

Flight Demonstrations and Capabilities (FDC)

Scalable Convergent Electric Propulsion
Technology and Operations Research (SCEPTOR)

Critical Design Review

November 15-17, 2016

Day 1 Package

Agenda Day 1

	Section	Presenter	Time Slot
0	Ground Rules	<i>CJ Bixby (Board Chair)</i>	8:00 – 8:15
1	X-57 Overview	<i>Sean Clarke</i>	8:15 – 8:25
2	Programmatic Overview	<i>Tom Rigney</i>	8:25 – 8:35
3	System Overview	<i>Matt Redifer</i>	8:35 – 8:45
4	Flight Control IPT	<i>Dave Cox</i>	8:45 – 9:35
5	Piloted Simulation	<i>Ryan Wallace</i>	9:35 – 10:00
6	Vehicle IPT	<i>Keith Harris</i>	10:00 – 11:30
	<i>Lunch (delivered)</i>		<i>11:30– 12:30</i>
7	Power and Command IPT	<i>Sean Clarke</i>	12:30 – 2:30
8	Instrumentation IPT	<i>Ethan Nieman</i>	2:30 – 4:00

SCEPTOR CDR Nov. 15–17, 2016

Agenda Day 2

	Section	Presenter	Time Slot
1	Performance & Sizing IPT	<i>Nick Borer</i>	8:00 – 9:00
2	Wing IPT	<i>Jeff Viken</i>	9:00 – 11:00
3	Software Management	<i>John Theisen</i>	11:00 – 11:45
	<i>Lunch (delivered)</i>		<i>11:45– 12:45</i>
4	T & V/AirVolt	<i>Yohan Lin</i>	12:45 – 1:45
5	Ground & Flight Operations	<i>Aric Warner</i>	1:45 – 3:00
6	Hazard Review/FMEA	<i>Phil Burkhardt</i>	3:00 – 3:30
7	Wrap-up/Breakout Schedule	<i>CJ Bixby</i>	3:30 – 4:00

SCEPTOR CDR Nov. 15–17, 2016

Day 3 Break-Out Sessions

		Room				
		S-211	S-234	S-241		
08:00				Battery (ITAR) <i>Sean Clarke</i>	08:00	
09:00	Wing Structure <i>Jeff Viken</i>			Vehicle Performance <i>Nick Borer</i>	09:00	
10:00	CFD (incl. LEAPTech) <i>Jeff Viken</i>	Secondary Structure <i>Wesley Li</i>		Cruise Motors/Traction Bus <i>Sean Clarke</i>	10:00	
11:00	Flutter / Whirl Flutter <i>Jen Heeg</i>			Instrumentation <i>Ethan Nieman</i>	11:00	
12:00	<i>Lunch (delivered)</i>					12:00
13:00					13:00	
14:00	Wrap-Up / RFAs <i>CJ Bixby</i>				14:00	

SCEPTOR CDR Nov. 15–17, 2016

Ground Rules

CJ Bixby
CDR Board Chair

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 1

Scope of Review

- Review covers Mods II and III
 - Design elements of Mod IV are included where they drive design
 - A separate design review will be held later for Mod IV
- Mod III Wing presented is not completely at CDR design level
 - Additional design review planned to provide CDR level detail on Mod III wing design
 - Follow-on review will present detailed structural analysis and materials properties supported by upcoming materials properties testing
 - Review currently scheduled for Jan. 25, 2017
 - Wing detail design presented at this review supports the current design iteration of the other vehicle subsystems

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 2

SBU Content

- Treat data marked as Proprietary accordingly
 - No Proprietary data in slide package
- Aspects of the Battery design are considered ITAR
 - No ITAR content in slide package
 - Telecon disconnected during battery discussion
 - Foreign nationals cannot be present during Battery CDR session or for break-out session

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 3

PDR RFAs

- All Closed (26)
- Closure package located on NX:
<https://nx.larc.nasa.gov/dsweb/View/Collection-81650>
- RFA Title and Description included in CDR package for reference

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 4

CDR Entry Criteria

- The Project has successfully completed the previous planned milestone reviews, and responses have been made to all RFAs.
- A preliminary CDR agenda, success criteria, and instructions to the review board have been agreed to by the technical team, project manager, and review chair prior to the CDR.
- The following programmatic products are baselined:
 - Project Cost and Schedule Estimates
 - Contractual Mechanisms
 - Project Documentation
 - Objectives and Requirements Document (ORD)
 - Contains Systems Requirements Document (SRD)
 - Subsystems Requirements Documents (SSRD)
 - Project Plan (PP)
 - Configuration Management Plan (CMP)
 - Systems Engineering Management Plan (SEMP)
 - System Safety Plan (SSP)
 - Master Measurement List (MML)
 - Quality Assurance Plan (QAP)
 - System and Subsystem T&V Plan (TVP)
 - Specifications

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 5

CDR Entry Criteria (cont'd)

- The following primary products are ready for review:
 - Subsystem design specifications (hardware and software), with supporting trade-off analyses, simulations, and data that support the design meets the driving requirements and key Technical Performance Metrics (TPMs)
 - Updated System Safety Analysis
 - FMEA/FMET
 - Hazards
 - Technical Data Package products are ready to be baselined or plan exists to get to baseline without unacceptable risk to schedule
 - Interface Control Documents
 - Drawings
 - Drawing Tree
 - Interconnect diagrams
 - Schematics
 - Specifications
 - Analysis

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 6

CDR Entry Criteria (cont'd)

- Fabrication, assembly, integration, and test plans and procedures are being developed and ready to be baselined or plan exists to get to baseline without unacceptable risk to schedule
- Baseline operations concept and draft Mission Rules
- Human Systems
- Programmatic & Technical Risks updated
- Software criteria and products, per NASA-HDBK-2203, NASA Software Engineering Handbook
 - Baseline Documentation
 - Software Management Plan (SMP)
 - Software Requirements Specification (SRS)
 - Software Assurance Plan (SAP)
 - Ready to Baseline
 - Interface Definition
 - Software Test Plan
 - Software V&V Plan
 - Software Design Description
 - Software Data Dictionary
 - Software Development Plan

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 7

CDR Exit Criteria

- The detailed design is expected to meet the requirements with adequate margins.
- Verification and Validation Plans complete. Verification tracking plan is adequate.
- The program cost and schedule are credible and within program constraints.
- Interface control documents are sufficiently mature to proceed with fabrication, assembly, integration, and test, and plans are in place to manage any open items.
- Design is stable, and adequate documentation exists or will exist in a timely manner to allow proceeding with fabrication, assembly, integration, and test.
- The testing approach is comprehensive, and the planning for system assembly, integration, test, and mission operations is sufficient to progress into the next phase.

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 8

CDR Exit Criteria (cont'd)

- The project risks are understood and have been credibly assessed, and plans, a process, and resources exist to effectively manage them.
- Safety and mission assurance (e.g., safety, reliability, maintainability, quality, and Electrical, Electronic, and Electromechanical (EEE) parts) have been adequately addressed in detailed designs and any applicable system safety analysis meets requirements, are at the appropriate maturity level for this phase of the program's life cycle, and indicate that the program safety/reliability residual risks will be at an acceptable level.
- Adequate technical and programmatic margins (e.g., mass, power, memory) and resources exist to complete the development within budget, schedule, and known risks.
- The operational concept has matured and is addressed in flight test planning.
- Material Test Plan is adequate (results and detailed structural analysis presented at Wing delta CDR)

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 9

CDR Exit Criteria (cont'd)

- The program/project has demonstrated compliance with applicable NASA and implementing Center requirements, standards, processes, and procedures.
- TBD and TBR items are clearly identified with acceptable plans and schedule for their disposition.
- Manufacturability has been adequately included in design.
- Long lead items tracked in schedule with risk identified.
- Software components meet the exit criteria defined in NASA-HDBK-2203, NASA Software Engineering Handbook.
- EEE parts have been selected, and planned testing and delivery will support build schedules.
- Plans for environmental testing and acceptance testing exist and are incorporated in schedule.

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 10

SCEPTOR PDR RFAs

No	Title	Description
1	Sceptor Low Altitude Bank Limit (Wingtip Propellers, Phase 3)	<p>In the Phase 3 wingtip cruise propeller configuration, the allowed bank angle is limited when the aircraft is close to the ground (airport departure and approach environment). Bank limits should be understood and employed as well as a bank warning system.</p> <p>a. Bank limits should be researched and established with appropriate margin to prevent accidental propeller-ground strikes when low to the ground.</p> <p>b. The cockpit display/warning system should incorporate a low-altitude bank warning system for the pilot when close to the ground and when the bank angle limit is approached.</p> <p>c. Crosswind landing limits should also be researched for the Phase 3 configuration, as bank angle is integral to a typical wing-low crosswind landing.</p> <p><u>Entry/Exit Criteria:</u> Subsystem design specs ready for baseline <u>Risk if not addressed:</u> If bank angle limit exceeded during takeoff or landing phases, the propeller will strike the ground causing propeller and engine damage, possibly wing damage, and potentially loss of aircraft.</p>
2	Sceptor Aileron Trim	<p>Aileron trim should be incorporated (added) to the pilot's flight control system.</p> <p><u>Entry/Exit Criteria:</u> Subsystem design specs ready for baseline <u>Risk if not addressed:</u> Increased technical risk of inadequate data collection or repeated attempts of test points requiring a stable aircraft (in roll axis). Slight safety risk if pilot became visually disoriented (inadvertent cloud entry; visual environmental illusions; night) with an untrimmed disturbance in roll leading to an unusual aircraft attitude.</p>
3	Sceptor Cruise Propeller Feathering Characteristics	<p>Cruise propeller feathering should include 1) pilot-operated manual feathering capability and 2) automatic emergency propeller feathering; and feathering characteristics should be fully understood prior to Phase 2 (and 3) flights.</p> <p>Features to include related to cruise propeller feathering:</p> <p>a. It is desirable that either cruise propeller can be manually feathered by the pilot. The length of time of the feathering sequence should be relatively short to minimize altitude/airspeed loss due to increased drag in an emergency loss of cruise motor thrust (single or dual motor loss).</p> <p>b. It is desirable that automatic propeller feathering should be triggered by any cruise motor failure that results in a loss of thrust (to a state of increased drag if not feathered). This protective automatic feature typically is manually activated/deactivated by the pilot (switch).</p> <p>Critical feathering characteristics include:</p> <p>c. Automatic emergency feathering – will it occur for any* type of failure of the (cruise) motor? *Could include (but not limited to) failures due to localized motor or electrical components; or higher level bus or power source failures.</p> <p>d. What is the time-to-completion for an auto-feathering event (from start to finish of activation of propeller feathering). Is this time increased for degraded battery voltage states? Does automatic (emergency) feathering sequence take the same time as the manual feathering event?</p> <p><u>Entry/Exit Criteria:</u> Subsystem design spec ready for baseline <u>Risk if not addressed:</u> Increased drag from a failed cruise motor's unfeathered propeller could limit the aircraft's capability to climb, maintain altitude, or may decrease glide capability, possibly leading to an off-field landing.</p>

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 11

SCEPTOR PDR RFAs

No	Title	Description
4	Wing temperature requirement not adequately defined	<p>The environment for the wing was defined as -21 to 113 Deg F. This upper limit does not account for additional heating due to solar radiation, both direct and reflected. Material properties and structural thermal loads need to be understood well above the upper temperature quoted.</p> <p>Recommendation is that the project develop an upper temperature requirement that accounts for solar radiation.</p> <p><u>Entry/Exit Criteria:</u> [Entry] Preliminary Subsystem Requirements and/or Specifications. [Exit] Subsystem level requirements identified and flow to system parents <u>Risk if not addressed:</u> Inappropriate selection of materials and processing could result in Phase III wing structure that loses strength to the point of permanently deforming under common summertime temperature conditions at the flight test location.</p>
5	Project needs to consider elevated temperature and humidity operation conditions in defining composite properties.	<p>It is not clear whether the project has considered the effects of elevated temperature and moisture on composite properties. Composite properties are usually developed for not only room temperature dry conditions, but also elevated temperature wet and dry conditions. The project needs to define the envelope of operating conditions and ensure that composite properties used in the analysis reflect the potential range of operating conditions.</p> <p><u>Entry/Exit Criteria:</u> Subsystem design spec ready for baseline <u>Risk if not addressed:</u> Inappropriate selection of materials and processing could result in Phase III wing structure that loses strength to the point of permanently deforming under common temperature and humidity conditions.</p>
6	Simulation lacks requirements and a validation plan	<p>During the sim briefing, no requirements were presented and it was not clear how good the simulation needed to be or how the project would know that it was good. The project should develop some measure of how good the sim needs to be and a plan to validate it. For future briefings, the fact that the simulation is developed per the Code M process would also be good information to include (it means it will comply with the center and agency's software engineering requirements).</p> <p><u>Entry/Exit Criteria:</u> Subsystem specs are ready to be baselined. System and subsystem test plans are ready to be baselined. <u>Risk if not addressed:</u> Using an unvalidated sim introduces risk, even if the sim is used primarily for pilot training. Training the pilot to be used to non-representative aircraft performance could turn an ok day into a really bad one.</p>
7	Structural verification plan not defined	<p>The project presented a good deal of analysis that had already been completed which is unusual and it also presented recommendations for various material qualification tests. However, it never articulated a concise plan showing the plan going forward for initial and revised analyses and the actual structures and materials tests they plan to conduct. Are the things listed as recommendations actual plans that have been adopted by the project?</p> <p>Recommendation: The project should document their structural verification plan in some form so that plan can be reviewed by the PDR committee for adequacy. Such a plan needs to show how the various analyses and tests support each other (e.g., material testing informing stress analysis updates, analysis results informing test planning etc.)</p> <p><u>Entry/Exit Criteria:</u> [Entry] Test and Verification Planning. [Exit] Test and verification approach is adequate. <u>Risk if not addressed:</u> Analysis and test regime may be inadequate, leading to a difficult flight readiness process, or excessive resulting in wasted project resources.</p>

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 12

SCEPTOR PDR RFAs

No	Title	Description
8	Trade-off of optimized wing design for increased manufacturability	<p>The project should look at decreasing the wing structural complexity trading off some decrease in performance and increased weight to provide a more manufacturable and robust flight article. Among the tradeoffs to be considered are:</p> <ol style="list-style-type: none"> 1. Decreased number of ply schedules 2. Use of aluminum where feasible (e.g. spars and ribs) 3. Increased thickness in wing skins. 4. Simplified profile. <p>These tradeoffs should be evaluated and documented. <u>Entry/Exit Criteria:</u> N/A <u>Risk if not addressed:</u> N/A</p>
9	Sim test cases	<p>There are difference in the linear checkcases (state space models?) between the sim and the Simulink models. This is a concern but since the sim is not being used for S&C analysis this might be ok. However since the pilots will be using this to train, how well do the time histories of the sim and Simulink match up? If this is part of the standard checkcases, I'd like to take a look at that. <u>Entry/Exit Criteria:</u> Technical Performance Metric <u>Risk if not addressed:</u> Pilots might be training with the wrong flight dynamics</p>
10	Aileron sizing/mechanical linkage	<p>Aileron is being resized for the new wing, which will change the hinge moments. Has any analysis been done that looks at how different the yoke forces are with the new yoke-aileron mechanical links. <u>Entry/Exit Criteria:</u> Technical Performance Metric <u>Risk if not addressed:</u> Poor handling qualities. This is not a concern during normal operations but its not ideal for emergency maneuvering</p>
11	Unpowered Clmax	<p>For the Phase III configuration, please provide the unpowered (i.e. no DEP engines running):</p> <ol style="list-style-type: none"> a. CL vs. AoA curve, CD vs. AoA curve and drag polar. b. Max flap deflection is most critical. Zero flap deflection 2nd most critical, other flap deflections as available (if they are available). c. Untrimmed is acceptable <p><u>Entry/Exit Criteria:</u> Exit #4: "... meet requirements at acceptable level of risk." <u>Risk if not addressed:</u> Unknown stall speed without DEP engines.</p>
12	CL and CD performance plot	<p>Would like to see a lift and drag curve of the new wing with flap with no power, but with the nacelle on. <u>Entry/Exit Criteria:</u> Design and Analysis <u>Risk if not addressed:</u> Verify performance with engine out, but flaps deployed.</p>

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 13

SCEPTOR PDR RFAs

No	Title	Description
13	HEIST vs. CFD Comparisons	<p>Please provide plots showing the comparison between CFD predictions and HEIST test data, once the test data has been properly corrected. (Corrections mentioned during the PDR were airspeed vs. ground speed and AoA corrections.) Please provide a list of all corrections made and also include the CFD vs "Raw" plot that was briefed during the PDR. <u>Entry/Exit Criteria:</u> Exit #4: "... meet requirements at acceptable level of risk." <u>Risk if not addressed:</u> Comparison between CFD and HEIST shown at PDR was poor. Poor enough that it raises doubts as to the predicted performance of the Phase IV wing.</p>
14	Balanced Loads Stress Analysis	<p>At CDR, present stress analysis using trimmed loads developed from the V-n diagram. <u>Entry/Exit Criteria:</u> Design meets requirements with acceptable level of risk <u>Risk if not addressed:</u> PDR charts gave the impression that the loads being used for the preliminary design were TOGW/2 per wing and it was not clear that a trimmed load case was used. This is sufficient for PD, but not Critical Design. Risk: understrength wings.</p>
15	P-Factor	<p>Please describe how P-factor is being taken into account for the propeller loads (to engine mount) analysis. <u>Entry/Exit Criteria:</u> Exit #4: "... meet requirements at acceptable level of risk." <u>Risk if not addressed:</u> P-factor will put an off-center load on the propeller disk, causing a moment about the engine mount. Ignoring the loads could lead to an undersized engine mount.</p>
16	Flutter analysis trends and more detailed results reporting for Baseline, Phase 2 and Phase 3 configurations.	<p>The effect of modifications to the Tecnam P2006T as they may, or may not, affect the flutter predictions should be carefully followed using the same code and the same basic model. This should be carried out for the baseline, Phase 2, and Phase 3 configurations. A classical flutter analysis using the baseline P2006T tip to tip FEM should be performed to confirm and to provide details of the mechanism(s) and the trends over that of the Tecnam original report which presented more of a pass/fail level of results. This should also be carried out for Phases 2 and 3. Extension of the classical flutter analysis to well below sea level and over several Mach numbers would show these trends. Plots of modes splined from the FEM to the aerodynamic model and of the flutter modes need to be shown. The aerodynamic model should have body elements for the motor nacelles and the fuselage. The use of ZAERO for all three above mentioned configurations, which NASA-AFRC has a license for, would be a robust code to use as a comparison to the code(s) used at NASA-LaRC. A Phase 2 configuration classical flutter analysis should be performed to show any effects of the mass (largely battery but also new motor and instrumentation). A whirl flutter analysis needs to be performed to confirm the stability for the new Phase 2 motors, propellers and their mounts to the baseline wing. The inputs to the whirl flutter analysis that are estimated, such as the motor mount stiffness, need to be compared to, and possibly updated, by the planned Phase 2 GVT. The same ZAERO code and basic models should be used for the Phase 3 classical flutter analysis so that clear trends can be shown. The Phase 3 whirl flutter analysis results which were presented at the PDR need to be more clearly explained as to what the modes were and what damping is being used to define stability. NOTE: See RFA for Detailed task assignments <u>Entry/Exit Criteria:</u> The requested analyses and results reporting. <u>Risk if not addressed:</u> Not understanding what predicted flutter mechanisms are critical with an accurate estimate of margin before flight test. Flutter/divergence safeties are not guaranteed.</p>

