Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jimmy	Hara	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David	Harris	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Diane	Hart	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Daniel	Hawk	<p>NEPA team first workups of Cpyro was part of KSC undergrad research for Advanced Astronaut Carbon-Based Life Support. The filtration properties of carbon are well known. What if high CEC Cpyro can make otherwise untreatable soil to treatable, or reduce or mitigate the soil to a lesser degree? This would be of great value to NASA and the public. It is worth discussing the use of high CEC pyrogenic carbon as a viable contamination nuclear mitigator with Dr Hamilton at Lawrence Livermore National Laboratory/ DOE.</p>	<p>This is an interesting and potentially useful technology for site remediation purposes. It appears to be a developing technology with some potential treatability indicated for radioactive type soil contamination, based on the readily available information. Many important factors for consideration of the technology as a viable alternative at SSFL are unknown, such as proven treatability potential for the range of COCs in SSFL soils; the dosage or loading rates of the treatment matrix vs. treatment performance obtainable for all the COCs; the degree treatment afforded by the technology and the corresponding time frame to achieve treatment for all the COCs; and the related cost factors to implement the technology application. NASA will continue to investigate the potential application of the technology in more detail, but under the time constraints of the AOC, cannot consider it as a viable proven alternative as a basis to reframe the EIS.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Salome	Hawkins	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Randy	Hawkins	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p> <p>***I grew up in Northridge, and I, as well as many of my friends and classmates have been made sick from the SSFL. Some of them are now dead, including my stepfather-I myself developed infertility/reproductive problems and Hashimoto's disease. You need to take responsibility and clean up the f#cking site once and for all before others get sick and die!</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

First Name	Last Name	Comment	NASA Response
Kassandra	Hawkins	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Heald	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lynn	Helvig	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Lynn	Helvig	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Lynn	Helvig	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

Lynn	Helvig	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
GlennaMae	Hendricks	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Beverly	Herber	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Robert	Heron	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Robert & Claire	Heron	Through decades of sloppy environmental practices, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been migrating off the property.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6)</p>

Joanna	Hess	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Lyle	Hibbs	<p>My reason for writing this is to plead for preserving something that will allow the public and future generations to see an example of what was done. I think one of the large engine test stands must be preserved as a museum piece and some type of facility be maintained to accomplish this. I'm sure most of the people who worked up there feel the same as I do and all of us would gladly donate some time to get this accomplished. I really feel that this is a national monument and some part of it should be preserved.</p>	<p>NASA appreciates your consideration and comments on the DEIS. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. Section 106 of the NHPA requires federal agencies to consider the potential effects of their proposed actions on historic properties. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. Comments such as yours are considered during that process. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects. Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP, and archaeological sites.</p>

DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dr. Ebert	Hino	<p>Over many decades, NASA’s poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Daniel	Hirsch	<p>NASA has no discretion to not clean up to background.</p> <p>The Draft EIS throws in soil volumes and truck trips for what it describes as residential, industrial, or recreational cleanup standards.</p>	<p>These alternatives were included for full disclosure to the public to answer questions about the relative impacts. There are clearly described as alternatives that are no longer considered.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	<p>The cleanup standard for any exposure scenario is in fact a range.</p> <p>Did whoever came up with those air grab estimates base them on a one in a million risk, as generally required.</p> <p>Which residential exposure scenario is assumed?</p>	<p>These estimates were based on a 1X10-6 risk for the three scenarios described (residential risk, industrial risk, and recreational risk) and presented in the various draft soil investigation reports. The summaries are provided for information only, as an EIS is obligated to present.</p>
Daniel	Hirsch	<p>The EIS should make clear that the County of Ventura, the City of Los Angeles, and the City of Simi Valley have all gone on record supporting the AOC. Those within NASA trying to sabotage the AOC may wish to point to a couple of tiny "neighborhood councils" that Boeing has been working through to oppose the cleanup. But they are not legal representatives; the Los Angeles City Council, which has passed resolutions supporting the AOC, is the legal representative. Neighborhood councils are tiny advisory groups with no formal power or authority; there are dozens of them in LA.</p>	<p>Each comment carries its own weight, regardless of perceived or formal power or authority. NASA has responded to each.</p>
Daniel	Hirsch	<p>US EPA has submitted comments that suggest it has not fully understood the situation at hand.</p>	<p>NASA acknowledges your comment. If you are referring to our response to EPA's comments on the EIS, please refer to the answers we give to EPA's submittal number 244.</p>
Daniel	Hirsch	<p>The beneficial impacts of remedying that environmental damage are essentially ignored, and the negative impacts of the No Action alternative, refusing to clean up, are also not addressed in any serious fashion.</p>	<p>Both aspects are addressed in the EIS.</p>
Daniel	Hirsch	<p>ES-1.0 add "under the Administrative Order of Consent (AOC) with the State of California" at the end of the first sentence.</p>	<p>The AOC detail is included in Section 2.0 along with the 2007 Order that governs the groundwater cleanup.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	ES-2.0 add "as well as some solid rocket fuel work" at the end of the first sentence in the second paragraph. Perchlorate contamination arose in part from the solid fuel activities.	No solid rocket fuel was used on Area II and no perchlorate has been detected to date.
Daniel	Hirsch	2nd ¶ deeded by whom? Who owned the land prior to 1958? Was work for the US government conducted on the land prior to the deeding to USAF?	In your cited paragraph we noted that work on behalf of space and air force programs occurred from the 1950s to the 1970s, prior to acquisition by NASA. NASA was deeded the land in 1973. Prior to development, the land at SSFL was used for ranching. During 1948, NAA (a predecessor to Rockwell International Corporation) began using (by lease) what is now known as the northeastern portion, or Area I of SSFL. The majority of SSFL was acquired with the purchase of the Silvernale property in 1954, and development of the western portion of SSFL began soon after.
Daniel	Hirsch	explain also what that work was – development and testing of nuclear missiles? Was work done for other DOD entitites (e.g., Navy for SLBMs?)	No records indicate that nuclear missiles were tested at any test stands in Area II.
Daniel	Hirsch	3rd ¶ 1st sentence. This needs to be greatly expanded, even in the Executive Summary.	NASA tried to balance the length and complexity of the Executive Summary with the presentation of facts and conclusions central to the analysis required by NEPA. The details you request are in the various RI reports referenced in the EIS.
Daniel	Hirsch	p. ES-2 at bottom. Only discusses communications received pushing for EIS to consider breaking the AOC, not the various communications insisting that NASA comply with its obligations under the AOC and evaluate in the EIS how to implement the AOC.	See Appendix K for additional public communications.
Daniel	Hirsch	p. ES-3 mentions comments from DTSC about the EIS scope regarding non-compliant alternatives. One should describe those comments in more detail. DTSC is NASA's regulator, and informed NASA in strong language that doing what it originally proposed would breach the AOC.	NASA summarized scoping comments in Appendix K.
Daniel	Hirsch	ES-4 asserts the AOC requires cleanup to background or laboratory detection limits. This is not correct.	The 2010 AOC requires a LUT to be determined by DTSC. The look up table values provided by DTSC include background values for some chemicals and laboratory detection limits for others.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	p. ES-7 Claims proposed action would have significant impacts on the burro flats cave paintings. NO. AOC expressly exempts Native American artifacts. This statement thus is completely false.	NASA will clarify the text. The Burro Flats site includes many rock features and areas of soil too. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the exception clause in the AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further details.
Daniel	Hirsch	Assertion that the entire 2850 acre site is a sacred site is absurd, and that the cleanup would have a significant negative impact on the sacred site is equally absurd. What would have a significant negative impact is failing to clean up the vast quantities of contaminants.	The Santa Ynez Band of Chumash Indians has declared the NASA-administered Area an Indian Sacred Site under EO 13007.
Daniel	Hirsch	The environmental impact of cleaning up the pollution at SSFL is BENEFICIAL, not NEGATIVE. The impact of the NO Action alternative is significant and negative. NASA has it backwards.	As discussed in the EIS, the potential impacts from the soil cleanup range from beneficial to negative and some are significant-negative. NASA believes the evaluation presented in the EIS is fair and defensible. Based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).
Daniel	Hirsch	Similarly about biological resources. The impact of cleaning up contamination is beneficial to biological resources, not negative.	NASA considers that there are some net beneficial impacts to the cleanup by removing contaminants from the soil that could affect wildlife. NASA also recognizes in section 4.4.1.3. that there will be significant impacts to native vegetation communities. Please also refer to Section 3.9 for and assessment of health risks associated with current contaminants.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	p. ES-7 Admits the truck estimates are heavily inflated, using the values that would produce the absolutely highest estimates.	The current estimate for the volume of soil required to be remediated is not overstated. DTSC has independently reviewed NASA's data and stated that the estimates are reasonable. As discussed in the EIS, NASA considered a range soil cleanup technology and viable ones were evaluated. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS. Impacts are presented for both ends (all are successful and none are successful).
Daniel	Hirsch	ES-8 Absurdly, the EIS claims the effect of cleaning up groundwater and soil contamination that has been creating surface water pollution is negative. No, it is positive. Leaving the groundwater contaminated and allowing continued surface water contamination is what would be negative.	NASA's analysis must focus on impacts of the action, thus NASA recognizes that cleanup has impacts.
Daniel	Hirsch	ES-9 Again, for health and safety, the EIS amazingly claims that cleaning up contamination results in negative impacts on health and safety; it is the pollution that is producing the negative impacts, leaving it in place would have negative impacts.	Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	ES-10 Again, NASA has it backwards, claiming that the cleaning up hazardous materials has negative effects whereas it is the pollution by the hazardous materials that has the negative effects.	Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	ES-15 again, absurd; says removing the contamination produces significant negative impacts on biological resources and remediation of pollution only moderate beneficial impacts. NASA's efforts to sabotage its commitments in the AOC are clear here. Under such an argument, no polluter would ever have to clean up the toxic mess it created.	NASA acknowledges your comment.
Daniel	Hirsch	Again, claims negative impact on EJ; but the pollution from the site, which apparently has caused cancers in the communities nearby, is a negative impact of NO ACTION, and eliminating that risk is a beneficial effect.	Based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	Exec Summary does not analyze impacts of the No Action alternative—major failure. Leaving the soil and groundwater polluted would have significant negative impacts.	Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	ES-3.2 Give a single small paragraph describing the No Action alternative, but not a word of analysis about its environmental impacts, of leaving all the toxic contamination not cleaned up.	Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	<p>Says only beneficial effects are hazardous waste and biology; not water quality, air quality, public health. This stuff is toxic pollution; cleaning it up is beneficial; without cleaning it up, water will continue to be polluted, toxic material will continue to spread when the wind blows; people's health will be at risk.</p>	<p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	p. 1-7 Yet this fundamental need – protecting human health and the environment” is barely discussed in the EIS. No detail is provided.	A cleanup to LUT values is required by the AOC.
Daniel	Hirsch	4.2.3 No Action Alternative; again, just a few sentences; nothing about the significant impact if NASA doesn’t clean up the polluted site.	Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6). To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).
Daniel	Hirsch	p. 4-15 in passing acknowledges that recognized Native American artifacts are protected by the AOC and exempted from the cleanup to background requirement if it would place them at risk. yet NASA nonetheless hypes the issue of the artifacts as a significant negative impact, when it isn’t, as the AOC exempts them.	NASA will clarify the text. The Burro Flats site includes many rock features and areas of soil too. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the exception clause in the AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further details.
Daniel	Hirsch	p. 4-44 claims no action alternative would have negligible effect on biological features such as birds from contamination; no evidence provided, crazy. claim big effects from cleanup and ignore pollution effects. similarly for vegetation, they don’t even identify effect of toxic materials on the vegetation.	Please refer to section 4.9 for the health risks associated with the contaminants on the site. Due to the relative low level of the majority of contaminants on NASA's property, the likely bioaccumulation of contaminants in flora and fauna is considered negligible.
Daniel	Hirsch	4-81 claims no action alternative would have only moderate impacts on groundwater or surface water quality. this is absurd.	The No Action Alternative includes the continuation of operating the GETs system as described in Section 4.6.3. Therefore, the potential severity of the impact would be moderate as described in Section 4.6.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	4-111 absurdly claims major impacts to air quality from cleanup, no impacts whatsoever from No Action, even though leaving all that contamination means constant resuspension and airborne release to neighboring communities of the toxic material.	<p>Impacts to air resources identified in NASA's DEIS for cleanup actions are appropriate.</p> <p>Based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).</p> <p>DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p>
Daniel	Hirsch	4-122 again, absurdly claims cleanup would have impacts on EJ communities and that failing to clean up the contamination would have none.	Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).
Daniel	Hirsch	4-128 crazily asserts that the health impacts of not cleaning up the contamination are not significant. Pure assertion, no technical basis provided. What are the contaminants? Very toxic materials.	<p>The NEPA process consists of an evaluation of the environmental effects of a federal undertaking including its alternatives. In this case NASA's federal action is to remediate the environment to a level that meets NASA's cleanup responsibilities and to perform demolition actions necessary to support both remediation and property disposition of the NASA-administered portion of SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Hirsch	4-152 similarly absurdly asserts that just walking away from the hazardous waste and contamination would not have significant environmental impacts. EPA recommended the site for consideration as a Superfund site, one of the most contaminated areas in the country. Leaving the contamination without cleanup would not have a significant environmental impact?	Based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).
Teri	Hitt	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Natalie	Hodapp	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Hogben	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Hogben	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Arthur	Holden	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Shannon	Holst	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Shannon	Holst	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Shannon	Holst	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

Shannon	Holst	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.

Barbara	Hope	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Rebecca	Hopkins	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Rebecca	Hopkins	Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Rebecca	Hopkins	I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Rebecca	Hopkins	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Gary	Horn	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sara	Horner	<p>I am writing to let you know of my support for the clean up law signed between NASA and the state of California in 2010 which mandated a cleanup of all detectable contamination at the Santa Susana Field Laboratory. The current Draft Environmental Impact Statement does not address the issue appropriately.</p> <p>The site, once fairly remote, has become increasing urbanized and the detrimental effects of the radioactive and chemical waste have thus significantly risen. Without adequate clean up the costs of the public health consequences and the financial obligations for NASA will increase dramatically. If taken care of appropriately and promptly both NASA and the regional population of this area will cease to be at risk.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Heather	Howard	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jana	Howington	<p>I am a huge supporter of NASA and all its amazing accomplishments. However, I'm writing this in stiff opposition to the proposed clean-up plan of the Santa Susana Field Lab. I live adjacent to the old lab and travel daily on Topanga Blvd, the main artery for proposed removal of lab debris. This boulevard is already past maximum vehicle capacity and extremely congested.</p> <p>Proposed heavy truck traffic would result in catastrophic disruption of travel in this area, not to mention diesel truck pollution, hauling toxic debris and noise. Besides, our roads are already in disrepair due to underfunding by the City of LA, and this would totally destroy the roadbeds.</p> <p>I beseech you to please halt this proposed clean-up activity until a more suitable means of hauling tons of toxic waste can be devised. One suggestion worth considering is by rail, since there is already rail tracks in the immediate vicinity.</p>	<p>Section 2.4 in the EIS discusses alternate transportation considerations (overland conveyor and rail transport of soil and option to build a new haul road). NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements. Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p> <p>NASA must continue to abide by its obligations under the AOC as drafted.</p>
Michael	Hu	<p>I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.</p>	<p>Your comment is noted.</p>

