent spacewalks to nominal. Clay had an additional hour to complete remaining open items on the uplinked EVA tool restow “matrix”/plan.
While in the A/L, the FE-2 cleaned up after an aborted maintenance discharge on the first two EMU (Extravehicular Mobility Unit) batteries (#2063, #2041), which stopped yesterday because of the “sudden-death” failure of the IBM 760XD laptop (shell #6016) required for running the DOS program of the automated discharge procedure. [The laptop is believed to have suffered a failure of its hard drive (#6021). Ground specialists are writing procedures for discharging the EMU batteries using an A31p laptop and a floppy boot disk luckily delivered on 13A.1. The activity will be rescheduled once the A31p procedures are verified and onboard.]

Afterwards, Anderson terminated the regeneration of the two METOX (Metal Oxide) CO₂ absorption canisters (#0016, #0019) started yesterday and initiated the bake-out process on the second METOX set (#0015, #17).

In the SM, Oleg Kotov worked on the Condensate Feed Unit (BPK) and Condensate Separation & Pumping Unit (BRPK) to restore unrestricted fluid flow through the systems by removing the electro-magnetic flow control valve from each unit for their subsequent dismantling, cleaning of deposits, reassembly and re-installation in their resp. units. [This activity was deferred last month.]

Later, Oleg conducted the periodic audit/inventorying of SGO (ACU) Sanitary/Hygienic Equipment in the RS (Russian segment), going by an uplinked detailed list of ~62 equipment items.

The CDR performed the periodic (about twice a month) replenishing of the Elektron’s water supply for electrolysis, filling the KOV thermal loops’ EDV container with water collected in CWC (Contingency Water Container) #1051 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

Anderson spent some time in the Node with a camcorder taping detailed imagery of the current stowage situation. [The video is intended for use on the ground to evaluate temporary stowage locations for the PMA-3 (Pressurized Mating Adapter 3) relocation next Wednesday (8/29) and to prepare for 10A stowage in October.]

Kotov collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen}
Fyodor performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the periodic checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1.

Working on the IMS (Inventory Management System), the CDR updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Clay conducted the weekly 10-min CWC audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. [Updated “cue cards” based on the crew’s water calldowns are sent up every other week.]

Before doing his exercise on TVIS, Oleg performed the weekly inspection of the treadmill’s bearings. [For the inspection, a finger or thumb is used to check for any noticeable depressions due to seized or work rollers as the belt is slowly rotated forward to aft.]

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS (CDR, FE-1), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later this afternoon, Clay will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The FE-2 conducted the periodic status checkup & filter inspection of the running CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The incubator is controlled from the ground with automatic video downlinked to Earth.]

Anderson also continued his support of the EPO (Educational Program Operation) “Kit C” project by conducting the periodic documentary photography, which acts as a “visual photo timeline” of the plant growth in zero-G. The demo experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design Challenge for K-12 students of all abilities. [During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is
pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it'll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.

Working off the Russian discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A new task added to the US crew-choice “job jar” list for Anderson is the change-out of the failed 760XD laptop computer of ER4 (EXPRESS Rack 4) with a new A31p. A subsequent installation of new R.5 software on the laptop for the ER4 RIC (Rack Interface Controller) will be scheduled some time in the future. [The new computer and RIC software will allow POIC (Payload Operation & Integration Center) flight controllers to command many laptop functions from the ground without crew involvement, e.g., power on/off, reboot, moving files, and downlinking entire directories.]

**RPC Trip:** Early yesterday morning, an RPC (Remote Power Controller, LA1B_B RPC 11) tripped open and again after reset. Troubleshooting indicates a standard Hybrid FET (Field Effect Transistor) failure. The RPC controls the OGS (Oxygen Generation System) H₂ (hydrogen) vent line heaters and the H₂ vent valve itself which are required for the next OGS activation. A POR (Power On Reset) could impact the CBM (Common Berthing Mechanism) forward system critical for 10A operations. Ground teams are assessing the requirement and timing of an R&R (removal & replacement) of the RCPM (RCP Module).

**PMA-3 Relocation:** Preparations are underway for the relocation of PMA-3 from Node 1 portside to nadir (for Node 2 installation on 10A), scheduled for Wednesday next week (8/29). Procedures for an SSRMS (Space Station Remote Manipulator System) relocation simulation run, for the set-up of the required video configuration, and for the robotics operations proper have been uplinked for the crew. Part of the relocation will involve a pre-berthing video inspection of the Node nadir CBM petal deployment and a high level survey of the CBM interface.

**TsVM/TVM Update:** With the completion of the new BOK-3 (Command Processing Unit) installation, all that remained was yesterday’s integration of the TsVM/SMCC Control and TVM/SMTC Navigation computers. After each connection, each computer was restarted and commands sent to restore system functionality. All
three lanes in each computer were restarted and integrated successfully. This completes all software and hardware tasks related to restoring Russian computer control and BOK R&R. There will be two more sets of tests in the near future, intended to verify the capability of BOK-3 to control (a) N₂ (nitrogen) transfer in the SM and (b) commanding to the DC-1.

**Vozdukh Update:** On Tuesday (8/21), Vozdukh suffered a failure of its Channel 2 valve assembly. The CO₂ (Carbon Dioxide) removal system was successfully recovered and returned to nominal operations, with Yurchikhin switching it first to Automatic Mode, then (yesterday) back to Manual Mode 5.

Today’s CEO (Crew Earth Observation) photo targets were **Eastern Tien Shan, China** *(continental glaciers on high mountains hold a different history of environmental change than coastal glaciers. The crew was asked to shoot glacier tongues of the Tien Shan range, all left of track, while images of the dust event in the deserts just before the Tien Shan glaciers--apparent on weather satellite images--should also be interesting),** **Arkenu 1 & 2 Impact Craters, Libya** *(the twin Arkenu craters, 7 and 10 km in diameter, lie in SW Libya. Visual cues for finding these small features are major, dark volcanic rocks. Twin craters are thought form when a single impactor breaks into two as it strikes the Earth’s atmosphere),** **Nile River Delta, Egypt** *(shooting detailed, overlapping images, in a mapping swath along track, to document fast land use changes in the delta), and High Central Andean Glaciers*(weather was particularly clear over the high Andes: the crew was to look for snow/ice-capped peaks near nadir. Two ice caps have been cored by geologists in the last decade and show major changes in snow accumulation rates over the last several hundred years. Most ice caps are melting fast at present, however.)*

CEO photography can be viewed and studied at the websites:  
[http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

[http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** *(as of this morning, 11:46am EDT [= epoch]):*  
Mean altitude -- 341.2 km  
Apogee height – 346.6 km  
Perigee height -- 335.8 km  
Period -- 91.36 min.  
Inclination (to Equator) -- 51.64 deg  
Eccentricity -- 0.0008042
Solar Beta Angle -- -19.1 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 74
Revolutions since FGB/Zarya launch (Nov. 98) -- 50142

**Significant Events Ahead** (all dates Eastern and subject to change):
08/29/07 -- ISS reboost (if required)
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/19/07 -- Progress M-60/25P undocking (SM aft port)
09/27/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/04/07 -- 50 Years of Spaceflight (Sputnik 1)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/08/07 -- Node 2 “Harmony” relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/18/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/26/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/11/08 -- Progress M-62/27P undocking
02/12/08 -- Progress M-63/28P launch
02/14/08 -- Progress M-63/28P docking
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour/1J/A undocking
03/02/08 -- ATV-1 docking (SM aft port)
04/04/08 -- ATV-1 undocking (from SM aft port)
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.
04/26/08 -- STS-124/Discovery/1J docking
05/02/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking.
ISS On-Orbit Status 08/22/07

All ISS systems continue to function nominally, except those noted previously or below. *The crew is enjoying the third day of a three-day rest period.*

Today’s main activity on board had CDR Yurchikhin supporting ground engineers in Moscow working on restarting the Russian TsVM (Central) and TVM (Terminal) computers, each of which comprises three processor “lanes”, during RGS/RCT (Russian ground site/Russian Contingency Telemetry) passes. *[Each of the six individual lanes in turn was first powered off and connected to the new BOK-3 Command Processing Unit for preserving context data, followed by a restart of the respective computer to incorporate the context data. Thus, TsVM (SMCC) and TVM (SMTC) required three complete restarts each. During the activities, which lasted about 9 hrs, the U.S. ACS (Attitude Control System) was kept in TVM Restart Mode, later restored to nominal. TVM Restart Mode inhibits U.S. GNC {Guidance, Navigation & Control} Recovery & automatic handover to Russian MCS (Motion Control System) and enables Fail Caution on the Primary GNC MDM (Multiplexer/Demultiplexer). For the duration of the day-long restart activities, the C&C (Command & Control) MDM was also enabled to automatically acquire -- via its FDIR (Fault Detection, Isolation & Recovery) system -- each new SMCC lane as it became available.]*

After the computer restart activities, FE-1 Kotov supported the ground in reactivating the Elektron oxygen generator at 32 amps, monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. *[During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]*

Yurchikhin switched the Vozdukh CO₂ (Carbon Dioxide) removal system from
automatic mode, enabled yesterday, back to manual mode 5.

Working in the U.S. Airlock (A/L), FE-2 Anderson “cleaned up” after the recent spacewalks by disassembling and stowing the tools and gear used in the EVAs.

Afterwards, Anderson initiated the 85-day maintenance cycle on the first two EMU (Extravehicular Mobility Unit) batteries (#2063, #2041), required for the next spacewalk. [The periodic maintenance consists of fully discharging and then recharging the storage units to prolong their useful life. After end of the maintenance cycle, Clay will restore the SSC laptop, which is used in DOS mode for the automated procedure, to nominal ops.]

In preparation for upcoming EMU cooling loop scrubs (planned for 8/28), the FE-2 installed Fyodor’s EMU (#3006) in the Airlock’s aft EDDA (EMU Don Doff Assembly) and stowed his own (#3018) in the A/L.

Finishing up in “Quest”, Clay installed two METOX (Metal Oxide) CO₂ absorption canisters (#0016, #0019) in the regeneration oven for their subsequent bake-out process.

FE-1 Kotov conducted the periodic collection and logging of accumulated data of the six Matryoshka-R Bubble Dosimeter detectors installed on 8/16 at various exposure locations in the RS (Russian Segment), using the special Bubble Dosimeter Reader. [The six detectors now in use were positioned in spherical “Phantom” containers, in the DC1 (Docking Compartment) and close to the maintenance work table next to the Matryoshka’s MOSFET (metal oxide semiconductor field-effect transistor) dosimeter sensor.]

For the upcoming deployment of the IMS (Inventory Management System) application on crew PDAs, Oleg installed an uplinked SSC (Station Support Computer) Client Service Pack.

Clay Anderson continued his support of the EPO (Educational Program Operation) “Kit C” project by conducting his first check-and-photo activity. The demo experiment studies the growth of basil and lettuce in zero-G, in support of an Engineering Design challenge for students at Nebraska and Iowa State Universities. [During the 20-day run, Clay takes still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20, whereas the plants will be watered on all odd numbered days. To determine if the plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it’ll be crew’s choice as to whether or not]
the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

Yurchikhin completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the periodic checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1.

Oleg Kotov performed the periodic data collection and downlink on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse. As a discretionary task from the RS “time permitting” job list, the FE-1 also conducted the regular health check on the fans of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS, using the hand to check for air flow of three control box fans and six fans of MID-Lada module.

As a second voluntary task, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Payload operators uplinked a number of short MELFI (Minus-Eighty Laboratory Freezer for ISS) configuration activities to Clay Anderson's discretionary “job jar” task list, to be hard-scheduled over the next several weeks. They are required to get MELFI and its samples and ICEPACs in the correct configuration to maximize success for 10A (and beyond) sample packing and return.

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later, Clay will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:25am EDT, Anderson held a private crew-choice audio event on S-band.

Later, at ~1:25pm, Clay also conducted his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on a laptop).
Today's CEO (Crew Earth Observation) photo targets were **33 Licancabur Volcano, Chile** *(CREW REQUEST: This locally well-known cone is located just southwest of a prominent small green lake, Laguna Verde. Aiming right of track. If the crew shot a continuous mapping swath, they should have caught the volcano which lies on the edge of the Andes Mountains. The summit crater contains a 70 x 90 m crater lake which is ice-covered most of the year. This is one of the highest lakes in the world, and despite air temperatures which can drop to -30 °C, it contains planktonic fauna. This and similar lakes are used by astrobiologists as analogs for possible life-sustaining environments on Mars), and **Hurricane Dean, Gulf of Mexico** *(DYNAMIC EVENT: The large cloud mass of this well-formed storm was right of track, as the storm makes landfall on the Gulf coast of Mexico. The crew was to try to include any coastlines or mountain ranges in a wide-angle view. Dean has raked Jamaica and the Yucatan peninsula with Category 4 and 5 winds.)*

CEO photography can be viewed and studied at the websites: [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); [http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/) [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

**ISS Orbit** *(as of this morning, 8:14am EDT [= epoch]):*
Mean altitude -- 341.3 km  
Apogee height – 346.7 km  
Perigee height -- 335.9 km  
Period -- 91.36 min.  
Inclination (to Equator) -- 51.63 deg  
Eccentricity -- 0.0008042  
Solar Beta Angle -- -14.7 deg (magnitude increasing)  
Orbits per 24-hr. day -- 15.76  
Mean altitude loss in the last 24 hours -- 10  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50124

**Significant Events Ahead** *(all dates Eastern and subject to change):*
08/29/07 -- ISS reboost (if required)  
08/29/07 -- SSRMS setup for viewing PMA-3 relocation  
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)  
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]  
09/20/07 -- Soyuz TMA-10/14S relocation (to SM aft port)  
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)  
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/5-8/07 -- Node 2 relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/17/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
??/??/08 -- ATV-1 docking (SM aft port)
02/??/08 -- Russian EVA-20 [to be reviewed]
02/12/08 -- Progress M-63/28P launch [to be reviewed]
02/14/08 -- Progress M-63/28P docking
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- (NET) STS-123/Endeavour/1J/A docking
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking
04/04/08 -- ATV-1 undocking (from SM aft port)
04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/21/07

All ISS systems continue to function nominally, except those noted previously or below.

After 12d 17h 57min in space, STS-118/Endeavour today returned to Earth, touching down at KSC on the first landing opportunity at 12:33pm EDT, after 201 orbits, over 5.2 million miles, and a perfect ISS 13A.1 mission, during which its seven-member crew conducted four EVAs, delivered & installed the Starboard-5 (S5) spacer truss, replaced Control Moment Gyroscope 3 (CMG-3), brought resupply, functionally verified the new SSPTS (Station-to-Shuttle Power Transfer System), “deployed” the first Teacher in Space, Astronaut Barbara Morgan, etc. Also, Endeavour also used its Shuttle-only “downmass” capability to return high-value samples from three physiological/human research experiments (Nutrition, SWAB, SPEGIS), two materials exposure payloads (MISSE 3 & 4), three different plant growth experiments (CGBA-CSI-01, Gravi, Tropi), plus data & hardware from three other experiments (CFE, FOOT, EMCH). It was the 119th flight of a Space Shuttle and the 22nd shuttle mission to visit the station. Welcome back, Endeavour, on your 20th flight! Next up: STS-120/Discovery in October.

Aboard the station, the crew is enjoying the second day of three days “recess”. Sleep cycle has now shifted back to the standard wakeup at ~2:00am EDT and 5:30pm bedtime.

The three crewmembers conducted the regular weekly three-hour task of thorough station cleaning. ["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency
In the SM, CDR Yurchikhin worked on the Vozdukh carbon dioxide (CO₂) removal system, readying two GA (gas analyzer) CO₂ sensors behind Panel 241 and later switching the Vozdukh to automatic mode. In automatic mode, Vozdukh is controlled by the SM’s BVS onboard computer complex in conjunction with the BA automatic control unit, operating in closed-loop control with the IK0501 gas analyzer. The IK0501 was successfully serviced by Oleg Kotov on 8/8 and recalibrated by MCC-Moscow, with the U.S. MCA (Major Constituent Analyzer) as check.

After setting up, watering and videoing the new EPO (Educational Payload Operation) engineering design project called Kit C, which studies the growth of basil and lettuce in zero-G, FE-2 Anderson today captured still images of the plants, to be used on the engineering design challenge website. For the two plant species, Clay suggested a competition between the two participating Universities (Nebraska & Iowa State), i.e., “Huskers” vs. “Cyclones”. During the 20-day run, Clay will take still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20. On all odd numbered days, the plants will be watered. To determine if plants need water, Clay looks in a viewport to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the pooling. At the conclusion of the 20-day investigation, it'll be crew’s choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.

Saturday Science Preview: Four optional activities for the voluntary “Saturday Science” program on 8/25 & 26 were suggested to Clay for his choice. His selection is required by tonight. The four choices are (1) video of the Plant Growth EPO, (2) a new run of CFE VG1 (Capillary Flow Experiment – Vane Gap 1) to complete the CFE-VG1 experiment, (3) SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), flying two and three satellites, requiring CDRA (CO₂ Removal Assembly) to be running, and (4) BCAT-3 (Binary Colloidal Alloy Test 3), using the CGBA-4 (Commercial Generic Bioprocessing Apparatus 4).