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 14

SCEPTOR PDR RFAs

No	Title	Description
17	Wing composite material properties need to be defined and documented.	<p>The project needs to clearly document the composite components and properties used in the analysis and intended for fabrication and the sources of these properties. For example, during the design review it was stated that Toray T600 fibers were planned to be used however, post-review, composite data sheets for Toray T700 fiber material were provided to the reviewers.</p> <p>Properties that require documentation fall under two categories: 1) laminae (single-ply) values, and 2) composite, laminate values. Additionally, values for both unidirectional tape and fabric (if used) should be provided.</p> <p>Properties should be defined for each direction of the laminae in tension and compression and the equivalent orthotropic properties for the laminates also should be given. Also, the limiting conditions and associate properties need to be given as well (see RFA TR-5)</p> <p><u>Entry/Exit Criteria:</u> Design meets requirements with acceptable level of risk <u>Risk if not addressed:</u> N/A</p>
18	Time code design not present on Instrumentation design	<p>Many times "TIME" is seen as an afterthought at the PDR level, but there needs to be a solid plan / concept in place at the PDR to give the reviewers information about the projects time-capturing method. It needs to be understood what the precision of TIME (seconds, milliseconds, microseconds, etc) needs to be and how any system other than instrumentation needs to use it (as applicable). It is not just a "we can get it from GPS" answer, since not all GPS systems are the same with respect to the available precision of the output time.</p> <p><u>Entry/Exit Criteria:</u> "The preliminary design is expected to meet the requirements at an acceptable level of risk" <u>Risk if not addressed:</u> Poorly correlated data may be unusable.</p>
19	Unsuccessful First Article Build	<p>It is not uncommon that the first composite article of a particular design contains flaws and discrepancies such as significant delaminations or disbonds that render the first article useless. It is unclear that the project considered the risk of this occurring and the resulting cost and schedule impacts in their decision to build a primarily composite wing. The recommendation is that the project evaluate this risk and factor it into decisions where it is relevant.</p> <p><u>Entry/Exit Criteria:</u> [Entry] N/A. [Exit] Project risks identified and mitigation strategies defined <u>Risk if not addressed:</u> First article may not be suitable as a flight article. It is not clear if the project is factoring this potential into its cost and schedule reserve strategy which could leave it unable to recover should the risk be realized.</p>

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 15

SCEPTOR PDR RFAs

No	Title	Description
20	Wing design and contractor fabrication acceptance criteria plan for the SCEPTOR Phase III wing	<p>The design and fabrication acceptance criteria need to be explicitly defined to encompass the total expectations of these two phased activities. It is not clear if the contractor will in fact design and fabricate or fabricate only the SCEPTOR phase III wing article. This is the first RFA element that the project should make clear. Second, the project must develop, document and circulate for acceptance to relevant technical authorities the acceptance criteria by which the design is complete and the fabrication of the final phase III wing is complete. This RFA is a key item that is linked to the development of the contract statement of work. The acceptance plan shall identify the particular samples, coupons, proof testing, quality and workmanship inspections and documentation required for the contractor to deliver a useable and safe wing assembly that will be mated with a fuselage to comprise a fully human rated airframe that meets all anticipated Airworthiness technical authority requirements.</p> <p>This more general and comprehensive RFA could be linked to that written by Tom Horne/AFRC concerning early fabrication article failure identification.*</p> <p><u>Entry/Exit Criteria:</u> The project risks are understood and have been credibly assessed, and plans, a process, and resources exist to effectively manage them. <u>Risk if not addressed:</u> Working this in an open loop without a defined and explicit document or plan impedes a successful contracting phase, leaves the project in an untenable position of discovering critical acceptance criteria along the way and in the end will either cause cost or schedule over-runs that could trigger termination by the funding Mission Directorate.</p>
21	QI inspections of contractor-led motor / battery builds during off-site assembly	<p>QI provide offsite inspection of parts going into Contractor-built assemblies to lower risk to project success.</p> <p>From the description provided, it sounds like the Contractor-built parts for this project are not 1-dimensional parts, but rather multi-component assemblies. If a visual inspection by our qualified staff is not provided prior to final assembly at the contractor facility, I feel the project will be accepting a high level of risk if we only depend on the contractor's processes and our own functional / environmental testing to assure airworthiness. An on-site visit with the goal to inspect all parts before final assembly can uncover potential failure points well before they risk failing in environmental testing.</p> <p><u>Entry/Exit Criteria:</u> "SMA have been adequately addressed..." <u>Risk if not addressed:</u> The failure of the contractor to not deliver an airworthy product will mean 100% project failure.</p>
22	Program and project management requirements declaration and requested tailoring documentation	<p>As this CAS project was initiated on a 'fast track' and given that it has reached the PDR phase, it is unclear as to what the specific NASA NPR this project is operating under. It is assumed by the project to be NPR7120.8 by the team however the Program Commitment Agreement was not shown or otherwise available at both the SRR and PDR reviews. Further, upon identification and documented declaration of a NASA program/project NPR, it is essential for the project to identify their specific tailoring needs to manage the project risks, costs and schedule. Such tailoring needs are to be maintained and shared as a request for concurrence from the authorized Engineering organization(s) defined in NPR7130 and other appropriate technical authorities. For this project, those other appropriate technical authorities are the assigned LaRC and AFRC chief engineers (not to be confused with the project chief engineer). The SE&I lead and Vehicle IPT are the appropriate project functional activities to maintain this documentation and tailoring requests in accordance with NPR 7130.</p> <p><u>Entry/Exit Criteria:</u> The program/project has demonstrated compliance with applicable NASA and implementing Center requirements, standards, processes, and procedures <u>Risk if not addressed:</u> The risk is in the form of schedule delay and/or failure to comply with applicable NASA and Center requirements, standards, processes and procedures.</p>

SCEPTOR CDR Nov. 15–17, 2016

Session 0, Ground Rules 16

SCEPTOR PDR RFAs

No	Title	Description
23	Subsystem Peer Reviews	<p>During the briefing, subsystem peer reviews to be held before CDR were alluded to several times, but it is not clear that all of the planned briefings are in the project schedule. Furthermore, inviting the appropriate IRT members to the peer reviews would be beneficial and may result in less detailed design information needing to be transmitted during formal CDR briefings.</p> <p>The project should develop a schedule for subsystem peer reviews, include the reviews that have been suggested in the body of the IRT PDR report, and invite the appropriate IRT members to the reviews.</p> <p><u>Entry/Exit Criteria:</u> The project has demonstrated compliance with applicable NASA and implementing center requirements, standard, processes and procedures.</p> <p><u>Risk if not addressed:</u> Delta-PDR or worse, delta-CDR.</p>
24	Software classification and configuration management	<p>Both flight and ground software need to be classified per NPR 7150.2. Once a classification has been established, then appropriate levels of documentation, testing, verification and configuration management can be established.</p> <p>A Software Configuration Management Plan needs to be reflected in the software documentation tree and developed to the requirements per the classification level.</p> <p><u>Entry/Exit Criteria:</u> The software shall have an official classification per NPR 7150.2 and appropriate Software Configuration Management Plan</p> <p><u>Risk if not addressed:</u> Without proper CM, software problems can arise creating budget and/or schedule pressure at a minimum and mission failure at a maximum</p>
25	Min Sink Speed	<p>Please provide the rationale for Requirement S25.2. (Summarized as Sceptor Min Sink = 2.5xTecnam)</p> <p>Context: I'm trying to understand why this requirement exists, and more specifically, why the 2.5 multiplier was chosen. Are you concerned about landing speed, sink rate vs. gear capability, kinetic energy landing off field?? The 2.5 multiplier seems high to me, but I'm sure I'm missing something. I think this RFA is best dealt with via a discussion rather than a written response. Charts, spreadsheets, etc are encouraged.</p> <p><u>Entry/Exit Criteria:</u> Exit #4: "... meet requirements at acceptable level of risk."</p> <p><u>Risk if not addressed:</u> Requirement may lead to incorrect design decisions.</p>
26	Structural Design and Modification for Phase 2	<p>In the PDR presentation, it was not clear to me that preliminary work for the Phase 2 structural design and analysis were discussed, particularly in the following areas: Cabin batteries and instrumentation mounts, Landing Gears, Cruise motor attachment and nacelle, Dry wing loading</p> <p>A couple of specific areas where the presentation is lacking:</p> <ol style="list-style-type: none"> 1. The battery weight presented is 380 kg or 837 Lb. Vehicle IPT slide 25 seems to suggest a proof test load of 4213 Lb in the longitudinal direction was done. That is about 5 times the battery weight but still much less than the required FAA load factor. Also, has the project evaluate loading in the vertical and side direction? What is the preliminary design of the beef up structure to help distribute the loads? Where is the preliminary loads/stress analysis? 2. Where is the preliminary design/analysis of the cruise motor attachment to wing hard points? Please identify all structural designs and modifications for phase 2. For each area, please provide a preliminary design and the associated loads/stress analysis plan. <p>Please also provide any technical or schedule challenges expected to demonstrate structural airworthiness.</p> <p><u>Entry/Exit Criteria:</u> Exit #4: "... meet requirements at acceptable level of risk."</p> <p><u>Risk if not addressed:</u> N/A</p>

X-57 Overview

New NASA Technical Challenge

AERONAUTICS STRATEGIC THRUST

Thrust 4: Transition to Low-Carbon Propulsion

AERONAUTICS OUTCOMES

Outcome (2015-2025): Introduction of Low-carbon Fuels for Conventional Engines and Exploration of Alternative Propulsion Systems

Outcome (2025-2035): Initial Introduction of Alternative Propulsion Systems

Outcome (>2035): Introduction of Alternative Propulsion Systems to Aircraft of All Sizes

Research Themes

Characterization and Integration of Alternative Fuels

Scalable Alternative Propulsion Systems

FDC

Technical Challenges

TC: Electric Propulsion Airframe Integration (FY20): Demonstrate 5x reduction in energy usage with zero in-flight emissions through innovative electric propulsion airframe integration.

X-57 will use less than 30% of the energy used in similar IC powered aircraft

Goals and Objectives

Goal

- 5x lower energy use at high speed cruise (compared to original P2006T @ 175 mph)

Objectives

- **Primary:** Internal combustion engine vs electric propulsion efficiency changes from 28% to 92% ($\geq 3.0x$)
- **Secondary:** Synergistic integration of high aspect ratio wing combined with wing tip propulsors and DEP ($\geq 1.2x$)

Derivative benefits

- Zero in-flight carbon emissions
- ~30% lower total operating cost

Additional Benefits (pending Mod IV extension)

- 15 dB Lower community noise
- Flight control redundancy and robustness
- Improved ride quality
- Certification basis for DEP technologies

SCEPTOR CDR Nov 15-17 2016

Session 1, X-57 Overview 3

Success Criteria

Minimum Success

Demonstrate 3.0x lower energy use at high speed cruise (compared to original P2006T @ 175 mph) in flight test of electrified Tecnam (Mod II configuration)

Full Success

Demonstrate 1.2x lower energy use (compared to Mod II X-57 @ 175 mph) in flight test (Mod III configuration) in addition to the Mod II goal above

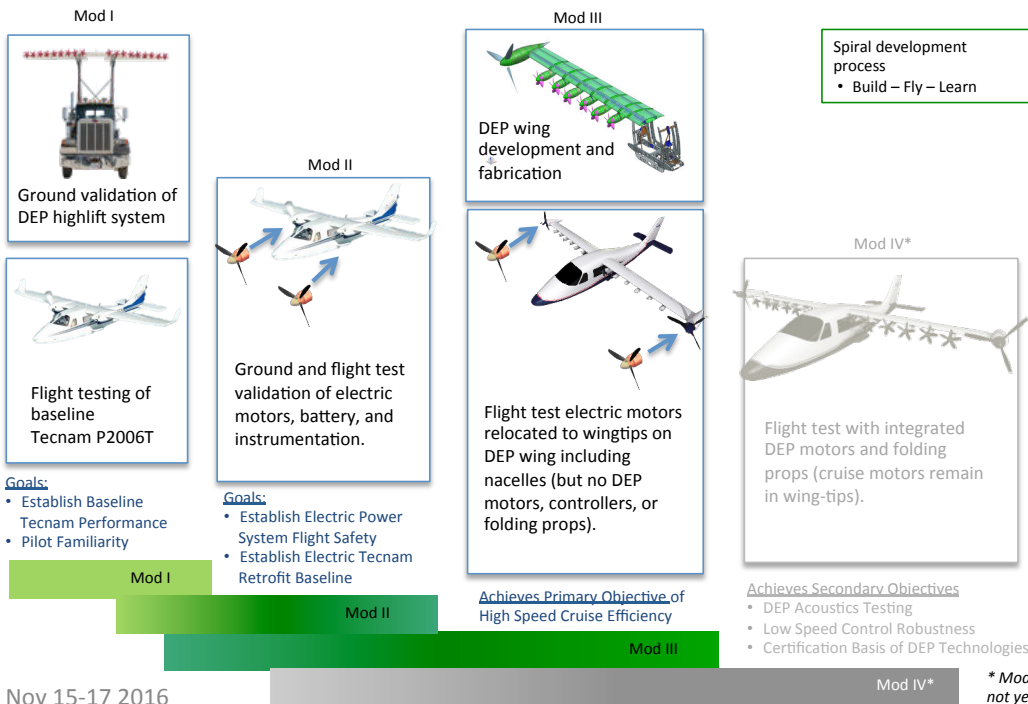

SCEPTOR CDR Nov 15-17 2016

Session 1, X-57 Overview 4

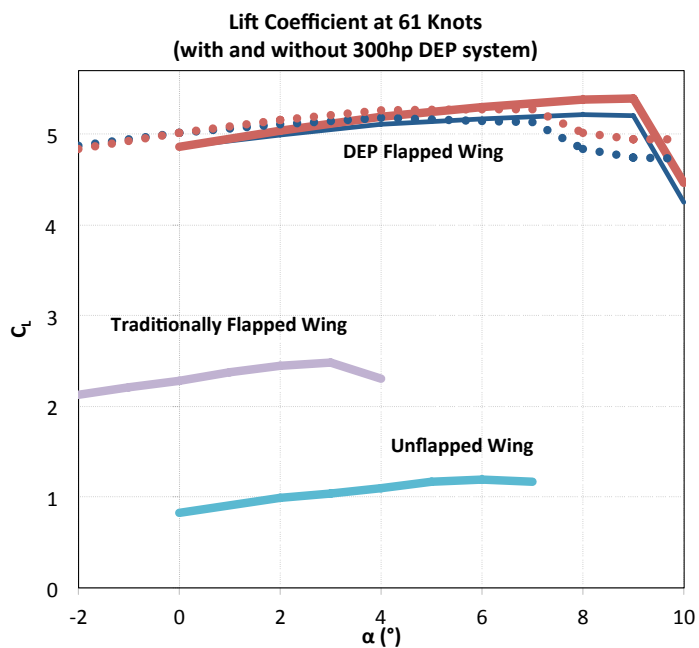

Project Approach

Distributed Electric Propulsion: Smaller Wing Without Stall Penalty

With DEP, wing can be optimized for cruise (right-sized) without compromising takeoff and landing speeds

SCEPTOR CDR Nov 15-17 2016

Session 1, X-57 Overview 6

X-57's Synergistic Integration features are DEP and Wingtip Propulsion

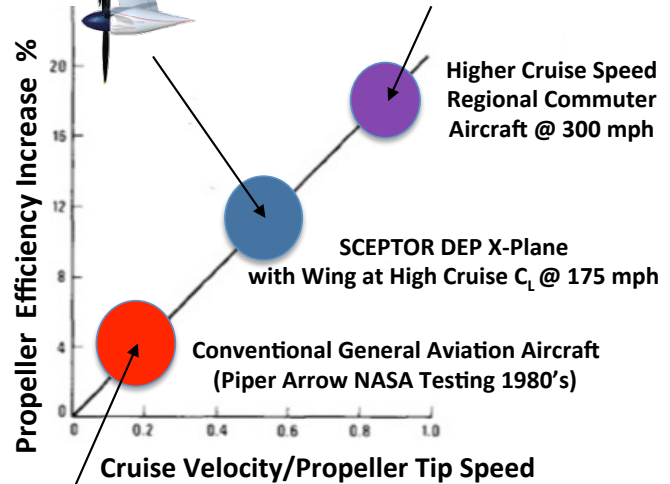

Folding Inboard Propellers with Low Tip Speeds

Wingtip Vortex Propeller Integration

+

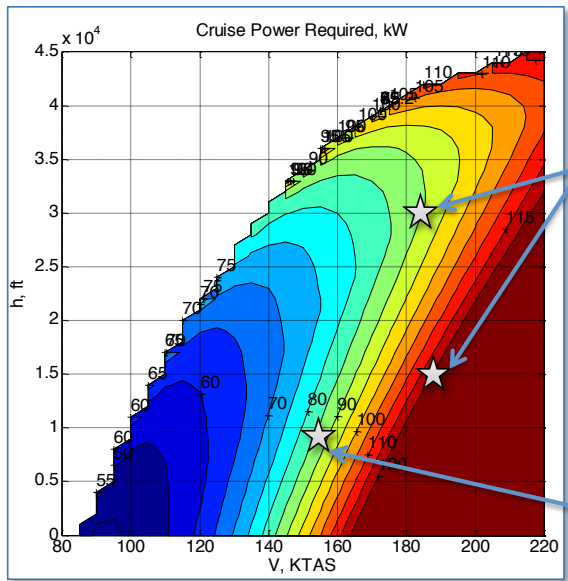

Session 1, X-57 Overview 7

Viva and Alisport Motorgliders

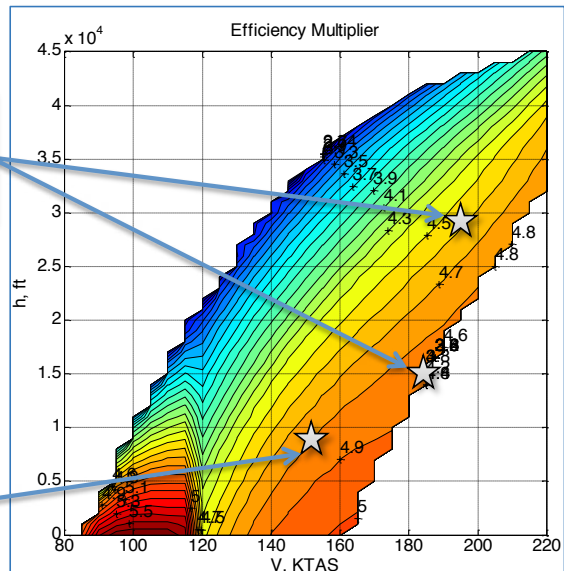

Current design is expected to show near 5x improvement

X-57's power system can achieve record-setting capability well beyond the baseline flight envelope

Mod III operating point expected to require ~85 kW (4.8x more efficient than the baseline)

Programmatic Risk Management

- X-57 Subproject manages programmatic risk process using format and likelihood/consequence criteria established by Flight Demonstrations and Capabilities (FDC) Project and Integrated Aviation Systems Program (IASP) Program
 - Risks reviewed bi-monthly
 - Important risk mitigations that cannot be covered within the Subproject's budget will be added to the FDC Lien List for consideration by the FDC Financial Management Board
- FDC Risk Manager responsible for documenting the X-57 risks, facilitating the process, and providing reports to FDC PM
- FDC PM reviews risks at least bi-monthly, providing feedback to X-57 PM and FDC Risk Manager
- Risks are identified, discussed, and statused during weekly SCEPTOR project meetings and at SCEPTOR monthly risk reviews.

SCEPTOR CDR Nov. 15–17, 2016

Session 2, Programmatic Overview 10

Risk Statement
Given that the project is operating with one experimental aircraft (no spare), there is a possibility of significant damage to the aircraft during ground or flight testing resulting in substantial delays and cost overruns or end of project.

Status:

11-3-2016: Mitigation 3 removed by PM until further defined (spare wing requirements and cost/schedule ROM needed).
 10-24-2016: Reviewed with PM, DPM, RO, CE, and SE. Retitled Risk. Reworded risk statement; Mitigation 1 complete, assess LxC at next review. Assigned Risk ID. Mitigation 3 to be discussed with FDC Project Office.
 8-24-2016: Risk opened; need to review dates and L x C values

Risk Approach: Mitigate

Risk Action Mitigation Step / Task Description	Cost to Implement (if exceeds current budget)	Start Date	End Date	New L x C (Cost, Schedule, Technical)
1) Purchase spare battery		Sep - 16	Sep - 16	2 x 5
2) Purchase spare fuselage		Sep -16	Feb-17	2 x 5

Consequence (Cost, Schedule, Technical)		L	C

Document Status

Doc No.	Doc Type	Document Title	Status
ICD-CEPT-004	ICD	Simulation Interface Control Document	Complete
TP-CEPT-002	Test Plan	SCEPTOR Unpowered Wind Tunnel Test	Complete

Simulation ICD contains block diagrams and tables that define:
Model-to-c, autocode programming interface
Axis systems, positive sense and reference points
Signal names and units
Mass properties

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 6

Test & Verification Approach

- Simulation is primary tool for verification that design meets system requirements
- Checkcases exist to track changes in simulation
- Cross checks run comparing piloted and desktop simulation
- Experimental data used to update simulation
- Comparison to flight data, where possible, used to verify simulation

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 7

Sources of Modeling Data

Mod-II Configuration: Electric Propulsion

- Manufacture's Mass Properties/Aerodynamic Coefficients
- Flight test data from commercial Tecnam-P2006T
- Propeller performance analysis

Mod-III Configuration: +Cruise Optimal Wing

- Test data from low-speed tunnel test

Mod-IV Configuration: +Blown High-Lift

- Predictions from CFD for wing performance under blowing

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 8

Mod I Flight Test at AFRC

Test flights conducted on a commercial Tecnam P2006T in July, 2015.