Holly	Huff	<p>So anyway, I think that your presentation was little misleading. I think that, you know, you're worried about air quality now and damaging the road? Potholes? Emissions from the cars? I mean, this is a true concern, but I have to laugh with all the things that have been going on up there for the last 60 years. You're trying to please other people that don't know the history as much as I think I do. You know, the children. The children's safety. Well, kids aren't going to be playing out in the street.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Holly	Huff	<p>And then everybody's concerned about the dust coming out of the trucks. Now, I am too. Are they -- is this a real problem? They're not sealed up? You're just throwing a tarp over the dirt and going down the freeway? ...</p> <p>I grew up at the lake. I moved to the Knolls. I grew flowers up at Sage Ranch for eight years right where the big lead contamination was all gutted. And in 2009 I was diagnosed with leukemia. I can't say that I got it from the site, but I happened to be there for everything. So I think I did.</p>	<p>Dust from trucks is addressed in the Air section and Air Quality BMP-1. Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>
Holly	Huff	<p>So my bottom line is that I want to see the best damn cleanup we can have and get. And I don't want the Indian artifacts ruined, and I don't want the oak trees touched. But I do want it clean. And if you could save a test stand and it would be clean, that would be great. But clean's No. 1 to me. And a park would be nice, but I would much rather just see a wildlife corridor personally.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p>
Holly	Huff	<p>I always thought an EIS was to consider real issues with the topic at hand, the cleanup of chemicals and how to accomplish it. When I read comments from "new" groups opposed to cleanup it's very hard for me to understand where these people could be coming from. They seem to not have a clue about how the people who live below the site feel and have felt for many, many years. I do know some have their own agenda's and it's not cleanup.</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Holly	Huff	<p>Until these "new" groups came along and Boeing got "Green" no one cared about school children, trucks and car fumes, accidents, etc.</p> <p>A thousand + cars on both roads drove the only two ways in and trucks, smog, kids and animals were never considered.</p> <p>Kids don' t play on Valley Circle, Roscoe or Plummer. Most kids don't even play outside at all these days so to make this a vital issue doesn't work f or me.</p>	Your comment is noted.
Holly	Huff	<p>What works f or me is getting the site cleaned up so that those of us that live below it don't have to worry about what is getting us when it's windy or rains.</p> <p>NASA has always said they will clean up to the AOC's , which they came up with. I can't applaud you more for that.</p> <p>Let's stay focused on the issue of cleaning up the chemicals and not kids playing in the streets. I trust the oak groves and Indian artifacts will be spared. I assum the carrying dirty soil would be well sealed.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Holly	Huff	<p>Please clean up.</p> <p>Please don't drop the AOC's and do a good cleanup for those of us that live here.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lara	Ingraham	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sheila	Irwin	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sheila	Irwin	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sheila	Irwin	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sheila	Irwin	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sheila	Irwin	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>
Luhui	Isha	<p>This Project has the potential to change the entire cultural landscape this historical, cultural, and religious treasure to the Chumash Peoples.</p> <p>We are especially concerned about the Project's and the DEIR's identification, mitigation for, and treatment of Chumash cultural resources.</p>	<p>NASA acknowledges your comments.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Luhui	Isha	<p>When Chumash cultural resources, including burials are identified, Phase III data recovery, or salvage operation, even if the salvage operation includes re-burial, does not achieve preservation in place of the Chumash Peoples' cultural resources, including burial sites, sacred sites, village sites, and cultural artifacts and remains. Even capping and filling of the Chumash Peoples' significant cultural, historic site, and burials, often does not adequately achieve preservation in place of our historic and cultural resources, as it can destroy the necessary relationship between the cultural, historic, and often religious resource with its surroundings and cultural landscape that are a component of the site's significance. Therefore, for identified impacts to Chumash cultural, historic, and religious sites, mitigation measures to achieve preservation in place must be thoroughly analyzed in consultation with the Chumash. The Environmental Impact Statement ("EIS") must not only identify adequate mitigation measures that preserve Chumash cultural resources in place, but it must commit to preservation in place mitigation measures (and not defer the mitigation measures to others' discretion at a later time so that Phase III data recovery can be implemented), unless these measure are proven to be infeasible by defined criteria.</p>	<p>NASA will proceed with its proposed action in accordance with stipulations laid out in the Programmatic Agreement and/or ROD to avoid, minimize or mitigate impacts to historic properties.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Luhui	Isha	<p>The initial study and DEIS fail to adequately identify significant impacts to significant Chumash cultural historic resources, villages, burial site, sacred sites, and remains. Further, the on the ground surveys were not sufficiently extensive, as a sufficient frequency of test pits were not dug; when they were dug, they were not dug deep enough; and the entirety of the Project area was not covered by on the ground surveying and sufficiently spaced test pits.</p> <p>Best available science was not used, such as forensic canines, to best ensure all Chumash burials and remains were identified in the Project Area. Because Phase III Data recovery is in most cases not sufficient mitigation, a dig first and excavate later approach is not sufficient for mitigation impacts to our cultural resources. It is thus critical to setting forth adequate mitigation measures that the presence of our cultural, historic, and religious resources are adequately analyzed and identified using best available practices.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Luhui	Isha	<p>Wishtoyo requests that specially trained forensic canines alone or in combination with ground penetrating radar are utilized (just like they were in Santa Cruz to identify Ohlone Native American burials for the KB Home development, to identify the location of all Native American burials within the project envelope. The use of specially trained canine forensics alone, or in combination with ground penetrating radar, represents the best available technology and most reliable means for the identification of Chumash burials, and thus should be used to identify potential impacts to Chumash cultural / historic resources and to mitigate those impacts to a less than significant effect. By utilizing highly trained forensic canines alone or in combination with ground penetrating radar to identify with more reasonable certainty all or almost all of the Native American burials within the Project envelope, mitigation measures can be developed in coordination with the local Native Americans to achieve preservation in place for those impacted burials and cultural historic resources.</p>	<p>NASA will consider this request.</p>
Luhui	Isha	<p>Wishtoyo also requests that the DEIS adequately indentify the impacts to Chumash cultural, historic, and religious resources through additional study in consultation with the Chumash and using best available science.</p> <p>The Project’s development envelope also contains Chumash natural cultural and historical resources. These include, but are not limited to hawk and eagle feathers, deer bones used for hair pins, bird bones for flutes, animal skeletal remains used for beads, medicinal plants, oak trees, black walnut trees, soap stone, cheart stone, medicinal plants, rabbit pelts and oarcker; gathering sites for natural cultural resources; and cultural landscapes which include undeveloped mountain tops, hillsides, tributaries and canyons that bring sacredness to sacred sites.</p>	<p>In accordance with the PA NASA will be setting up a Native American Advisory Board to assist NASA in its stewardship of important Native American sites during the implementation of the proposed actions.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Luhui	Isha	These natural cultural resources within the Project site may be contaminated, as may be the areas around the cultural sites within the Project envelope. Thus, not only must these cultural resources be protected and preserved, but the contamination of these cultural resources and sites must be assessed and remediated so that residual toxins do not pose health threats to Chumash Peoples utilizing the area for cultural purposes.	Section 4.4 identifies impacts to biological resources including plants of interest identified by the Santa Ynez Band of Chumash Indians.
Luhui	Isha	Meaningful consultation during the NEPA process with Chumash tribal representatives from the Federally recognized Santa Ynez Band of Chumash Indians, and from unrecognized bands of Chumash including Mati Waiya from the Turtle Clan in Saticoy and Luhui Isha Waiya from Barbareño Chumash, is crucial to understanding, identifying, and mitigating irreversible impacts to this national Native American treasure, Chumash cultural landscape, Chumash heritage and culture, and to the sacred and religious, cultural resources of the Chumash People within the Project site.	We acknowledge your comment.
Luhui	Isha	Despite the need, there has been no meaningful consultation with the Chumash. Even the consultation with the Federally recognized band of Santa Ynez Chumash Indians is not in compliance with Section 106 of the National Historic Preservation Act (“NHPA”), which according to the Advisory Council on Historic Preservation states, “in carrying out its responsibilities under Section 106, a Federal agency shall consult with any Indian tribe or Native Hawaiian organization that attaches religious and cultural significance to properties described in subparagraph (A). [16 U.S.C. 470a (a)(6)(A) and (B)].”	NASA has reached out to all Native American tribes identified on the list provided by the Native American Heritage Commission in 2011 and again in 2012. NASA continues to consult with the Federally Recognized Santa Ynez Band of Chumash Indians and has included members of local and state tribes within the consulting parties.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Luhui	Isha	We believe this Project would significantly alter future use, and impact the Cultural sites, resources and heritage these lands represent. The outreach that has been done is insufficient. Extensive outreach to Chumash, Tatavium, Tongva and other Native American tribal families/groups that have a longtime and historical connection to the sacred and cultural sites at SSFL/Burro Flats should occur with notice of the issues in this letter, and these Native American stakeholders should be given an opportunity to submit comment and participate in meaningful consultation.	NASA has reached out to all Native American tribes identified on the list provided by the Native American Heritage Commission in 2011 and again in 2012. NASA continues to consult with the Federally Recognized Santa Ynez Band of Chumash Indians and has included members of local and state tribes within the consulting parties.
Luhui	Isha	The project will impart significant negative unmitigated impacts to sacred sites and cultural resources. Areas that contain artifacts contaminated with toxins may need to be cleaned up as part of the project. How are these artifacts, that are contaminated with toxins to be preserved in place, and if storage or removal occurs - which we are opposed to, how are they to be stored. How are uncovered villages or sacred sites to be preserved in place.	NASA is in consultation with the SYBCI and SHPO regarding any further archeological investigations and/or data recovery. Please refer to the Programmatic Agreement and/or ROD for additional information. NASA has not yet determined where artifacts from data recovery would be curated.
Luhui	Isha	How would the legal transfer of land on the Project site affect the protection of historic properties? We request that parcels with Chumash sacred and cultural resources are not transferred without adequate guarantees of protection.	NASA will request that GSA include a covenant for the protection of historic resources in accordance with the Programmatic Agreement and/or ROD.
Luhui	Isha	The Chumash have held ceremonies on the Project site for the past 30 yrs. Or more, and want to continue to do so.	NASA intends to continue to allow access for ceremonies in accordance with EO 13007, Indian Sacred Sites.
Luhui	Isha	Please conduct independent studies to review cultural sites and cultural resources that are present. Ensure that Chumash are considered for retention under contract to conduct cultural resources surveys with archeologists, trusted by the Chumash community, who have worked with Chumash resources. Cultural sites not identified are likely scattered throughout the entire Project site/property. This area hosted different tribal groups that where passing through or were neighboring tribes.	NASA will consider your request.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Luhui	Isha	Agencies and entities that own the different properties within the Project site, like DOA, Boeing and NASA need to look at, analyze, and mitigate cultural sites as a whole district or historic district, which are not separated by legal property boundaries with the site.	A potential archeological district could and likely would include sites off NASA-administered property. NASA is required under the law to identify historic properties within its Area of Potential Effect which includes NASA owned portions of SSFL and a few small portions of Boeing land.
Luhui	Isha	The project must avoid all impacts to Chumash cultural resources within the Project site.	NASA will proceed with its proposed action in accordance with stipulations laid out in the Programmatic Agreement and/or ROD to avoid, minimize or mitigate impacts to historic properties.
Luhui	Isha	Traditional cultural landscapes to include natural resources, plants, stones, creeks and habitat that helped us, and continue to help us, sustain our lifeway and traditions. These resources need to be protected.	NASA acknowledges your suggestions. In conducting NASA's TCP study, many of these factors were considered.
Luhui	Isha	Please add a mitigation measure that provides that the Interpretation of Chumash History in relation to the Project site, uncovered cultural resources, preserved in place cultural resources, protected Chumash cultural resources, and recovered cultural resources is to be done by Chumash representatives.	Thank you for your MM suggestion. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.
Anna	Isis-Brown	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Sandra	Islas de Avalos	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Taylor	Jacobs	<p>I believe that first and foremost that it is a good idea to remediate the lands that the Santa Susana Field Laboratory (SSFL), but I believe certain alternatives are left unexplored in the DEIS.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Taylor	Jacobs	Restoring the lands would give Ventura County valuable open space for development in Area I (the Liquid Oxygen Plant Area- 41.7 acres) and all of Area II (409.5 acres), but due to SSFL history in Ventura County I believe these structures may have historical relevance to the County and their disposal should be appropriately considered.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Taylor	Jacobs	In Section 1.1 of Appendixes A, B, C, D of the DEIS, it is outlined that on the site there is approximately 500,000 cubic yards of contaminated soil from past and SSFL uses. It is also stated that 64% of this soil (320,000 cubic yards) will have to be removed, and the other 180,000 cubic yards may have to be excavated to remediate successfully. This remediation effort when compounded with the Proposed Action proposal of removing the 55 structures on the sites would essentially destroy all existing ecology on the site if not properly executed.	NASA recognizes that impacts to some resources will be significant.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Taylor	Jacobs	<p>I believe that it would be far more productive and cost effective to work with the County of Ventura’s Planning Department to come up with a rough plan for development or preservation in the future on the site. Creating a plan would naturally inform upon what methods should be employed for remediation in specific areas. This could also save some of the landscapes of the Historical Indian sites, and buildings from the SSFL by slating them to be historical landmarks, museums, or adaptive reuse projects for the county. This could save both the County and NASA money by approaching this process with a little vision down the road of what they want the land to become.</p>	<p>Thank you for your suggestions.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Taylor	Jacobs	<p>The site also has three NRHP eligible districts (Alfa, Bravo, and Coca) with three buildings from each district eligible for the status. If the proposed action option is chosen than the buildings will no longer be there; therefore ineligible for NRHP status. But if the no-action alternative is chosen than the buildings will remain but the land will stay contaminated and unproductive. The two-option plan is acting as a double edged sword that prevents responsible land use methods and much as it is trying to promote them.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Catherine	James	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vida	Jatulis	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vida	Jatulis	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vida	Jatulis	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

