

FD12 MMT Summary

The MMT met briefly to review orbiter systems and mission progress. Endeavour and her crew continue to perform in an outstanding manner, and the team is ready to support the re-planned EVA 5.

CDRA - After some outstanding work by the ECLSS team, the CDRA is being operated manually. A PPL was delivered late last night to off load some of the commanding and, an INT MDM patch is being tested that would enable the CDRA to operate automatically. However, that patch will require an INT MDM transition and deactivation of multiple ECLSS LRUs, so the current plan is to implement that patch post undocking. With a functional CDRA and cryo margins below +3 days, the MMTs have agreed to transfer the LiOH for the +3 day which will leave the ISS stockpile at 17 cans.