Flights supported both pilot familiarization, and a validation data-source for the Mod-II piloted simulation.

SCEPTOR CDR Nov. 15-17, 2016

Simulation vs. Flight Response, pitch rate

Simulation vs. Flight Response, roll rate

Session 4, Flight Control IPT 9

S&C Tunnel Test, LaRC 12ft Tunnel

Primary Objectives:

- **Static aerodynamic database: Mod-III, unpowered**
Alpha sweeps to and past stall (-8° to 40°)
Beta sweeps out to 20° sideslip
- **Control Powers: ailerons, rudder, stabilator and flap.**
Independent runs for left-right aileron
Coupled tests for flap/stabilator and flap aileron
- **Dynamic derivatives for roll, pitch, and yaw**
Forced oscillation testing in all 3 axes
Several frequencies, at and below expected modes

Data Summary:

- 119 alpha-sweep runs, each with 16 dwell points
- 11 forced oscillation runs, 3 freqs each axis

Tunnel database forms the basis for analysis and piloted simulation in the Mod-III configuration

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 10

Mod-IV: Blown High Lift

CFD analysis provides lift/moment curves for flapped wing with distributed blowing. Supports Mod-IV performance analysis.

Driving Requirements (1/5)

System Req No.	System Requirement Description	Subsystem Req No.	Subsystem Requirement Description	Verification Method
33	The CEPT aircraft shall be designed to have adequate roll authority.	V33.1	The CEPT vehicle shall be able to roll the aircraft through an angle of 60 degs, reversing the direction of a turn in 5 seconds or less with the flaps in takeoff position, gear up, and trimmed to a speed of 1.2 VS1.	Simulation
		V33.2	The CEPT vehicle shall be able to roll the aircraft vehicle through an angle of 60 degs, reversing the direction of a turn in 4 seconds or less with flaps in the landing position, gear extended, trimmed to a speed of 1.3 VS0	Simulation

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 13

Turn Reversal - Takeoff

Bank to Bank turns within 5 seconds in takeoff configuration

SCEPTOR CDR Nov. 15-17, 2016

Turn Reversal - Landing

Bank to Bank turns within 4 seconds in landing configuration

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 15

Driving Requirements (2/5)

System Req No.	System Requirement Description	Subsystem Req No.	Subsystem Requirement Description	Verification Method
34	Pitch Control: The CEPT system shall be designed to have sufficient pitch authority.	V34.1	The CEPT vehicle shall have sufficient pitch authority to be trimmed under the forward CG limit at VS0 with flaps in landing configuration and at VS1 with flaps retracted.	Analysis
		V34.2	The CEPT vehicle shall have sufficient pitch authority to lift the nose of the aircraft at the forward CG limit at an acceptable Vr.	Analysis

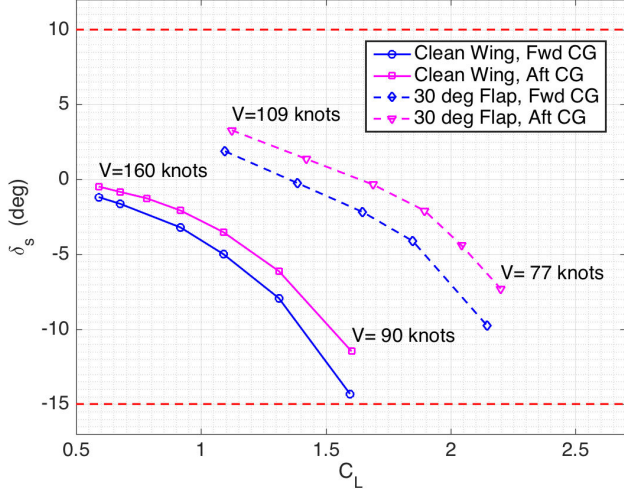

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 16

Trim and Rotation

Trim Map: Mod-III Clean Wing and Landing Configuration

Trims within stabilator range for cruise and landing configuration, at 3000 lbm
 At low weight preserves CG range of Tecnam, above 2500 lbs forward limit is decreased

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 17

Driving Requirements (3/5)

System Req No.	System Requirement Description	Subsystem Req No.	Subsystem Requirement Description	Verification Method
36	Longitudinal Stability: The CEPT system shall be designed and ballasted to have static and dynamic longitudinal stability.	V36.1	The CEPT vehicle's longitudinal response will be such that a yoke pull is required to maintain speeds below the trim speed and a push required to maintain speeds above the trim speed	Simulation
		V36.2	The CEPT vehicle's longitudinal response will be such that the airspeed returns to within 10 percent of trim airspeed when control is slowly released from a position aft or forward of trim.	Simulation

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 18

Return to Trim Airspeed

Returns to trim airspeed following a stabilator pulse.
Phugoid damping is 7.7%, with a period of approximately 30 seconds

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 19

Sense of Trim Forces

Simulation trimmed to high pitch rate level-flight condition at cruise speed

Meets sense requirement for “a pull to maintain speed below trim and ...”
Slope of Elevator/g curve is approximately 3x the baseline vehicle
This corresponds to much higher stick forces

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 20

Force Feel for Mod-III

- Tecnam has an all moving tail, mounted on a pivot just aft of the tail's aero-center
- An anti-servo tab is geared with the stabilator motion, to provide a hinge moment

The gearing for this tab, currently at 1.6 deg/deg will be adjusted to provide a similar force-feel as the baseline Tecnam vehicle.

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 21

Driving Requirements (4/5)

System Req No.	System Requirement Description	Subsystem Req No.	Subsystem Requirement Description	Verification Method
35	Yaw Control: The CEPT system shall be designed to have sufficient yaw authority.	V35.1	The CEPT vehicle shall be capable of making directional changes up to 15 degrees, while retaining a wings level attitude to within 5 degrees and at and airspeed of 1.4 VS1.	Simulation
37	Lateral Stability: The CEPT system shall be designed and ballasted to have static and dynamic lateral stability.	V37.1	The CEPT vehicle shall recover from a wings level sideslip with the rudder neutral in takeoff and landing configurations at 1.2 VS1 and and cruise configuration at high-speed cruise.	Simulation

Driving Requirements (5/5)

System Req No.	System Requirement Description	Subsystem Req No.	Subsystem Requirement Description	Verification Method
38	Handling Qualities: The CEPT system shall be designed and ballasted to have Level-1 or Level-2 handling qualities	V38.1	The CEPT vehicle shall have sufficient pitch authority to be trimmed under the forward CG limit at VS0 with flaps in landing configuration and at VS1 with flaps retracted.	Analysis
		V38.2	The CEPT vehicle shall be designed to have a dutch roll damping of no less than .02 in both landing and cruise configurations	Analysis
		V38.3	The CEPT vehicle shall have a forward and aft cg limits that preserve stability and control properties.	Simulation
		V38.4	The CEPT vehicle total mass shall be below limits set by structural load constraints, including landing gear response.	Analysis
		V38.5	The CEPT vehicle inertias will be below levels that degrade the transient response to sharp control inputs in all axes.	Simulation

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 25

Maneuverability – Reachable V/N

	KEAS	gLoad	Stab	Alpha
Clean Wing	164	3.4	-14.8	14.8
30 deg Flap	107	2.0	-9.97	11.0

Stabilator and Alpha for high-g pull conditions can reach V/N boundaries

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 26

Pitch Rate Response: Mod-III vs. Tecnam

Longitudinal transient response to sharp inputs is similar to baseline vehicle.

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 27

Roll Rate Response: Mod-III vs. Tecnam

Lateral transient response shows effect of increased roll inertia.

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 28

Technical Performance Metrics

The following quantitative metrics will be evaluated routinely during the design process to assess impact of any proposed configuration change

At a nominal airspeed of 1.3 Vs1

Control Power:

- Time required for a 60 deg bank-to-bank coordinated turn
- Percent of stabilator authority required for a forward-CG trim
- Percent rudder authority required for 10 deg wings level sideslip

Stability:

- Static stability margin as percent of chord
- Short period damping estimate from linearized model
- Dutch roll damping estimate from linearized model

Control Power TPMs

SCEPTOR Mod-III Configuration:

AirSpeed	Condition	Metric
107knots (1.2*VS1)	Flaps T/O	3.7 sec Bank-to-Bank Roll
95 knots (1.3*VS0)	Flaps Land	3.8 sec Bank-to-Bank Roll
89 knots (VS1)	Clean Wing, cg@26.5%	-14.7 deg stabilator, 98%
110 knots	Clean Wing, = 10 deg	- 6.5 deg rudder, 25%

Dynamic	Condition	Metric
Static Stability Margin	cg@41%, rear limit	94% Margin
Short Period Damping	133 KEAS, cg@41%	0.49 Damping Ratio
Dutch Roll Damping	133 KEAS, cg@41%	0.24 Damping Ratio

SCEPTOR Hazard Analysis

Hazard Summary (Flight Controls)

X-57 HR-9 Inadequate Stability Control (Mod III)

X-57 HR-18 Abrupt Asymmetric Thrust (Mod III)

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 31

HR-18 Abrupt Asymmetric Thrust (Mod III)

In the Mod-III configuration the aircraft is powered by cruise motors mounted at the wing tips. This placement reduces the effect of induced drag, however, it leads to a more dramatic yaw moment in the event of a single engine failure. The vertical tail and rudder are not sized to provide a sufficient level of control authority for single engine performance, as is typical in multiengine aircraft. This restricts operations in Mod III to EAFB lakebed where it is acceptable to depower the remaining motor and safely land the vehicle as a glider. Abrupt asymmetric thrust will create a transient response that, particularly at low altitudes, may be difficult to control and will require immediate response from the pilot.

Causes	Effects	Mitigations
<ul style="list-style-type: none"> A. Power system fault B. Motor mechanical system failure C. Motor controller failure D. Throttle system malfunction E. Power train structural failure F. Propeller pitch controller failure G. Inadvertent prop feather H. Propeller damage I. Erroneous command (pilot input) 	<ul style="list-style-type: none"> • Loss of aircraft control • Damage or loss of aircraft • Damage to ground assets • Injury or death to personnel 	<ol style="list-style-type: none"> 1. Motor and power system redundancy (A, B, C, D) 2. Flight Test (Mod II) (A, B, C, D, E, F, G, H, I) 3. Peer review of design (A, B, C, D, E, F) 4. Design margin (B, E) 5. Stress analysis (B, E) 6. Pilot warning light and audible alarm (A, C, D, I) 7. Manual shutdown of opposite side cruise motor (A, B, C, D, E, F, G, H, I) 8. Control room monitoring of health and status (A, B, C, D, E) 9. Piloted simulation training (A, B, C, D, E, F, G, H, I) 10. Environmental acceptance test (A, C, D) 11. Qualification test (A, B, C, D, E) 12. Ground test (CST) (A, B, C, D, E, F, G, H, I) 13. Taxi tests (A, B, C, D, E, F, G, H, I) 14. Propulsion system acceptance testing (Airvolt) (B, C, E, F, H)

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 32

HR-18 Abrupt Asymmetric Thrust (Mod III)

In the Mod-III configuration the aircraft is powered by **cruise motors mounted at the wing tips**. This placement reduces the effect of induced drag, however, it leads to a more dramatic yaw moment in the event of a single engine failure. The vertical tail and rudder are not sized to provide a sufficient level of control authority for single engine performance, as is typical in multiengine aircraft. This restricts operations in Mod III to EAFB lakebed where it is acceptable to depower the remaining motor and safely land the vehicle as a glider. Abrupt asymmetric thrust will create a transient response that, particularly at low altitudes, may be difficult to control and will require immediate response from the pilot.

Causes	Effects	Mitigations
<ul style="list-style-type: none"> A. Power system fault B. Motor mechanical system failure C. Motor controller failure D. Throttle system malfunction E. Power train structural failure F. Propeller pitch controller failure G. Inadvertent prop feather H. Propeller damage I. Erroneous command (pilot input) 	<ul style="list-style-type: none"> • Loss of aircraft control • Damage or loss of aircraft • Damage to ground assets • Injury or death to personnel 	<ol style="list-style-type: none"> 1. Motor and power system redundancy (A, B, C, D) 2. Flight Test (Mod II) (A, B, C, D, E, F, G, H, I) 3. Peer review of design (A, B, C, D, E, F) 4. Design margin (B, E) 5. Stress analysis (B, E) 6. Pilot warning light and audible alarm (A, C, D, I) 7. Manual shutdown of opposite side cruise motor (A, B, C, D, E, F, G, H, I) 8. Control room monitoring of health and status (A, B, C, D, E) 9. Piloted simulation training (A, B, C, D, E, F, G, H, I) 10. Environmental acceptance test (A, C, D) 11. Qualification test (A, B, C, D, E) 12. Ground test (CST) (A, B, C, D, E, F, G, H, I) 13. Taxi tests (A, B, C, D, E, F, G, H, I) 14. Propulsion system acceptance testing (Airvolt) (B, C, E, F, H)

Engine Out Response

- Partial Failure
 - 50% power loss on a single engine
 - Corresponds to loss of A or B leg of power system
- Level Flight Trims are still achievable

KEAS	Throttle %	Rudder Angle	Pitch, Lf.	Pitch, Rt
130	92.08	3.06	28.34	25.48
120	78.82	3.46	26.15	23.32
110	68.81	3.95	23.98	21.31
100	65.13	4.89	22.24	19.47
90	64.36	7.42	20.74	17.49
85	59.32	7.33	19.67	16.39
80	58.48	8.42	18.84	15.53

Engine Out Response

- Full Single Engine Failure
 - 100% power loss on a single engine
- Vehicle is not able to trim in level flight
 - Emergency procedure is to throttle back both motors and continue as glider.
- Piloted Simulation testing will be done to determine if pilot response is a sufficient mitigation.

SCEPTOR CDR Nov. 15-17, 2016

Engine Out Transient Change time scale from -1

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 36

HR-9 Inadequate Stability and Control (Mod III)

In the Mod III vehicle configuration the baseline Tecnam is to be modified with new wing and cruise motor placement. Although it is nearly the same span, the Mod III wing differs significantly from the baseline wing in aspect ratio, with a chord length approximately half the original chord, and is thinner in cross-section. The flaps and aileron surfaces are also smaller than the baseline vehicle. These changes introduce the potential for undesirable characteristics in the aircraft's dynamic response, as well as different degree of control authority in roll and a different force feedback to the pilot. The mass properties of the vehicle will also change, with an increase in weight to 10% above the Tecnam P2006T's rated MTOW. In addition to the weight increase the placement of motors in Mod-III at the vehicles wing tips also changes the inertia, with a significant increase in roll and yaw inertias. The CG of the vehicle in Mod III will be different than the stock Tecnam and, being dominated by battery placement in the fuselage, may have a restricted degree of adjustment. These changes introduce the potential for the vehicle to have poor handling qualities and inadequate controllability for safe flight operations.

Causes	Effects	Mitigations
<ul style="list-style-type: none"> A. Experimental Wing (high aspect ratio and new control surfaces) changes vehicle stability and control characteristics B. Operating above production Tecnam MTOW C. Operating with MOI and CG location different than production Tecnam D. Pilot unfamiliar with new aircraft performance characteristics 	<ul style="list-style-type: none"> • Reduction of and/or loss of aircraft control • Inadequate damping in longitudinal and/or lateral dynamics • Increased pilot work load • Damage or loss of aircraft • Damage to ground assets • Injury or death to personnel 	<ol style="list-style-type: none"> 1. Wind Tunnel test to obtain S&C derivatives (A) 2. Manage aircraft CG to ensure pitch stability (C) 3. Monte-Carlo analysis to cover uncertainty in aero estimates (A, B, C) 4. Piloted simulation training (D) 5. Taxi tests (A, B, C, D) 6. Flight test build up (envelope expansion) (A, B, C, D)

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 37

Major Accomplishments

- Mod-II model update from flight data
 - Updated selected aero parameters
 - Ran comparison cases against dynamic maneuvers
- Low Speed Tunnel Test
 - Full alpha/beta sweep of complete vehicle in Mod-III configuration
 - Forced oscillation testing for dynamic derivatives
- Updated Propulsion model in batch simulation
 - Includes MT propeller performance
 - Failure emulation in power/hub subsystems

SCEPTOR CDR Nov. 15-17, 2016

Session 4, Flight Control IPT 38

Go Forward Plan

Prior to Mod-II FRR:

- Address fidelity issues in simulation
 - Ground handling improvements, braking and steering
 - Add gear-down aerodynamic increment

- Introduce battery state subsystem in propulsion model
 - Energy tracking, with voltage decay
 - Reflect independent A/B Traction Bus charges

- Upgrade desktop simulation to allow Monte-Carlo analysis
 - Compute TPMs over parameter sets including variation in mass properties and aerodynamic parameters

Exit Criteria

Subsystem Level Exit Criteria

Evidence

Detailed design is shown to meet the subsystem requirements with adequate technical margins	Slides: 14,15,17,19,20,23, 24,27,28
Subsystem level design is stable and adequate documentation exists to proceed to the next phase	Slides: 8,9,10,11
Subsystem interface control documents are sufficiently mature to proceed to the next phase, and plans are in place to manage any open items	Slide: 6
Subsystem technical risks are identified and mitigation strategies defined	Slides: 32,33,37
Test, verification, and integration plans are sufficient to progress into the next phase	Slide: 7
Final hazards adequately addressed and considered in the detailed design	Slides: 34,35,36

SCEPTOR CDR Nov. 15–17, 2016

Session 5, Piloted Simulation 5

Roles and Responsibilities

- NASA LaRC: Flight Controls and Dynamics
 - Builds and updates X57 desktop simulation models
 - Builds and integrates aero models, propulsion models, and landing gear models, etc.
 - Monte Carlo analysis
 - Compares desktop simulation to core simulation
- NASA AFRC: Piloted Simulation
 - Integration of the X57 desktop simulation model into core piloted simulation
 - Performs independent comparison of desktop simulation to core simulation
 - Develop the simulator cockpit hardware and Head Down Display (HDD) setup
 - Test pilots fly and evaluate the simulation
 - Provide pilot training for nominal and emergency procedures

SCEPTOR CDR Nov. 15–17, 2016

Session 5, Piloted Simulation 6

External Interfaces

- Integrated Power and Control IPT
 - Cockpit Display: MFD
 - Center Cockpit Console

Overview			
Throttle Pos	120	300	Throttle Pos

Check Cases – w cockpit hardware in the loop

- Mod II
- Rudder Doublet Case
- Comparison of the Piloted Sim data to the Desktop Sim data
 - Inserted Piloted Sim control surface and flight conditions data into the Desktop Sim

SCEPTOR CDR Nov. 15–17, 2016

Session 5, Piloted Simulation 21

Pilot Comments

- Mod II
 - Roll, Pitch, and Yaw feel close to the real aircraft
 - Did not notice any P factor effects
 - Yoke force feedback feels correct
 - Landing gear steering feels sensitive and brakes not as effective as the Tecnam
 - Failure: Left motor to zero power
 - Noticed failure occurred almost right away. RTB without issue.

SCEPTOR CDR Nov. 15–17, 2016

Session 5, Piloted Simulation 22

Major Accomplishments

- Cockpit development
 - Heads Down Display
 - Left Hand Panel gauges drawn and driven
 - Yoke Force Feedback
 - Based on flight data
 - Audio Warning
 - Stall

SCEPTOR CDR Nov. 15–17, 2016

Session 5, Piloted Simulation 23

Major Accomplishments

- Mod I
 - Improved Aero Model with Tecnam Flight Data
- Mod II
 - Integrated into the simulator
 - Flown by project test pilots
 - Initial failures testing done
- Mod III
 - Initial model integrated into core sim

SCEPTOR CDR Nov. 15–17, 2016

X-57 Mod II Structural Design Criteria

Wesley Li - NASA Armstrong

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 21

Structural Design Criteria

- The max design gross and landing weight is 3,000 lbs.
- The primary structures shall be designed to meet the loads requirements described in
 - REQ-CEPT-007 (floor, battery mount, and equipment support structure)
 - REQ-CEPT-008 (Mod II wing motor mount)
 - REQ-CEPT-010 (Cruise Motor)
- **Environmental / Temperature requirements:**
 - Primary structure: 0°F to max operational temperature or not lower than +165°F.
 - Secondary structure (i.e. nacelle fairings) and if the structure is painted in glossy white color: 0°F to max operational temperature or not lower than +135°F.
- The fatigue life of the structures shall be considered. Structure will be designed to 200 flight hours. A scatter factor of 4 times the planned number flight cycles or flight hours will be used for fatigue analysis.
- All structure **MUST** have positive Margin(s) of Safety.
 - $MS = (\text{allowable load} / \text{ultimate load}) - 1.0$
- Ultimate load is defined as:
 - ultimate load = factor of safety x design limit load.