CDR Yurchikhin conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).
Later, Clay will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 9:29am EDT [= epoch]):
Mean altitude -- 341.3 km
Apogee height – 346.7 km
Perigee height -- 335.9 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008042
Solar Beta Angle -- -10.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 88
Revolutions since FGB/Zarya launch (Nov. 98) -- 50109

**Significant Events Ahead** (all dates Eastern and subject to change):
08/29/07 -- ISS reboost (if required)
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)

04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
All ISS systems continue to function nominally, except those noted previously or below. Flight Day 13 for STS-118. Underway: Week 18 of Increment 15.

Aboard the station, the crew is enjoying a light-duty day. After wakeup at ~4:00am EDT (shifting now to the left), CDR Fyodor Yurchikhin, FE-1 Oleg Kotov and FE-2 Clay Anderson were mostly occupied with cleaning up after the Shuttle guests. [Sleep time tonight: 5:30pm.]

FE-1 Kotov took the periodic sensor readings of the Russian “Pille-MKS” (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (port cabin window, starboard cabin window, ASU toilet facility, control panel, etc.). Nine of the ten dosimeters are read manually (last time done: 7/16/07).

FE-2 Anderson reconfigured the SSRMS (Space Station Remote Manipulator System) video setup by disconnecting the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable at the Cupola & Lab RWS (Robotics Work Station).

Later today, the FE-2 will also disconnect the EXPRESS Rack 1 (ER1) jumper from the ITCS (Internal Thermal Control System).

Anderson began an extended activity with an EPO (Educational Payload Operation) demo project called Kit C, dealing with the growth of basil and lettuce in zero-G. Today’s task was to set up the payload and add water (~180 ml) to each of the growth chambers. [During the course of the 20-day run, Clay will take still imagery of the growth chambers on all even numbered day (2, 4, 6…) through day 20. On all odd numbered days, the plants will be watered. To determine if plants need water, Clay will look in a view port to see if water is pooling; if so, he is to attach a syringe to the plant growth chamber and draw out enough water to alleviate the
pooling. At the conclusion of the 20-day investigation, it'll be crew's choice as to whether or not the plant growing should be continued. If so chosen, downlinking of further still images will be appreciated on the ground.]

CDR Yurchikhin completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM).

Anderson completed the periodic CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout on the prime unit (#1060) and backup unit (#1057). [Clay changed out the prime unit’s battery, then zero-calibrated both instruments. Following zero calibration, the backup unit was stowed, while the prime unit’s datalogger function was turned on to collect data at the SM Central Post as a spot check. After one hour, the datalogger was deactivated, with the prime CSA-CP remaining on for continuous passive sampling.]

The FE-2 also distributed and stowed the new STS-118 delivered SODF (Station Operation Data File) procedures books for Stage 13A.1. [The print material typically includes three new Emer-1 (Emergency 1, red cover) books, POC (Portable Onboard Computer) manual changeout pages, Medical checklist & cue cards, a Lab window shutter constraint cue card, a Leak Pinpoint Procedures book, a Contingency Jumper Procedures book, and an EMU Integrated System Schematic.]

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later, Clay will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Hurricane Dean Update: As of this morning, the projected track of the storm takes it well south of Johnson Space Center onto Yucatan, and JSC remains open. As a result, MCC-H and the Shuttle’s MER (Mission Evaluation Room) continue nominal operations in support of the mission.

STS-118 landing at KSC is set for tomorrow (8/21, Tuesday) at ~12:31pm EDT, after de-orbit burn at 11:24am on Revolution (Rev) 201, weather permitting. There are one alternative (wave-off) opportunity at KSC (Rev 202, deorbit burn TIG (time of ignition)-12:59pm; land-2:06pm), plus two opportunities at EDW (Rev 203: TIG-2:30pm, land-3:36pm; and Rev 204: TIG-4:05pm, land-5:11pm EDT). A 24-hour
delayed deorbit for KSC is possible on Rev 217, at TIG = 11:52am. *If the landing occurs at KSC on the 1st opportunity as planned, Endeavour’s mission duration will have been 12d 17h 55m. For the 2nd opportunity landing (rev 202), duration would be 12d 19h 30m.*

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/19/07

All ISS systems continue to function nominally, except those noted previously or below. Flight Day 12 for STS-118. Sunday. Ahead: Week 18 of Increment 15. [Flight Control to ISS crew: “We all join you in wishing farewell to our STS 118 crew. It’s been an awesome week and a half, with a fabulous job of working together, Robotic operations, 4 EVAs and all of their logistics, tons of transfer, PAO events, several R&Rs, comm. troubleshooting, special photos, timeline updates, and especially a timely, coordinated and successful execution of a very ambitious plan. All we can say about you gentlemen is “Wow!” We are very impressed and wish you a heartfelt “thank you.””]

STS-118/Endeavour and ISS are flying in separate orbits again.

After final preparations on both sides of the hatches (closed last night at 5:10pm EDT), Endeavour undocked smoothly from PMA-2 (Pressurized Mating Adapter 2) this morning at 7:57am, after a total docked time of 8d 17h 45min. [For undocking, the station was turned 180 deg to +XVV ZLV (+x-axis in velocity vector, z-axis in local vertical) at 6:46am, put briefly on free drift for the undocking, and then maneuvered to 13A.1 Stage attitude of +XVV TEA attitude at 8:49am.]

KSC landing is nominally expected on 8/21 (Tuesday) at ~12:30pm EDT (unless moved to 8/22 {11:52am at KSC}).

Aboard the station, the crew is enjoying a light-duty day. After wakeup at ~4:37am, CDR Fyodor Yurchikhin, FE-1 Oleg Kotov and FE-2 Clay Anderson, went through last-minute preparations for the undocking. [Sleep time tonight: 7:30pm.]

FE-1 Kotov made sure that the Lab science window was shuttered for protection against jet plumes during the undocking.

Before and during the undocking, Kotov stood by at a laptop with a stopwatch to
monitor the proper performance of automatic undocking software for the PMA-2 departure under Russian thruster control. [The procedure provides for the crewmember to take over the automatic operational attitude control sequence manually if the software does not resume control after the period of free drift a few minutes after physical separation.]

Anderson later powered down the Airlock and Lab Cupola PCS (Portable Computer System) A31p laptops, no longer required for now.

Assisted by Kotov, Fyodor Yurchikhin later depressurized the PMA-2 to prevent humidity condensation and pressure fluctuations. Leak checking by Clay followed for the standard one hour. Afterwards, the necessary equipment was torn down.

After Yurchikhin had shot video footage of the undocking, FE-2 Anderson reconfigured the VDS VTR (Video Distribution System/Video Tape Recorder) bypass cables into a nominal undocked operations configuration. [On 8/9, Clay had connected the bypass cables for passing video to and from the station on the Lab’s starboard side and allowing the station to receive video from the Orbiter on the Lab’s port side.]

The FE-2 also disassembled and stowed the BPSMU (Battery Powered Speaker Microphone Unit) with its drag-through cable and QDs (quick disconnects) along with video adapter cables, all used by the Shuttle crew during the docked phase with the Orbiter.

Oleg Kotov did the reconfiguration of the Russian telephone/telegraph subsystem (STTS) to its post-undocking settings, from its primary string back to nominal mode on the backup string. This also severed the VHS (UHF) channel to the receding Shuttle Orbiter and restored the RSA-2 S/G (Space-to-Ground) comm configuration on Panel 3. [The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM’s outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]

After yesterday’s shortened EVA-4, Clay Anderson took another session of the standard Russian crew health-monitoring program’s medical assessment MO-9/Biochemical Urinalysis. [MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the
sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).

Later, as standard post-EVA health status checkup, Clay also took the general U.S. PFE (Periodic Fitness Evaluation), assisted by Oleg Kotov as CMO (Crew Medical Officer), a 20-min procedure to check up on general crewmember health before/after the spacewalk. [Cardiovascular readings were logged by Oleg on the MEC’s IFEP software. Later, Anderson also linked up with the ground via Ku- and S-band with NetMeeting/video for the usual private medical conference (PMC).]

In the “Quest” Airlock, the FE-2 performed the usual post-EVA water recharge of the EMU (Extravehicular Mobility Unit) cooling water tanks. Clay also took another set of digital photos of the gloves used by him and Dave during EVA-4 for subsequent downlink.

The FE-1 spent about 30 min. of equipment servicing in the ASU toilet facility, changing out two urine receptacles (PR & MP) and a filter insert (F-V).

Oleg also completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

In the “Unity” Node, the CDR cleaned the Smoke Detector #2 (SD-2).

Afterwards, working on the IMS (Inventory Management System), Fyodor updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Afterwards, the CDR copied the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Consumables Transfers Update:
- Total quantity of Supply Water transferred to ISS for the mission: 918.6 lbm (416.6 L):
  - Water transferred in eight CWCs (Contingency Water Containers): 778.9 lbs (353.2 L), all treated with biocide, two also with minerals;
Water samples were collected during five fills:

- Water transferred in seven PWRs (Payload Water Reservoirs, incl. for OGS): 139.7 lbm (63.4 L); 1 OGS PWR was filled twice to support OGS operations. PWR fills #3 and #7 were the OGS PWRs;
  - Oxygen ($O_2$) transferred = 77 lbm (34.9 kg) of $O_2$.
  - Nitrogen ($N_2$) transferred = 33.8 lbm (15.3 kg) of $N_2$.
  - Lithium Hydroxide (LiOH) transferred: ISS to Shuttle = 12 canisters; Shuttle to ISS = 30 cans.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit** (as of this morning, 10:13am EDT [= epoch]):
Mean altitude -- 341.6 km
Apogee height -- 347.0 km
Perigee height -- 336.2 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008084
Solar Beta Angle -- -0.7 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude gain in the last 24 hours -- 290
Revolutions since FGB/Zarya launch (Nov. 98) -- 50078

**Significant Events Ahead** (all dates Eastern and subject to change):
08/21/07 -- STS-118/Endeavour/13A.1 landing, ~12:30pm (or 8/22 if no Dean evacuation of JSC)
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]
09/20/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/5-8/07 -- Node 2 relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/17/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
??/??/08 -- ATV-1 docking (SM aft port)
02/??/08 -- Russian EVA-20 [to be reviewed]
02/12/08 -- Progress M-63/28P launch [to be reviewed]
02/14/08 -- Progress M-63/28P docking
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- (NET) STS-123/Endeavour/1J/A docking
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking
04/04/08 -- ATV-1 undocking (from SM aft port)
04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/18/07

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 11 for STS-118; Day 9 of Joint Ops.*

>>> Mission 13A.1 has been replanned because of Hurricane Dean, forecast for landfall on the South Texas coast on 8/23 (Thursday). A decision to close JSC on FD13 or not is to be made tomorrow, Sunday (8/19), at 1:00pm EDT. STS-118/Endeavour would then land on FD14, i.e., one day early on 8/21 (Tuesday). Consequently, today's EVA-4 was reduced in length by dropping two objectives to protect for Endeavour undocking on FD12 (Sunday, 8/19) morning.

Wakeup time for the ISS crew was at 5:07am EDT, with bedtime half an hour earlier than yesterday, at 8:07pm (Shuttle crew: 8:37pm).

Today's **EVA-4 was completed** as re-planned. Shuttle MS3 Dave Williams (EV2) and ISS FE-2 Clay Anderson (EV3) –

- Installed the OBSS OSE (Orbiter Boom Sensor System/Orbital Support Equipment) install on S1 truss Zenith trunnions,
- Engaged the Z1 SASA (S-band Antenna Support Assembly) Gimbal Locks (deferred from EVA #3),
- Retrieved the MISSE-3 & -4 (Materials ISS Experiment 3&4) payloads (deferred from EVA #3),
- Installed the EWIS (External Wireless Instrumentation System) antennas on the U.S. Lab,
- Cleaned Up.

[Official start time of the spacewalk was 9:17am EDT (45 minutes ahead of schedule). It ended at 2:19pm, for a total EVA duration (PET = Phase Elapsed Time) of 5h 02m. It was the 92nd spacewalk for ISS assembly & maintenance and]
the 64th from the station (28 from Shuttle, 42 from Quest, 22 from Pirs) totaling 380h 38m. After today's EVA, a total of 105 spacewalkers (75 NASA astronauts, 20 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 568h 02m outside the station on building, outfitting and servicing. It also was the 114th spacewalk by U.S. astronauts.

After the 8.5-hr sleep period before the spacewalk, the CL (Crewlock) hatch was cracked for a one-hour hygiene break w/mask prebreathe for Williams & Anderson, after they spent the night on 10.2 psi campout. The hatch was then closed again for a continued depress period at 10.2 psi. EMU purging began ~7:27am, followed by spacesuit pre-breathe period at ~7:42am. Airlock depressurization started at ~8:32am.

Post-EVA activities included the standard spacesuit servicing, disassembly of the MISSE payloads, transfer of MISSE and the Shuttle spacesuits to Endeavour and completing the remainder of cargo transfer Shuttle to ISS and ISS to Shuttle.

CDR Yurchikhin and FE-1 Kotov reviewed CB (Cold Bag) handling instruction, then packed and transferred two DCBs (Double CBs). [Return of the DCBs on 13A.1 has high priority since the downmass for 10A is already full, and MELFI (Minus-Eighty Laboratory Freezer for ISS) can only hold a limited number of ice packs.]

First thing in the morning, MS5 Alvin Drew performed an R&R (Removal & Replacement) on the CEVIS (Cycle Ergometer with Vibration Isolation System) in the Lab, replacing the Display Cable and the Ergometer itself. Oleg Kotov then completed the standard calibration and checkout exercise. [The Manual Control Knob was removed and stowed on ISS. Kotov calibrated the CEVIS Display/Control Panel to the Ergometer using Clay Anderson’s new CEVIS PCMCIA memory card (#1026). He then performed an exercise session using an automated “test” protocol. Afterwards, Oleg downlinked the data to the MEC (Medical Equipment Computer), to allow ground engineers to review the data before returning to nominal CEVIS operations.]

Fyodor Yurchikhin repaired an SKV-2 air conditioner ventilation airduct for the VTK-2 fan that was found yesterday to be rotted due to humidity.

Preparatory to potable water transfer from Progress M-61/26P, Yurchikhin initiated the compression of the SM’s Rodnik BV1 tank bladder to check for leak tightness (hermeticity). [Each of the spherical Rodnik tanks (BV1 & BV2) consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane and is leak-tested before receiving the liquid waste.]
FE-1 Kotov exchanged the tape in the VTR (Video Tape Recorder).

Oleg also tore down and stowed the equipment used for transferring oxygen (O₂) from Shuttle to ISS.

It was Kotov’s turn today for his third session with the Russian experiment DYKHANIE (“respiration”, “breathing”), tagged up with ground specialists and conducted the session, later closing down and stowing the equipment. [Dykhanie-1 gear uses two belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]

The FE-1 also completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the SM, FGB and DC1. [This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons.]

Working on the IMS (Inventory Management System), Oleg updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-1/checkout), TVIS treadmill (CDR, FE-1, FE-2), RED resistive
exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Afterwards, Oleg copied the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The traditional **Farewell** ceremony between ISS crew and the departing Shuttle astronauts took place at ~4:47pm. Shuttle/ISS airduct disassembly and **hatch closing** was complete at 5:10pm. Undocking of Endeavour from PMA-2 is scheduled tomorrow morning at 7:57am EDT, after a total docked time of 8d 17h 45min. Landing is expected on 8/21 (Tuesday). See below.

Working off the discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  *This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.*

A second item on the “time permitting” task list for Oleg today was the periodic status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse, including a health check on the fans of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS, using the hand to check for air flow of three control box fans and six fans of MID-Lada module.  *Rasteniya-1 examines a variety of different types of plants over multiple generations on ISS.*

**DAIU Update:**  Troubleshooting was performed yesterday on the Docked Audio Interface Unit, including scopemeter measurements of laptop-generated tones. The problem appears to be a wiring issue between PMA-2 and the Lab, and not a DAIU problem.

**Hurricane Response Strategy:**

- **If NASA JSC closes,** two Flight Control Teams (one for Planning and one for Entry team) will remain in place to support landing only. The Orbiter will land on Tuesday at one of the three primary landing sites (KSC, EDW, or White Sands).
- **If JSC remains open,** a normal entry strategy will be in effect (i.e., trying for KSC-only on Tuesday).
- **Should landing not occur on Tuesday and JSC is still threatened,** an Entry Team will be sent to KSC to activate the Emergency MCC.
- **If JSC is not threatened,** MCC-H will continue to operate with a landing on
8/22 (Wednesday).

- For the station, the ISS Flight Control Team support will transition to BCC (Backup Control Center) operations. Tomorrow at 1:00pm EDT JSC management will review the threat to the Center and any decision regarding closure.

**Weekly Science Update (Expedition Fifteen -- 17th)**

**ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):** On 8/7, data file from test was downlinked. Data analysis shows nominal performance of ALTEINO device. Next ALTCRISS activity is currently scheduled for 8/27.