APPENDIX K

First Name	Last Name	Comment	NASA Response
Vida	Jatulis	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. Rosemary	Jenkins	<p>The clean-up issue at the Santa Susana Field Lab Site/Rocketdyne has been going on for years. We, in the community, are asking that you fulfill your commitment to making this area safe for all affected by the contamination.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Rosemary and Willie	Jenkins	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Stephanie	Jennings (DOE)	<p>DOE notes that the cumulative impacts analysis in Section 4.13, page 4-156, of NASA's Draft EIS contains outdated information that was provided to NASA by DOE in April 2012 as a preliminary estimate of the potential soil volume that may need remediation. Specifically, the text states that "the remediation project . . . is estimated to require the removal of a minimum of 184,000 [cubic yards] of soil" (page 4-156). DOE's estimate of 184,000 cubic yards of soil was generated before the Radiologic Look-Up tables were published by the DTSC in January 2013 and before DTSC published in June 2013 the Chemical Look-Up Tables. The Look-Up Tables can be found on DTSC's website at: http://www.dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/ssfl_document_library.cfm</p> <p>At that time, DOE's estimate was based on 50 areas within Area IV and the Northern Buffer Zone that DOE had previously identified as clearly contaminated and likely to need remediation.</p>	NASA will consider MM recommendations submitted by the public and consulting parties as it finalizes the agreement document stipulating NASA's commitments.
Stephanie	Jennings (DOE)	<p>DOE is currently completing the chemical data gap sampling and is re-evaluating sampling results for all of Area IV and the Northern Buffer Zone from all phases of chemical and radiologic sampling. This evaluation is based on the recently published Look-Up tables. DOE is developing information from all phases of chemical and radiologic sampling to further refine our estimates and the scope of the necessary cleanup. DOE's initial review indicates that the revised volume estimates for preliminary remediation areas are significantly larger than we had estimated previously (information in NASA's Draft EIS).</p> <p>In 2014, after DOE completes sampling, evaluates the sampling results, and continues our EIS process, DOE will be able to share more complete information not only with NASA, but with DTSC, and stakeholders.</p>	NASA contacted DOE to obtain updated soil removal volume estimates to incorporate into Section 4.13 of the FEIS (Section 4.13.1).

