ATLANTIS (OV-104)

Atlantis was NASA's fourth space shuttle orbiter to join the fleet at Kennedy Space Center in Florida. Atlantis also is known inside the space agency by its designation Orbiter Vehicle-104, or OV-104.

Construction of Atlantis began March 30, 1980, and it rolled out of the assembly plant in Palmdale, Calif., in March 1985. It first launched Oct. 3, 1985.

Atlantis is named after the two-masted boat that served as the primary research vessel for the Woods Hole Oceanographic Institute in Massachusetts from 1930 to 1966. The boat had a 17-member crew and accommodated up to five scientists who worked in two onboard laboratories, examining water samples and marine life. Atlantis also served as the in-orbit launch site for many noteworthy spacecraft, including planetary probes Magellan and Galileo, as well as the Compton Gamma Ray Observatory.

Starting with STS-71, Atlantis pioneered the Shuttle-Mir missions, flying the first seven missions to dock with the Russian space station. When linked, Atlantis and Mir together formed the largest spacecraft in orbit at the time.

Atlantis is targeted to liftoff on its final mission, STS-135, on July 8, 2011. It will be the final space shuttle retired from NASA's fleet.