**ANITA:** Planned.

**BCAT (Binary Colloidal Alloy Test):** Reserve.

**CARDIOCOG-2:** Next session scheduled around 9/10.

**CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS):** Continuing,

**CFE (Capillary Flow Experiment):** Reserve.

**CHROMOSOME-2 (E14 SFP):** Completed.

**CSI-1/CGBA (CGBA Science Insert #1/Commercial Generic Bioprocessing Apparatus):** Powered off. Waiting to support other experiments such as BCAT.

**CGBA-2 (Commercial Generic Bioprocessing Apparatus 2):** Powered off.

**EarthKAM (Earth Knowledge Acquired by Middle School Students):** Next scheduled operation is 10/29-11/3.

**EMCH (Elastic Memory Composite Hinge):** Complete.

**EPO (Educational Payload Operation) Kit C:** Planned.

**IMMUNO (Saliva Sampling):** First session samples are currently stowed in MELFI Dewar #2.

**LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):** Complete.
**MISSE (Materials ISS Experiment):** Ongoing.

**MTR-2 (Russian radiation measurements):** Passive dosimeters measurements in DC1 “Pirs”.

**MULTIGEN-1:** Samples uploaded on 13A.1 and transferred to ISS. Start of MULTIGEN experiment is currently scheduled in Week 18.

**MUSCLE (E14 SFP):** Completed.

**MSG-SAME (Microgravity Science Glovebox):** Planned.

**NEOCYTOLYSIS (E14 SFP):** Completed.

**NOA-2 (Nitric Oxide Analyzer):** Planned.

**NUTRITION:** Planned.

**PMDIS (Perceptual Motor Deficits in Space):** Al Drew and Dave Williams each completed a data session on ISS. “CSA is delighted that crew time was made available for that experiment. We thank profusely the two astronauts for their time and dedication to complete the experiment. We also extend our sincere thanks to Clay Anderson who was instrumental in setting up & stowing the hardware and for installing the camera. Once the CDs are back on Earth, they will be going to our PI at York University to verify if data recorded properly and if data can be analyzed.”

**SAMPLE:** Ongoing.

**SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):** SAMS and MAMS were activated on 8/8 and are collecting acceleration data in support of joint ops. The SAMS ICU locked up late on 8/8, but was recovered on 8/9 after a laptop reboot by the crew.

**SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight):** Clay Anderson will have his third Actiwatch download and initialization session tomorrow.

**SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):** Planned.

**Swab (Characterization of Microorganisms & Allergens in Spacecraft):** Planned.

**TRAC (Test of Reaction & Adaptation Capabilities):** Planned.
CEO (Crew Earth Observations):  No change from last week.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

ISS Orbit (as of this morning, 7:41am EDT [= epoch]):
Mean altitude -- 341.4 km
Apogee height – 346.6 km
Perigee height -- 336.1 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0007846
Solar Beta Angle -- 9.0 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 100
Revolutions since FGB/Zarya launch (Nov. 98) -- 50044

Significant Events Ahead (all dates Eastern and subject to change):
08/19/07 -- STS-118/Endeavour/13A.1 undocking (7:57am)
08/21/07 -- STS-118/Endeavour/13A.1 landing (or 8/22 if no hurricane evacuation of JSC)
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]
09/20/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/5-8/07 -- Node 2 relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/17/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
??/??/08 -- ATV-1 docking (SM aft port)
02/??/08 -- Russian EVA-20 [to be reviewed]
02/12/08 -- Progress M-63/28P launch [to be reviewed]
02/14/08 -- Progress M-63/28P docking
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- (NET) STS-123/Endeavour/1J/A docking
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking
04/04/08 -- ATV-1 undocking (from SM aft port)
04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/17/07

All ISS systems continue to function nominally, except those noted previously or below.  *Flight Day 10 for STS-118; Day 8 of Joint Ops.*

Wakeup time for the ISS crew shifted half an hour earlier, to 5:07am EDT, with bedtime remaining at 8:37pm (Shuttle crew: 9:07pm).

In preparation for tomorrow’s EVA-4, FE-2 Anderson, before breakfast, took another session of the standard Russian crew health-monitoring program’s medical assessment MO-9/Biochemical Urinalysis.  *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).]*

Later, as standard pre-EVA health status checkup, Clay Anderson also took the general U.S. PFE (Periodic Fitness Evaluation), assisted by Oleg Kotov as CMO (Crew Medical Officer), a 20-min procedure to check up on general crewmember health before/after the spacewalk.  *[Cardiovascular readings were logged by Oleg on the MEC’s IFEP software. Tonight, before starting Campout, also links up with the ground via Ku- and S-band with NetMeeting/video for the usual private medical conference (PMC).]*

The CDR, FE-1 and FE-2 participated in the Shuttle crew’s on-going troubleshooting of the DAIU (Docked Audio Interface Unit) which today required equipment setup, voice checks & safing, removal of a Lab smoke detector and OGS Feedwater System to rotate the Lab OGS rack, DAUI activation and voice checks.
The ISS C&T (Communications & Tracking) audio system has experienced off-nominal performance during numerous docked Orbiter operations. Currently suspects, to be investigated, are either the DAUI itself or the wiring or the APAS (Androgynous Peripheral Attach System) docking ring electrical connector (which transfers the voice signal from Shuttle to Station, and may have contamination). Yesterday, a test was performed to determine if the hard line audio on A/G1 (Air-to-Ground 1), A/A (Air-to-Air) and ICOMA is functioning between the Shuttle and Station. The results were consistent with past Shuttle docked anomalies: no comm on Docked Air to Air (both from Station and Shuttle), no comm on Docked Air to Ground from Shuttle. Docked Air to Ground from Station works as expected.

CDR Yurchikhin set up the equipment for his third session with the Russian experiment DYKHANIE (“respiration”, “breathing”), tagged up with ground specialists and conducted the session, later closing down and stowing the equipment. [Dykhanie-1 gear uses two belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]

The CDR conducted the periodic/long-term visual inspection of the pressure hull in the Service Module (SM) Working Compartment (RO), behind panels 130, 134, 135, 138 and TVIS, looking for any moisture, deposits, mold, corrosion, cavities and pitting. [Fyodor inspected the hull surface, which is coated with a primer and dark-green enamel, using cleaning napkins to wipe the area in question if required and reporting results to the ground.]

Oleg Kotov completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the SM,
FGB and DC1.  

*This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons.*

Working on the IMS (Inventory Management System), Oleg also updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Kotov had another two hours reserved on the timeline for deinstalling and removing no longer used SUD (Motion Control System) equipment from the FGB module. *The equipment, which was used to provide orientation to the vehicle at the inception of ISS operations when the FGB was the only ISS module in space, will be disposed of in Progress 25P. Its removal frees up valuable stowage space behind FGB panels. The new stowage spaces will be outfitted with stowage enclosures delivered on the ESA ATV-1 (European Space Agency/Automated Transfer Vehicle 1) “Jules Verne”, increasing the efficiency and accessibility of stowage in the FGB Zarya (“Dawn”,- not “Sunrise”!).*

A special task was added for Yurchikhin and Kotov: repair of an SKV-2 air conditioner ventilation airduct that was found yesterday to be failed.

TsUP/Moscow today continued the two-day functionality testing of the Russian BOK-3 Command Processing Unit of the TVM/Terminal & TsVM/Central computers that was installed on 8/14. Crew intervention was not required. The testing is to ensure that all cable connections were properly established and verify full functionality of the unit itself. The test methodology has been developed for the first two days of testing, but it could take as much as a week depending on the initial results.  *Today, TsUP uplinked commands (no crew involvement) and all commanding and telemetry monitoring are being performed via RGS (Russian ground site) passes. Plans for further testing depend on results from the first two days. Also, while there are no plans to activate TORU, Russian ground controllers do plan to send some commands to the KURS antenna tomorrow. The antenna will not be activated, but controllers will verify that commands can be successfully sent to the antenna through the BOK-3.*

For tomorrow’s EVA-4 by Dave Williams (EV2) & Clay Anderson (EV3), Kotov readied the DCS-760 cameras with their freshly charged batteries, while Clay removed Rick Mastracchio’s EV1 EMU from the Airlock (A/L) to replace it with Dave’s EV2 suit, then configured the A/L EL (Equipment Lock) for the Campout, and prepared the EVA tools. EVA-4 gloves have been approved for both spacewalkers.

After all preps for EVA-4, including a review of the timeline & procedures, the two
spacewalkers will begin their “campout” in the “Quest” A/L, starting mask prebreathe at ~7:32pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi. Sleep for the ISS crew will commence at 8:37pm, for the Shuttle crew at ~9:07pm.

The planned timeline for EVA-4 tomorrow is as follows:

- Hygiene Break (5:47am EDT)
- Campout EVA Prep (6:57am)
- Transfer Ops (8:27am)
- Egress EVA #4 (10:07am)
- OBSS OSE (Orbiter Boom Sensor System/Orbital Support Equipment) install on S1 truss (10:22am)
- Z1 SASA Gimbal Locks engage
- MISSE 3&4 retrieval (11:22am)
- EWIS Antenna install (12:07pm)
- Lab MMOD Shield cleanup (1:47pm)
- Node MMOD Shield cleanup (2:32pm)
- Sundry: AL TB Ops, P1 RBVM MLI (3:17pm)
- Cleanup 3:47pm
- Ingress EVA #4 (4:12pm)
- End of EVA-4 (4:37pm).

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-1, FE-2), and VELO cycle with bungee cord load trainer (CDR).

Later tonight, Fyodor will copy the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~7:50am, the ISS crew downlinked two PAO/TV addresses of greetings, one to the participants of the International Aerospace Salon MAKS-2007 at Baikonur, the other to key CIS antiterrorist and Special Forces personnel participating in a Baikonur-Anti-Terror-2005 Joint Operational & Strategic Commanding Staff Exercise (showing Antiterrorist Center pennants on board).

At ~1:12pm EDT, the ISS and Shuttle crew assembled in the SM for posing for the standard joint crew photograph.

Afterwards, at ~1:34pm, both crews supported a 40-min. news conference conducted with U.S. media at NASA centers (20 min.) and the Canadian Space
Agency (CSA) at CSA Headquarters in St. Hubert (20 min.). [Media clients taped the event for use within their respective media outlets.]

Working off the discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Cargo Transfer Update: Transfer ops are ahead of schedule with 76% MDD (Middeck) and 79% SH (Spacehab) completed. Powered MDD payloads and transfers are on plan with 95% completion, except for MISSE3/4 retrieval and Cold Pack transfer. A total of 92 lbs of O2 (oxygen) was transferred from Shuttle to ISS HPGTs (High Pressure Gas Tanks).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:  
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);  
http://earthobservatory.nasa.gov/  
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:41am EDT [= epoch]):
Mean altitude -- 341.4 km  
Apogee height – 346.6 km  
Perigee height -- 336.1 km  
Period -- 91.36 min.  
Inclination (to Equator) -- 51.63 deg  
Eccentricity -- 0.0007846  
Solar Beta Angle -- 9.0 deg (magnitude decreasing)  
Orbits per 24-hr. day -- 15.76  
Mean altitude loss in the last 24 hours -- 100  
Revolutions since FGB/Zarya launch (Nov. 98) -- 50044

Significant Events Ahead (all dates Eastern and subject to change):  
08/18/07 -- EVA-4 (~10:07am)  
08/20/07 -- STS-118/Endeavour/13A.1 undocking (8:00am)  
08/22/07 -- STS-118/Endeavour/13A.1 landing (12:48pm)  
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]
09/20/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/5-8/07 -- Node 2 relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/17/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
02/??/08 -- ATV-1 docking (SM aft port)
02/12/08 -- Progress M-63/28P launch [to be reviewed]
02/14/08 -- Progress M-63/28P docking
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- (NET) STS-123/Endeavour/1J/A docking
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking
04/04/08 -- ATV-1 undocking (from SM aft port)
04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/16/07

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 9 for STS-118; Day 7 of Joint Ops.*

Wakeup time for the ISS crew shifted half an hour earlier, to 5:37am EDT, with bedtime also half an hour earlier than yesterday, at 8:37pm (Shuttle crew: 9:07pm).

The IMMT (ISS Mission Management Team) has decided to switch timelines for Friday (8/17) and Saturday (8/18), with EVA-4 to be conducted no earlier than Saturday. A decision on a special Tile Repair EVA is expected by tonight. The tasks of MISSE retrieval and SASA Space Gimbal Locks engage, deferred from EVA-3, are being replanned.

FE-2 Clay Anderson worked a late-added 30-min. task of photographing his and Dave Williams’ EVA gloves for comparison purposes for the ground to analyze “side by side”. During yesterday’s EVA-3, Rick Mastracchio noticed a 3/16-in. hole in the outer layer of his left glove, at 4h 17m into the spacewalk. Later, small pin holes were discovered also in the right glove. The spacewalk was terminated consistent with flight rule established following Bob Curbeam’s glove damage on STS-116. There was no leak of the bladder seal barrier. Preliminary analysis suggests abrasion rather than a cut. EV1 had not identified damage during prior inspection and was unable to identify a specific event which might have caused the damage, which occurred during CETA cart relocation and ATFR setup. Ground specialists are reviewing video and photos to determine when and how the damage occurred. They are also reviewing worksites and tools for EVA-4 and a possible Tile Repair EVA for commonality with EVA-3 tools and procedures. EV1 will use backup gloves for future EVAs during this mission. A decision on a “glove rationale” for continuing EVA-4 and potential Tile Repair EVA is expected tonight or tomorrow.

With CDR Yurchikhin providing support, TsUP/Moscow today began two-day
functionality testing of the Russian BOK-3 Command Processing Unit of the TVM/Terminal & TsVM/Central computers that was installed on 8/14. The testing is to ensure that all cable connections were properly established and verify full functionality of the unit itself. The test methodology has been developed for the first two days of testing, but it could take as much as a week depending on the initial results. [Today, the CDR sent various commands through the BOK-3 unit to verify they reach the proper destinations. The ground will also uplinked commands, and all will be monitored via RGS (Russian ground site) passes. Tomorrow, TsUP will uplink commands (no crew involvement) and all commanding and telemetry monitoring will be performed via RGS passes in order to deconflict with US EVA activities. Plans for further testing depend on results from the first two days. Also, while there are no plans to activate TORU, Russian ground controllers do plan to send some commands to the KURS antenna tomorrow. The antenna will not be activated, but controllers will verify that commands can be successfully sent to the antenna through the BOK-3.]

FE-2 Anderson, MS4 Barbara Morgan and MS5 Alvin Drew unstowed the equipment of the EPO (Educational Payload Operation) demo SEEDS and worked on capturing video and still imagery of the seeds in the micro-G environment to share with students and educators. [This is part of an engineering design challenge aimed at having students design, build, and evaluate their own plant growth chamber for future missions to the Moon. Students will use the images of the seeds to assist in evaluating their designs.]

Yurchikhin retrieved a protective EVA hatch window cover from stowage and installed it on the forward window hatch window of the Lab on the EVA side.

The CDR also performed the periodic (about twice a month) replenishing of the Elektron’s water supply for electrolysis, filling the KOV thermal loops’ EDV container with water collected in CWC #1078 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. [The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]

Clay Anderson and PLT Charley Hobaugh set up and configured the oxygen (O₂) transfer equipment for transferring O₂ from the Shuttle to the two HPGTs (High Pressure Gas Tanks) at the outside of the A/L (Airlock). [N₂ (nitrogen) gas has been transferred earlier.]

FE-1 Kotov meanwhile retrieved the OGS PWR (Oxygen Generation System/Payload Water Reservoir) from the OGS rack front (LAB1P1) and temporarily
stowed it near the Shuttle galley, for its later refilling with Shuttle water and transfer back to the ISS.

In the “Quest” A/L, Anderson terminated the regeneration of the first METOX (Metal Oxide) CO₂ absorption canister, started yesterday, and initiated the bake-out process on the second METOX can. Afterwards, Clay also terminated and initiated the recharge of the EMU (Extravehicular Mobility Unit) batteries in the BSA (Battery Stowage Assembly). In addition, Anderson was to reattempt charging a PGT (Pistol Grip Tool) battery which did not charge properly yesterday due to an issue with BC2 CH3 (Battery Charger 2/Channel 3)

The CDR conducted the periodic verification of IMV (intermodular ventilation) airflow between the U.S. (USOS) and Russian segment (RS) by taking air flow measurements using the Velocicalc meter. [There is no direct measurement of airflow except as reflected by differences in atmosphere partial pressures measured between the RS and USOS. ppCO₂ (CO₂ partial pressure) is a good yardstick since an increasing ppCO₂ in the Lab not reflected in the SM indicates that Vozdukh is not receiving the air from the Lab at an efficient rate. Periodic air flow degradation checks support establishing a most effective fan cleaning schedule.]

Oleg Kotov collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. [GANK tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]

Fyodor Yurchikhin had 75 min. to update the three SODF (Station Operation Data File) “Warning” Books in the Service Module (SM), FGB and Lab, replacing pages for post-EVA-3 conditions, discarding the old pages as trash, and restowing the books.

Starting a new round of the monthly preventive maintenance of RS ventilation systems, Kotov began in the FGB (Funktsionalnyi-Grusovoi Blok) with the regular cleanup of the detachable VT7 fan screen guards (grilles) of the TCS/SOTR (Thermal Control System)’s gas-liquid heat exchangers (GZhT4).