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Johnsen	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Barbara	Johnson	<p>I've lived in the area since 1970. I had breast cancer in 1990 with no visible markers, and I can't help but believe that I have been affected. Also, Simi Valley has the highest incidence of breast cancer in California and has the largest support group for autism and has exceptionally large cases of thyroid problems and cancer. ... I also was on the panel of an extensive health study of mortality of badged workers, was done by UCLA through DTSC, which showed a significance of those workers who died from various cancers.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>
Barbara	Johnson	<p>After years of indiscriminate contamination, it is imperative that this land be cleaned to background levels as agreed upon in the AOCs. Let's not muddy the waters with scenarios for end use. First and foremost you owe it to the populace, past, present, and future, to clean to background. EIS should only look at Alternative 1, clean to background.</p> <p>Significant impacts can never be as invasive as what has taken place in the past. I urge you to use all means to clean to background. And I would like to say that I certainly endorse with Brian Lindquist and Anthony Zepeda have said.</p>	<p>Your comment is noted.</p>

Kent	Jone	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Sandra	Joos	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Joe	Jordan	Through decades of sloppy environmental practices, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been migrating off the property.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6)</p>

Vesselin	Kamenov	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. Vesselin	Kamenov	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Katherine	Karras	Through decades of sloppy environmental practices, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been migrating off the property.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6)</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David	Katz	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Katz	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Joan	Kelly	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Tyler	Kerce	<p>Although NASA certainly did not intend for its research to leave a legacy of radioactive contamination at the SSFL and its environs, it is an unfortunate fact that exposure to high radiation levels has resulted in excessively elevated rates of cancer in nearby communities.</p> <p>Mr. Elliott, I humbly urge you to ensure that NASA abides by the full terms of its 2010 binding agreement to rid the SSFL of its toxic residue. The health and happiness of nearby families have fallen victim to radioactive contamination at the SSFL, and since NASA created this contamination, it is only just that it clean up the contamination to background.</p> <p>For over half a century, NASA has dedicated itself to improving the lives of the Americans through scientific exploration. I hope that you, like me, will consider the cleanup of the SSFL to be a huge step towards this goal of improving Americans' lives.</p> <p>Mr. Elliott, please ensure that NASA's work at the SSFL will no longer have an adverse impact on nearby communities. Please reaffirm NASA's commitment to the public good by making good on your 2010 agreement to clean up the SSFL.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL</p> <p>NASA's activities at SSFL did not involve research using radiological components. Its cleanup responsibilities are chemical constituents.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
James	Kher	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
James	Kher	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anita	Khermandalian	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anita	Khermandalian	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anita	Khermandalian	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>
Steve	Khermandalian	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Steve	Khermandalian	NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chester	King	<p>The discussion of archaeological sites in the DEIS is based on a report attached to the DEIS as Appendix C. The Appendix C study is inadequate. A study by archaeologists with local knowledge and experience that includes the results of subsurface testing and provides real estimates of the costs of a data recovery program is necessary to complete the EIS and make informed decisions concerning impacts to National Register eligible properties. The new report should be subject to public review and its recommendations should be included in a new DEIS that will also be subject to public review. The archaeologists who conduct the study should not be employed by a company that stands to benefit from the cleanup project.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chester	King	<p>The most serious problem with the cultural resources report is absence of information necessary to assess the impact of the project on Native American sites. The report fails to describe all cultural resources that may be disturbed by the project. The report does not contain information adequate to design a data recovery program and estimate its cost.</p> <p>The report relies exclusively on surface observations. Adequate assessment of the project impacts requires controlled archaeological subsurface testing to identify the boundaries, depths, and contents of archaeological deposits.</p> <p>The report indicates artifacts were recorded as isolates. These isolates are apparently outside the areas described in the report as archaeological sites. The isolates are not described in the report.</p> <p>... All areas of bedrock should all be carefully checked. The soil bodies between the bedrock should also be carefully checked, the description of survey procedures indicate some soil bodies may have been walked across once at best.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chester	King	<p>The EIS can't be complete until the impact of the project on all project area archaeological deposits is determined. It is necessary to use archaeological techniques traditionally used to determine the presence of archaeological deposits. The techniques should be adequate to demonstrate presence or absence of human activities. Conduct of an adequate number of controlled subsurface excavations with soil being sifted through fine mesh water screens, laboratory sorting by people experienced in the identification of artifacts found at local sites, study of significant soil constituents, and report preparation by people who have knowledge of local archaeology, can determine the presence or absence of site deposits in the project area.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Chester	King	<p>It should not be necessary for volunteers or paid monitors to pick up pieces of significant and sensitive site areas discovered after the review process while they are being destroyed during monitoring because a consultant did not adequately evaluate the project area. Monitoring is not adequate to recover information concerning many significant categories of artifacts or features.</p>	<p>We acknowledge your comment.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chester	King	<p>...the cultural resource study needs to determine the scope and costs of archaeological data recovery programs. The report should contain enough information to allow archaeologists to design and estimate the costs of data recovery programs. These costs are largely dependent on volume of site deposits that are present and the numbers of artifacts and features that are expected to be encountered. Information necessary to estimate the costs of data recovery can only be obtained by conducting excavations similar to those that will be conducted during data recovery.</p> <p>The existing information is not adequate to estimate the cost of data recovery programs. If bids are sought using the available information, local experienced archaeologists will not be able to make bids because they will fear the consequences of underbidding. Only nong local archaeologists who make low bids on the basis of inadequate information will be chosen and the data recovery program will be inadequate, both because the archaeologists will not recognize the resources and they will not have adequate funds.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chester	King	<p>No cemetery has been identified during archaeological excavations at Burro Flats and it is expected that one or more cemeteries (probably from different time periods) are present within or in the vicinity of the site in areas that have not been tested, or disturbed by development at Burro Flats.</p> <p>...Testing is necessary to determine the significance of site areas and needs to be adequate to develop meaningful data recovery programs or design special avoidance programs if highly sensitive areas will be damaged by the project.</p> <p>... Removal of a cemetery has different social, emotional, and cost impacts than removal of a camping area after conduct of a data recovery program.</p>	<p>No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources and archeological investigations as part of the MMs to address the adverse effect on cultural resources.</p>
Chester	King	<p>The background section discussion of Native American history demonstrates lack of knowledge of archaeology in the region. The cultural resources report background section appears to be adapted from a poor boilerplate that concerns archaeology in Orange or San Diego Counties.</p> <p>It is stated that new studies indicate rapid rather than gradual culture change. There is no uncontested data that demonstrates anything other than a continuous, gradual growth of Chumash society over at least the last 7000 years.</p> <p>...On page C-22, it is stated that there is no accepted chronology. ... In 1939 Lillard, Heizer, and Fenenga published a report that described three successive chronological time periods in Central California. ... California archaeologists have not disputed this temporal sequence. There is constant dispute and refinement of the actual dates marking the beginnings and ends of subdivisions and whether or not beginnings and endings correlate with imagined or real catastrophic environmental changes.</p>	<p>We acknowledge your comment and for pointing out these discrepancies.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chester	King	On page C-55 it is stated that if human remains are discovered NASA will follow California state requirements. California law places decisions in the hands of a most likely descendant. Federal law places decisions in the hands of a recognized tribe. How will the discrepancy be handled?	NASA will follow Federal Law under NAGPRA.
Chester	King	Presumably grading and filling will occur at a site used to dispose of the soil taken from the project site. The DEIS does not address impacts to historic properties at disposal sites. It is possible that the impacts at disposal sites could be as severe as the impacts at the Burro Flats project site.	Soil is being disposed of in authorized landfill facilities. Impacts at disposal facilities are not included in this EIS.
Chester	King	...the Chumash cultural sites in the Burro Flats area are too significant to be managed by people who lack expertise. Perhaps a panel including Chumash, other concerned local Native Americans, and archaeologists with experience and knowledge of archaeology in the vicinity of Burro Flats could be formed to review cultural resource studies and review proposals to conduct data recovery. The panel would be responsible for insuring that money and resources are not squandered as has been the case on some other large projects. The panel would attempt to insure that adequate and sensitive data recovery or other mitigations are designed and conducted.	Thank you for your MM suggestion. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chester	King	<p>The report admits it does not identify and assess cultural resources that may be damaged by the project. The presence or absence of the possible resources can be identified using standard subsurface testing procedures. These procedures have been used during evaluation of similar projects. It is necessary to conduct studies using accepted procedures to evaluate the locations, boundaries, and contents of cultural resources that will be affected. This information is necessary to make informed decisions regarding the fate of cultural resources and types of remedial action that can be performed.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>
Chester	King	<p>The contents of archaeological site areas that will be affected need to be determined to design the best possible mitigation program. Perhaps procedures could be used to remove contamination without significantly disturbing sensitive areas such as cemeteries.</p>	<p>Thank you for your minimization and MM suggestions. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chester	King	<p>The DEIS fails to address what should be a central question of whether conduct of the project will lessen or increase exposure of people to pollutants proposed to be removed from the site and whether it will cause more death and disease than alternatives. ... What will the net public health benefit be from conduct of the project, as opposed to the no project or lesser project alternatives? This question needs to be answered in the EIS. The EIS should not protect a politically motivated agreement. It should provide objective information necessary to make good decisions. If the project will save one life at the expense of the death three as well as destroy significant cultural and natural areas, it is not a good project. Perhaps designation of the area as passive recreation and natural preserve land with limited public access and maintenance of existing ground cover would result in less exposure of people to pollutants than the proposed project. An alternative project that would reduce the most dangerous concentrations of pollutants to acceptable public health standards, might be best.</p>	<p>NASA appreciates your comments regarding the risk posed by soil and groundwater at SSFL. NASA has compared the risk for cleanup to residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment based on three factors: (1) application of cleanup levels that are 2 to more than 1 million times more conservative than risk-based levels, (2) potentially requiring cleanup of up to 51 chemicals that do not pose risk, and (3) potentially impacting 87 additional acres when compared to a suburban residential risk-based cleanup.</p> <p>Consequently, the benefit to human health and the environment of cleaning up to background is questionable for several reasons. The more aggressive remediation of the site that would occur under the background cleanup (more soil removal, more trucks entering the site, more emissions, more road miles, more soil to dispose of in landfills, etc.) could result in an increase in traffic accidents, spills, and habitat modification and disturbance of wildlife, all of which might result in reduced net benefits when compared to the risk-based cleanup scenario. Because only 10 percent of those analytes detected in soil are identified based on risk estimates as requiring remediation under the background cleanup scenario, the overall net benefit of cleaning up to background for all chemicals as opposed to a risk-based cleanup is low.</p>