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 22

Factor of Safety for Mod II

- The appropriate ultimate factor of safety shall be used for any new or modified structures.

Ultimate Factors of Safety	
New Primary structure (metallic)	2.25
New Primary structure (composite)	3.0
Existing primary and original structures	1.5
Secondary structure	1.5
Thermal loads	1.2

- The factor of safety prescribed above must be multiplied by the highest pertinent special factors of safety prescribed in FAR 23.619. i.e. Fitting factor of 1.15.
- Proof test is required if the FS requirements are not met (see G7123.1-001 for details).

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 23

Loads Requirements for Floor/Equipment Support

- The new aircraft support structure, for example the battery system mounts, power system components, and instrumentation pallet and/or mounts, shall be designed to meet the following loads requirements.
- The items of mass within cabin that could injure an occupant, will be secured to fuselage structure to withstand the cash loads conditions.

Loads Requirements for Floor and Equipment Support Structure				
	Design Limit Load Factor (g)	Factor of Safety		Condition
		New metallic structure	Exiting structure	
Upward, Nz	3.4	2.25	1.5	Maneuver loads
Forward, Nx	-18.0	1.0	1.0	Crash loads
Sideward, Ny	+/- 4.5	1.0	1.0	Crash loads
Downward, Nz	-6.0	1.0	1.0	Crash loads

Sign Conventions:

- Nx: Longitudinal, Aftward (+)
- Ny: Lateral, Right (+)
- Nz: Vertical, Up (+)

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 24

Loads Requirements for Mod II Wing

- The new motor mount and its supporting structure shall be designed to meet the following loads requirements. Structural fatigue shall be addressed as well.

Load Case	Design Limit Load Factor			Thermal Stress	Thrust & P-factor Loads	Gyroscopic Loads	Engine Torque	Condition
	Nx	Ny	Nz					
1	0.0	+/-1.33	3.4	x	x	x		Flight
2	0.0	+/-1.33	-2.0	x	x	x		Flight
3	0.0	+/-1.33	3.4	x	x		x	Flight
4	0.0	+/-1.33	-2.0	x	x		x	Flight
5	0.0	+/-1.33	3.4	x	x	x	x	Flight
6	0.0	+/-1.33	-2.0	x	x	x	x	Flight

Session 6, Vehicle IPT 26

X-57 Mod II

Landing Gear, Wing and Empennages Loads

Landing Gear Loads

- The limit load factor resulting from the drop tests is g (per Tecnam Ground Load Report)
 -
 -
- SCEPTOR will be operated at higher weights than those used by the Tecnam landing gear.
 - Gross weight increased by 15.4%
 - 2600 to 3000 lbs
 - Descent velocity increased by 13%
 - Landing decent velocity = $4.4 \cdot (W/S)^{1/4}$
 - Tecnam descent velocity = $4.4 \cdot (2601/158.88)^{1/4} = 8.85$ ft/sec.
 - SCEPTOR descent velocity = 10.0 ft/sec.
 - With $W/S=45$ psf, the required descent velocity is 11.4 ft/sec. As per FAR 23.473, the descent rate must be at least 7 ft/sec and need not exceed 10ft/sec.
 - $(10-8.85)/8.85=13\%$
 - Therefore, total kinetic energy increased by 47.4%
 - $\frac{1}{2} mv^2 = 1.154 \cdot 1.13 \cdot 1.13 = 47.4\%$
- SCEPTOR landing gear is adequate for g
 -
 -

Landing Gear Loads (cont'd)

Conclusions

- Landing gear is adequate for Mod II configuration.
- Lower the landing gear load factor from g to g, which is comparable to FAR 23.473 (g) requirement, to maintain a factor of safety of 2.4 for the ultimate load factor.

Recommendations

- While the landing gear structure is good for g landing, the aircraft landing load factor will be limited to 2.0g.
- Although the drop tests were conducted at ft/sec descent velocity, a normal landing descent velocity will be less than 3 ft/sec according to the Pilot.
- Conduct a landing gear visual inspection after each normal landing (<2.0g)
 - Each normal landing is considered as a heavy weight landing.
- Thorough inspection will be required if exceed 2.0g.
 - Per P2006T Aircraft Maintenance Manual, Section 05-50: "Severe Turbulence, Hard or Overweight Landing".

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 29

Mod II Wing Loads

- **Concern:** overloading the Mod II wing structure.
- Tecnam P2006 MTOW is 2712 lbs
- Loads analyses are based on 2600 lbs
- Gross weight increased by +15.4%
 - from 2600 to 3000 lbs
- Weight distribution changed
 - Battery system located in fuselage
- Wing inertia relief reduced
 - Dry wing, no fuel
 - Cruise motors are lighter than the OEM engines

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 30

Mod II Wing Loads (cont'd)

- For the stock wing, the +3.8g and full fuel case showed a max vertical shear of 4409 lbs and a max bending moment of +499,092 in-lbs.
- For the Mod II configuration (MTOW 3000 lbs), the maneuver limit load factor will be limited to 3.1g to maintain the vertical shear and wing root bending moment.
- The Gust load factor at Vc, 50fps gust and at sea level
 - For 2600 lbs -> Nz is 3.69g
 - For 3000 lbs -> Nz is 3.40g
- Gust load factor is higher than the maneuver load factor and becomes the limiting factor.
- In agreement with Scaled Composites' assessment.

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 31

V-n Diagram for Mod II

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 32

Mod II Wing Loads

Conclusions

- Mod II maneuver limit load factor will be limited to 3.1g to maintain same wing root bending moment.
- Gust load factor is higher than maneuver load factor and becomes the limiting factor.

Recommendations

- Meteorological limits will be required during flight.
- Proposed flight mission rule: **No reported turbulence above light within the flight envelope.**

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 33

Empennages Loads

- Concern: Overloading of the Empennages during Mod III and IV flights.
- Mod III & IV will have a smaller wing and higher wing loading (W/S) than the stock airplane. Depending on the aircraft C.G. and A.C. location, the tail plane may require extra downward or upward force acting on it to re-balance the aircraft. Trim loads might be higher.

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 34

Empennages Strain Survey

- To conduct a baseline strain survey on empennages during Mod II configuration flights and develop a strain limit for Mod III and IV configuration flights.
- Approach:
 - Install strain gages on Vertical Tail and Stabilator (scheduled, Dec, 2016)
 - All strain gages will be installed by AFRC FLL.
 - VT: Bending and torsion
 - Stabilator: Bending
 - Vishay: CEA-13-250US-350 & WK-13-125PC-350/W
 - Measure the MaxMin strain values during Mod II configuration flights.
 - For example: various AOA, high g, unchecked and checked maneuver flights and rudder deflection.
 - Develop strain limit for Mod III and IV flight envelope.
 - To monitor and avoid exceeding the strain limit during Mod III and IV configuration flights.

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 35

Mod II, Ground Vibration Test

- Scheduled, 7/17 at AFRC
 - Fleet Aircraft w/Mods
 - Cruise Motors, Battery Stack, Power Cabling, Instrumentation Pallet...
 - On Soft Tires, as was Tecnam Original GVT
 - Measurement Objectives
 - New Motor/Nacelle Response (Whirl Flutter Analysis, Input Comparison/Update)
 - Pitch & Yaw Stiffnesses...
 - Verify FEM
 - After Prototype Model Modified to Match Fleet Aircraft by AFRC
 - » Many Changes: Wingspan, Tail Planform, Mass Distribution, Stiffness
 - Wing, Fuselage, Vert. and Horiz. Tail Bending Modes
 - Aileron, Rudder and Stab Rotation Modes
 - » Free Play, Potentially
 - FEM Update for Classical Flutter Analysis - Required if Low Margin

Session 6, Vehicle IPT 67

X-57 CAD Configuration Control

Computer Aided Design (CAD) solid models are used for geometry, weights, inertias, cg analysis, volumetric studies & component tracking on the X-57 project. These CAD files are controlled on the Johnson Space Center (JSC) Design Data Management System (DDMS). This is a similar system used on the Aries I, the Lunar Truck, the Space Shuttle & the Space Station programs.

The JSC DDMS is used to create the baseline model representations, the intermediates and the final ready-for-flight representations. Each baseline & final representation is zipped up and uploaded to the project NX website. A project spreadsheet is used to capture all of the project & team member decisions when significant CAD changes are made. The JSC DDMS is described as:

- a “secured cloud environment” using “PIV certificates”
- DoD approved
- contains a work flow package process
- can change “states” (i.e. conceptual, preliminary, under review, fab, final, retired, cancelled, etc.)
- has a revision process

SCEPTOR CDR Nov 15-17, 2016

Suzanne Huebinger – NASA JSC technical point of contact

rep. "mod-2_20161021"

The mega model assembly can be reconfigured to represent all project configurations. The JSC DDMS tracks model part & assembly changes via their version numbers. Comparison between these version numbers lists their modifications. The CAD models are backed-up at JSC and weekly at LaRC.

Session 6, Vehicle IPT 72

SCEPTOR Hazard Analysis

Hazard Summary (Vehicle Integration)

HR-5 Aircraft Damage due to Exposure to Excessive Environmental Conditions during Ground Operations

HR-11 Failure of Motor Mounts (Mod II)

HR-17 Battery Modules Separate from Attach Points

HR-20 Landing Gear Structural Failure (Mod II and III)

HR-22 Restricted and/or Obstructed Crew Egress

HR-23 Cockpit Air Contamination

HR-25 Equipment Pallet Separates from Attach Points

HR-26 Personnel Exposed to High Voltage/Current

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 73

HR-5 Aircraft Damage due to Exposure to Excessive Environmental Conditions during Ground Operations

This hazard pertains to outdoor ground operations only. Due to the unique nature of the SCEPTOR design, i.e. experimental electric propulsion system, location of cruise motors in Mod III, and overall limitations of design, damage to the aircraft as a result of excessive environmental conditions can occur.

Causes	Effects	Mitigations
A. Sand/FOD intrusion	<ul style="list-style-type: none"> • Damage to motor(s) • Damage or loss of electrical components (e.g. instrumentation, propulsion and command system) 	<ol style="list-style-type: none"> 1. Weather limitations to be observed during ground operations (A, B, C, D, E) 2. Exposed components will be wrapped/covered to protect against environmental exposure (custom covers for motors, etc.) (A, C, F) 3. Pre and post-flight inspections (A, C, E, F) 4. Closeout inspections of aircraft maintenance access panels (A, C) 5. Circuit protection (A, C) 6. Thermal reflective coating to be applied to wing (E) 7. Wing tie down points (D)
B. Lightning strike		
C. Moisture intrusion	<ul style="list-style-type: none"> • Damage or loss of wing tip propellers • Damage to aircraft 	
D. High wind		
E. Temperature out of limits		
F. Solar radiation		

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 74

Failure of Motor Mounts (Mod II)

In Mod II, the Tecnam Rotax 912S 100 HP engines are replaced with the experimental Joby JM-X57 60KW motors. This hazard pertains to the experimental structure and associated hardware required to mount the new motors in the stock engine locations. During ground test/flight ops, a failure could occur.

Causes	Effects	Mitigations
<ul style="list-style-type: none"> A. Inadequate structural design B. Flutter/whirl flutter C. Material defect D. Improper installation E. Excessive static/dynamic loads F. Physical damage 	<ul style="list-style-type: none"> • Loss of aircraft control • Damage or loss of aircraft • Damage to ground assets • Injury or death to personnel 	<ol style="list-style-type: none"> 1. Peer review of design (A, B) 2. Design margin (A, B, E) 3. Stress analysis (A) 4. Flutter analysis (B) 5. Installation procedure (D) 6. Pre and post flight inspections (C, D, F) 7. Quality control process (C, D) 8. Ground tests (to include motor and propeller dynamic balancing) (A, B, C, D, E, F)

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 75

HR-17 Battery Modules Separate from Attach Points

This hazard pertains to the experimental structure that mounts the EPS Battery System to the baseline Tecnam primary structure. The EPS Battery System consists of 2 Battery Packs (4 battery modules per pack), and 2 Battery Control Modules. The EPS Battery System (~829lbs), which includes all required module mounting racks, cables and harnesses is located inside the aircraft cabin Aft of the pilot. During flight ops, hard landing/crash, the battery modules could separate from the attach point locations.

Causes	Effects	Mitigations
<ul style="list-style-type: none"> A. Inadequate design B. Material defect C. Improper installation D. Excessive loads E. Failure of attach point hardware 	<ul style="list-style-type: none"> • Loss of power • Loss of TM • Damage to batteries • Personnel exposed to hazardous materials • Electrical short • Loss of aircraft control • Damage or loss of aircraft • Damage to ground assets • Injury or death to personnel 	<ol style="list-style-type: none"> 1. Peer review of design (A) 2. Design with positive margins (A, D) 3. Stress analysis (A, D, E) 4. Installation procedure (C) 5. Visual inspection (B, C, E) 6. Quality control process (B, C)

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 76

HR-20 Landing Gear Structural Failure (Mod II and III)

This hazard pertains to the baseline Tecnam landing gear system. The SCEPTOR aircraft maintains the baseline system throughout completion of the project mods. Although the aircraft gross vehicle weight will be above the manufacturer’s specifications, analysis based on test data shows the landing gear system is capable of functioning at higher loads. However, changes in the takeoff and landing characteristics as a result of the modifications to the baseline aircraft could increase the likelihood of a landing gear system failure.

Causes	Effects	Mitigations
A. Increased takeoff/landing speed	• Loss of propellers	1. Adhere to SCEPTOR procedures, mission rules, fact sheets and updated POH (A, B)
B. Increased rate of decent	• Scattering debris	2. Maintain aircraft CG within specifications (E)
C. Exceed MTOW	• Damage or loss of aircraft	3. Minimize sink rate on landing (B, C, E)
D. Nose wheel shimmy	• Injury to personnel	4. Analysis review (A, C, D, E)
E. Excessive loading		5. Taxi tests (A, D)

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 77

HR-22 Restricted and/or Obstructed Crew Egress

This hazard pertains to ground and flight operations (taxi/emergency landing). Due to modifications to the baseline Tecnam aircraft, i.e. experimental power source located aft of the pilot, equipment pallet located on the R/H FWD seat rails, and location of the experimental wing which eliminates the overhead emergency exit, crew egress will be limited and/or obstructed. In an emergency, personnel could be injured in the event of a hindered egress.

Causes	Effects	Mitigations
A. Design necessity (location of battery pallet, cruise propellers, equipment pallet)	• Injury or death to personnel	1. Peer review of design (A, C, E)
B. Propeller rotation (cruise)		2. Hinges on pilot door equipped with quick release pins (B, C, D)
C. Failure of door safety interlock		3. Secondary egress - Hinged windshield (Mod III) (A, B, C, D, E)
D. Egress door(s) not functional due to structural damage		4. Egress training per SCEPTOR emergency procedure (C, F)
E. Secondary structure fails and obstructs or hinders egress		5. Design secondary structure with adequate margins (A, E)
F. Crew unfamiliar with door safety interlock/emergency egress procedure		6. Emergency (Manual) shutdown of propulsors (A, B)
		7. Structural design analysis (A, E)

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 78

HR-23 Cockpit Air Contamination

This hazard pertains to ground and flight operations. In the event of an electrical anomaly, i.e. battery system failure, equipment pallet failure or failure of related system components or wiring, personal injury and/or loss of aircraft control could occur as a result of inhalation of toxic materials, loss of situational awareness and/or incapacitation due to contamination of the aircrafts cabin from smoke, fumes or battery ejecta.

Causes	Effects	Mitigations
A. Battery venting into cockpit	<ul style="list-style-type: none"> Loss of situational awareness Crew incapacitation Loss of aircraft control Damage or loss of aircraft Damage to ground assets Injury or death to personnel 	1. Emergency Passenger Oxygen System (EPOS) (A, B, C)
B. Smoke and fumes from electrical fire		2. Battery Ejecta directed outside of aircraft (A, B)
C. Outgassing due to over heating of electrical components/harnesses		3. Fire extinguisher (B)
		4. Activate vent air system (to include opening pilot window) (A, B, C)
		5. Fire/smoke detection system (A, B, C)
		6. BMS (A)
		7. Shutdown aircraft power system (A, B, C)
		8. Adhere to SCEPTOR procedures, mission rules, fact sheets and updated POH (A, B, C)

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 79

HR-25 Equipment Pallet Separates from Attach Points

This hazard pertains to the experimental equipment pallet that provides a mounting platform for the CDAU: Data acquisition system main hub, MCDAU: Data acquisition system satellite unit, DAQ Data Recorders 1 & 2, MT Prop Controller units 1 & 2, MOTEC ACL, UHF Radio system, TTC Transmitter and 4 ea. 28V DC-DC (13.8VDC-28VDC) converters. The pallet (~53 lbs.) is located inside the aircraft cabin and attaches to the stock Tecnam R/H FWD seat rails utilizing the stock Tecnam seat mechanism and hardware. During flight ops, hard landing or crash, the instrumentation pallet could separate from the attach point locations.

Causes	Effects	Mitigations
A. Inadequate design	<ul style="list-style-type: none"> Damage to equipment pallet components Loss of TM Electrical short Damage to aircraft Injury or death to personnel 	1. Peer review of design (A)
B. Material defect		2. Design with positive margin (A, D)
C. Improper installation		3. Stress analysis (A, D, E)
D. Excessive loads		4. Installation procedure (C)
E. Failure of attach point hardware		5. Visual inspection (B, C, E)
		6. Quality control process (B, C)

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 80

HR-26 Personnel Exposed to High Voltage/current

This hazard pertains to ground operations only. Due to the experimental design of the SCEPTOR propulsion system, high voltage power and current is present on the aircraft. During ground testing; system trouble shooting; installation and removal of motors, battery modules, or other traction system components; and aircraft maintenance, personnel can inadvertently come in contact with energized components/systems.

Causes	Effects	Mitigations
A. Personnel unfamiliar with SCEPTOR aircraft	<ul style="list-style-type: none"> • DC arc flash • Injury or death to personnel 	1. SCEPTOR training (A, B, C, D, E, F, H)
B. Installation/maintenance mishandling		2. SCEPTOR procedures and checklists (A, B, C, D, E, H)
C. Inadvertent contact with exposed electrical components (loss of situational awareness)		3. Visual inspections (B, D, E, F)
D. Battery/power system misconfigured		4. PPE and specialized tools to be utilized while working on energized components (B, C)
E. Procedural error		5. Placards, warnings and labels to be installed (high voltage and polarity) (A, C, H, I)
F. Damaged GSE/aircraft components		6. Keep out zone and warning lights (A, C, I)
G. Inadequate design		7. Design (battery enable plug and protective enclosure) (B, C, D, G, H)
H. Operator error		8. Peer review of design (G)
I. Inadequate caution/warning		9. Lockout/Tagout (C, H)
J. Inadequate lighting in aircraft cabin		10. System continuity and isolation checks (F)
		11. Operations and maintenance to be performed by qualified personnel (A, B, C, D, E, F, H)
		12. Auxiliary work lighting plan to be implemented (J)

Keith Harris
Trend
Criticality
Medium
Original L x C
3 x 4
Current L x C
2 x 4
Target L x C
1 x 4
Open Date
3-22-16
Closed Date

Risk Statement
 Given that the aircraft weight and take-off/landing speeds are higher than the stock Tecnam P2006T, there is a possibility that the gear may be overloaded during flight test, resulting in a re-design (cost < 1% of annual budget) and retrofit effort (> 1 month slip to level 1 milestone) with no impact to project technical objectives.