The FE-1 set up new Bubble dosimeters for recording radiation traces as an additional component of the RS radiation payload suite “Matryoshka-R”. [Using Velcro, the panel with the Bubble dosimeter reader was attached at the SM work site (on panel 107) and equipped with its own MMC memory card. Of eight Bubble dosimeter detectors supplied, six were initialized and positioned at their exposure
locations. The setup was photo-documented. The complex Matryoshka payload suite is designed for sophisticated radiation studies.]

The CDR participated in the ongoing cargo transfers between Shuttle and ISS. [As of last evening, transfer activities have been proceeding well: Middeck – about 72% complete; Spacehab – greater than 69% complete.]

Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, the CDR today charged the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (#23). The last test pressurization was done by Yurchikhin on 6/18. [During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]

Fyodor completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables.

Working on the IMS (Inventory Management System), Oleg updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later tonight, Oleg will copy the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

FGB SUD Removal Update: Yesterday’s removal of no longer used SUD (Motion Control System) equipment from the FGB module was not for return to Earth. The equipment, which was used to provide orientation to the vehicle at the inception of
ISS operations when the FGB was the only ISS module in space, will be disposed of in Progress 25P. Its removal frees up valuable stowage space behind FGB panels. The new stowage spaces will be outfitted with stowage enclosures delivered on the ESA ATV-1 (European Space Agency/Automated Transfer Vehicle 1) “Jules Verne”, increasing the efficiency and accessibility of stowage in the FGB Zarya (“Dawn”,- not “Sunrise!”).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  (as of this morning, 4:47am EDT [= epoch]):
Mean altitude -- 341.5 km
Apogee height – 346.7 km
Perigee height -- 336.3 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.000777
Solar Beta Angle -- 13.9 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 60
Revolutions since FGB/Zarya launch (Nov. 98) -- 50027

Significant Events Ahead  (all dates Eastern and subject to change):
08/18/07 -- EVA-4
08/20/07 -- STS-118/Endeavour/13A.1 undocking (8:00am)
08/22/07 -- STS-118/Endeavour/13A.1 landing (12:48pm)
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)

05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/15/07

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 8 for STS-118; Day 6 of Joint Ops.*

Wakeup time for the ISS crew remained at the current 6:07am EDT, with a bedtime half an hour earlier than yesterday, at 9:07pm (Shuttle crew: 9:37pm).

Today’s EVA-3 was completed as scheduled, except for two objectives. Shuttle MS2 Rick Mastracchio (EV1) and ISS FE-2 Clay Anderson (EV3) –

- Relocated SASA (S-band Structural Assembly) from P6 to P1, in preparation for P6 truss relocation on 10A,
- Upgraded S-communications equipment by installing a new BSP (Baseband Signal Processor) & new XPDR (Transponder) at P1,
- Relocated, with SSRMS support, two CETA (Crew & Equipment Translation Aid) carts from the portside of the MT (Mobile Transporter) to the starboard side, required prior to P6 installation on 10A,
- Retrieved P6 XPDR, required prior to P6 relocation on 10A, for return for refurbishment as spare, and replaced it with a dummy box in its place, and
- Cleaned Up.

The spacewalk was cut short when EV1 Mastracchio discovered a small hole in the outer layer of the thumb of his left glove. There was no leakage, but per flight rules Rick returned to the Airlock and went on umbilical power. EV3 Anderson finished the retrieval of the P6 XPDR and returned also. Two scheduled tasks were not completed: (1) Engage Z1 SASA gimbal locks in preparation for SASA return on 10A, and (2) retrieve MISSE (Materials ISS Experiment) containers 3 & 4 for return on 13A.1 (Spacehab) after one year of exposure (installed during Expedition 13 on 8/3/06),

*[Official start time of the spacewalk was 10:37am EDT (30 min ahead of schedule). It ended at 4:05pm, for a total EVA duration (PET = Phase Elapsed Time) of 5h]*
28m. It was the 91st spacewalk for ISS assembly & maintenance and the 63rd from
the station (28 from Shuttle, 38 from Quest, 22 from Pirs) totaling 375h 36m. After
today’s EVA, a total of 103 spacewalkers (73 NASA astronauts, 20 Russians, and
ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 563h 0m outside the station on building, outfitting and
servicing. It also was the 113th spacewalk by U.S. astronauts.

After the 8.5-hr sleep period before the spacewalk, the CL (Crewlock) hatch was
cracked at ~6:45am EDT for a one-hour hygiene break w/mask prebreathe for
Mastracchio and Anderson, after they spent the night on 10.2 psi campout. Around
7:57am, the hatch was closed again for a continued depress period at 10.2 psi.

During the EVA, PLT Hobaugh & FE-1 Kotov maneuvered the SSRMS in support of
the SASA relocation from P6 to P1 and the CETA transfers from port to starboard.

As part of EVA preps, CDR Yurchikhin powered down the Ericsson amateur radio
equipment in the FGB to prevent RF interference with the EMUs.

Yurchikhin had three hours reserved on the timeline for deinstalling and removing
no longer used SUD (Motion Control System) equipment from the FGB module for
return to Earth.

FE-1 Kotov terminated N₂ (nitrogen) transfer from the Orbiter to the ISS HPGTs
(High-Pressure Gas Tanks) on the exterior of the U.S. Airlock (A/L) and tore down
the transfer equipment/jumpers. [A total of ~40 lbs of N₂ was transferred to the ISS
until stopped by the counter pressure.]

The CDR performed the regular monthly maintenance of the TVIS (Treadmill with
Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats,
corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and
gyroscope wire ropes for any damage or defects, lubricating as required plus
recording time & date values.

Yurchikhin also conducted the periodic (every two weeks) inspection of the RED
(Resistive Exercise Device) with canister cords and accessory straps as well as the
canister bolts for re-tightening if required.

Oleg Kotov completed the routine maintenance of the SOZh system (Environment
Control & Life Support System, ECLSS) in the Service Module (SM), including ASU
toilet facilities systems/replaceables and the periodic (currently daily) checkout/
verification of IP-1 airflow sensors in the various RS (Russian segment) hatch
openings (8) in the SM, FGB and DC1. [This is especially important when the
ventilation/circulation system has to cope with a larger crew on board, currently ten persons.

Working on the IMS (Inventory Management System), Oleg also updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The CDR participated in the ongoing cargo transfers between Shuttle and ISS. [As of last evening, transfer activities have been proceeding well: Middeck – greater than 60% complete; Spacehab – greater than 40% complete.]

Yurchikhin also configured and stocked the new 13A.1 CHeCS AMP (Crew Health Care Systems/Ambulatory Medical Pack) kits with items from the old AMP and Progress 26P cargo. Afterwards, Fyodor set up for PHS (Periodic Health Status) activities.

After A/L CL (Airlock Crewlock) repress and return of the spacewalkers, Clay Anderson and Scott Kelly completed the usual post-EVA activities in the A/L, including starting regeneration of the METOX (Metal Oxide) canister used for the Campout, recharging the EMU water tanks, starting EMU battery recharge, and downlinking the digital EVA photo/video imagery.

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1), VELO cycle with bungee cord load trainer (CDR), and on the Shuttle equipment.

Later tonight, Fyodor will copy the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

**MT Translation Event:** During last night’s scheduled translation from WS-7 (Work Site 7) to WS-4, the MT (Mobile Transporter) was halted unexpectedly by an “MT Overspeed” caution about 4 meters short of WS-4. After confirming that there were no indications of a hardware failure, as well as a photo survey to verify no
obstructions, the ground team successfully reset the translation drive and completed the translation manually. Specialists are investigating the cause of the over-speed message. No vehicle momentum or MSS (Mobile Service System) thermal issues were observed during the operations.

ESP-3 Update: Yesterday’s “nonhuman EVA” of grappling & transferring the Shuttle-delivered ESP-3 (External Stowage Platform 3) for subsequent installation on the zenith side of the P3 truss element was another stellar achievement of the two Canadian robotarms SRMS (Shuttle Remote Manipulator System) and SSRMS (Space Station RMS). [ESP-3 is an external pallet that can securely hold up to seven ORUs (Orbital Replacement Units). For Mission 13A.1, ESP-3 at deployment had the following massive ORUs (Orbital Replacement Units) mounted on it: CMG-3 (now successfully installed and running in the Z1 truss) on a PFRAM (Passive Flight Releasable Attachment Mechanism), a spare NTA (Nitrogen Tank Assembly), a spare SSRMS Pitch/Roll Joint, a spare BCDU (Battery Charge/Discharge Unit), the ATA FSE (Ammonia Tank Assembly/Flight Support Equipment), and two empty PFRAMs for future ORU storage.]

BOK Update: After deactivating VD-SU control system mode of the BITS2-12 onboard telemetry measurement system, Fyodor and Oleg yesterday mated the final cable required to complete installation of the new BOK-3 Command Processing Unit of the TVM/Terminal & TsVM/Central computers in the RS. VD-SU was then successfully reactivated. The only remaining task is to remove the computer jumpers and mate the TVM & TsVM connections. No BOK-3 activation or testing is planned until after 13A.1 undock.

26P Leak Checks: In preparation for upcoming propellant transfers from Progress M-61/26P, TsUP/Moscow was scheduled to perform the standard leak checks on the 26P prop transfer equipment, e.g., the fuel (ZUG) and oxidizer (ZUO) lines.

Something to Marvel at: The stack’s attitude control system (ISS CMGs or Shuttle Orbiter) is currently smoothly controlling a mass of ~732,000 lbs (332 tons).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography
ISS Orbit (as of this morning, 8:31am EDT [= epoch]):
Mean altitude -- 341.5 km
Apogee height -- 347.1 km
Perigee height -- 336.9 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008265
Solar Beta Angle -- 18.9 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude gain in the last 24 hours -- 57
Revolutions since FGB/Zarya launch (Nov. 98) -- 50013

Significant Events Ahead (all dates Eastern and subject to change):
08/17/07 -- EVA-4 (~10:06am)
08/20/07 -- STS-118/Endeavour/13A.1 undocking (8:00am)
08/22/07 -- STS-118/Endeavour/13A.1 landing (12:48pm)
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]
09/20/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/07/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGP nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/5-8/07 -- Node 2 relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/17/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
01/31/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
??/??/08 -- ATV-1 docking (SM aft port)
02/??/08 -- Russian EVA-20 [to be reviewed]
02/12/08 -- Progress M-63/28P launch [to be reviewed]
02/14/08 -- Progress M-63/28P docking
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- (NET) STS-123/Endeavour/1J/A docking
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking
04/04/08 -- ATV-1 undocking (from SM aft port)
04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/14/07

All ISS systems continue to function nominally, except those noted previously or below. Flight Day 7 for STS-118; Day 5 of Joint Ops.

Today at 11:17am EDT, the ISS, specifically its FGB “Zarya” module, completed 50,000 orbits of the Earth, having covered a distance of 2.1 billion kilometers (1.32 billion st.miles) in almost 3170 days. [The 19,300 kg (42,600 lbs) Zarya (“Dawn” was launched on a Russian/Khrunichev Proton from Baikonur almost nine years ago, on 11/20/1998, as the first element of the multi-national space station.]

Wakeup time for the ISS crew shifted again for an earlier wakeup, to the left, at 6:07am EDT, with bedtime at 9:37pm (Shuttle crew: 10:07pm).

ESP-3 (External Stowage Platform 3) has been successfully installed on the P3 truss element. [The activity began with FE-1 Kotov and FE-2 Anderson working with the SSRMS (Space Station Remote Manipulator System), completing its “walk-off” from the Lab to the MBS PDGF-3 (Mobile Service System/Power & Data Grapple Fixture-3), then maneuvering it to the ESP-3 (External Stowage Platform 3) pre-grapple position. “Piloted” by MS4 Barbara Morgan and MS1 Tracy Caldwell, the EPS-3 was then unberthed in the Shuttle cargo bay, lifted straight up to the hover position with the SRMS (Shuttle RMS) and handed over to the SSRMS for the subsequent maneuver to and installation at the zenith side of the P3 truss.]

The newly installed CMG-3 (Control Moment Gyroscope 3) is working nominally.

In preparation for tomorrow’s EVA-3, FE-2 Anderson, before breakfast, took the standard pre-EVA session with the Russian crew health-monitoring program’s medical assessment MO-9/Biochemical Urinalysis. [MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical
tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)’s special IFEP software (In-Flight Examination Program).]

As standard pre-EVA health status checkup, Clay Anderson also took the general U. S. PFE (Periodic Fitness Evaluation), assisted by Oleg Kotov, a 20-min procedure to check up on general crewmember health before/after the spacewalk. [Cardiovascular readings were logged on the MEC’s IFEP software. Later, Clay also linked up with the ground via Ku- and S-band with NetMeeting/video for the usual private medical conference (PMC).]

After the R&R (Removal & Replacement) of the Russian BOK-3 Command Processing Unit of the TVM/Terminal & TsVM/Central computers, Oleg Kotov had 2h 50m for gathering and prepacking the old BOK cable sections and connectors for return on the Shuttle.

CDR Yurchikhin conducted the routine task of shooting two photos each of the docking cones of the passive docking assemblies (ASP-B) of the Service Module (SM) aft port and Docking Compartment (DC1), currently occupied by the Progress M-60/25P and M-61/26P spacecraft, a standard practice after Russian dockings. These images are used to refine current understanding of docking conditions. Fyodor afterwards downlinked the pictures via OCA assets. [The objective is to take photo imagery of the scratch or scuff marks left by the head of the docking probe on the internal surface of the drogue (docking cone, ASP) ring, now rotated out of the passageway. Before shooting the picture, the cosmonaut highlights the scuffmark with a marker and writes the date next to it. As other crewmembers before him, the CDR used the Nikon D1X digital still camera to take two pictures with the hatch partially closed.]

Yurchikhin conducted a search for three “missing” LKT TA251M1B Local Temperature Commutators (switches) with their associated PZU TA765B ROM (read-only memory) units, salvaged from previous Soyuz & Progress vehicles for returned on the Shuttle for recycling.

Kotov worked on auditing and relocating/consolidating accumulated accessories of the Russian AOK GANK-4M Real-Time Harmful Contaminant Gas Analyzer system, looking for stowage kits of the hardware and an Am-1 Ammonia Chip-Cassette.

After installing, on TsUP/Moscow Go, telemetry connectors of the Russian BVS computer system to the BITS2-12 onboard telemetry measurement system (to allow
ground monitoring), the CDR installed a cable for the BOK-3 unit behind an SM panel.

The FE-1 supported the ground in reactivating the Elektron oxygen generator at 32 amps, monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. [During nominal operations a gas analyzer is utilized to detect hydrogen (H2) in the O2 line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]

After the Shuttle water dump maneuver (~12:51pm), PLT Hobaugh handed over attitude control authority of the stack from the Orbiter to ISS CMG-Only without RS MCS (Motion Control System) at ~3:50pm EDT. [This was a test of the possibility of performing attitude control handovers from Orbiter to US CMG control if the RS thrusters were unavailable.]

Yurchikhin conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the periodic (~monthly) checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the SM, FGB and DC1.

Working on the IMS (Inventory Management System), Fyodor later updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~2:01pm EDT, STS-118 Mission Specialists Barbara Morgan and Tracy Caldwell (who celebrates her 38th birthday in space today) participated in PAO/TV interviews with ABC Good Morning America (Diane Sawyer), CBS News (Kelly Cobiella), CNN (Miles O’Brien), NBC (Tom Costello) and Fox (Jane Skinner).

At ~5:07pm, Barbara Morgan and Clay Anderson conducted a PAO EPO (Educational Payload Operation) event, taking photographs of crew members with the SEEDS payload.

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR, FE-1), RED resistive exerciser (CDR, FE-1, FE-2), and VELO cycle with bungee cord load trainer (FE-1).

Later tonight, Fyodor will copy the crew’s exercise data file to the MEC (Medical
Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

For tomorrow’s EVA-3 by Rick Mastracchio (EV1) and Clay Anderson (EV3), Oleg Kotov readied the DCS-760 cameras with their freshly charged batteries, while Clay removed Dave Williams’ EV2 EMU from the Airlock (A/L) to replace it with his own EV3 suit, then configured the A/L EL (Equipment Lock) for the Campout, prepared the EVA tools, and completed the pre-EVA configuration of the OBSS OSE (Orbiter Boom Sensor System/Orbital Support Equipment) for its installation on the S1 truss.

After all preparations for EVA-3, including a review of the timeline & procedures, the two spacewalkers, Rick and Clay, will begin their “campout” in the “Quest” A/L, starting mask prebreathe at ~8:32pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi. Sleep for the ISS crew will commence at 9:37pm, for the Shuttle crew at ~10:07pm.

Working off the discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Also off the voluntary task list, Oleg performed the periodic status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/13/07

All ISS systems continue to function nominally, except those noted previously or below. Flight Day 6 for STS-118; Day 4 of Joint Ops. Underway: Week 17 of Increment 15.

Wakeup time for the ISS crew shifted again, to the left, with wakeup at 6:37am EDT, bedtime at 9:37pm (Shuttle crew: 10:07pm).