Coleen	Kirnan	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Coleen	Kirnan	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Coleen	Kirnan	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Coleen	Kirnan	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Kathe	Kirrene	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bonnie	Klea	<p>In 1995 I was diagnosed with an environmental/work related cancer. My oncologist and radiologist said they were treating many patients who worked at Santa Susana. West Hills Hospital had a whole ward full of workers who had brain cancer. My radiologist also said he was treating many brain cancers.</p> <p>My house was built in 1959 and is in close proximity to SSFL. After my diagnosis in 1995, I went door-to-door, neighborhood to neighborhood and asked about cancer incidents oneach street. The numbers were staggering. Almost every house had cancer and multiple cancers. I received toxicology studies that were done of the 5 mile radius around Santa Susana and 3 studies showed my cancer was elevated 50 percent.</p> <p>In NASA's heyday all the test stands ran for 24 hours a day every day of the week. The emissions landed near the test stands and wherever the wind blew. My evening walks in the 1980's ended up in the hospital with asthma and hives. In the 1970's our children were born with learning disabilities and the schools adopted "special education" programs. Leaving the chemicals in place and fencing the property is not an option because the rain and wind carry it down to our lowlands.</p> <p>The chemicals from NASA ran off site with hundreds of NPDES permit violations every time it rained. Brandies Barden Institue had multiple violations of chemicals on their property and may of the drinking wells in Simi are polluted with chemicals.</p> <p>Comparing bird and animal health to human health is unscientific. Animals are smaller and have a short lifespan and their bodies handle chemicals differently than humans. Cancer can take 5-40 years to develop in humans.</p>	<p>As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP)will be developed; similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p> <p>As detailed in the EIS, after trucks leave Woolsey Canyon Road, project-related traffic is negligible as compared to the existing traffic levels. Therefore, typical incident response procedures should sufficiently address transportation-related needs.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bonnie	Klea	Don't try to scare us with all the trucks. The Sepulveda Pass currently handles 379,000 vehicles per day and we are talking about 80,000 round trips spread over years and three routes of travel. Break that down for us into how many trips per hour or how many trips per day.	These issues are addressed in the Transportation section of the DEIS. Based on current information, NASA has provided the best analysis based on information available.
Bonnie	Klea	Don't send up empty trucks but use empty trucks to haul the fill and then refill with contaminated soil.	Thank you for your comment regarding the trucks that will be required for remediation activities. NASA will consider transporting clean soil with the trucks used to transport excavated soil from the site. There are logistical factors that will be considered such as the location of the backfill soil in relationship to the landfills and properly cleaning the trucks used to haul the excavated soil prior to loading the clean soil.
Bonnie	Klea	The comments on reviving Silvernale Pond for the benefit of Bell Canyon and the wildlife and ecology were made without any knowledge of history of the site. In the early days of the SRE radioactive and chemical waste was discharged to an earthen dam behind the building. After the dam broke the waste was piped to Silvernale Pond. It was a holding area for toxins.	Neither the SRE nor Silvernale are NASA sites and both predate NASA's arrival at SSFL by nearly 20 years. NASA is not familiar with the origins of the Silvernale Reservoir. However, there is a pathway for water emanating from the SRE site could flow through the Old Conservation Yard site and down to Silvernale.
Bonnie	Klea	Needless to say, I fully support the AOC.	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bonnie	Klea	<p>But I worked there in the '60s and '70s, and I had terrible health effects from my job. I had cancer, as well as most of the workers. And I've been in touch with many of the NASA workers, and they have lung cancer, they're dead, or they have COPD and they can't walk anymore. So I'm telling you that the health effects are serious, and they're serious to the community.</p> <p>We had periods of times where every single test stand was running 24 hours a day, every day of the week, and the emissions went on the ground and they went in the community. Wherever the wind would blow would be the emissions. And now we have findings in Simi Valley of perchlorate in their wells. And we have -- where I live in West Hills, we have several census tracts that, in three different studies, show where I live exactly has a higher rate of bladder cancer by 50 percent. And that's also mirrored in the workers. Lung cancer is No. 1 up there, and bladder cancer is No. 2.</p>	<p>NASA respects public concerns regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>Based on these and other comments, NASA will revise the EIS to reflect the impacts of contaminants if left in place as well as to include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>
Bonnie	Klea	<p>So you can't just leave it up there. Okay. And for those people who think that you could just fence it or cover it, it can't be done. It has to be removed. And we can't leave the mess for future generations. And needless to say, I support the cleanup. I support the AOCs. NASA made this mess and profited from it. Take the test stands down if there's contamination underneath.</p> <p>Don't leave the mess behind in our community for innocent generations. We have a moral duty, for what we know, to take care of it before future generations are born and wander up there and don't know what the hazards are.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Leslie	Klein	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon	Knapton	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