Consequence (Cost, Schedule, Technical)	
Cost	1 < 1% of annual budget
Schedule	4 > 1 month slip to level 1 milestone (Phase II flights complete)
Technical	1 No impact to project objectives

Statu
 10-24-2016: Reviewed with PM, DPM, RO, CE, and SE. Mitigation #2: In progress, changed end date from Apr to Nov. Mitigation #3: Changed start date from Apr to Nov.
 8-30-2016: Reviewed new RO; No changes; need better fidelity on the wing/hardware design and the weights for proper assessment of L x C
 8-23-2016: Reviewed with DPM and RO; Risk owner changed to Vehicle IPT lead, Keith Harris;
 3-23-2016: Reviewed risk with RO, PM, OE, and established L X C, criticality, and updated mitigations. Updated and scored risk.
 3-22-2016: Transferred risk to new FDC format

Risk Approach: Mitigate

Risk Action Mitigation Step / Task Description	Cost to Implement (if exceeds current budget)	Start Date	End Date	New L x C (Cost, Schedule, Technical)
1) Select airplane configuration with over-designed landing gear system.		Jan - 15	Apr - 15	2 x 4
2) Analyze gear loads for all test conditions including glide descent.		Oct - 15	Nov - 16	1 x 4
3) Collaborate with Tecnam on improved nose gear design.		Nov - 16	May - 17	1 x 4
4) Pilot training in piloted simulation with high fidelity gear model.		Oct - 17	Jan - 18	1 x 4

Keith Harris
Trend
Criticality
Medium
Original L x C
2 x 5
Current L x C
2 x 4
Target L x C
1 x 4
Open Date
3-22-2016
Closed Date

Risk Statement
 Given that there is limited volume in the wing and fuselage to accommodate electrical propulsion system components and instrumentation, there is a possibility that redesign may be required, resulting in additional cost (10%-15% of yearly project cost) schedule (> 2 month slip to level 1 milestone) and possible reduction in system capability.

Consequence (Cost, Schedule, Technical)	
Cost	4 10%-15% of yearly project cost
Schedule	4 < 2 month slip to level 1 milestone
Technical	4 May result in not completing Phase IV flights (as a result of descoping)

Statu
 10-24-2016: Reviewed with PM, DPM, RO, CE, and SE. No changes. Mitigation #2 and #3 are in progress.
 8-30-2016: Reviewed new RO; No changes; need better fidelity on the wing/hardware design and the weights for proper assessment of L x C
 8-23-2016: Reviewed with DPM and RO; Risk owner changed to Vehicle IPT lead, Keith Harris; Mitigation #1 complete; however, the correct L x C is 2 x 4 and Criticality is Medium
 3-23-2016: Reviewed risk with RO, PM, OE, and established L X C, criticality, and updated mitigations. Updated and scored risk.
 3-22-2016: Transferred risk to new FDC format

Risk Approach: Mitigate

Risk Action Mitigation Step / Task Description	Cost to Implement (if exceeds current budget)	Start Date	End Date	New L x C (Cost, Schedule, Technical)
1) Select a 4+ passenger aircraft for retrofit.		Jan - 15	Apr - 15	2 x 4
2) Provide early conservative estimates of volume required.		Nov - 15	Dec - 18	1 x 4
3) Use high fidelity CAD model.		Nov - 15	Dec - 18	1 x 4

SCEPTOR CDR Nov 15-17, 2016

Session 6, Vehicle IPT 84

X-57 - Workmanship and Quality Control

RISK ID
SC07
Risk Owner

Power & Command Architecture

Mod IV Only

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 14

Roles and Responsibilities

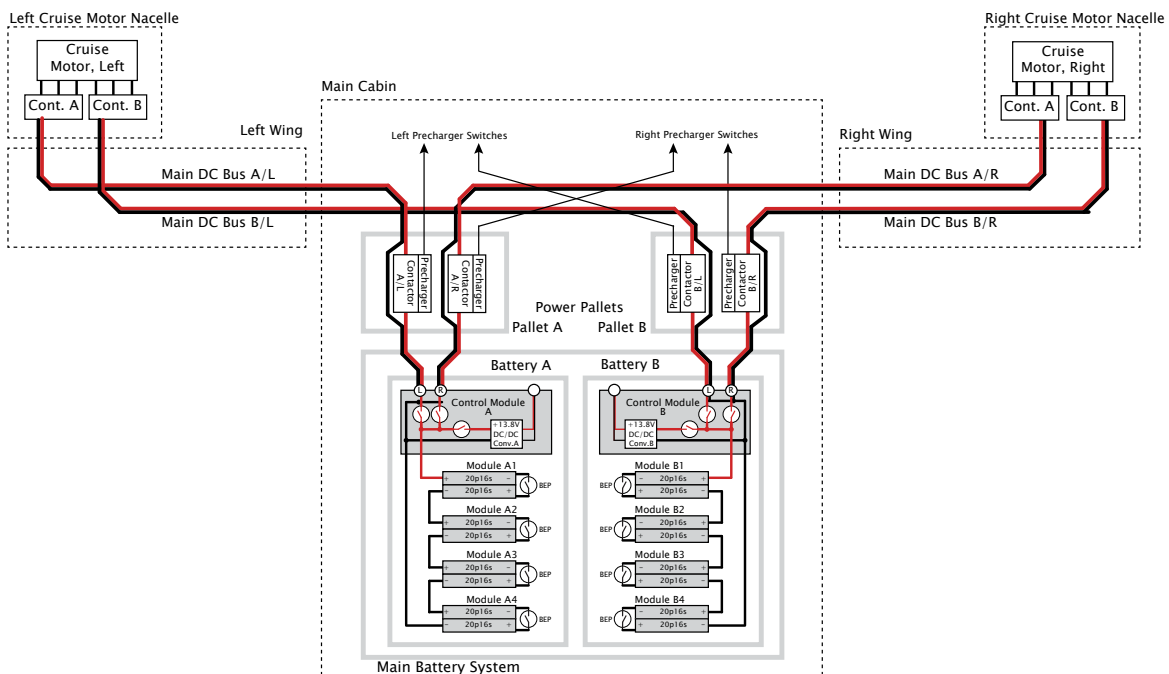

- Power and Command Systems managed by NASA at AFRC with participation at GRC, LaRC and battery peer review from NESC (JSC, KSC)
- ESAero responsible for Power and Command system architecture support, detailed implementation and system delivery.
 - Joby responsible for development of custom cruise motor and controller
 - Electric Power Systems developing custom Battery System based on COTS Li-Ion cells
 - TMC Technologies responsible for Software Verification and Validation (esp. Class 1S: Motor Controllers and Battery Management Systems)
 - Electro Aero developing custom high voltage precharge controllers
 - Western Reserve Controls developing custom CAN Bus fiber modems
 - Methode developing custom low inductance/low EMI power cable
 - Scaled Composites responsible for Mod II integration, initial system-level testing
 - Xperimental responsible for Mod III integration (traction bus, cruise motors/controllers)
- AFRC managing command and H&S bus implementation and Pilot Display for power system H&S
- System level Test and Verification will be managed at AFRC

EPS Technology: A "Systems Solution" to a complex problem

Flexible & Scalable Battery Management System

- Fault tolerant & redundant functions showing 1e-9 probability of failure
- Chemistry Agnostic
- Scalable to 1000V series modules
- Continuous monitor & control
- Active & Passive Topologies
- Centralized & De-centralized processing
- Solid State Disconnecting & pre-charge circuitry

Packaging

- Full containment for failed conditions
- Cell to cell propagation
- Modular welding & assembly techniques

Chemistry

- Robust Characterization & Screening methodology for Harsh Environments
- Use the right chemistry for the right job (NMC, LTO, LiFePO₄)
- Leverage the significant investment done in Commercial applications

Interconnected Technical Disciplines

Improve Safety

Reduced Costs

Drop in Replacement for legacy buses

Can work in a harsh Environment

Session 7, Power and Command IPT 21

Key Requirements – SCEPTOR Traction Battery System Specification Rev B – April 22, 2016

- Provides electrical power to the Traction Battery Bus, with a nominal voltage range within 330 and 480 VDC. (CEPT-BATT-004)
- Provide electrical power to the Avionics Power Bus with a nominal voltage of 12 VDC (± 2 VDC). This power bus will be independent of main power bus precharge/contactors.
- Fit within the volumetric constraints of the SCEPTOR X-plane fuselage. Have a life cycle of at least 250 charge/discharge cycles.
- Provide a minimum effective capacity of 38 kWh
- Be comprised of two independent, stand-alone module battery sub-systems, hereafter referred to as battery sub-systems, each capable of supplying approximately one-half the rated capacity.
- Be configured so the battery terminals are isolated from the case to greater than 10 Megohms at 1200 VDC $\pm 10\%$.
- Be fault tolerant, allowing the Traction Battery System to operate at half the rated capacity if a fault has occurred in either module battery sub-system.

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 22

Key Requirements – SCEPTOR Traction Battery System Specification Rev B – April 22, 2016

- Have a modular design to limit a thermal failure in one module from cascading to other modules, contain thermal events within a module should such an event occur, and vent out one through a designated ventilation port in case a thermal event does occur. .
- Not present a fire hazard.
- Include any necessary provisions for cooling via airflow if/as required.
- Have provisions for charging from the power bus in the installed configuration.
- Accept a charge rate for the complete battery system of up to 140A.
- Provide source current capable of delivering 60kW of continuous power per module battery sub-system (120kW total), 74kW for a minimum of 3 minutes per module sub-system, and 132kW for a minimum of 45 seconds per module sub-system.

Traction Bus – Cable Selection

Flexi-Lene 300/SHF260

Pro:
Flexible, 3.75" radius
Nickel Plated Conductor
FAR Part 25 flam.

Con:
Non-Shielded

EXRAD-XLE

Pro:
Shielded, 95%
Flexible, 2" radius
COTS

Con:
Bare Conductor

Custom 'EXRAD'

Pro:
Shielded
Very Flexible
Silver Plated Conductor

Con:
Non-COTS

W-5590-100

Pro:
Shielded, 90%
Silver Plated Conductor

Con:
Increased cost over custom
single conductor
Non-COTS

TBD

Pro:
Both Conductors within same
Shield
Terminates into single connector
cleanly
Silver Plated Conductor

Con:
Manufacturers reluctant to make
because braided shield will not
'behave well'.
Non-COTS
Less Flexible

PPC

Pro:
Fusion Lugs
Plated Conductor
Compact Profile
Flexible

Con:
COTS cable has PVC jacket

*Assumed 4awg (or equiv.) wire

Winding aspects

Eddy-currents, circulating currents

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 64

Magnetics: prototype performance

Good

- Sufficient torque: 340 N·m demonstrated
- Full current extrapolation: 390 N·m
- One-inverter capabilities fully demonstrated: 60% torque capable
- No heating problems

Bad

- Distorted phase current:
- Non-linear inductance
 - Inverter specifics

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 65

Magnetics: torque reduction

Next prototype: output torque reduced to 255 N·m

- Design for 275 N·m
- Size driven mostly by thermal performance, rather than peak torque
- Final size will depend on cause of distorted current

Expected active mass: 16-19 kg

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 66

Prototype motor status

- Motor #1 designed, manufactured, and briefly tested
- Motor design revisions prepared based on new requirements on cooling and load cases
- Motor #2 fab pending certified materials, electromagnetic performance review, and design reviews

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 67

Motor #1 stress Analysis

Ford Lightning Testing Round 1

July 20 2016

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 69

Lightning Testing Round 1

Single 3-phase inverter in bed of truck

Static tests (no airflow)

56kW max at 2400 rpm

Windings at 75C after 10 minutes at 30 kW, 2100 rpm

27C ambient, 55% RH, 300m elevation

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 70

Lightning Testing Round 2

Oct 8-11 2016

Double 3-phase inverters on test boom

6-phase tested at up to 560Vdc

Peak power of 66 kW at 2400 rpm (260 N-m)

Peak torque of 340 N-m at 1700 rpm (60 kW)

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 71

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 72

Lightning Testing

27kWh battery assembled using Farasis Cellboxes

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 73

Inverter Requirements Review

Maxwell requires an inverter which:

- Has consistent torque response across a range of speeds, battery voltages, and operating conditions
- Fits within the Phase 2, 3, and 4 mechanical constraints
- Does not present an undue burden on the vehicle systems to accommodate
- Survives the vibration and environment of X-57 and AFRC
- Can, with a large safety margin, power the JMX57J

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 74

Session 7, Power and Command IPT 85

Motor Temperatures Variations

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 86

CFD Results

- Fin base temperature:

$$T_{base} = 97C$$

- Chip Thermal Resistance:

$$R_{th_{j-c}} = .0125W/K$$

- Thermal Paste Resistance:

$$R_{th_{paste}} = .001W/K$$

- Chip Max Temp @1000W

$$T_{chip} = T_{base} + R_{th_{tot}} * \dot{Q}_{in}$$

$$T_{chip} = 97 + (.001 + .0125) * 1000 = 110.5C$$

- The chip is rated up to 150C

Cooling Analysis -- Conclusions

- Motor temperature is within allowable for all operating conditions
- Asymmetry in the duct/bulkhead causes uneven inverter temperatures. Higher temperatures on the inboard side, but still within tolerances. Temperature gradient of this magnitude is not an issue

MOTOR STRUCTURAL ANALYSIS

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 89

Nacelle Geometry

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 90

Simulation Setup

**Solver: Abaqus 2016 nonlinear FE solver.
Quadratic elements, 20-node/quad and
10-nodes/tet.**

Boundary Conditions

- Pin holes (yellow) constrained in U_y and U_z , free in U_x
- Bolt holes (red) Clamped

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 91

Loads and Masses

- Thrust Load with worst case P-factor: $F_x = -2837N$ $F_y = -333N$ $F_z = 398N$ $M_x = 614Nm$ $M_y = 297Nm$ $M_z = 365Nm$.
- Gyro Load: $392Nm$ in yaw and $157Nm$ in pitch
- Propeller mass: $15.4Kg$ with CG assumed on axis 130mm from mounting surface
- Propeller Imbalance: $150lb$ or $667N$

Calculating Gyro Loads

For three bladed prop $M = \frac{3}{2} * I * \omega_2 * \omega_1$

$I = 0.37Kgm^2$ (From MT Propeller), $0.5Kgm^2$ was used to be conservative

ω_1 = rate of propeller rotation = 2700rpm = 282rad/sec

ω_2 = off axis propeller rotation = assumed 2.5 rad/sec in yaw, 1 rad/sec in pitch (FAR 23.371)

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 92

Load Cases

Case	Nx g's	Ny g's	Nz g's	Thrust	Gyro	Centrifugal Imbalance	Ground Handling
1*	0.0	+/-1.33	3.4	X	X	X	
2	0.0	+/-1.33	-2.0	X	X	X	
3	0.0	+/-1.33	3.4	X		x	
4	0.0	+/-1.33	-2.0	X		x	
5							X

Note: x means loads are included. Cases from Sceptor Structural Loads requirements for phase II. Thermal Loads not included because analysis was focused on loads from the propeller. Thermal will be considered separately. * Most critical load case

Simulation Setup - Mesh

Material Allowable and Safety Factors

Material	Yield Strength	Fatigue Limit @5e8 cycles	Yield Strength/FS
Al7075-T6	503MPa	159MPa	224MPa
Al6061-T6	276MPa	96.5MPa	123MPa

Safety Factor: the structure must be designed with a SF of 2.25. In practice, this means that the maximum stress in the part must not exceed the yield strength of the material divided by the SF.

Fatigue: due to the difficulty in coming up with accurate number of cycles for the motor, it was assumed that the part would satisfy fatigue requirements if the resulting stress did not exceed the material fatigue limit. One question that remains is whether the FS must be taken into account in fatigue analysis. Doing so would be putting very stringent requirements on the motor design as material allowable would be significantly reduced.

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 104

Bolt Loads – Margins of Safety

1. Extract reaction forces/moments at bolts and pins from FEA in each direction
2. Compute stresses on bolts as follows:

- Normal Stress: $\sigma_{normal} = \frac{F_y}{A_{bolt}}$

- Shear Stress: $\sigma_{shear} = \frac{\sqrt{F_x^2 + F_z^2}}{A_{bolt}}$

- Torsion: $\sigma_{torsion} = \frac{M_y D}{2J}$

- Bending: $\sigma_{bend} = \frac{M D}{2I}$

3. Add together all stresses for a given bolt to show that even that worst case scenario still gives positive MoS:

$$\sigma_{max} = \sigma_{normal} + \sigma_{shear} + \sigma_{torsion} + \max(\sigma_{bend})$$

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 105

Bolt Data

Bolt Material	Stainless Steel 17-4
Bolt Diameter	8.0 mm
Bolt Area	50.3 mm ²
Bolt Mol	402.1 mm ⁴
Fatigue	430.0 MPa
Ultimate/FS	444.4 MPa

Note: actual bolt hardware has not been selected yet. Conservative properties have been assumed for 17-4SS.

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 106

Conclusions

- The latest design satisfies all strength and fatigue requirements under the proposed load cases.
- Modal analysis shows the first bending mode at 9240RPM and the first torsion mode at 15000RPM.
- The modified geometry does not show any buckling modes for the proposed load cases.
- Bolt analysis shows positive safety margins for bolts. Safety margin can be increased by selecting higher strength bolts if necessary.

Test & Verification Approach

- Requirements: SW-CDS1 through SW-CDS26
- Hardware:
 - Cockpit Display (MoTeC D175)
 - Cockpit Display Computer (MoTeC ACL)
 - Cockpit Display page switch
 - Cockpit Display faults page switch
 - CAN Bus monitor/transmitter
- Test:
 - Use simulation computer to produce signals per ICD-CEPT-005.
 - Verify accurate representation of values on display.
 - Verify accurate logic response on display.

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 121

Example

- SW-CDS14: The display shall show the highest reported BMS battery cell temperature
- Test: Use the CAN Bus monitor to send BMS CAN messages per ICD-CEPT-005. Send multiple temperature values and verify that the display indicated the highest temperature.

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 122

Test & Verification Approach

- Requirements: SW-T1
- Hardware:
 - Throttle Encoders
 - CAN Bus Monitor
- Test:
 - Use CAN Bus monitor to validate messages coming from encoder match with encoder messages defined in ICD-CEPT-005.

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 123

Test & Verification Approach

- Requirements: SW-EGSE5 through SW-EGSE7
- Hardware:
 - EGSE Computer
 - CAN Bus Monitor
- Test:
 - Use the CAN Bus monitor to validate that EGSE is able to simulate all messages described in ICD-CEPT-005.
 - Use CAN Bus monitor to validate that the EGSE can send the correct messages to configure appropriate command bus devices per product manuals.

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 124

Upcoming Work

- Finalize ICD
 - BMS/CMC messages
 - Iterate on specifics of other messages
- BMS/CMC Lab integration
- Conduct verification and validation
- Configuration control
 - CAN devices (Id's, CAN Open states etc.)
 - D175/ACL Configurations
- Aircraft Integration at AFRC

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 125

Technical Performance Metrics

- **Motor Performance Margin:** Defined as the excess torque available across the defined operating range of the motors.
PDR estimate: 10%. Prototype: ~65%. Revised spec to remove margin due to exceptional performance.
- **Controller Performance Margin:** Defined as the excess steady state power the motor controller is able to demonstrate transmitting from the tractions power bus to the motor above the defined performance spec.
PDR estimate: 10%. Prototype: ~65%.
- **Controller Processing Margin:** Defined as the percentage of spare processor capacity before task saturation would limit functionality.
PDR estimate: unknown, Current estimate: unknown. Software development is ongoing.
- **Command Bus Bandwidth Margin:** Defined as the percentage difference between bus capacity and bus utilization in the most heavily loaded bus configuration.
PDR estimate: unknown. Current estimate: 60%.
- **Battery Capacity Margin:** Defined as the percent excess energy available in the battery system following the maximum predicted reference mission energy usage.
PDR estimate: 44% for the Farasis 10-pack design. Current Estimate: ~17% in Mod II, ~34% in Mod III (upgraded battery).
- **Battery Mass Margin:** Defined as the excess allocation in kg available to the battery system from the current vehicle sizing release.
Initial estimate: (20 kg) for the Farasis 10-pack design and the Rev3/Mod3 mass distribution. Current Estimate: (37 kg).
- **Traction Power Delivery Margin:** Defined as the excess instantaneous power delivery capability in Watts available from the traction battery and power buses beyond the power required by the propulsors.
Initial estimate: unknown. Current Estimate: 144 kW in Mod II/III, 24 kW in Mod IV
- **Avionics Power Delivery Margin:** Defined as the percent excess instantaneous power delivery capability available from the battery system at the LH and RH generator buses beyond the power required by the avionics components.
Initial estimate: unknown. Current estimate: 50%.

Risk Statement

Given that the X-57 cruise motors need to exhibit high specific power, high heat rejection, and meet environmental requirements, there is a possibility that development of new motors will not meet those requirements resulting in delayed delivery of the Phase II/III/IV propulsion system (1-2 month impact to Level 1 milestone) and associated labor overruns (1%-5% of yearly project budget) and not meeting some technical objectives.