Today’s EVA-2 was completed successfully. Shuttle Mission Specialists Rick Mastracchio (EV1) and Dave Williams (EV2) –

- Removed the failed CMG-3 (Control Moment Gyroscope 3),
- Transferred the new CMG to ESP-2 (External Stowage Platform 2),
- Removed the new CMG from ESP-2
- Installed the new CMG on Z1 truss,
- Installed the failed CMG on ESP-2, and
- Cleaned Up.

[Official start time of the spacewalk was 11:33am EDT (4 min ahead of schedule). It ended at 6:00pm. Total EVA duration (PET = Phase Elapsed Time) was 6h 27m. It was the 90th spacewalk for ISS assembly & maintenance and the 62nd from the station (28 from Shuttle, 38 from Quest, 22 from Pirs) totaling 370h 8m. After today’s EVA, a total of 101 spacewalkers (71 NASA astronauts, 20 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 557h 32m outside the station on building, outfitting and servicing. It also was the 112th spacewalk by U.S. astronauts.]

After the 8.5-hr sleep period before the spacewalk, the Crewlock (CL) hatch was cracked at ~7:27am EDT for a one-hour hygiene break/with mask prebreathe for Mastracchio and Williams, after spending the night on 10.2 psi campout. Around 8:27am, the hatch was closed again for a continued depress period at 10.2 psi.

During the EVA, PLT Hobaugh & FE-2 Anderson maneuvered the SSRMS in
support of the CMG-3 R&R (Removal & Replacement).

As part of EVA preps, CDR Yurchikhin verified powerdown of onboard ham radio equipment (Kenwood in SM & Ericsson in FGB) to prevent RF interference with the EMUs.

While the spacewalk went on, CDR Yurchikhin and FE-1 Kotov began the restoration of the Russian BVS onboard computer system to nominal operation, today performing the 3-hr job of routing & installing new 26P-delivered cabling in the Service Module (SM) for tomorrow’s replacement of the Russian BOK-3 Command Processing Unit of the TVM/Terminal & TsVM/Central computers.

Yurchikhin transferred the OGS PWR (Oxygen Generation System Payload Water Reservoir) to the Shuttle for temporary stowage near the Shuttle galley. [The PWR will be vented and filled tomorrow.]

The CDR also had an additional 1.5 hrs reserved for equipment transfers from and to Endeavour. [As of this morning, the crew was 21% ahead of the cargo transfer plan schedule.]

During the spacewalk, Fyodor Yurchikhin installed newly arrived 18 blue U.S. RAM (Radiation Area Monitor) dosimeters in the ISS, documenting their deployment photographically, and collected 18 used white RAMs for return on 13A.1.

FE-1 Kotov collected potable water samples for chemical and microbial analysis from the SVO-ZV tap and the SRV-K warm tap, the latter after preliminary heating of the water (two heating cycles) and flushing. The samples will be returned on 13A.1. [From each port, Oleg collected two 225 mL microbial samples for on-board processing and two 750 mL chemical archival (post-flight) samples for return to Earth, using Russian collection procedures. The flush water, collected in a water bag, is to be reclaimed for technical use.]

Kotov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow, and today also the periodic (~monthly) checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the SM, FGB and DC1.

The FE-1 also gathered data on total operating time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM’s SOGS air revitalization subsystem for reporting to TsUP.
Working on the IMS (Inventory Management System), Oleg later updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Time again for recharging the new Motorola-9505 Iridium satellite phone brought up on Soyuz 14S, a monthly routine job. Yurchikhin took care of the recharge, completing the process and cleaning up at about 3:50pm EDT. [After retrieving it from its location in the Soyuz TMA-10/14S descent module (BO), Fyodor initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion, the phone was returned inside its SSSP Iridium kit and stowed it back in the BO’s operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown. The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap.]

Kotov performed the periodic inspection of spaces behind panels in the SM (#206-220) and DC1 (#301).

The FE-1 transferred (“walked off”) the SSRMS to PDGF-2 (Power & Data Grapple Fixture 2) on the MBS (Mobile Base System).

After A/L CL (Airlock Crewlock) repress and return of the spacewalkers, Clay Anderson completed the usual post-EVA activities in the Airlock (A/L), including downlinking the digital EVA photo/video imagery, while Oleg Kotov started the EMU battery recharge.

Oleg Kotov also set up the equipment for tomorrow’s planned “Urolux” biochemical urine test (PZE MO-9), standard operating procedure before & after each Orlan EVA.

Yesterday, CDR Yurchikhin and FE-1 Kotov removed the failed BOK-3 Command Processing Unit of the TVM/Terminal & TsVM/Central computers and installed a new unit. The remainder of the operations are planned for tomorrow.

On Endeavour, the FI (Focused Inspection) yesterday identified TPS damage at one site 3 in. by 2 in. spanning two tiles. Additional inspection will be performed on a .2 in. by 1 in. cavity. There are several options available for repair if found necessary. The MMT (Mission Management Team) has determined that the Orbiter is safe to reenter in the current condition in case of an emergency.
Nitrogen Transfer: As of this morning, N₂ transfer is approximately 35 lbs out of a planned transfer of 50 lbs.

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1) and VELO bike with bungee cord load trainer (CDR, FE-1). [No exercise allowed on ISS or Shuttle during OBSS operations on SSRMS.]

Later, Fyodor copied the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites: http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this noon, 12:44pm EDT [= epoch]):
Mean altitude -- 341.0 km
Apogee height – 346.5 km
Perigee height -- 335.5 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.000822
Solar Beta Angle -- 28.9 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 70
Revolutions since FGB/Zarya launch (Nov. 98) -- 49985

Noteworthy Milestone ahead: Tomorrow, ISS completes its 50,000th orbit.
tomorrow.

**Significant Events Ahead** (all dates Eastern and subject to change):

08/15/07 -- EVA-3 (11:07am)  
08/17/07 -- EVA-4 (~10:06am)  
08/20/07 -- STS-118/Endeavour/13A.1 undocking (8:00am)  
08/22/07 -- STS-118/Endeavour/13A.1 landing (12:48pm)  
08/29/07 -- SSRMS setup for viewing PMA-3 relocation  
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)  
09/20/07 -- STS-118/Endeavour/13A.1 landing (12:48pm)  
10/10/07 -- Soyuz TMA-10/14S relocation (to SM aft port)  
10/12/07 -- Soyuz TMA-11/15S launch (9:21am)  
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)  
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)  
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate  
10/25/07 -- STS-120/Discovery/10A docking  
11/03/07 -- STS-120/Discovery/10A undocking  
11/4/07 -- Node 2 relocation; PMA2 relocation  
11/13/07 -- US EVA-10  
11/17/07 -- US EVA-11  
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite  
12/08/07 -- STS-122/Atlantis/1E docking  
12/15/07 -- Progress M-61/26P undocking (DC1) & reentry  
12/23/07 -- Progress M-62/27P launch  
12/25/07 -- Progress M-62/27P docking (DC1)  
12/30/07 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)  
11/1/08 -- ATV-1 docking (SM aft port)  
02/10/08 -- Russian EVA-20 [to be reviewed]  
02/12/08 -- Progress M-63/28P launch [to be reviewed]  
02/14/08 -- Progress M-63/28P docking  
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS  
02/16/08 -- (NET) STS-123/Endeavour/1J/A docking  
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking  
04/04/08 -- ATV-1 undocking (from SM aft port)  
04/07/08 -- Progress M-63/28P undocking  
04/08/08 -- Soyuz TMA-12/16S launch  
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)  
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)  
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)  
04/24/08 -- (NET) STS-124/Discovery/1J launch -- JEM PM “Kibo”, racks, RMS.  
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/12/07

All ISS systems continue to function nominally, except those noted previously or below. Sunday -- Flight Day 5 for STS-118; Day 3 of Joint Ops. Ahead: Week 17 of Increment 15.

13A.1 Mission Extension: As a result of successful SSPTS (Station-to-Shuttle Power Transfer System) operations, the MMT (Mission Management Team) made the decision to extend the Shuttle mission by three days to a 14+2 mission and add a fourth EVA.

Wakeup time for the ISS crew remains at the shifted “docked” schedule of wakeup at 7:07am EDT, bedtime at 10:07pm (Shuttle crew: 10:37pm).

Yesterday, the crew completed all scheduled activities, plus many get-aheads. During the successful first spacewalk, EVA-1, Shuttle Mission Specialists Rick Mastracchio (EV1) and Dave Williams (EV2) –

- installed the S5 truss element,
- relocated the PVRGF (Photovoltaic Radiator Grapple Fixture) from the S5 launch position to the S5 keel,
- connected utility umbilicals between S4 and S5,
- removed four outboard launch locks on S5 to allow future installation of S6,
- retracted and cinched the P6 PVR,
- cycled the S5 CLA (Capture Latch Assembly),
- retrieved a 3/8 “ Drive Ratchet Wrench from the Z1 Tool Box,
- inspected four suspect P6 PiP Pins (all found to be intact), and
- relocated an APFR (Articulating Portable Foot Restraint) from WIF-9 to WIF-11.

A total of 24 lbs of nitrogen (N2) was transferred from the Shuttle to the ISS Hi-P storage tanks (outside the Airlock).
Today, CDR Yurchikhin and FE-1 Kotov continued the routing and installation of cabling for the BOK-3 Command Processing Unit of the TVM/Terminal & TsVM/ Central computers and began the actual removal & replacement of the failed BOK-3 with the new 26P-delivered unit. [BOK-3 R&R is ahead of schedule, but the Russian segment (RS) needs telemetry communications to proceed with checkout activities. Upon removal of the old BOK-3 unit, the crew reported to TsUP/Moscow that there was cold condensate behind it. Drops of humidity and mold were discovered. The unit itself is humid. Pictures will be downlinked for review. The crew recommended some sort of heat shield barrier be fashioned before installation of the new unit is installed. TsUP gave crew a Go to find something on ISS to use as a barrier and to photograph it.]

FE-2 Anderson meanwhile set up, connected and activated the new CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) payload hardware for operation.

A major portion of the crew timeline (~3 hrs) was set aside for the Focused Inspection (FI) of some selected damage locations on the Endeavour’s bottom heat shield, identified during the RPM inspection. [For the FI, the SSRMS (Space Station Remote Manipulator System) grappled the OBSS (Orbiter Boom Sensor System) and moved it from the handoff position to under the belly with a series of single joint maneuvers. The forward targets were scanned first, and the arm then moved with an OCAS (Operator Commanded Auto Sequence) to the aft target. Later in the day, the SSRMS was maneuvered to the pre-grapple position and then handed off, after which Clay Anderson moved the SSRMS to the Lab rear by grappling the Lab PDGF (Power & Data Grapple Fixture) in preparation for EVA-2 activities.]

After MS5 Alvin Drew’s data acquisition session with the Canadian Space Agency’s PMDIS (Perceptual Motor Deficits in Space) hand-to-hand coordination experiment yesterday, FE-2 Anderson set up the video/camcorder equipment for recording a PMDIS session with MS3 Dave Williams (CSA). After the shoot, the camcorder was deactivated and the PMDIS gear stowed. [PMDIS investigates why Shuttle astronauts experience difficulty with hand-eye coordination while on orbit. PMDIS will attempt to distinguish between the three current theories for this initial decline in hand-eye coordination in space {the current explanations are as follows: The brain isn’t adapting to the weightlessness of space; the difficulty of performing fine movements when floating in space; and stress due to factors such as space sickness and sleep deprivation}. PMDIS first measures the Shuttle astronaut’s hand-eye coordination prior to docking with ISS (transition from 1-g to zero-g). Measurements are taken while the astronaut’s arm is securely supported or floating free in three conditions: Tapping targets on a computer screen with a stylus and moving a cursor between the targets with a joystick, performing these...
tasks while responding to tones presented via earphones with a button press. The experiment will test the theory that the loss of eye-hand coordination during spaceflight is due to the disruption of certain neural circuits in the human brain, arising from a disruption in the vestibular system.]

Clay Anderson worked on the right glove of his EMU (Extravehicular Mobility Unit), worn over a comfort glove, to make it more comfortable in the thumb area during EVA activities, following uplinked repair instructions.

Oleg Kotov had another data monitoring & calldown session with the MATRYOSHKA-R radiation payload and its Lulin-5 electronics box.

Fyodor Yurchikhin performed IFM (In-flight Maintenance) on the TVIS (Treadmill with Vibration Isolation System) by removing and replacing its skirt with a new one delivered on Endeavour. The installation was then checked for full treadmill motion by raising and lowering the TVIS and moving it side to side with the Service Module (SM) “pit”. [The old skirt was stowed for return on 13A.1.]

Kotov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working on the IMS (Inventory Management System), Yurchikhin updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

After lunch, Clay Anderson filled out the regular FFQ (Food Frequency Questionnaire), his seventh, on the MEC (Medical Equipment Computer). [By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]

Anderson prepared the DCS-760 cameras for tomorrow’s spacewalk.

Clay also assisted MS5 Drew in transferring the EPO (Educational Payload Operation) hardware to the ISS for the educational activities by MS4 Barbara Morgan.

Getting ready for tomorrow’s EVA-2, the two designated spacewalkers, Rick Mastracchio (EV1) & Dave Williams (EV2), along with Yurchikhin and Kotov, reviewed procedures and timeline for the excursion.
Afterwards, the “Campout” by Mastracchio & Williams in the A/L Crewlock (CL) began with mask prebreathe and tool configuration at ~9:00pm, with hatches closed and depressurization of the CL initiated from 14.7 to 10.2 psi for their 8.5-hr sleep time.

The planned timeline for EVA-2 tomorrow will be -

- Campout EVA Prep (8:27am EDT)
- Transfer Ops (9:37am)
- Egress EVA #2 (11:37am)
- CMG R&R (11:37am)
  - Remove failed CMG
  - Transfer new CMG to ESP-2
  - Remove new CMG from ESP-2
  - Install new CMG on Z1
  - Install failed CMG on ESP-2
  - Clean Up
- Ingress EVA #2 (5:42pm)
- SSMRS Walkoff Lab to MBS (6:22pm)

ISS crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR) and RED resistive exercise device (FE-1). [No exercise allowed on ISS or Shuttle during OBSS operations non SSRMS.]

Later, Fyodor copied the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~8:50pm, Clay had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-8 laptop).

Working off the discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

**Weekly Science Update** *(Expedition Fifteen -- 16th)*
ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): On 8/7, a 5-min test was done with recording on card 933, the result was a file of around ~60kB, which is the normal size expected. Thus it is assumed that the facility is performing nominally. Data are being downlinked, but not yet received. Next ALTCRISS activity is currently scheduled for 8/27.

ANITA: Planned.

BCAT (Binary Colloidal Alloy Test): Reserve.

CARDIOCOG-2: Next session scheduled around 9/10.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Continuing,

CFE (Capillary Flow Experiment): Reserve.

CHROMOSOME-2 (E14 SFP): Completed.

CSI-1/CGBA (CGBA Science Insert #1/Commercial Generic Bioprocessing Apparatus): Powered off. Waiting to support other experiments such as BCAT.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Next scheduled operation is 10/29-11/3.

EMCH (Elastic Memory Composite Hinge): Complete.

EPO (Educational Payload Operation) Kit C: Planned.

IMMUNO (Saliva Sampling): First session completed successfully on 7/27. Next session to be planned at the end of the Increment.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.
MULTIGEN-1: Samples uploaded on 13A.1 and ready for transfer to ISS. Start of MULTIGEN experiment is currently scheduled in Week 18.

MUSCLE (E14 SFP): Completed.

MSG-SAME (Microgravity Science Glovebox): Planned.

NEOCYTOLYSIS (E14 SFP): Completed.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION: “Clay, great work on Wednesday. And thanks a bunch for reporting down all the tube numbers and bar codes.”

SAMPLE: Ongoing.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): SAMS and MAMS were activated on 8/8 and are collecting acceleration data in support of joint ops. The SAMS ICU locked up late on 8/8, but was recovered on 8/9 after a laptop reboot by the crew.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Planned.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Seven of the eight required SWAB sampling runs have now been completed. The next, and last, SWAB Air and Surface activities are scheduled to be done prior to the docking of 15S. Thanks to the crew for the information about the blocked sampling locations called out in the procedure. The SWAB team will work to correct this issue before the crew’s next SWAB session. “Thanks also for your suggestion regarding cue cards, which we are also working to implement before the next session.”

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observations): Through 8/5 the ground has received a total of 9,625 CEO images for review and cataloging for Increment 15. “We are pleased to report your successful acquisition of the Polar Mesospheric Cloud phenomenon over the North Pacific Ocean that we requested on 8/1. We are also glad that you
tried different lens setting and techniques in your session. This offered a number of
opportunities to enhance different cloud features. We look forward to more of these
types of sessions in the coming weeks while the opportunity lasts. You also
acquired imagery of our Kerguelen Islands target on 8/3. It appears the area of
interest to the west was under clouds; however your photos of the eastern end of
the archipelago are very good and provide rare views of large beds of kelp in the
near-shore waters. Keep up the good work!

