

STENNIS SPACE CENTER HISTORY

When President John F. Kennedy issued his 1961 challenge for the United States to send humans to the Moon and back by the end of that decade, a site was needed to test the powerful rocket engines and stages that would propel them on the historic journey.

For NASA officials, the rough terrain of Hancock County, Mississippi, provided five essentials for testing the large Apollo Program engines and stages: isolation from large population centers, water and road access for transportation, available public utilities, supporting local communities and a climate conducive to year-round testing. The site was selected – and in May 1963, workers cut the first tree to launch a daunting building project. The effort marked the largest construction effort in the state of Mississippi and one of the largest in the United States at the time.

Despite a pressing schedule, inevitable setbacks and even the disruption of Hurricane Betsy in 1965, construction workers prevailed. On April 23, 1966, a Saturn V second-stage prototype was test-fired on the newly completed A-2 Test Stand on the site. With the shake, rattle and roar of the test, south Mississippi was blasted into the space age.

Until 1972, Stennis test-fired first and second stages of the Saturn V rockets used in the the Apollo Program. Stennis Space Center then tested main engines for NASA's space shuttle. From 1975 to 2009, the south Mississippi site tested every main engine used to power space shuttle missions.

Stennis now is testing RS-25 rocket engines for the new Space Launch System, being built to carry humans back to the Moon as part of NASA's Artemis Program and, ultimately, to Mars. Stennis also will test the SLS core stage that will fly on the maiden Artemis I mission. Testing will involve installing the stage on the B-2 Test Stand and firing its four RS-25 engines simultaneously.

At the same time, the center is partnering with commercial companies to test engines and components for various commercial and military missions.

Into its sixth decade of NASA support, Stennis continues to build on its rich history as the nation's largest rocket engine test site – a place where space dreams are powered into reality.

27

Saturn V rocket stages were tested at Stennis Space Center, including stages that carried the first humans to the surface of the Moon during the Apollo 11 mission.

2,307

Space shuttle main engine tests were conducted at Stennis Space Center from May 19, 1975 to July 29, 2009, totaling 820,475.68 seconds of hot fire.

1 MILLION

Seconds of space shuttle main engine hot fire – including tests and launches – was achieved during a test on the A-2 Test Stand at Stennis Space Center on January 24, 2004.

16

On April 4, 2019, Stennis Space Center completed testing of all 16 former space shuttle main engines that will power the first four flights of NASA's new Space Launch System vehicle, including the mission that carries the first woman and the next man to the Moon.