Sharon	Knapton	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Sharon	Knapton	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

Sharon	Knapton	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Norman	Knepher	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Norman	Knepher	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Albert	Knight	<p>The NASA DEIS contains no suggested dust mitigation measures for any of the 10 listed Burro Flats pictograph locations, inc. the main panel. The loci are #s 6-11, 13, 16-17, and 23, according to CH2M Hill (C-37). Locus 10 is on the NRHP and deserves the highest possible level of protection.</p>	<p>BMPs for fugitive dust emissions are described in Section 4.7 (Air Quality) and apply to the entire project area. These measures include such items as: apply water at a sufficient quantity and frequency to prevent wind-driven dust; do not perform loading during unfavorable weather conditions (such as high winds or storms); and use properly secured tarps that cover the entire surface area of the load for hauling.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>CH2M Hill notes in various places in their report that ".65" acres of CA-VEN-1072 may need to be removed during clean-up. There is no indication in the report as to how this number was arrived at.</p> <p>Was a portion of the site actually tested, or is .65 acres an assumption?</p> <p>What part of the site was teste?</p> <p>Who did the testing</p> <p>When was the testing done</p> <p>What work was done and how was it done?</p> <p>What was found during the testing</p> <p>If no testing was performed, who made the assumption ?</p> <p>Based on what information?</p> <p>Where is the rert?</p> <p>Who are the report authors</p> <p>Where is the map that was produced showing exactly what is being talked about?</p>	<p>The 0.65-acre is only a rough estimate of soil that may need to be remediated within the Archaeological Resource Management District of the Burro Flats site. The 0.65-acre of soil that may need to be remediated within this district was an estimation based on prior activities and will be finalized during Field Sampling Plan 6. The Burro Flats archaeological site is a sensitive cultural site, so the location is kept confidential; it is not depicted in any maps in the report.</p>
Albert	Knight	<p>3-16 says that transects were "between 49.2 feet and 98.4 feet" apart. Really? Not 50 to 100 feet apart? This is absolutely inadequate. ALL areas where transects at these distances were utilized should be re-surveyed, with 5 meters between transects, maximum.</p>	<p>These numbers are conversions from meters; the transects were between 15 and 30 meters.</p> <p>All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in California. No additional surveys are planned prior to the FEIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	In their discussion of possible in-place soil treatments the Draft (4-21) states that "drilling for piping for wells and boreholes" would cause no adverse effect to Indian Sacred Site CA-VEN-1072. This is an odd statement, especially given that there is no mention of the necessity to clear, grub, and grade to allow equipment access, and for the construction of the suggested "wells, piping, and holding tanks."	The text describing the in situ treatment method indicates the wells would be placed in previously disturbed areas as much as possible. The pumps and equipment required for this treatment method would be contained in skid-mounted trailers and would not be permanent. There could be impacts to unknown archeological resources due to the minor grubbing and clearing needed for truck access.
Albert	Knight	4-22 paragraph 1 is gibberish. How can one possibly know what impacts there might or might not be to "unknown archaeological resources"? Consider especially that no cemetery has ever been located in the Burro Flats area. Over-enthusiastic remediation has the potential to change that. See comments by Dr. Chester King on this particular.	NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in California. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.
Albert	Knight	The conclusion presented in 4-23 paragraph 1 is odd. The work suggested in the DEIS CANNOT be "done in discrete locations to minimize impacts" and cause "no adverse effect" in a Sacred Site, period. The conclusion presented in 4.13.2.2 (4-158) is more realistic: i.e. that "The cumulative impacts of NASA, DOE, and Boeing's activities would have significant, negative, local, and long-term impact on cultural resources and the Indian Sacred Site and TCP."	The reference to discrete locations is only discussing impacts from in situ groundwater treatments. NASA believes these specific groundwater treatments would have a minor, negative, local, short-term impact on the Indian Sacred Site, because they can be strategically located to minimize impacts.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>The DEIS 6.1.1, MM-3 states in part that "... NASA would contribute additional information regarding the existing literature of the ethnographic history of the area." If this means that NASA will rehash what is already known about the Burro Flats site complex and the surrounding FSSFL, MM-3 is inadequate. Instead, NASA should pay close attention to MM-4 and utilize knowledgeable local archaeologists to summarize previous studies, and to produce new information, in the form of at least several papers, which would discuss the various aspects of the Burro Flats site complex, the greater Santa Susana Field Lab area, and the Bell Canyon site complex. Importantly, MM-4 should include the complete analysis of ALL OF THE PREVIOUSLY EXCAVATED ARCHAEOLOGICAL COLLECTIONS NOW ARCHIVED AT THE SOUTHWEST INDIAN MUSEUM/AURTY MUSEUM OF THE WEST.</p>	<p>Thank you for your MM suggestions. Please refer to the Programmatic Agreement (PA) and/or ROD for final stipulations identifying MMs for historic properties. The PA and/or ROD will be developed to identify MMs. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 will be incorporated in the PA and/or ROD.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>DEIS 3-16 says in part that "In June 2007, NASA re-recorded the site and updated the site record; this effort resulted in combining 16 separately recorded sites into one site, CA-VEN-1072...." This is interesting since Knight did this work almost 20 years earlier. This fact is mentioned in a previous report (2007) by CH2M HILL , Archaeological Resources Review: Santa Susana Field Laboratory especially Attachment 1, Archaeological Sites' Individual Loci (pp. 1-1 and 1-2), which mentions a short article by Knight (1995), and lists him in the Bibliography. However, that paper does not cite him as author, although essentially all of CH2M HILL 2007, Attachment 1 follows Knight, in places almost word-for-word.*Compare Recent Investigations at Burro Flats (CA-VEN-1072), Ventura County, California. pp. 11-12, Society for California Archaeology Newsletter 29 (5), 1993, by Albert Knight, with CH2M HILL 2007:1-1 and 1-2.</p> <p>* CH2M HILL (2007:1-2) notes that- as a part of Knight's research and- ".... at the request of the staff at the South Central Coastal Information Center.... the entire site complex was re-recorded as a single 'site' (with multiple loci), and given the new trinomial CA-VEN-1072 (56-001072) in August of 1991."</p>	<p>We acknowledge your pointing out these inconsistencies. This information will be corrected in the text of the DEIS (Section 3.3) and in Appendix C, the cultural resources technical report.</p>
Albert	Knight	<p>I would also like to note a number of small errors, all of which show that the preparers of the DEIS were not familiar with the local Native American peoples, or the local geography- - C-24 paragraph 4, refers t "Bony Peak." Proper usage is "Sandstone Peak" which is the highest point "Boney Mountain."</p>	<p>We acknowledge your pointing out these inconsistencies. Corrections will be made to the cultural resources technical report in Appendix C.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>C-25 paragraph 1:</p> <p>a. The Chumash Language family has not been considered to be part of the Hokan language family for over 20 years.</p> <p>b. The Chumash language extended north beyond Point Conception, to at least Morro B.</p> <p>c. The Gabrielino/Tongva did not occupy the San Fernando Valley, nor did they occupy Burro Flats, although they certainly visited for ceremonies and for trade, etc. The DEIS authors should instead have referred to the Fernandeno people. Although the Fernandeno were ethnically and linguistically related to the Tongva, their culture was distinct and they are considered to be a separate tribe. I note that the Gabrielino/Tongva of the San Gabriel Valley are listed as NASA Section 106 consultants, but that the Fernandeno, of the San Fernando Valley, are not included on the 106 consultant list.</p>	<p>Thank you for pointing out these inconsistencies. NASA established early on a process for applying to be a Section 106 consulting party. The request form is open to the public and available on the NASA SSFL website.</p> <p>In Appendix C, the section name and discussion has been changed to Gabrielino/Fernandeno.</p>