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are
downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit  
*as of this morning, 7:39am EDT [= epoch]*:
Mean altitude -- 341.1 km
Apogee height – 346.7 km
Perigee height -- 335.6 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008267
Solar Beta Angle -- 38.8 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 70
Revolutions since FGB/Zarya launch (Nov. 98) -- 49950

**Noteworthy Milestone ahead:** ISS will complete its 50,000th orbit of the Earth
next Tuesday.

**Significant Events Ahead**  
*all dates Eastern and subject to change*:
08/13/07 -- EVA-2 (11:37am)
08/15/07 -- EVA-3 (11:07am)
08/17/07 -- STS-118/Endeavour/13A.1 undocking (8:28am) -- *if not extended to 14
days*
08/19/07 -- STS-118/Endeavour/13A.1 landing (1:16pm) -- *if not extended to 14
days*
08/17/07 -- EVA-4 (~10:06am) -- *if extended to 14 days*
08/20/07 -- STS-118/Endeavour/13A.1 undocking (8:00am) -- *if extended to 14
days*
08/22/07 -- STS-118/Endeavour/13A.1 landing (12:48pm) -- *if extended to 14 days*
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]
09/20/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/5-8/07 -- Node 2 relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/17/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
??/??/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
??/??/08 -- ATV-1 docking (SM aft port)
02/??/08 -- Russian EVA-20 [to be reviewed]
02/12/08 -- Progress M-63/28P launch [to be reviewed]
02/14/08 -- Progress M-63/28P docking
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- (NET) STS-123/Endeavour/1J/A docking
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking
04/04/08 -- ATV-1 undocking (from SM aft port)
04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/11/07

All ISS systems continue to function nominally, except those noted previously or below. Flight Day 4 for STS-118; Day 2 of Joint Ops.

S5 truss installation on the S3/S4 truss was nominal, with no issues. All EVA-1 objectives plus get-ahead tasks were accomplished.

Yesterday, grappling of the starboard-5 spacer truss segment by the SRMS (Shuttle Remote Manipulator System), transfer of the S5 truss out of the Endeavour payload bay to the ISS and its “handover” to the SSRMS (Space Station Remote Manipulator System) went smoothly and on time. The S5 was “parked” overnight at the SSRMS end effector for establishing temperature equilibrium prior to its installation today.

SSPTS (Station-to-Shuttle Power Transfer System) activation was also completed yesterday with three of four OPCUs (Orbiter Power Converter Units) checked out successfully per the plan. [For the first time in history, the ISS is transferring power to the Orbiter to allow it to remain docked longer. OPCUs 1A, 1B, & 2A are currently active, transmitting up to 6.45 kW of power to the Shuttle PTUs (Power Transfer Units). Two of the OPCUs were deactivated this morning, prior to locking the S4 BGA (Beta Gimbal Assembly) for EVA-1, to maintain ISS power balance.]

Today’s EVA-1 was completed successfully. Shuttle Mission Specialists Rick Mastracchio (EV1) and Dave Williams (EV2) –
- installed the S5 truss element,
- relocated the PVR (Photovoltaic Radiator) Grapple Fixture from the S5 launch position to the S5 keel,
- connected utilities between S4 and S5,
- removed launch locks on S5 to allow future installation of S6, and
- retracted and cinched the P6 PVR.
[Official start time of the spacewalk was 12:28p EDT (5 min behind schedule). It ended at 6:45pm. Total EVA duration (PET = Phase Elapsed Time) was 6h 17m. It was the 89th spacewalk for ISS assembly & maintenance and the 61st from the station (28 from Shuttle, 38 from Quest, 22 from Pirs) totaling 363h 41m. After today’s EVA, a total of 99 spacewalkers (70 NASA astronauts, 20 Russians, and nine astronauts representing Japan-1, Canada-3, France-1, Germany-1 and Sweden-3) have logged a total of 551h 5m outside the station on building, outfitting and servicing. It also was the 111th spacewalk by U.S. astronauts.]

After the 8.5-hr sleep period before the spacewalk, the Crewlock (CL) hatch was cracked at ~8:17am EDT for a one-hour hygiene break/with mask prebreathe for Mastracchio and Williams, after spending the night on 10.2 psi campout. Around 9:17am, the hatch was closed again for a continued depress period at 10.2 psi. Prior to EV1/EV2 egress from the CL, Hobaugh & Anderson maneuvered the SSRMS with the S5 truss element to the ready-to-latch position at the S4 truss and completed capture of the S5 by the S4 SSAS (Segment-to-Segment Attachment System) and bolting, with the SSRMS switched to “limp” mode.

As part of EVA preps, the FE-1 verified powerdown of onboard ham radio equipment (Kenwood in SM & Ericsson in FGB) to prevent RF interference with the EMUs.

While the spacewalk went on, CDR Yurchikhin and FE-1 Kotov began the restoration of the Russian BVS onboard computer system to nominal operation, today performing the 3-hr job of routing & installing new 26P-delivered cabling in the Service Module (SM) for tomorrow’s replacement of the Russian BOK-3 Command Processing Unit of the TVM/Terminal & TsVM/Central computers.

Yurchikhin also started the transfer of nitrogen (N₂) gas from the Shuttle to the ISS hi-P storage tankage.

Clay Anderson set up the Canadian Space Agency’s PMDIS (Perceptual Motor Deficits in Space) hand-to-hand coordination experiment, readying it for the data acquisition session conducted later by MS5 Alvin Drew. A second session, by Dave Williams, is scheduled for tomorrow. Results will then be copied to CD and the equipment stowed for the next run. [PMDIS investigates why Shuttle astronauts experience difficulty with hand-eye coordination while on orbit. PMDIS will attempt to distinguish between the three current theories for this initial decline in hand-eye coordination in space (the current explanations are as follows: The brain isn’t adapting to the weightlessness of space; the difficulty of performing fine movements when floating in space; and stress due to factors such as space sickness and sleep]
deprivation}. PMDIS first measures the Shuttle astronaut's hand-eye coordination prior to docking with ISS (transition from 1-g to zero-g). Measurements are taken while the astronaut's arm is securely supported or floating free in three conditions: Tapping targets on a computer screen with a stylus and moving a cursor between the targets with a joystick, performing these tasks while responding to tones presented via earphones with a button press. The experiment will test the theory that the loss of eye-hand coordination during spaceflight is due to the disruption of certain neural circuits in the human brain, arising from a disruption in the vestibular system.]

Oleg Kotov performed the periodic data collection and downlinking on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

FE-2 Anderson completed the usual post-EVA activities in the Airlock (A/L).

Clay also downlinked the digital photography obtained during the spacewalk, while Oleg Kotov assisted Mastracchio and Williams in refilling the EMU (Extravehicular Mobility Unit) water tanks and initiating the recharge of the depleted EVA batteries in the BSA (Battery Stowage Assembly).

The FE-1 performed the regular monthly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

Oleg also deployed the newly updated SODF (Station Operation Data File) Warning Books.

The CDR conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working on the IMS (Inventory Management System), Fyodor updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The ISS crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1), RED resistive exercise device (CDR), and VELO bike with bungee cord load trainer (FE-1). [No exercise allowed on ISS or Shuttle during S5 grappled by both arms.]
Later, Fyodor copied the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the discretionary job list, the FE-1 conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

RPM Update: The R-bar Pitch Maneuver photo/video imagery went as per plan. Evaluation of downlinked pictures showed one area between the right ET door and the right landing gear doors of Endeavour which appears to be coincident with another imaging of a small spray resembling an ice impact 58 seconds after launch midway. The Focused Inspection scheduled for tomorrow (FD5) will provide a three-dimensional map of the damage or cavity at this location. The results and the condition of the TPS at the site of the apparent ice impact will be known Monday afternoon (see two images, below).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov  (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

http://earthobservatory.nasa.gov/Study/AstronautPhotography

ISS Orbit (as of this morning, 7:39am EDT [= epoch]):
Mean altitude -- 341.1 km
Apogee height -- 346.7 km
Perigee height -- 335.6 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008267
Solar Beta Angle -- 38.8 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 70
Revolutions since FGB/Zarya launch (Nov. 98) -- 49950
**Significant Events Ahead** *(all dates Eastern and subject to change)*:

08/13/07 -- EVA-2 (11:36am)
08/15/07 -- EVA-3 (11:06am)
08/17/07 -- STS-118/Endeavour/13A.1 undocking (8:28am) -- *if not extended to 14 days*

08/19/07 -- STS-118/Endeavour/13A.1 landing (1:16pm) -- *if not extended to 14 days*
08/17/07 -- EVA-4 (~10:06am) -- *if extended to 14 days*
08/20/07 -- STS-118/Endeavour/13A.1 undocking (8:00am) -- *if extended to 14 days*

08/22/07 -- STS-118/Endeavour/13A.1 landing (12:48pm) -- *if extended to 14 days*
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]
09/20/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/5-8/07 -- Node 2 relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/17/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)

??/??/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
??/??/08 -- ATV-1 docking (SM aft port)
02/??/08 -- Russian EVA-20 [to be reviewed]
02/12/08 -- Progress M-63/28P launch [to be reviewed]
02/14/08 -- Progress M-63/28P docking
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS

04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.

Possible debris damage between right ET door & right landing gear doors (see also below).
ISS On-Orbit Status 07/23/07

All ISS systems continue to function nominally, except those noted previously or below. EVA Day. Wake-up was shifted 30 min earlier, to 1:30am EDT. Sleep will be equally earlier, at 4:30pm.

FE-2 Anderson continued his current SLEEP experiment by accessing the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software and completing questionnaire entries in the experiment’s laptop session file. [SLEEP is supported by the HRF1 (Human Research Facility 1) laptop. To monitor Clay’s sleep/wake patterns and light exposure, he is wearing a special Actiwatch device which measures the light levels encountered by the FE-2 as well as his patterns of sleep and activity throughout the Expedition.]

Clay Anderson (EV1) and Fyodor Yurchikhin (EV2) successfully completed EVA-9 with A/L (Airlock) hatch closure at 2:05pm EDT, followed by cleanup and post-EVA ops. Accomplished tasks of this spacewalk were –

- Install a video stanchion at CP-7 (Camera Position 7) on the S0/P1 truss interface, from the VSSA (Video Stanchion Support Assembly);
- Reconfigure power connections at the SASA (S-band Antenna Support Assembly) on the S1 truss;
- Remove & replace the failed RPCM (Remote Power Controller Module) S04B_F on the S0 truss which has impacted MT (Mobile Transporter) operations, and return old RPCM to A/L (Airlock);
- Install an APFR (Articulated Portable Foot Restraint) on the SSRMS (Space Station Remote Manipulator System);
- EV1 ingress APFR, maneuver to jettison position & jettison the integrated VSSA FSE (Flight Support Equipment) and EFRAM (EVA Flight-Releasable Attachment Mechanism), with a combined mass of ~212 lb, in retrograde direction [done at ~9:19am];
- Jettison the ~1400 lb Early Ammonia Servicer (EAS) [done at ~10:36am];
- Perform CBM (Common Berthing Mechanism) seal cleaning at Node nadir port (for PMA-3 relocation in late August); and
- Clean up, returning APFR to ESP-2 (External Stowage Platform 2) and ingress A/L.

As Get-ahead Tasks, the crewmembers also removed GPS antenna #4, relocated an auxiliary bag from P6 to Z1, and released two fluid tray bolts on the Node Unity.

[Official start time of the spacewalk was 6:24am EDT, 6 minutes ahead of schedule. Total EVA duration (PET = Phase Elapsed Time) was 7 hrs 41 min. It was the 88th spacewalk for ISS assembly & maintenance and the 60th from the station (28 from Shuttle, 38 from Quest, 22 from Pirs) totaling 357h 24m. After today's EVA, a total of 97 spacewalkers (69 NASA astronauts, 20 Russians, and eight astronauts representing Japan-1, Canada-2, France-1, Germany-1 and Sweden-3) have logged a total of 544h 48m outside the station on building, outfitting and servicing. It also was the 110th spacewalk by U.S. astronauts.]

Before spacewalk begin, the Crewlock (CL) hatch was cracked for a hygiene break with mask prebreathe for Yurchikhin and Anderson, after spending the night on 10.2 psi campout. Around 3:00am, the hatch was closed again for a continued depress period at 10.2 psi.

FE-1 Kotov, who provided IVA (intravehicular activities) support, used a DCS 760 EVA camera for documenting the hatch closure and ensured Lab science window shutter closure.

Oleg also set up the final configuration of the STTS onboard audio subsystem to support the EVA.

After the spacewalk, the FE-1 reset the STTS comm system was reset to the original conditions and reconfigured the DCS 760 EVA cameras.

In addition, Kotov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Later tonight (4:20pm EDT), ISS attitude control authority will be handed over to Russian MCS (Motion Control System) thrusters for maneuvering to reboost attitude at 4:25pm. After the reboost firing, the station, at ~6:45pm, will maneuver to +XVV TEA (+X-Axis in Velocity Vector/Torque Equilibrium Attitude) and control authority will return to US Momentum Management at ~7:30pm.

No CEO (Crew Earth Observation) photo targets uplinked for today.
CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/

05/02/08 -- (NET) STS-124/Discovery/1J undocking
ISS On-Orbit Status 08/10/07

All ISS systems continue to function nominally, except those noted previously or below.

**STS-118/Endeavour docked smoothly** at the PMA-2 (Pressurized Mating Adapter-2) port at 2:02pm EDT (9 min behind schedule), and the station now hosts ten occupants again as Mission 13A.1 is underway.  *All docking hooks were closed at 2:22pm, and the station was reoriented as planned to minimize the risk of micrometeoroid/debris impacts upon the Shuttle (-x-axis in velocity vector, +z-axis in local vertical). Hatches were open at 4:04pm, and the new crew was welcomed aboard the ISS and given the mandatory safety briefing. Later, the S5 truss was successfully unberthed in the Shuttle PLB (Payload Bay) with the SRMS (Shuttle Remote Manipulator System), handed off to the ISS SSRMS (Space Station RMS) and “parked” overnight for tomorrow’s installation.*

Wakeup time for the ISS crew had shifted once more this morning, to 7:37am EDT, for a long day (sleep time tonight: 11:07pm).

Preparatory to the Shuttle arrival, FE-2 Anderson closed the Lab science window shutter as protection against thruster plumes, connected the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cables at the Lab & Cupola RWS (Robotics Work Stations) for the SSRMS (Space Station Remote Manipulator System) video coverage, and installed the IWIS (Internal Wireless Instrumentation System) configured the IWIS (Internal Wireless Instrumentation System) hardware for measuring and recording structural dynamics. IWIS will be dismantled again tonight.

FE-1 Kotov assembled the STIMUL-01 hardware and performed another 40-min. functional test of the physical fitness experiment, using the Russian PZE STIMUL-01 suit for physical stimulation conditioning training with the freshly charged
batteries. *The STIMUL-01 neuromuscular myostimulator suit uses electrical stimulation for rhythmic contraction and relaxation of body muscle fibers for conditioning. It is part of the suite of BMS (Biomedical Support) systems under development at IBMP (Institute for Biomedical Problems) in Moscow for long-duration spaceflights including piloted Mars missions.*

Yurchikhin collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. *GANK tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).*

For the Endeavour docking, the CDR worked with the ground to shut down the Elektron O₂ generator. Later in the evening, the Elektron was reactivated at 32 amps, with the FE-1 monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. *During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.*

Yurchikhin and Kotov conducted a final checkout of the photo/video equipment for the RPM (Rbar Pitch Maneuver) before Endeavour docking. They also verified the readiness of the communications configuration required for the photo shoot.

Shortly before the docking, Kotov configured the Russian MCS (Motion Control System) for the automatic “PMA-2 Arrival” mode, an operational sequence used to monitor Orbiter arrival at the PMA-2. *At “Capture Confirmed” (2:02pm), ISS attitude was immediately set to “free drift” to allow dampening out relative motions of ISS and Endeavour (with the ODS dampers/shock absorbers), then maneuvered to “Mated TEA” (Torque Equilibrium Attitude) to account for the new overall configuration with Endeavour docked. Later tonight it will maneuver to “Overnight Park” attitude when the S5 truss element is attached to the SSRMS and “parked”.*

Oleg Kotov also performed final STTS communications configuration checks for the docking, while Clay Anderson prepared for taking photo/video footage of the approach and docking.

Prior to final approach, Scott Kelly & Charles Hobaugh took the Endeavour through the scheduled RPM at ~600 ft distance under the ISS, a full-circle backflip to allow digital imagery of its TPS (thermal protection system) from the ISS by Yurchikhin & Kotov, with photography commencing at 12:56pm and ending at 1:05pm. *The ISS
crew had about 100 seconds actual shooting time to photograph the Orbiter TPS. Fyodor operated the 400mm-lens DCS (digital camera system) and Oleg wielded the long-barreled 800mm camera, each one attempting to obtain about 150 pictures. After the docking, the images will be downlinked for further analysis.

After the RPM, at a distance of ~575 ft, Endeavour initiated TORVA (Twice Orbital Rate V-bar Approach). The final Go for Docking was given, and Endeavour closed in a slow rate for docking at 2:02pm.

After leak checks of the ODS (Orbiter Docking System) vestibule for about an hour, hatches were opened at ~4:04pm and hand shakes between the crews came 15 minutes later.

Before and during ISS/STS hatch opening, Oleg Kotov performed the standard collection of air samples with the Russian AK-1M sampler in the SM, FGB, and Lab.