Status:

8-26-2016: Reviewed risk with RO and DPM. Added mitigation #3 to perform environmental stress screening. Reassessed mitigation #4, changed L x C from 2x5 to 1x4 and changed the Start and End dates from Jan/Feb to Feb/Mar of 2017
 3-28-2016: Reviewed risk with RO, PM, RM and established L X C, criticality, and updated mitigations. Updated and scored risk.
 3-22-2016: Transferred risk to new FDC Project format

Risk Approach: **Mitigate**

Consequence (Cost, Schedule, Technical)

Cost	2	1%-5% of yearly project budget
Schedule	4	1-2 month impact to Level 1 milestone
Technical	5	Would not meet technical objectives

Risk Action Mitigation Step / Task Description	Start Date	End Date	New L x C (Cost, Schedule, Technical)
1) Base the motor design on an existing design (maximize heritage).	Jul - 15	Nov - 15	3 x 5
2) Design the motor with performance margin (may increase cooling drag or mass).	Nov - 15	Oct - 16	2 x 5
3) Perform Environmental Stress Screening test program (ESS).	Nov - 17	Feb - 17	1 x 5
4) Reduce environmental testing requirements (increases likelihood of failure in flight).	Feb - 17	Mar - 17	1 x 4

Risk Statement

Given that the battery requirements for the X-57 vehicle has aggressive mass and energy requirements, there is a possibility that a battery system meeting these requirements will not be available, resulting in reduced X-57 vehicle mission duration and moderate impacts to technical objectives and having schedule (1-2 month impact to Level 2 milestone) and cost (1%-5% of yearly project budget) impacts.

Status:

8-26-2016: Reviewed risk with RO and DPM. No changes to report.

3-28-2016: Reviewed risk with RO, PM, RM and established L X C, criticality, and updated mitigations. Updated and scored risk.

3-22-2016: Transferred risk to new FDC Project format

Consequence (Cost, Schedule, Technical)

Cost	2	1%-5% of yearly project budget
Schedule	2	1-2 month impact to Level 2 milestone
Technical	3	Some impact to technical objectives

Risk Approach: **Mitigate**

Risk Action Mitigation Step / Task Description	Start Date	End Date	New L x C (Cost, Schedule, Technical)
1) Reduce battery longevity requirements to open battery selection options and reduce impact of model uncertainties.	Oct - 15	Feb - 16	3 x 4
2) Select higher TRL battery system to reduce development risks and performance uncertainties.	Feb - 16	Apr - 16	2 x 3
3) Increase battery system mass allocation (reduce mass allocated to other systems or increase MTOW).	Jun - 16	Oct - 16	2 x 3
4) Reduce mission energy usage (e.g., towing to runway or even towing to altitude).	Jan - 17	May - 17	2 x 2

The Electric Propulsion System may Generate EMI that the Command System Cannot Tolerate

Risk Statement

Given that the X-57 propulsion system will be switching high currents at high frequency, there is a possibility that EMI from the propulsion system will affect the command system resulting in delayed integration of the X-57 vehicle and possible lengthy troubleshooting and repairs with cost (1% - 5% of the total yearly budget) and schedule (>2 month impact to level 1 milestone) impacts as well as some impact to meeting technical objectives.

Status:

8-26-2016: Reviewed risk with RO and DPM. No changes to report.

3-28-2016: Reviewed risk with RO, PM, RM and established L X C, criticality, and updated mitigations. Updated and scored risk.

3-22-2016: Transferred risk to new FDC Project format

Consequence (Cost, Schedule, Technical)

Cost	2	1% - 5% of the total yearly budget
Schedule	5	>2 month impact to level 1 milestone
Technical	3	Some impact to technical objectives

Risk Approach: **Mitigate**

Risk Action Mitigation Step / Task Description	Start Date	End Date	New L x C (Cost, Schedule, Technical)
1) Use EMC guidelines in design and installation.	Oct - 15	Oct - 16	3 x 5
2) Use flight proven hardware to the extent possible.	Oct - 16	Feb - 17	3 x 4
3) Conduct EMI testing on components.	Oct - 16	Feb - 17	3 x 4
4) Use innovative routing and shielding techniques in vehicle.	Mar - 17	Jun - 17	2 x 4
5) Evaluate EMI during integrated system tests.	Jun - 17	Oct - 17	1 x 4

SCEPTOR Hazard Analysis

Hazard Summary (Power and Command)

- X-57 HR-1 Aircraft Traction Battery Fire
 - X-57 HR-3 Traction Bus Failure
 - X-57 HR-8 Uncommanded Thrust
 - X-57 HR-14 Avionics Bus Failure
 - X-57 HR-19 Electromagnetic Interference in Flight
 - X-57 HR-24 Inadvertent Cruise Motor Propeller Rotation
-

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 131

HR-1 Aircraft Traction Battery Fire

This hazard pertains to the experimental power source that provides 461 VDC to the propulsion system via the Traction Bus, as well as, power to the Avionics Bus via DC/DC Converters. The power source is made-up of 8 battery modules and 2 BMS control modules, and is located within the aircraft cabin aft of the pilot. Each battery module consists of 640 Samsung 18650 lithium-ion NCA cells, arranged in a 32s20p configuration. During system discharge, i.e. ground tests/flight ops; battery charging and handling; and aircraft maintenance, a battery fire could occur.

Causes	Effects	Mitigations
A. Cell design flaw	• Loss of power	1. Environmental lot testing of cells (AB)
B. Cell manufacturing Defect	• Ejection of hazardous material	2. Select cells and manufacturer with proven design and fabrication process (AB)
C. Cell Aging		3. Track cell performance throughout battery lifetime (ABCHI)
D. Cell packaging design flaw		4. System design will protect cells from external shorting and physical damage (FIJ)
E. Inadequate design/manufacturer defect (battery module)	• Cockpit contamination	5. Validate charger performance and safeguards before use with batteries (G)
F. External/environmental abuse of cells (thermal/mechanical)	• Damage or loss of aircraft	6. Restrict cell operating and storage environment and ensure environmental limits are maintained (FH)
G. Over charging (current/voltage)	• Damage to ground assets	7. Visual inspection after every charge and discharge cycle (HIJ)
H. Battery exceeds temperature limits (operation/storage)	• Injury or death to personnel	8. Batteries will handled by trained and qualified personnel in accordance with SCEPTOR and Center wide procedures (FIJ)
I. Battery structure degraded by mechanical abuse		9. Validate BMS performance and safeguards (GH)
J. External battery shorting		10. Peer review of design (DE)
		11. Environmental acceptance and qualification testing (ABCDEF)

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 132

HR-3 Traction Bus Failure

This hazard pertains to ground and flight operations. The SCEPTOR Traction bus provides high voltage power (461 VDC) from the SCEPTOR experimental power source to the aircraft's propulsors. The bus is routed through the baseline Tecnam wing in Mod II and the experimental wing in Mod III. During system operation, i.e. ground tests/flight ops, and aircraft maintenance, a traction bus failure could occur.

Causes	Effects	Mitigations
A. Electrical short	• Loss of essential avionics power	1. Design avionics bus for single fault tolerance (ABCDE)
B. Wiring defect	• Total loss of aircraft power	2. Ground test (CST) (ABCDEFGHI)
C. Design error	• Motor failure	3. Grounding checks (GH)
D. Circuit protection component failure	• Propeller governor failure	4. Design with margin (de-rate power system) (CDF)
E. Installation error	• Fire	5. Quality control process (BEI)
F. External/environmental abuse (thermal/mechanical)	• Damage or Loss of aircraft	6. Peer review of design (C)
G. Ground isolation fault	• Damage to ground assets	7. VFR operations only (J)
H. Inadequate grounding	• Injury or death to personnel	8. Perform visual inspection of system components (ABDEF)
I. Operational/procedural error		9. Adhere to SCEPTOR operational placards and procedures (EFHIJ)
J. Lightning strike		

HR-8 Uncommanded Thrust

This hazard pertains to a deviation from a commanded thrust input due to a failure in either a hardware or software system or subsystem. Of particular concern, asymmetric thrust may occur from a single propulsor failure in the Mod III configuration due to the location of the aircraft's propulsors on the experimental wing. Uncommanded thrust could occur during flight operations including ground roll through take-off and landing.

Causes	Effects	Mitigations
A. Failure in throttle control hardware (throttle levers or throttle linkage)	• Asymmetric thrust (if failure affects single propulsor)	1. Use Tecnam heritage thrust command system (throttle levers and cockpit switches) (AB)
B. Failure in motor controller enable logic	• Uncommanded aircraft motion or acceleration	2. Redundancy in throttle encoder (C)
C. Failure of throttle encoder	• Loss of vehicle control	3. Configure motor controllers to perform a graceful shutdown in response to loss of communication (C)
D. Failure of motor controller	• Damage to aircraft	4. Peer review of design (ABCD)
	• Damage to ground assets	5. Ground test (CST) (ABCD)
	• Injury or death to personnel	6. V & V (to include software) (ABCD)
		7. Taxi tests (ABCD)

HR-14 Avionics Bus Failure

This hazard pertains to ground and flight operations. The SCEPTOR Avionics Bus, including the Wing Avionics Bus provide low voltage power (14 VDC) from the SCEPTOR experimental power source (via DC/DC converters) to the aircraft's avionics system. The bus is routed through the aircraft's fuselage to the baseline Tecnam wing in Mod II and the experimental wing in Mod III. During system operation, i.e. ground tests/flight ops, and aircraft maintenance, a avionics bus failure could occur.

Causes	Effects	Mitigations
A. Traction Battery System Failure	<ul style="list-style-type: none"> Loss of instrumentation system Loss of cockpit instruments Loss of throttle control Loss of propeller pitch control Loss of flap control Loss of rudder trim control Damage of aircraft Injury to personnel 	<ol style="list-style-type: none"> Peer review of design (F) Backup battery (lead acid) powers avionics essential bus (ABCDE) Maintaining stock Tecnam bus architecture (redundancy, isolation, protection and battery powered essential bus) (ABCDE) Audio and visual alarm to alert pilot of degraded system condition and potential hazard (A)
B. Avionics DC converter failure		
C. Avionics/electrical component fault		
D. Instrumentation system fault		
E. Faulty wiring		
F. Inadequate design		

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 135

HR-19 Electromagnetic Interference in Flight

The X-57 vehicle's electric propulsion system is orders of magnitude higher power than typical GA electrical systems. It relies on a power bus with DC voltage supplying loads (motor controllers) that exhibit high frequency switching. This can potentially lead to radiated and conducted electromagnetic interference (EMI) onto other aircraft systems such as the Command system and the Instrumentation system.

Causes	Effects	Mitigations
A. Traction power bus not electromagnetically compatible with avionics and instrumentation	<ul style="list-style-type: none"> Interrupted/corrupted communication of the Throttle Lever Angle (TLA) signal from the throttle encoder to the motor controllers Interrupted/corrupted communication of the propeller control from the speed controller to the propeller actuators Interrupted communication of the motor controller state to the cockpit display and instrumentation Interrupted/corrupted measurement of sensor data to the Data Acquisition System Interruption of data bus communication between Data Acquisition Systems Interruption of communication of data to transmitter and recorder Intermittent radio communication 	<ol style="list-style-type: none"> Ground test (CST) to evaluate EMC (ABCDEF) Peer reviews of design (Power, Command and Instrumentation Subsystems) (ABCDEF) Perform bench tests of subsystems with increasing complexity (DF) Use industry best practices for shielding, grounding and termination (ABCEF) Select EMI-hardened components (DEF) Utilized lessons learned from LEAPTech, HEIST, Airvolt and other projects to influence future SCEPTOR designs (ABCDEF)
B. Cruise motors not electromagnetically compatible with avionics and instrumentation		
C. Avionics/Instrumentation components insufficiently shielded, grounded/segreated		
D. Avionics/instrumentation components unsuitable for flight environment		
E. Aircraft susceptible to external sources of radiated emissions (range, chase aircraft)		
F. Aircraft susceptible to internal sources of radiated emissions (Communication system)		

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 136

HR-24 Inadvertent Cruise Motor Propeller Rotation

This hazard pertains to unintended rotation of the cruise motor propellers during ground operations. Damage to assets and/or personnel injury could occur in the event of inadvertent propeller rotation.

Causes	Effects	Mitigations
A. Inadequate design	• Damage to propellers	1. Peer review of design (ACD)
B. Erroneous command; crew input	• Damage to aircraft	2. Adhere to SCEPTOR procedures, mission rules, fact sheets and updated POH (B)
C. Motor controller fault	• Scattering debris	3. Multiple hardware actions required to energize system (ABCD)
D. GSE (Test laptop) fault	• Damage to ground assets	4. Propeller tether/tie-down (E)
E. Wind	• Injury or death to personnel	5. SCEPTOR procedures to include safety critical cautions and warnings (BCDE)
		6. System to be operated by trained personnel only (B)

Issues & Resolutions

Issue	Resolution Plan
CMC Software not yet baselined	CMC Hardware design is complete, team is refocusing on software development and V&V now
Motor prototype testing not completed	More testing with prototype motor planned and will feed into final flight design in the next couple weeks
Subsystem drawings are not released	Subsystem-level drawings will be delivered by contractor with the vehicle, components such as Battery System items and Cruise Motor/Inverter are being fabricated to released component drawings
Traction power cable is non-standard	Have coordinated potential waivers with AFRC-O, will not use PVC coatings

Major Accomplishments

- Peer reviews of every major subsystem or component
- EMI risk reduction testing completed at GRC/NEAT
- Motor/inverter prototype built and tested
- Selected a Battery System integrator, awarded three separate contract tasks
- Traction bus selection/integration into Mod III Wing

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 139

Go Forward Plan

- Finalize design of the PPC Flat cable, pre-chargers
- Confirm availability/lead time of the contactors
- Finalize Command System ICD
- Build flight hardware (cruise motors/controllers, batteries, power pallets, command system, etc.)
- Functional, acceptance, qualification testing
- Integrate systems into Mod II vehicle, complete system testing

SCEPTOR PDR Nov. 12-13 2015

Session 7, Power and Command IPT 140

Schedule to Mod II FRR

Exit Criteria

Subsystem Level Exit Criteria	Evidence
Detailed design is shown to meet the subsystem requirements with adequate technical margins	17–125
Subsystem level design is stable and adequate documentation exists to proceed to the next phase	3
Subsystem interface control documents are sufficiently mature to proceed to the next phase, and plans are in place to manage any open items	11–13, 140
Subsystem technical risks are identified and mitigation strategies defined	127–130, 138
Test, verification, and integration plans are sufficient to progress into the next phase	44–46, 71, 78, 124
Final hazards adequately addressed and considered in the detailed design	131–137

Project MML & Mod MML

- Utilizing a Project Master Measurement List (MML) to:
 - Track all measurements from Mods II through IV (designate which Mods each measurement applies to)
 - Used as configuration control for X-57's measurements
- Utilizing a Mod MML (currently only maintaining Mod II MML)
 - Contains only measurements for Mod II
 - Uses format that eases transition from MML to configuration files (MATLAB script in works that will translate Mod MML into TTC Configuration)

Session 8, Instrumentation IPT 23

Technical Performance Metrics

- Available to Required Bandwidth
 - Current Total Mod IV Estimated BW – 5.04 Mbps
 - CAIS Bus BW Limit – 5 Mbps each
 - Recorder BW Limit – 10 Mbps each
 - Transmitter BW Limit – 5 Mbps
 - Frequency Scheduling – ~12 MHz up to 15MHz
- Available to Required Power Consumption – ~550 W required; 800 W Available

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 24

Instrumentation System Details

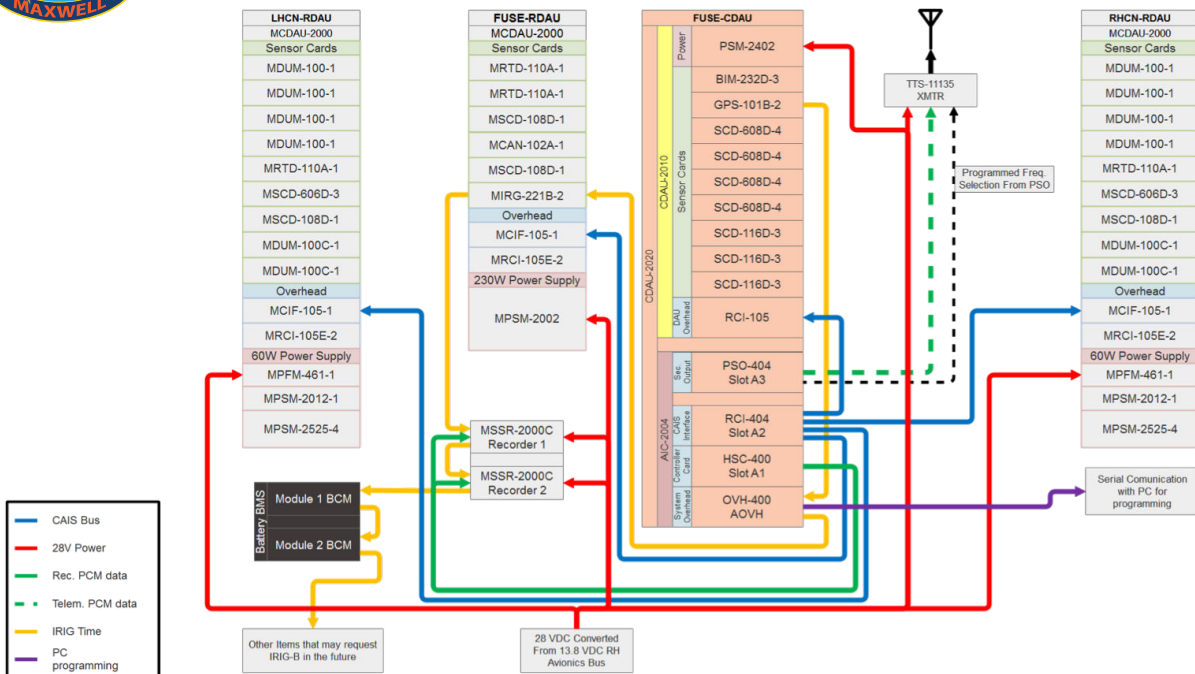

- Measurements
- Technical Performance Metrics
- Instrumentation Architecture
- Sensor Selections

- GSE Requirements
- Standards & Processes

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 25

Mod II DAU Architecture

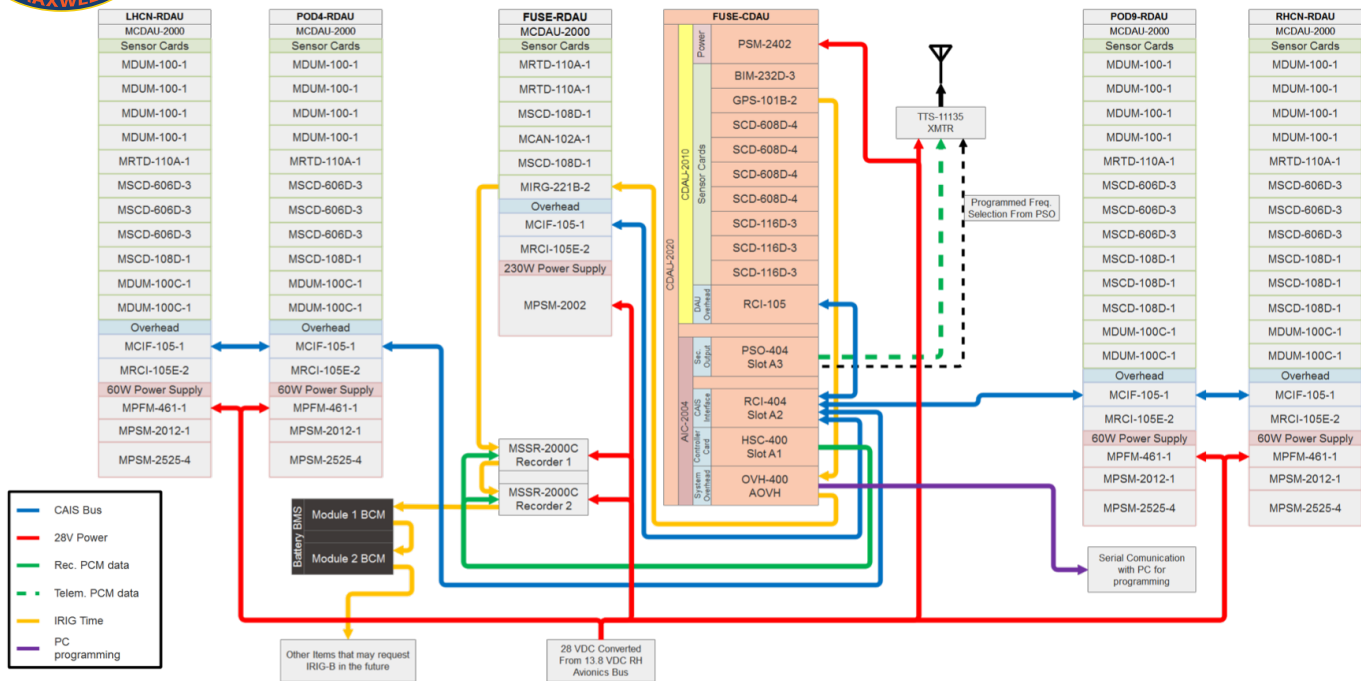

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 26

Mod III/IV DAU Architecture

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 27

Architecture Components

- CAIS bus compatible units
 - CDAU "CAIS" DAU
 - MCDAU "Miniature" CDAU
- PCM NRZL & others output
- Single point RS232/422 programming interface
- CDAU capable of 20Mb/s
 - CDAU 2020 unit accepts up to 4 CAIS bus's at 5Mb/s
- MCDAU capable of 5Mb/s each
- CDAU will be used as master unit
- MCDAUs will be slave units