Joint crew activities after the Welcome ceremony included –

- Safety briefing for all,
- Preparing the Orbiter approach imagery for downlink,
- Setting up the transfer equipment for supplying Shuttle O₂ (oxygen) to the ISS to support the “Campout” by Mastracchio and Williams overnight in the Airlock (A/L) for denitrogenation/pre-breathe,
- Transferring the Shuttle EMU/spacesuits to the ISS,
- Installing the REBAs (Rechargeable EVA Battery Assemblies) in the EMUs, and
- Checking out the REBA powered suit equipment and tools.

Also after the docking, Yurchikhin conducted the routine maintenance of the SOZح system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables, and today also the periodic (~monthly) checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1.

Working on the IMS (Inventory Management System), the CDR updated/edited its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

After completing A/L Equipment Lock (EL) configuration for the first spacewalk tomorrow and conducting a joint review of EVA-1 timeline & procedures at ~7:20pm, the two spacewalkers, Rick Mastracchio (EV1) and Dave Williams (EV2), will begin their “campout” in the “Quest” A/L, starting mask prebreathe at ~10:00pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to
10.2 psi. Sleep for the ISS crew will commence at 11:07pm, for the Shuttle crew at ~11:37pm.

Earlier today, the ISS crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exercise device (FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). [No exercise allowed on ISS or Shuttle during S5 grappled by both arms.]

Later, Oleg copied the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

No CEO (Crew Earth Observation) photo targets uplinked for today.

02/16/08 -- (NET) STS-123/Endeavour/1J/A docking
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking
04/04/08 -- ATV-1 undocking (from SM aft port)
04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/09/07

All ISS systems continue to function nominally, except those noted previously or below. STS-118/13A.1 FD 2. ISS crew off duty.

ISS sleep/work cycle shifted to the right by another two hours: Wakeup - 7:03am EDT, sleep - 10:33pm (tomorrow/FD3: wakeup -- 7:33am; sleep -- 11:06pm).

STS-118/Endeavour lifted off last night from KSC Pad 39A on time at 6:36pm EDT flawlessly on Mission ISS-13A.1 and is currently catching up with the ISS, carrying the seven-member crew of Commander Scott Kelly, Pilot Charles Hobaugh and Mission Specialists Tracy Caldwell, Rick Mastracchio, Dave Williams (CSA), Barbara Morgan, and Alvin Drew. We are off to another great mission!

Docking is scheduled for tomorrow (Friday, 8/10) at about 1:53pm EDT. With the docking, ISS Stage 13A.1 begins. After hatch opening (~3:08pm), first tasks are safety briefing, S5 truss hand-off from SRMS (Shuttle Remote Manipulator System) to SSRMS (Space Station RMS) at ~5:08pm, SSPTS (Station-to-Shuttle Power Transfer System) activation at ~6:38pm, and preparations for the first spacewalk, EVA-1, by MS2/EV1 Mastracchio and MS3/EV2 Williams with overnight Campout of the two in the Airlock (A/L) for denitrogenation/pre-breathe. Objectives of the nominal 11-day mission include: Deliver & install the S5 truss element, deliver & replace CMG-3 (Control Moment Gyroscope 3), retract P6 fwd PVR (Photovoltaic Radiator), relocate P6 SASA, install MISSE 3&4, relocate CETA carts 1&2, etc. Depending on successful SSPTS activation, a decision may be made to extend the mission to 14 days, including a fourth EVA on FD10, to install OBSS OSE (Orbiter Boom Sensor System/Orbital Support Equipment) on S1 truss, install two EWIS (External Wireless Instrumentation System) antennas on the Lab, secure Lab and Node MMOD shields, and install WETA-3 (Wireless Video System External Transceiver Assembly #3) on S3 truss. Landing will nominally take place at KSC on FD12 (8/19) at 1:16pm EDT, or, if extended to 14 days, on FD15 (8/22) at 12:48pm.]
FE-1 Kotov, with TsUP/Moscow support, conducted full-scale testing of the entire OpsLAN (Operations Local Area Network) network to check out yesterday’s IFM (in-flight maintenance), which replaced the malfunctioning Russian BRI Smart Switch Router with a new unit delivered on Progress 26P. [The network testing included activation of the BSMM (Multi-Channel Matching Unit), BSPN (Payload Server), OBC (Onboard Controller) for RokvISS, and GTS (Global Timing System).]

FE-2 Anderson replaced the BBA (Baseplate Ballast Assembly) of the failed LHA (Lamp Housing Assembly) in the A/L, after Monday’s swap of the LHA with a working unit from the Lab did not resolve the issue, pointing to the BBA as the culprit.

Clay and Fyodor also removed their EMUs (Extravehicular Mobility Units) from the A/L to make room for the STS-118 spacesuits.

Earlier in the morning, the FE-2 provided support for the ground-controlled activation of the U.S. CDRA (Carbon Dioxide Removal Assembly) by connecting the LTL coolant supply line to the Lab D6 rack. Later, Clay was to power off the VOA (Volatile Organics Analyzer).

In preparation for the STS-118 RPM (R-bar Pitch Maneuver) tomorrow, Oleg Kotov is to configure the DCS-760 cameras for the photo shoot, and Clay Anderson will likewise set up the video camcorder.

Anderson will also connect the bypass cables for the VDS VTR (Video Distribution System/Video Tape Recorder) for passing video to and from the station on the Lab’s starboard side and allowing the station to receive video from the Orbiter on the Lab’s port side. The old tapes in the VTRs, having eclipsed their usefulness after 250 hrs, were replaced with new ones.

In preparation for tomorrow’s Endeavour docking, CDR Yurchikhin performed the repressurization process on the PMA-2 (Pressurized Mating Adapter #2) and prepared the PMA for the Shuttle’s arrival.

The FE-2, at his discretion, is to make preparations and to preposition tools and equipment for the FD3 transfer of oxygen (O₂) from the Shuttle.

Oleg will collect the standard ammonia fluid sample from the Lab ITCS MTL (Internal Thermal Control System Moderate Temperature Loop) port for 13A.1 return to the ground.
Kotov is also scheduled for the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Yurchikhin and Anderson had another hour for hardware prepacking for return on the Shuttle.

As a recurring item on the Russian voluntary “time permitting” task list, Yurchikhin and Kotov are to perform an equipment audit in the Russian segment (RS) of the ISS, behind stowage panels in the FGB, supported by an uplinked comprehensive list, and to continue shooting photo/video footage of the RS modules’ interiors, started before.

Also from the discretionary job list, the FE-1 will conduct the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]*

The crew is performing their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2), and VELO cycle with bungee cord load trainer (CDR, FE-1).

Later, Oleg copies the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~11:08am EDT, Fyodor Yurchikhin powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), and at 11:14am conducted a radio exchange with ham amateurs/mountain climbers from the Sporadik (Kursk) Youth Sports Club during their climb of the eastern peak of Mt. Elbrus (5642 m above sea level). This was their third radio contact with the ISS crew.

- **26P Dynamic Thruster Test Update:** The retest of the Progress 26P DPO (approach & attitude control) Manifold 1 thrusters was successfully conducted by Energia/Moscow today, first at 6:53am EDT with three firings of 10 sec duration each, and then at 8:20am for a second set of three 10-sec firings. ISS attitude control was handed over to the Russian segment at 6:05am and returned to the U.S. segment at 9:00am.
• **BOK-3 R&R Update:** The replacement of the Russian BOK-3 Command Processing Unit of the TVM/Terminal & TsVM/Central computers with a new unit delivered on 26P is scheduled for 8/12 (~9:51am).

• **STS-118 Orbiter Middeck Payloads:** Three interesting Utilization Sortie experiments are active on the Endeavour middeck during ascent and docked ops: CBTM-2 (Commercial Biomedical Test Module-2), involving three AEMs (Animal Enclosure Modules) with eight mice to study countermeasures for muscle atrophy; CCM-A (Cell Culture Microgravity-A) with two DoD Space Test Program (STP) experiments to study human immune cells and wound healing; and SPEGIS (Streptococcus pneumoniae Gene Expression & Virulence Potential in the Space Environment) to examine the behavior and growth of bacteria in micro-G.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
http://earthobservatory.nasa.gov/
http://earthobservatory.nasa.gov/Study/AstronautPhotography

**ISS Orbit  (as of this morning, 8:29am EDT [= epoch]):**
Mean altitude -- 341.3 km
Apogee height – 346.8 km
Perigee height -- 335.7 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008241
Solar Beta Angle -- 48.4 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 83 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 49919

**Significant Events Ahead (all dates Eastern and subject to change):**
08/10/07 -- STS-118/Endeavour/13A.1 docking (1:51pm)
08/11/07 -- EVA-1 (12:36pm)
08/13/07 -- EVA-2 (11:36am)
08/15/07 -- EVA-3 (11:06am)
08/17/07 -- STS-118/Endeavour/13A.1 undocking (8:28am) -- if not extended to 14 days
08/19/07 -- STS-118/Endeavour/13A.1 landing (1:16pm) -- if not extended to 14 days
08/17/07 -- EVA-4 (~10:06am) -- if extended to 14 days
08/20/07 -- STS-118/Endeavour/13A.1 undocking (8:00am) -- if extended to 14 days
08/22/07 -- STS-118/Endeavour/13A.1 landing (12:48pm) -- if extended to 14 days
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]
09/20/07 -- Soyuz TMA-10/14S undocking (to SM aft port)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/5-8/07 -- Node 2 relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/17/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
??/??/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
??/??/08 -- ATV-1 docking (SM aft port)
02/??/08 -- Russian EVA-20 [to be reviewed]
02/12/08 -- Progress M-63/28P launch [to be reviewed]
02/14/08 -- Progress M-63/28P docking
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- (NET) STS-123/Endeavour/1J/A docking
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking
04/04/08 -- ATV-1 undocking (from SM aft port)
04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
All ISS systems continue to function nominally, except those noted previously or below.

The crew’s sleep/work cycle continues right-shifted by three hours: Wakeup 5:00am EDT, sleep 8:30pm.

As part of their regular physical fitness evaluation, Fyodor Yurchikhin and Oleg Kotov both undertook the Russian MO-5 MedOps protocol of cardiovascular assessment during graded physical load on the VELO cycle ergometer, their second, each assisting the other in turn as CMO (Crew Medical Officer). [The assessment, supported by ground specialist tagup (VHF) and telemetry monitoring, uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer’s instrumentation panels. For the graded-load exercise, the subject works the pedals after a prescribed program at load settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]

Clay Anderson unstowed the equipment for the SWAB (Surface, Water & Air Biocharacterization) experiment and collected air and surface samples at several times during the day, after taking documentary photographs of the surfaces. The samples were sealed in special SWAB tubes with fixative, labeled as to location origins and prepared for return to Earth. [SWAB is a comprehensive characterization of microorganisms and allergens in spacecraft. It uses advanced molecular techniques to comprehensively evaluate microbes on board the space station, including pathogens. It also tracks changes in the microbial community as spacecraft visit the station and new station modules are added. This study allows an assessment of the risk of microbes to the crew and the spacecraft.]

Using the MAS (Microbial Air Sampler) kit, the FE-2 gathered air samples in Lab,
Node & Service Module (SM) for bacterial and fungal analysis in Petri dishes and stowed them for return to Earth on 13A.1. Later, Anderson also collected collect surface sample swabs in Lab & Node for cultivation/incubation with the EHS SSK (Environmental Health Systems/Surface Sample Kit). [The MAS sampling analysis is performed once per month for the first three months, and once every three months thereafter. Bacterial and fungal air samples are taken at two locations in each module. The colony growth on the sampling slides will usually (not this time) be analyzed on board after five days of incubation in 4 Petri dishes. As done for MAS, SSK sampling is performed once per month for the first three months that a module is on orbit and once every three months thereafter. Bacterial and fungal samples are taken at two locations in each module, with the prime site in the Lab being the air supply diffuser at the LAB1P5 rack. The colony growth on the 10 sampling slides will be analyzed after five days of incubation. For onboard visual analysis of media slides from SSK, MCDs (Microbial Capture Devices) from WMK (Water Monitoring Kit), coliform detection bags from MWAK (Microbial Water Analysis Kit), and Petri dishes from MAS, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]

FE-1 Kotov serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated at ~7:00pm EDT. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]

After conferring with ground specialists via S-band tagup, CDR Yurchikhin removed the malfunctioning Russian BRI Smart Switch Router in the SM (behind medical cabinet) and replaced it with a new unit delivered on Progress 26P. The installation was then tested from the RSS1 laptop for performance and network connectivity. [The failure of the BRI was reported by the crew on 6/4, with no spare on board. BRI is part of the RS OpsLAN network with connections to the three SSC (Station Support Computer) clients, the Ethernet tie-in with the US network, and a network printer in the RS (Russian segment). At that time, the crew made do by bypassing the unit by connecting SSC1 directly to the SSC router in the USOS (US segment), making this laptop the only SSC available in the SM. The SM printer could be connected directly to the SSC1 port.]

Meanwhile, Oleg Kotov conducted a search and audit behind FGB panels of equipment needed for the Russian/Japanese 3DPC experiment, scheduled for Expedition 16 in December. [3DPC hardware was removed by Valery Tokarev on 3/23/06 as part of closing out the Japanese/JAXA 3D-PCGF (3D Photon Crystals Growth Facility) experiment and may inadvertently have been returned to Earth.
3DPC studies the production of 3D photonic crystals, from UV LEDs, through self-organization and ordering of colloid nanoparticles in an electrolyte solution with subsequent fixation in an elastic gel matrix.

Later, the FE-1 worked on the SM’s IK0501 GA (gas analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System, deactivating the unit and replacing its BF carbon dioxide (CO₂) filter assembly with a new unit from FGB stowage (replaced last: 5/18/07). [After ensuring good seals on the instrument’s base and no leaks around the installed filter, Oleg reactivated the GA and stowed the spent BF for disposal. IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed.]

After reviewing R&R (removal & replacement) procedures for the failed (partially corroded) BOK-3 Command Processing Unit of the Russian (German-built) TVM/ Terminal & TsVM/Central computers, Yurchikhin and Kotov tagged up with ground specialists to discuss the upcoming repair with the new BOK-3 delivered on 26P. Oleg then readied the cabling and plugs for the R&R, which should restore the Russian BVS Onboard Computer System to full service. [Preparatory steps for removing the BOK-3 from behind SM access panels were already taken by Yurchikhin on 7/11.]

Anderson undertook the monthly FDS PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit. [The IMS (Inventory Management System)-supported inspection involves verification that PFEs (portable fire extinguishers), PBAs (portable breathing apparatus), QDMAs (quick-don mask assemblies) and EHTKs (extension hose/tee kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware (QDMA inspection was not required this time). In the U.S. segment (USOS), there are a total of 5 PFEs and 7 PBAs, plus 7 QDMAs and 4 EHTKs.]

Clay completed his second run with the MedOps WinSCAT (Spaceflight Cognitive Assessment Tool) experiment by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. [WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR’s, crewmembers or flight surgeons request.]

Fyodor conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables, and today also the periodic (~monthly) checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and
Oleg did the daily IMS updating, editing its standard “delta file” for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew is performing their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-1, FE-2), and VELO cycle with bungee cord load trainer (CDR).

Later, Clay copies the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As a recurring item on the Russian voluntary “time permitting” task list, Yurchikhin and Kotov are to perform an equipment audit in the Russian segment (RS) of the ISS, behind stowage panels in the FGB, supported by an uplinked comprehensive list, and to continue shooting photo/video footage of the RS modules’ interiors, started before.

Also from the discretionary job list, the FE-1 is to conduct the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).  

[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

A fourth item on the “time permitting” task list for Oleg is the periodic status check on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse, including a health check on the fans of the BO/V control box (verifying all-green LEDs) and Lada-10/MIS, using the hand to check for air flow of three control box fans and six fans of MID-Lada module.  

[Rasteniya-1 examines a variety of different types of plants over multiple generations on ISS.]

Go-back: Yesterday at ~9:20am EDT, Clay Anderson powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 9:25am conducted a ham session with students at One Stop Richmond Hill Community Center, Richmond Hill, NY. 

["What are your favorite foods in space and does chocolate taste strange in space”; “Do your children want to travel in space like you and why?”; “Do you have Internet on the ISS and what video games are your favorite (if you have any)?”; “Is the ISS
going to become a national laboratory, and what kind of experiments will be most important?"

26P Dynamic Thruster Test Update: As reported yesterday, the test of Manifold 1 of the 26P DPO thrusters was unsuccessful, because of a missing “Ready” signal (“flag”). Specialists suspect faulty cabling on the US-21 matching unit. Manifold 2 is “Go” for roll control, if necessary (the current nominal thruster configuration is 26P thrusters for pitch & yaw and SM thrusters for roll). After data evaluation, the specialists will recommend a retest at a later date.

STS-118/Endeavour Launch Update: The launch window opens tonight at 6:31pm EDT and closes 10 minutes later at 6:41pm. Optimal launch time is 6:36pm. At that time, ISS, having passed over Canada, will be at 44 deg N latitude, 54.8 deg W longitude, i.e., south of St. John’s (Newfoundland) and east of Halifax (Nova Scotia). Probability of KSC weather prohibiting launch remains unchanged at 20% (isolated showers in the vicinity).

- 24-hour delay:
  Probability of KSC weather prohibiting launch: 30%
  Probability of KSC weather prohibiting tanking: 5%

- 48-hour delay:
  Probability of KSC weather prohibiting launch: 20%
  Probability of KSC weather prohibiting tanking: 0%

Today’s CEO (Crew Earth Observation) photo targets were Polar Mesospheric Clouds--PMC, Northern Hemisphere (looking left for wispy clouds, well above the horizon in the quadrant NW thru NE. Window of opportunity today was 12 min long. Ground specialists suggested attempting 400 mm-lens views. These indicators applied to several PMC opportunities today), Lake Nasser, Egypt (crew was asked to shoot the banks of Lake Nasser at nadir), and Patagonian Glaciers (southern end of this site was clearer—looking right for smaller glaciers, especially on the less cloudy east side of the Andes).

CEO photography can be viewed and studied at the websites: [http://eol.jsc.nasa.gov](http://eol.jsc.nasa.gov) (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site); [http://earthobservatory.nasa.gov/](http://earthobservatory.nasa.gov/) [http://earthobservatory.nasa.gov/Study/AstronautPhotography](http://earthobservatory.nasa.gov/Study/AstronautPhotography)

ISS Orbit (as of this morning, 8:07am EDT [= epoch]):
Mean altitude -- 341.4 km
Apogee height – 346.9 km
Perigee height -- 335.9 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008174
Solar Beta Angle -- 53.0 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 70 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 49903

**Significant Events Ahead (all dates Eastern and subject to change):**

08/08/07 -- STS-118/Endeavour/13A.1 launch -- S/Hab-SM, S5, ESP3 (6:36pm EDT).
08/10/07 -- STS-118/Endeavour/13A.1 docking (1:51pm)
08/11/07 -- EVA-1 (12:36pm)
08/13/07 -- EVA-2 (11:36am)
08/15/07 -- EVA-3 (11:06am)
08/17/07 -- STS-118/Endeavour/13A.1 undocking (8:28am) -- if not extended to 14 days
08/19/07 -- STS-118/Endeavour/13A.1 landing (1:16pm) -- if not extended to 14 days
08/17/07 -- EVA-4 (~10:06am) -- if extended to 14 days
08/20/07 -- STS-118/Endeavour/13A.1 undocking (8:00am) -- if extended to 14 days
08/22/07 -- STS-118/Endeavour/13A.1 landing (12:48pm) -- if extended to 14 days
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]
09/20/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15pm/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking

04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.
ISS On-Orbit Status 08/07/07

All ISS systems continue to function nominally, except those noted previously or below.

The crew’s sleep/work cycle continues shifted by three hours to the right: wakeup 5:00am EDT, sleep 8:30pm.

The two Russian crewmembers each completed the 2.5-hr Part 2 of their second onboard “Profilaktika” (MBI-8, “Countermeasures”) preventive health maintenance fitness test series, including ECG (Electrocardiogram), blood tests and subjective rating. [Today’s fitness test was performed on the TVIS treadmill in unmotorized (idle) mode, with free choice of speeds within the range permitted. The test differs from the normal TVIS session by the use of the TEEM-100 gas analyzer (via a mask equipped with a pneumotachometer sensor), measurement of blood lactate level and subjective evaluation of physical exertion levels during the test. The lactate blood samples were taken twice at the end of the session, using the ACCUSPORT analyzer and REFLOTRON-4 accessories. Results were entered on a log sheet. TEEM and ECG (electrocardiograph) data were transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results were also called down to specialists standing by at TsUP.]

CDR Yurchikhin and FE-1 Kotov had three hours set aside to conduct the Soyuz emergency descent training exercise, standard procedure for each ISS expedition. The exercise, which does not involve any command activation, uses computer simulation on the RSK1 laptop with a descent hand controller (RUS) to set up reentry conditions and switch between modes. It was supported by a tagup and discussions with a ground instructor at TsUP/Moscow via S-band. [The onboard training (OBT) session included a review of the pertinent RODF (Russian Operations Data Files), specifically the books on Soyuz Insertion & Descent]
Procedures, Emergency Descents, and Off-Nominal Situation Procedures such as manual undocking. Nominal return of Soyuz 14, with Yurchikhin, Kotov and the Malaysian SFP, is scheduled for 10/21, but station crews must always be prepared for emergency descents. (Note: Expedition 16 crewmembers Whitson & Malenchenko will arrive with the Malaysian SFP on 15S on 10/12.)

The FE-1 started the periodic regeneration of the Russian Harmful Impurities Removal System (BMP) by initiating the "bake-out" cycle to vacuum on absorbent bed #1 of the dual-channel filtration system. The bake-out will be terminated at ~7:10pm EDT. Regeneration of bed #2 follows tomorrow. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]

Yurchikhin prepared ten DCS (Digital Camera System) batteries, eight for the STS-118 RPM (R-bar Pitch Maneuver) and two for the 13A.1 EVA-1, charging four simultaneously for at least three hours, to be moved afterwards to the SM (Service Module) for the DCS-760 camera configuration in preparation for the RPM.

Kotov concurrently reformatted eight 1-GB EVA flash memory cards and PCMCIA 1-GB Microdrives (inside the DCS-760 cameras) using vehicle power, for storage of the RPM imagery. [Formatting took ~20 minutes/card. After all cards were formatted, the 1-GB EVA Flash Cards were to be moved to the SM for the DCS 760 camera configuration.]

Also in support of the RPM photo shoot on 8/10, FE-2 Anderson set up the BPSMU (Battery Powered Speaker Microphone Unit) for communications between the crewmembers during the intense shooting activity from SM windows.

Oleg Kotov performed the periodic data collection and downlinking on the long-term BIO-5 Rasteniya-1 ("Plants-1") micro-G plant growth payload in the Lada-10/MIS (Module for the Investigation of Substrates) greenhouse.

Clay Sanderson worked in the Airlock preparing the EMU #3008 spacesuit for his EVA-3 spacewalk during the STS-118 docked period, installing the EMU battery and METOX (Metal Oxide) canister, putting EV stripes, patches and flags in place, and replacing the failed helmet light bulb from US EVA-9.

Fyodor performed his routine servicing of the ESA/Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS). [The CDR first replaced the AST-SM1 spectrometer's PCMCIA memory card (#932) in the AST slot with card #933 and activated the AST, then checked #933 in the RSK1 laptop and ascertained its file quantity and sizes before replacing card #933 in the AST. Previously accumulated data were downlinked from PCMCIA card #932 via OCA]
and the card returned to its stowage pouch. ALTCRISS uses the AST spectrometer employed by VC8 guest cosmonaut Roberto Vittori in 2005 in the DC1 for the Italian LAZIO (Low Altitude Zone/Ionization Observatory) experiment.]

Anderson had another go at reloading and repositioning two SSC (Station Support Computer) laptops for the STS-118 crew, for viewing video, which was unsuccessful on 8/5. [On SSC 1108, Clay was to replace the DVD drive with a new one, and for SSC 1109 new software was uplinked to prevent a procedure error made on 8/5 (by removing the load disk too soon).]

The CDR conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working from the discretionary “time permitting” task list, Oleg Kotov did the IMS (Inventory Management System) updating, editing its standard “delta file” for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

FE-2 Anderson had another ~2:15 hrs reserved for hardware prepacking for return on STS-118/13A.1.

Kotov and Yurchikhin had three more hours between them to unload the 26P resupply ship, transfer its cargo to the ISS and keep track of movements in the IMS.

The crew completed their regular daily physical workout program (about half of which is used for setup & post-exercise personal hygiene), on the TVIS treadmill (CDR/MBI-8, FE-1/MBI-8, FE-2), and RED resistive exerciser (FE-2).

Later, Clay will copy the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As a recurring item on the Russian voluntary “time permitting” task list, Yurchikhin and Kotov were to perform an equipment audit in the Russian segment (RS) of the ISS, behind stowage panels in the FGB, supported by an uplinked comprehensive list, and to continue shooting photo/video footage of the RS modules’ interiors, started before.

Also from the discretionary job list, the FE-1 was to conduct the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on
its ART (automatic temperature recorder). [This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 15.]

Dynamic 26P Thruster Testing: After the CDR ensured closure of the protective Lab window shutter, Russian ground controllers conducted the standard firing tests of the Progress 26P DPO (Approach & Attitude Control) thrusters at 10:43am & 12:18pm EDT. The test of Manifold 2 was successful, but the test of Manifold 1 failed because a “Ready” signal (“flag”) was not set. The cause is under investigation. TsUP will make a decision to retest Manifold 1 at a later date. The current thruster configuration is 26P thrusters for pitch & yaw and SM thrusters for roll. [These dynamic firings test the installation of the electronic US-21 matching unit in the Progress vehicle, performed yesterday (8/6), which connects its motion control and DPO systems to the SM so that they can be commanded by the latter's BVS computer system. They are also used to determine which thruster manifold will be considered the primary one for reboosting and debris avoidance burns. For today’s tests, conducted from the SM MCS (Motion Control System) via the US-21, station attitude was handed over from USOS to the Russian segment MCS at 10:15am. Afterwards, control authority was returned to the U.S. CMGs for Momentum Management in LVLH XVV at 12:40pm.]

STS-118/Endeavour Launch Update: The launch window opens tomorrow, 8/8, at 6:31pm EDT and closes 10 minutes later at 6:41pm. Optimal launch time is 6:36pm. Probability of KSC weather prohibiting 8/8 launch: 20% (isolated showers in the vicinity);
Probability of KSC weather prohibiting 8/8 tanking: 10%;
  ● 24-hour delay:
  Probability of KSC weather prohibiting launch: 30%
  Probability of KSC weather prohibiting tanking: 5%
  ● 48-hour delay:
  Probability of KSC weather prohibiting launch: 20%
  Probability of KSC weather prohibiting tanking: 0%

Today’s CEO (Crew Earth Observation) photo targets were Polar Mesospheric Clouds--PMC, Northern Hemisphere (looking left for wispy clouds, well above the horizon in the quadrant NW thru NE. Window of opportunity today was 17 min long. The ground suggested attempting 400 mm lens views. These indicators apply to subsequent PMC opportunities today. Images have been received of definite PMC taken shortly before CEO researchers activated their formal PMC request for imagery), A22 Iceberg, S. Atlantic Ocean (this may have been the crew’s last opportunity to image this iceberg for a while. As before, weather conditions were not optimal, but the crew may have seen the two halves of this major berg between cloud masses, just left of track), and Haze front, Bahamas
(haze composed mainly of smog, with only minor components of smoke and dust, is blowing southward off the continental US, reaching the Bahamas. Between the haze and clear oceanic air there is a marked front. Looking left from the ISS pass, the crew should have seen this smog front curving around the low pressure system).

CEO photography can be viewed and studied at the websites:

http://eol.jsc.nasa.gov (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

**ISS Orbit (as of this morning, 7:45am EDT [= epoch]):**
Mean altitude -- 341.4 km
Apogee height -- 347.1 km
Perigee height -- 335.8 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0008362
Solar Beta Angle -- 57.3 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 40 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 49887

**Significant Events Ahead (all dates Eastern and subject to change):** [new dates & times!]
08/08/07 -- STS-118/Endeavour/13A.1 launch -- S/Hab-SM, S5, ESP3 (6:36pm EDT).
08/10/07 -- STS-118/Endeavour/13A.1 docking (1:51pm)
08/11/07 -- 13A.1 EVA-1 (12:36pm)
08/13/07 -- 13A.1 EVA-2 (11:36am)
08/15/07 -- 13A.1 EVA-3 (11:06am)
08/17/07 -- STS-118/Endeavour/13A.1 undocking (8:28am) -- if not extended to 14 days
08/19/07 -- STS-118/Endeavour/13A.1 landing (1:16pm) -- if not extended to 14 days
08/17/07 -- EVA-4 (~10:06am) -- if extended to 14 days
08/20/07 -- STS-118/Endeavour/13A.1 undocking (8:00am) -- if extended to 14 days
08/22/07 -- STS-118/Endeavour/13A.1 landing (12:48pm) -- if extended to 14 days
08/29/07 -- SSRMS setup for viewing PMA-3 relocation
08/30/07 -- PMA-3 relocation (from Node 1 portside to nadir, for 10A Node 2 install)
09/??/07 -- Progress M-60/25P undocking (SM aft port) [under review]
09/20/07 -- Soyuz TMA-10/14S relocation (to SM aft port)
10/10/07 -- Soyuz TMA-11/15S launch (9:21am)
10/12/07 -- Soyuz TMA-11/15S docking (FGB nadir port) (10:47am)
10/21/07 -- Soyuz TMA-10/14S undocking (SM aft port) & landing (3:15am/6:32am)
10/23/07 -- STS-120/Discovery/10A launch -- Node 2 “Harmony”, racks; P6 relocate
10/25/07 -- STS-120/Discovery/10A docking
11/03/07 -- STS-120/Discovery/10A undocking
11/5-8/07 -- Node 2 relocation; PMA2 relocation
11/13/07 -- US EVA-10
11/17/07 -- US EVA-11
12/06/07 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite
12/08/07 -- STS-122/Atlantis/1E docking
12/15/07 -- STS-122/Atlantis/1E undocking
12/22/07 -- Progress M-61/26P undocking (DC1) & reentry
12/23/07 -- Progress M-62/27P launch
12/25/07 -- Progress M-62/27P docking (DC1)
??/??/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guiana)
??/??/08 -- ATV-1 docking (SM aft port)
02/??/08 -- Russian EVA-20 [to be reviewed]
02/12/08 -- Progress M-63/28P launch [to be reviewed]
02/14/08 -- Progress M-63/28P docking
02/14/08 -- (NET) STS-123/Endeavour/1J/A launch/1J/A -- SLP-SPDM, JEM ELM-PS
02/16/08 -- (NET) STS-123/Endeavour/1J/A docking
02/27/08 -- (NET) STS-123/Endeavour/1J/A undocking
04/04/08 -- ATV-1 undocking (from SM aft port)
04/07/08 -- Progress M-63/28P undocking
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (SM aft port)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/??/08 -- Soyuz TMA-12/16S relocation (to FGB nadir port)
04/24/08 -- (NET) STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS.
04/26/08 -- (NET) STS-124/Discovery/1J docking
05/02/08 -- (NET) STS-124/Discovery/1J undocking.

FOR OFFICIAL USE ONLY

ISS On-Orbit Status 08/06/07

All ISS systems continue to function nominally, except those noted previously or below. Underway: Week 16 of Increment 15.

The crew’s sleep/work cycle continues shifted by three hours: wakeup 5:00am, sleep 8:30pm EDT.

Yurchikhin, Kotov and Anderson started out before breakfast with the Russian biomedical routine assessments of PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (seventh time for CDR & FE-1, fourth for FE-2), using the IM mass measurement device which Oleg Kotov afterwards broke down for stowage. [Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]

Later in the day, the two Russian crewmembers also completed a 2h 30m session each of Part 1 of their second onboard “Profilaktika” (MBI-8, “Countermeasures”) preventive health maintenance fitness test series, starting with the VELO stationary cycle ergometer. [Fyodor and Oleg will do an additional part of the test tomorrow (8/7) on the TVIS treadmill. Test procedure for MBI-8 is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical
exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med Laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results were also called down to specialists standing by at TsUP."

Much of today’s work is focusing on Progress M-61/26P unloading, starting with Yurchikhin removing the docking mechanism (StM, Stykovochnovo mekhanizma) between the cargo ship and the DC1 Docking Compartment. [The StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]

With the passageway to 26P thus freed, FE-1 Oleg Kotov and the CDR have three hours between them to unload the resupply ship, transfer its cargo to the ISS and update the IMS accordingly.

Working in the cargo ship (TKG), Oleg Kotov installed the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry measurement system, along with its ROM unit (read-only memory, TA765B), a 1-hr. job. The LKT was subsequently switched on by the ground to complete the basic configuration. He then completed the electronic integration of 26P into the ISS by installing the standard US-21 matching unit, another 1-hr. task. [The US-21 matching unit connects the SM with the Progress motion control and DPO thrusters systems, so that they can be commanded by the SM computer system (BVS). After bolting the box down, Oleg hooked up its telemetry (TM) connector to the BITS2-12 onboard TM system on Go from TsUP, after Moscow had inhibited data output to the VD-SU control system mode, powered off the BITS and deactivated the Elektron and the SKV-1 air conditioner. These systems were subsequently turned back on. A dynamic thruster test of the installation is scheduled tomorrow.]

As part of Progress unloading, Kotov transferred the new hardware of the Japanese experiment GCF-JAXA (Granada Crystallization Facility) to the Service Module (SM) for installation in the Russian TBU incubator (set up 8/3 & 8/4), maintained at +20 degC. The configuration was photographed for documentary purpose with the Nikon D1X camera, and the container for the crystallizer gear was discarded.

Yurchikhin unloaded four BIOEKOLOGIA containers (#13/#14/#15/#17) of the
BTKh-31 ANTIGEN experiment from 26P and set up the Bioecology kits #4 & #5 at their exposure location in the DC1 Docking Compartment, followed by documentary photography.