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 28

Architecture Components

- Transmitter: TTS-11135
 - Ruggedized
 - 100g vibration
 - 100g 11ns Peak
 - 5W AC coupled transmitter
 - Selectable carrier frequency
 - 2200.5 to 2299.5 MHz
 - Requires Large Heatsink
 - Capable up to 5Mb/s
 - Maybe further rate limits bandwidth reservation concerns

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 29

Architecture Components

- Solid State Recorder: TTC MSSR-2000C (two stand alone units)
 - Internal Power conditioning from 28V aircraft supply
 - 10Mb/s Bandwidth
 - Each hold two Solid State recorder cards
 - Each Card has 64G of storage space
 - HSC capable of outputting two mirrored 10Mb/s Streams
 - If total bandwidth goes over 10Mb/s HSC can output two custom streams(Not anticipated)

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 30

Instrumentation Power

- CUI Inc. VHK200W-Q24-S28
 - Input range of 10-36VDC
 - Output 200W at 28VDC
 - Remote on/off
 - Over current/voltage/temperature protections
 - Short circuit protection
 - Built in heatsink

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 31

Architecture Components

- Equipment Pallet
 - All Fuselage DAUs
 - Motec ACL
 - Recorders
 - Propeller controllers
 - Transmitter
 - UHF Radio
 - 13.8VDC-28VDC converters
- No structural issues
 - ~54lbs < 200lbs Passenger
 - Lowest margin of safety = 8.6 for CDAU bolts on 18g forward crash load

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 32

Wire Routing

- Internal Structure of MOD 2 Wing will provide ample space for wiring
- Adhesive cable ties

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 33

Wire Routing

- Instrumentation Duct installed in MOD 3/4 wing
- Protection from elements
- Additional wires can be run easily
- No need for securing at intervals inside ducting
- Will secure harness in pods if needed

Instrumentation duct
Zig-Zagged for Traction
Bus drop downs

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 34

Serial Communication

- Advanced Navigation INS unit requires serial communication
- BIM232D-3: 4CH input, allows custom programming as well as standard Serial input.
- Program TTC card using manufacturer supplied bit mapping

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 35

Time Distribution

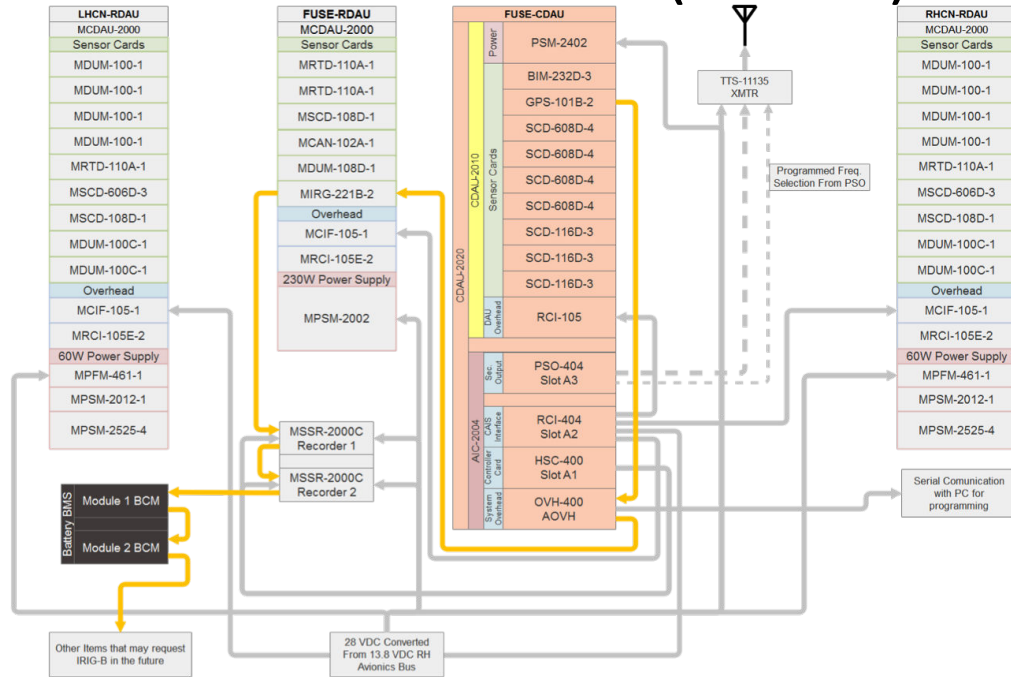

- Time source will be TTC GPS module (GPS-101B)
 - Internal oscillator used to produce IRIG-B AC and DC signals
 - Time increases monotonically from zero until GPS lock acquired, then syncs to GPS/UTC time
 - IRIG-B has absolute accuracy/precision of 0.1 sec WRT UTC time; relative accuracy/precision between synchronized devices is approximately 1 μ sec
- IRIG output is daisy-chained to any devices requiring synchronization
 - MDAU with CAN Card
 - Recorders
 - Battery BMS
- CAIS bus and remote DAU time synchronization is provided by the master CAIS controller modules
 - Only remote DAU's with bus modules (RS-422, CAN, etc) require direct IRIG-B input

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 36

Time Distribution (Mod II)

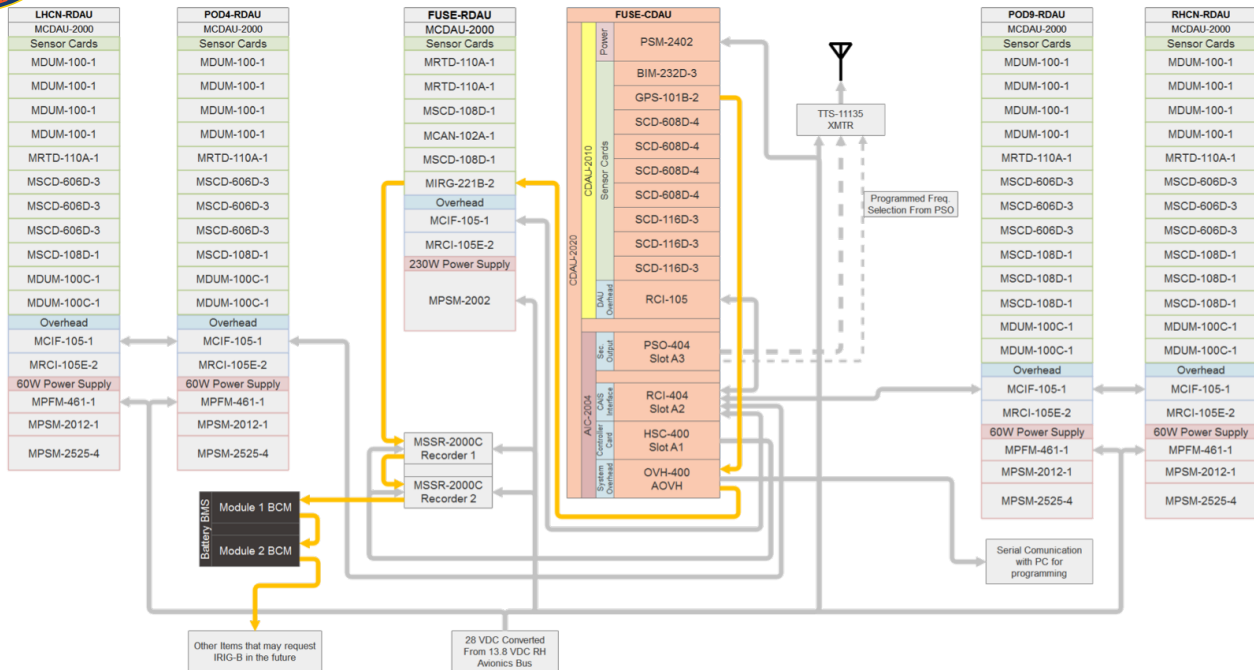

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 37

Time Distribution (Mod III/IV)

SCEPTOR CDR Nov 15-17 2016

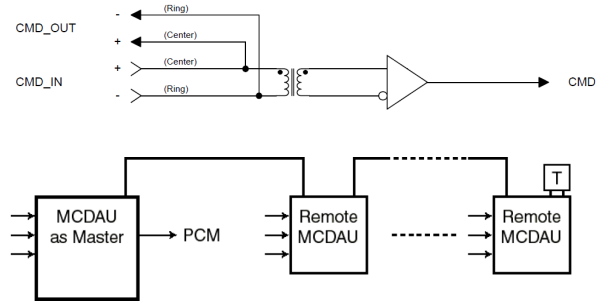

Session 8, Instrumentation IPT 38

CAIS Bus

Common Airborne Instrumentation System

- Single Standard for communication between multiple data acquisition units
- Full duplex communication network of up to 60 units in series
- Star/Daisy chain Hybrid
- Command response
- Triax or shielded twisted pair
- 75ohm termination resistor

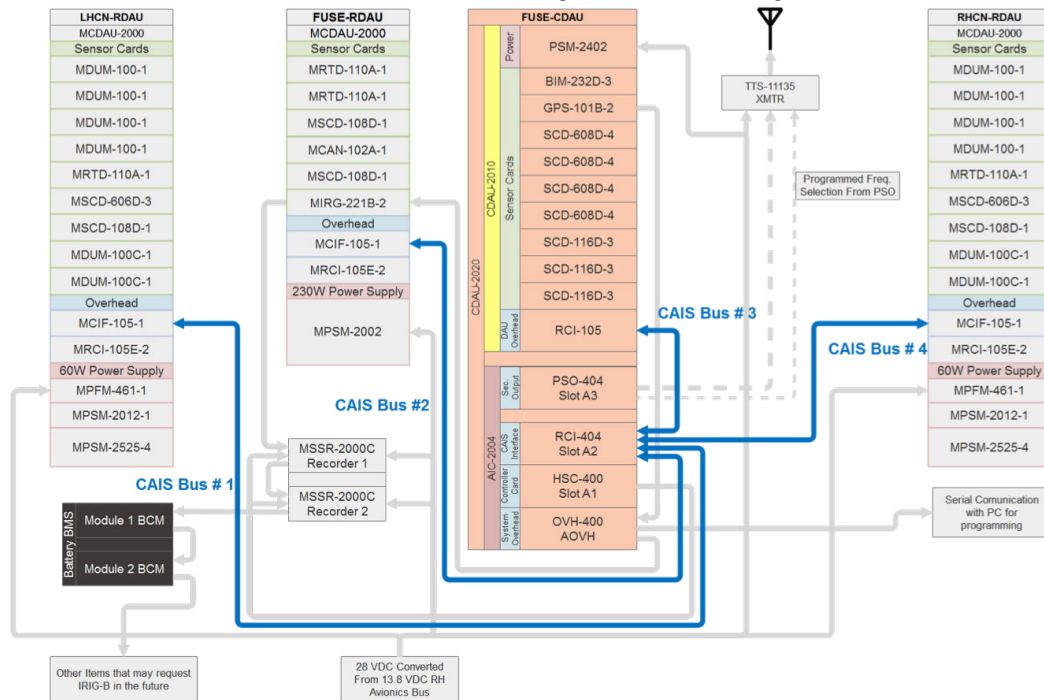

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 39

CAIS Bus (Mod II)

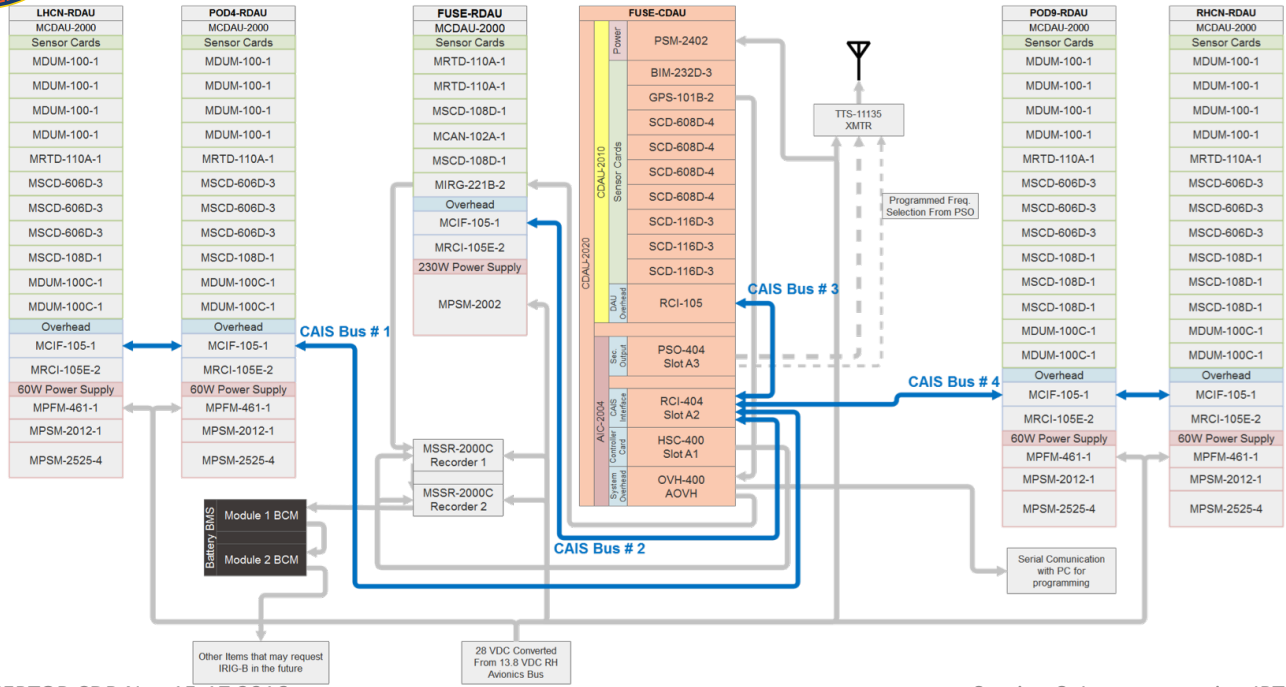

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 40

CAIS Bus (Mod III/IV)

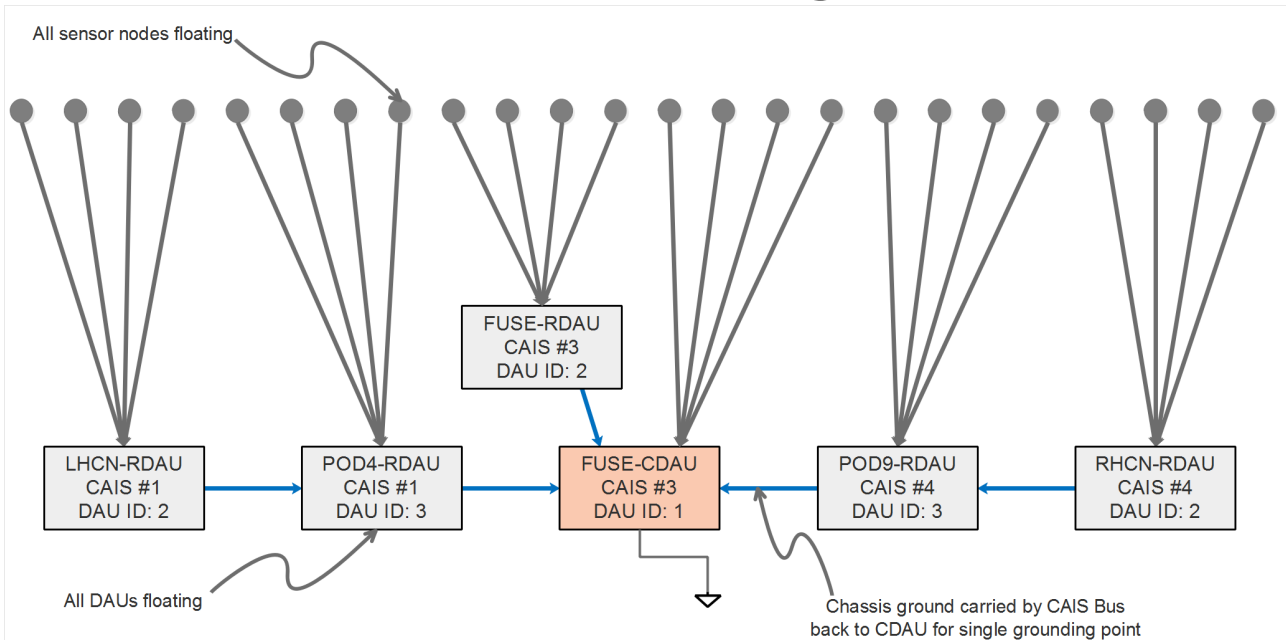

SCEPTOR CDR Nov 15-17 2016

CAIS Bus Grounding Scheme

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 42

Instrumentation System Details

Measurements
Technical Performance Metrics
Instrumentation Architecture
Sensor Selections
Drawings
GSE Requirements
Standards & Processes

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 43

Traction System Information

- Battery Information (CAN)
 - Multiple channels of information required by BMS but not required to be monitored or recorded
 - Paired down version of those signals will be recorded
- DC-DC converter Faults (CAN)
 - Over temp
 - Over voltage
 - Over current

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 44

Traction System Information

- Motor Controller Currents & Voltages From (CAN)
 - DC Bus input current and voltage
 - Reported by each controller
 - AC 3-Phase Current and Voltages
 - Reported by each controller
 - 3 AC Peak Current Signals/controller (Current on phases A,B, & C)
 - 3 AC Peak Voltage Signals/controller (Voltages between phase pairs AB,BC, & CA)

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 45

Traction System Information

- DEP Motor Controller Currents & Voltages (CAN)
 - DC Bus input current and voltage
 - Reported by each DEP controller (1 per DEP pod)
 - AC 3-Phase Current and Voltages
 - Reported by each DEP controller (1 per nacelle)
 - 3 AC Current Signal/DEP pod (Current on phases A,B, & C)
 - 3 AC Voltage Signal/DEP pod (Voltages between phase pairs AB,BC, & CA)

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 46

Traction System Information

- Analog Reading of Traction Bus Voltage and Current
 - DC Bus current and voltage measured on Power Pallet.
 - Pallet A: Traction Bus/Battery Module A left and right wing branches.
 - Pallet B: Traction Bus/Battery Module B left and right wing branches.
 - Current and Voltages Used for Bus Power
 - 4 power modules installed in right instrumentation panel.
 - Each module outputs analog current and voltage for logging in TTC system.

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 47

RPM Measurement

- RPM pulled from controllers on CAN bus
- Redundant, Independent RPM measurement required
 - Magnets in circular array built into motor structure
 - Extra line for Hall effect sensor split to feed data to instrument panel tachometer and DAQ
 - Independent of MT prop controller loop

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 48

Blade Angle: Control

- Use of slip ring to pass current through motor core
 - CHS-12-rated to 3000RPM
12channels
 - 4 conductors in use for DC power to propeller angle motor (2 for +DC and 2 for – DC)
 - Other 8 conductors available for sensor wires

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 49

Blade Angle: Measurement

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 50

Sensors on CAN

- Cruise Propeller Angle (All MODs)
 - 10V Supply to a Hall effect sensor

- DEP Propellers fold status (MOD 4 Proposed)
 - Simple momentary switch
 - 1 of 10 single ended Inputs in SVIM with a 0 to 5V range

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 51

Control Deflections

- Control surface deflections to be measured:
 - Elevator, rudder, ailerons, pitch trim, rudder trim, flaps
- String pots tied to control surface linkages
- String pot mounted to bottom of custom panels or internal structure adjacent to control surface linkages

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 52

Control Deflections

- Access panel near empennage allows access:

- Elevator
- Rudder
- Pitch trim

Access hatch on aircraft here (not shown).

- Access panel under pilot seat allowed access:

- Ailerons

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 53

Control Deflections

- Mounted in empennage
 - CPT mounted adjacent to rudder trim actuator

- M150 string pot bolted to bracket
- Eyelet Bracket bonded to arm
- Bracket bonded to surface

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 54

Control Deflections

- Hole in overhead frame allowed for flap string pot mount
- Similar mounting strategy to Tecnam factory flap angle sensor

Nylon rubber spacers expand into inner face of hole as plates compress, constraining rotation and translation.

Arm to pull string affixed to flap control tube

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 55

Control Deflections

- Access Hatch in rear section of wing for access to flap mechanism
 - String potentiometer attached to flap hardware

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 56

Control Deflections

- Throttle Commands
 - CAN enabled throttle encoder passes throttle position to CAN bus.
- Landing Gear Status
 - Monitoring current gear status switches

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 57

Strain Gages

- All strain gauges model number to be selected and installed by NASA AFRC Flight Loads Lab
- Possible arrangements
 - Torsion Bridge
 - Bending by use of two axial strain bridges
 - Standard Bending Bridge

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 58

Tail Strain Gages

- Tail strain gages
 - MOD II
 - Monitoring stresses on the tail for baseline flight data
 - MOD III/IV
 - Monitoring stresses to understand new wing and propulsion systems effect on tail control surfaces
 - Safety
 - Vishay WK-13-250US-350 and WK-13-125PC-350 Option W
 - No calibration required

SCEPTOR CDR Nov 15-17 2016

Pull Force Strain Gages

- Stabilator linkage tube
 - Pull forces from pilot

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 60

Pull Force Strain Gages

- Vishay WK-13-125PC-350 Option W
 - Current choice

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 61

Wing Strain Gages

- Bending at 3 locations 11ch each
 - Transverse bending seen in FEA
 - Root, 1/3, and 2/3 semi span

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 62

Motor Reaction Strain Gages

- Bending at each Motor Pod (2 Ch each)
- Torsion in Cruise Pod Structure (2Ch)

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 63

Motor Reaction Strain Gages

- Bending at each DEP Motor Pod (2 Ch each Pod)

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 64

Motor Reaction Strain Gages

- Torsion on cruise pod structure (2 Ch each Pod)

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 65

AC Accelerometers

- IEPE AC Accelerometers
 - PCB Model 354C03
 - Measurement Range +/-50g
 - 10mV/g, 0.5 to 2k HZ
 - 6000RPM → 100Hz → 500 SPS

MOD 2
Configuration

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 66

AC Accelerometers

- IEPE AC Accelerometers
 - PCB Model 354C03
 - Measurement Range +/-50g
 - 10mV/g, 0.5 to 2k HZ
 - 6000RPM → 100Hz → 500 SPS

MOD 3/4 Configuration

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 67

DC Accelerometers (All Mods)

- DC Accelerometers
 - PCB Model 3741E1250G
 - Measurement range +/-50g
 - 80mV/g, 0 to 1k Hz
 - 6000RPM → 100Hz → 500 SPS

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 68

DC Accelerometers (All Mods)

- DC Accelerometers
 - PCB Model 3741E1250G
 - Measurement range +/-50g
 - 80mV/g, 0 to 1k Hz
 - 6000RPM → 100Hz → 500 SPS

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 69

DC Accelerometers (Mod III/IV)

- DC Accelerometers
 - PCB Model 3741E1250G
 - Measurement range +/-50g
 - 80mV/g, 0 to 1k Hz
 - 6000RPM → 100Hz → 500 SPS

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 70

Accelerometer/Strain DAU Assignment (Mod III/IV)

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 71

Aerodynamic

- Air Data probe
 - Standard method with historical use case
 - Static and Stagnation pressures [**50 SPS**]
 - AoA & AoS from Potentiometers attached to vanes [**20 SPS**]
- High precision unit provided by NASA
- Need for longer boom to get most rear sensor 3ft in front of nose
- TAT Sensor for free stream temperature

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 72

Aerodynamic

- Pressure scanner and high speed pressure transducers
 - Used for diagnostics/recommendation based on CFD
 - Space on MDAUS reserved
 - Extra cards when location of measurement is defined.

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 73

Navigation

- Dual GPS Antennas
 - Located along long axis to derive real time bearing data
 - Metal ground plane if mounting location requires it
- Centrally located IMU unit
 - Mounted near rear seat belt mounting location
 - Programmable via USB to give offset coordinates

SCEPTOR CDR Nov 15-17 2016

Mod II LH MCDAU Encoder Slot X Wiring (one drwg per slot)	X57-57XXX
Mod II RH MCDAU Encoder Slot X Wiring (one drwg per slot)	X57-57XXX

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 79

GSE Requirements

- Only EGSE required (no requirement for mechanical GSE):
 - 13.8 VDC power supply, capable of providing 500W to power entire instrumentation system during checkouts (as backup source in case 13.8 VDC Avionics bus unavailable)
 - Laptop with serial port or USB port with RS232-USB adaptor
 - Used for loading configuration file to data acquisition system
 - Used for reading PCM data through hard-link connection
 - Software
 - TTCWare
 - Omega
 - PCM decom brick (with USB output)

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 80

Standards/Processes

- Software Management
 - Practiced this with Rental Activity and LEAPTech
 - Use AFRC's GitLab repository as integrated DR, CCR, and code repository
 - Track TTC, CIMS, Omega project files
 - Used consistent naming convention: new date to indicate hardware/TM map change, new letter (rev) to indicate soft changes (calibration coef., derived parameters, etc.)
- ETP-CEPT-007 – Environmental Test Plan
 - Derives from DCP-O-018 and DO-160
- TP-CEPT-001 – Instrumentation Integration & Test Plan

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 81

Test & Verification Approach

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 82

Test & Verification Approach

- Detailed test plans laid out in TP-CEPT-001
- Component/Subsystem Testing
 - Bench functional checks of all components
 - Build-up approach, start with quick functional check of individual components, build up and test data acquisition system in steps
 - Environmental testing of applicable components (subcontracted to outside test site by ESAero)
 - Excludes accelerometers, RTDs, strain gages, antennas, and CPTs

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 83

Test & Verification Approach

- Required calibrations occur in parallel with installation efforts
 - Before installation: accelerometers, RTDs, Hall Effect sensors (prop angle), RPM sensors, voltage transducers
 - After installation: pressure transducers (pitot boom, steady/unsteady pressures [if installed]), control surface deflections (CPTs), pull-force strain gages (on stabilator linkage)
 - May have to rely on manufacturer calibration for some items (e.g. current transducers)

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 84

Test & Verification Approach

- V&V and System Level Testing
 - Post-installation instrumentation system checkouts (performed at Scaled)
 - Also performed at AFRC after aircraft arrival to ensure functionality after transport and verify measurement, data acquisition, and EGSE requirements
 - Hangar Radiation Test and Combined Systems Test procedures to be written and performed at AFRC
 - Pre-Flight/Post-Flight procedures to be written and performed at AFRC

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 87

Lessons Learned

- Lessons Learned from LEAPTech and Mod I ([presented at PDR](#))
 - Must place access panels in a way that allows for non-destructive modification/part replacement
 - CAD model Wing Instrumentation to track volume available/used
 - Take advantage of distributed DAUs to minimize harness volume
 - Knowledge of how to route wire in Tecnam fuselage and instrument basic airframe & controls
 - Must use proper connector and harness shielding to protect data from EMI caused by motors

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 88

Lessons Learned

- Lessons Learned from LEAPTech and Mod I ([presented at PDR](#))
 - Must place access panels in a way that allows for non-destructive modification/part replacement
 - Will utilize a duct in the wing dedicated to instrumentation harnessing, access to duct available at each DEP nacelle to allow harnessing to be fed through
 - Space reserved in nacelles for MDAU's and pressure scanners
 - CAD model Wing Instrumentation to track volume available/used
 - CAD models for MDAU's and pressure scanners were created and delivered to Xperimental to ensure available space during wing design
 - Take advantage of distributed DAUs to minimize harness volume
 - Placing four remote DAUs in wing (two left, two right); also taking advantage of motor controller data available on CANBus

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 89

Lessons Learned

- Lessons Learned from LEAPTech and Mod I ([presented at PDR](#))
 - Knowledge of how to route wire in Tecnam fuselage and instrument basic airframe & controls
 - Current designs for control surfaces measurements and fuselage wire routing leverage those used in Mod I
 - Must use proper connector and harness shielding to protect data from EMI caused by motors
 - Grounding DAU's via CAIS harnesses
 - Using differential signals where possible

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 90

X-57 – Instrumentation Failure During Ground or Flight Testing Causes Loss Of Mission or Data

RISK ID
SC13
Risk Owner
Ethan Nieman
Trend
➔
Criticality
High
Original L x C
4 x 5
Current L x C
4 x 5
Target L x C
3 x 2
Open Date
3-22-2016
Closed Date

Risk Statement
 Given the likelihood of an instrumentation failure during ground or flight test, there is a possibility of needing to replace a component or subsystem, resulting in significant cost (1% - 2% of the total yearly budget), schedule (>2 month impact to level 1 milestone), and technical (moderate impact to project technical objectives) impacts.

Consequence (Cost, Schedule, Technical)		
Cost	2	1% - 2% of the total yearly budget
Schedule	5	>2 month impact to level 1 milestone
Technical	4	Moderate impact to project technical objectives

Status
 10-24-2016: Reviewed with PM, DPM, RO, CE, and SE. Changed Risk title. Mitigation 2: Changed end date from Oct -16 to Nov -16. Added Mitigation 3.
 8-18-2016: DPM and RO; Changed name to "Major Instrumentation Failure". Removed redundant sensors mitigation.
 3-23-2016: Reviewed risk with RO, PM, OE, CE, Systems Engineer and established L X C, criticality, and updated mitigations. Updated and scored risk.
 3-22-2016: Transferred risk to new FDC Project format

Risk Approach: Mitigate

Risk Action Mitigation Step / Task Description	Cost to Implement (if exceeds current budget)	Start Date	End Date	New L x C (Cost, Schedule, Technical)
1) Purchase critical spare instrumentation components		Jul - 16	Sep - 17	4 x 2
2) Identify existing NASA assets that can be reserved as spares		Nov -15	Nov - 16	4 x 2
3) Install redundant sensors in critical locations		Oct -16	Oct -20	3 x 2

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 92

X-57 - Purchasing DAQ Hardware Before CDR

RISK ID
SC14
Risk Owner
Ethan Nieman
Trend
Criticality
Medium
Original L x C
3 x 5
Current L x C
2 x 5
Target L x C
1 x 4
Open Date
3-22-16
Closed Date

Risk Statement
 Given that the project is procuring DAQ hardware prior to CDR, there is a possibility of selecting an inadequate system, resulting in the need to purchase a different system or additional components with cost (1% - 2% of the total yearly budget) and schedule (>2 month impact to level 1 milestone) impacts as well as some impact to meeting technical objectives.

Consequence (Cost, Schedule, Technical)	
Cost	2
Schedule	5
Technical	3

Statu
 10-24-2016: Reviewed with PM, DPM, RO, CE, and SE. Mitigation 1 complete. Mitigation 2: Changed end date from Oct to Nov.
 8-18-2016: Reviewed risk with RO and DPM; no changes
 3-23-2016: Reviewed risk with RO, PM, OE, CE, Systems Engineer and established L X C, criticality, and updated mitigations. Updated and scored risk.
 3-22-2016: Transferred risk to new FDC Project format

Risk Approach: Mitigate				
Risk Action	Cost to Implement	Start Date	End Date	New L x C
Mitigation Step / Task Description	(if exceeds current budget)			(Cost, Schedule, Technical)
1) Conduct System Table Top Review (STTR) prior to procuring long lead items.		Dec - 15	Dec - 15	2 x 5
2) Design a flexible architecture (spare channels where possible, choice of TM data rates, etc.).		May - 15	Nov - 16	1 x 4

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 93

X-57 – EMI/EMC Renders Instrumentation Data Unusable

RISK ID
SC15
Risk Owner
Ethan Nieman
Trend
Criticality
High
Original L x C
4 x 5
Current L x C
4 x 5
Target L x C
3 x 4
Open Date
3-24-2016
Closed Date

Risk Statement
 Given that EMI/EMC issues may be discovered during development, it is possible that they may result in noise or damage that makes the instrumentation data unusable, resulting in lengthy trouble shooting and repairs with cost (1% - 5% of the total yearly budget) and schedule (>2 month impact to level 1 milestone) impacts as well as some impact to meeting technical objectives.

Consequence (Cost, Schedule, Technical)	
Cost	2
Schedule	5
Technical	3

Statu
 10-24-2016: Reviewed with PM, DPM, RO, CE, and SE. Mitigation 1: changed start date from Oct -16 to Mar-17. Mitigation 2: changed start date from Oct to Nov. Mitigation 3: changed end date form Oct to Nov.
 8-18-2016: Reviewed with RO and DPM. Added Start and End dates and L x C values. Changed cost for AirVolt mitigation to In budget.
 3-24-2016: Opened risk, developed risk statement and started working on mitigations. Need to score risk and complete mitigation steps during next risk meeting.

Risk Approach: Mitigate				
Risk Action	Cost to Implement	Start Date	End Date	New L x C
Mitigation Step / Task Description	(if exceeds current budget)			(Cost, Schedule, Technical)
1) Conduct development test using AirVolt motor/propeller test stand		Mar - 17	April -17	3 x 5
2) Use build-up development and test approach		Nov - 16	End of Project	3 x 4
3) Design for EMC		May - 16	Nov -16	3 x 4

Issues & Resolutions

Issue	Resolution Plan
Volume Available/Accessibility in Wing (from PDR)	Access via each DEP nacelles, wing MDAUs to be located in DEP nacelle and Cruise nacelle; wing harnesses to be routed through dedicated duct
EMI (from PDR)	Implement appropriate shielding with harnesses and connectors; minimize wire length where possible; plan for developing grounding diagrams

Major Accomplishments

- Completed baseline of project MML
- Baseline encoder layout for each DAQ remote
- Down-selection of sensors/components
- Started tracking MDAUs (and other equipment) volume/location via solid models
- Completed subsystem Peer Review in July

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 97

Go Forward Plan

- Complete Functional and Environmental Testing
- Develop control room displays
- Complete Mod II integration with aircraft (at Scaled)
 - Complete calibrations and post-integration functional check-out
- Complete system-level testing
 - Instrumentation requirements verification
 - Hangar Radiation Testing and Combined Systems Test
- Mod III design
 - Generate Mod III MML
 - Baseline drawings & functional test procedures

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 98

Exit Criteria

Subsystem Level Exit Criteria	Evidence
Detailed design is shown to meet the subsystem requirements with adequate technical margins	20-24
Subsystem level design is stable and adequate documentation exists to proceed to the next phase	25-79
Subsystem interface control documents are sufficiently mature to proceed to the next phase, and plans are in place to manage any open items	13
Subsystem technical risks are identified and mitigation strategies defined	92-94
Test, verification, and integration plans are sufficient to progress into the next phase	83-85
Final hazards adequately addressed and considered in the detailed design	N/A

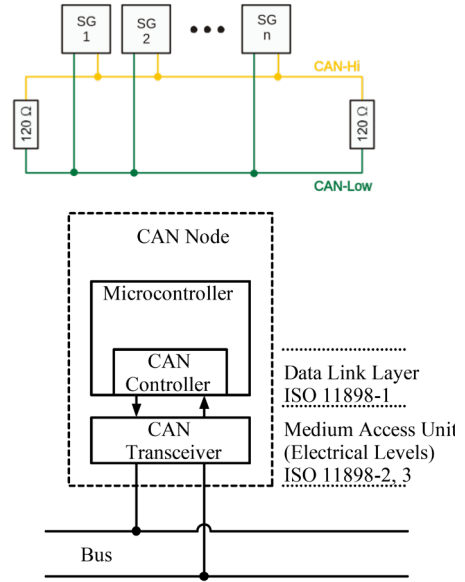

Backup Slides

CANBus

- CAN 2.0 A and B
 - Both have 8 byte (64 bit) data message
 - Up to four 16 bit words per message
 - A: 11 bit identifier
 - B: 29 bit identifier
 - Bit rates of 1Mbit/s if bus < 40m

SCEPTOR CDR Nov 15-17 2016

Session 8, Instrumentation IPT 101

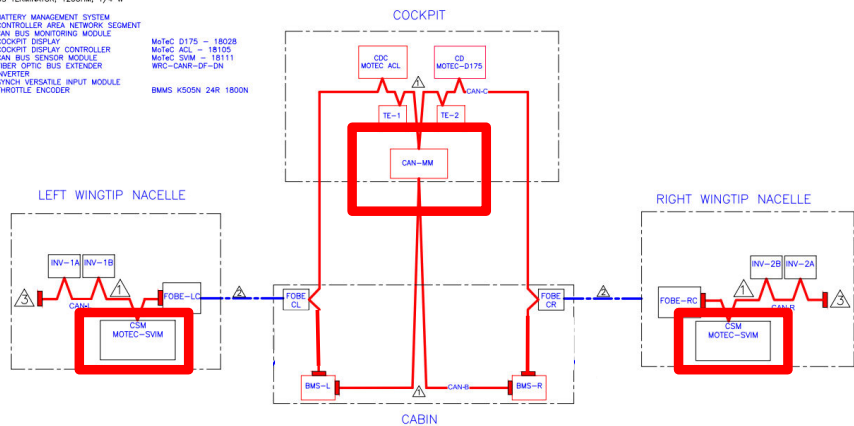

CANBus

- Single CAN Bus
 - Programmable Baud rate
 - Single copper bus in fuselage
 - Fiber Optic Segment from cockpit to Nacelles (1/controller)
 - TTC CAN Card will monitor bus

▲ CAN BUS SEGMENT, 4-CONDUCTOR, SHIELDED, TBD WIRE SIZE
 ▲ CAN BUS EXTENSION, 2-FIBER STRANDS, MULTIMODE (62.5 MICRONS)
 ▲ CAN BUS TERMINATOR, 120OHM, 1/4" W

BMS: BATTERY MANAGEMENT SYSTEM
 CAN: CONTROLLER AREA NETWORK SEGMENT
 CAN-MM: CAN BUS MONITORING MODULE Motec D175 - 18028
 CDC: COCKPIT DISPLAY Motec ACL - 18105
 CDC: COCKPIT DISPLAY CONTROLLER Motec SWM - 18111
 CSM: CAN BUS SENSOR MODULE WRC-CANR-DF-DN
 FOBE: FIBER OPTIC BUS EXTENDER
 INV: INVERTER
 SVM: SYNCH VERSATILE INPUT MODULE
 TE: THROTTLE ENCODER BMS K50SN 24R 1800N

SCEPTOR CDR Nov 15-17 2016

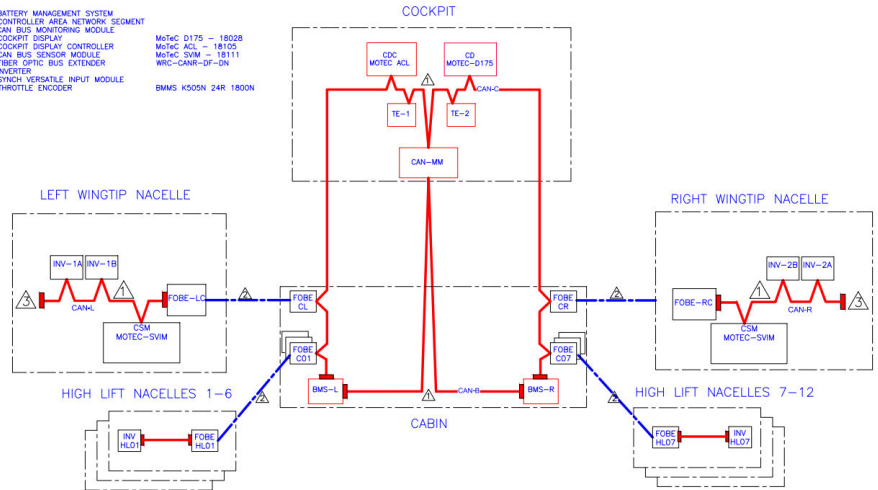

Session 8, Instrumentation IPT 102

CANBus

- Fiber optic segments in star configuration
 - fiber optic segments (1 per controller)

▲ CAN BUS SEGMENT, 4-CONDUCTOR, SHIELDED, TBD WIRE SIZE
 ▲ CAN BUS EXTENSION, 2-FIBER STRANDS, MULTIMODE (62.5 MICRONS)
 ▲ CAN BUS TERMINATOR, 120OHM, 1/4 W