Albert	Knight	<p>C-34 refers to the ".... full recordation of Burro Flats Painted Cave," by CH2M Hill in 2007. I have carefully examined both the 2007 CH2M Hill survey report, and the 2007 CA-VEN-1072 site record supplement. Neither document is or includes a "full recordation" of anything. Both documents provide decent overviews, but provide few particulars, except the identification of nine "new" loci. Neither the previously listed loci, nor the newly listed loci, are described in any but the most general manner. There is no indication if the "new" loci numbers were established by subdividing previously recorded loci, or if loci 16-24 are really completely new discoveries (which I find hard to believe, given the amount of attention the area has been given in the past). In fact, CA-VEN-1072 remains mostly unrecorded, with the exception of the justly famous locus 10.</p>	<p>Thank you for pointing out these inconsistencies. The cultural resources technical report in Appendix C will be corrected.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>Finally, the Draft CH2M Hill EIS repeatedly refers to the "Burro Flats Painted Cave" site, which is actually ONLY locus 10 of a much larger site complex. The DEIS makes no attempt to address, even speculatively, the relationship between the "main panel," the rest of the VEN-1072 site complex, the relationship between the 1072 site complex to the larger complex that includes the rest of the SSFL, and/or the relationship(s) between this larger site complex and the other recorded sites in the greater Bell Canyon area.</p>	<p>NASA acknowledges your comments. We have changed the nomenclature in our reports to better reflect the large site of CA VEN 1072 ("Burro Flats Painted Cave" has been changed to the "Burro Flats site") (Sections 3.3.3.3, 4.3.1.1, 4.3.1.2, 4.3.1.3, and 4.3.2, and Table 6.1-1).</p>
Albert	Knight	<p>We recognize that NASA was politically pressured to only consider two alternatives in the DEIS –the No Project and Clean to Background [as prescribed in the 2010 Administrative Order on Consent (AOC)]. This is very unfortunate, and we agree with the Santa Ynez Band of Chumash Indians (as noted in the DEIS Executive Summary) that NASA's signing of the AOC constituted a federal action subject to review under the National Environmental Policy Act (NEPA), and that by signing on to the AOC without such review, NASA is in violation of the spirit and intent of NEPA to provide an open and public decision-making process.</p>	<p>NASA originally proposed to evaluate a cleanup to background (proposed action) that meets the 2010 AOC requirements, a no action alternative, and three other alternatives that are normally analyzed for a typical Superfund cleanup based on common cleanup goals associated with risk-based scenarios to evaluate the full range of options and their associated environmental or cultural impacts. Additionally, we always included evaluation of the different technological approaches to soil and groundwater cleanup. These additional three alternatives included a cleanup to suburban residential, industrial, and recreational cleanup standards. Based on input from multiple parties, NASA streamlined the evaluation to only one alternative which reflects the AOC background cleanup levels, while examining impacts of various technologies to meet that goal, that is, how to meet the AOC level. CEQ's letter dated July 19, 2012 states, "However, there is no requirement that NASA consider alternatives that cleanup to other standards that differ from the agreement with the State."</p> <p>Additional information regarding the eliminated alternatives is provided in Section 2.4.1 of the EIS and at http://ssfl.msfc.nasa.gov/environmental-cleanup/environmental-impact-statement/default.aspx.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	By defining the Purpose and Need solely according to the restrictions set forth in the 2010 AOC, and thus by limiting the range of reasonable and feasible soil cleanup alternatives that would meet standard industry accepted risk-based protocols for the protection of human health and the environment, the usefulness of the DEIS as a decision-making tool is severely curtailed, again violating the spirit and intent of NEPA. Further, if a standard risk-based protocol is sufficient for treatment of groundwater contamination at the entire SSFL site and for soils on Boeing-owned parcels, why is the same risk-based protocol not applicable to treatment of soil contamination on lands under federal jurisdiction?	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted. Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).
Albert	Knight	It would seem that at the very least, separate project alternatives that propose different technologies of cleanup in accordance with the 2010 AOC should have been proposed (i.e. complete excavation; excavation plus in situ treatment; excavation plus ex situ treatment, etc.). Unfortunately, soil sampling and soil treatment pilot testing for the "clean to background" threshold are ongoing, thus comprehensive project alternatives cannot yet be fully developed (refer to Section 2.2.2.1 of the DEIS). As such, we believe that the release of the DEIS without the completion of those studies is premature and greatly hampers the ability of the responsible parties and oversight agencies to make an informed decision based on the DEIS document as it currently stands.	The EIS does evaluate impacts from various technical soil cleanup options. It looks at a range that represents from 100% excavation to the minimum excavation plus the maximum in situ / ex situ onsite treatments. What is not known is if the onsite technologies can treat the soil to a level that meets 2010 AOC requirements. See EIS Section 2.2.2.3 Soil Cleanup Technologies form more information.
Albert	Knight	Alternatively, NASA has already completed remedial investigation (RI) reports that outline cleanup alternatives using a risk-based approach, which resulted in the 2007 Consent Order. It is unclear then, in Section 1.1.4 of the DEIS, why the 2010 AOC was subsequently executed. As a public disclosure document, the DEIS should make this decision more transparent.	The rationale for the execution of the 2010 AOC is outside of the scope of this EIS. NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	As described in Section 1.3 of the DEIS, separate environmental reviews will be conducted for each portion of the responsible parties' jurisdictions. This would seem to make the decision-making process overly cumbersome and confusing such that cumulative effects stemming from multiple cleanup strategies would not be apparent. Why was there not one combined EIS/EIR document prepared concurrently by all responsible parties (Boeing, NASA and DOE) and the oversight agency (DTSC) to allow for full public disclosure?	Cumulative impacts are included in NASA's EIS. See section 4.13.
Albert	Knight	At the same time, the DEIS Purpose & Need includes the action "to prepare the property for disposition," yet does not consider end land use of the property in the determination of appropriate cleanup standards. Our understanding is that the General Services Administration (GSA) will conduct separate NEPA review for property disposal/transfer actions, with the potential for additional confusion. We believe that it is important not to divorce end use from cleanup, and that both should be considered together in one joint-agency EIS/EIR document.	The AOC requires NASA to cleanup to background. Cleanup to background will support any future land use.
Albert	Knight	NASA is proposing to remove and treat 105 acres of soil to a depth of at least two feet as a "worst case scenario" approach based on incomplete soil testing and treatability studies. As acknowledged in the DEIS, this will have a significant impact on cultural resources. Despite this, alternatives that would allow some degree of archaeological and historic preservation and still incorporate cleanup to levels protective of human health and the environment for suburban, industrial or recreational uses have been eliminated from analysis and treated as nonviable alternatives. We believe that this approach is greatly flawed, and should be reconsidered in order to move forward with the site cleanup in a manner that makes it possible to avoid demolishing significant historic structures and severely impacting the archaeological resources associated with Burro Flats Painted Cave site, CA-VEN-1072.	NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as NASA determines whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	The DEIS mixes the terms “ROI” and “APE” within the discussion of cultural resources (Sections 3.3 and 4.3). In order to avoid confusion, only terminology (i.e. Area of Potential Effect, or “APE”) consistent with Section 106 of the National Historic Preservation Act (NHPA) should be used.	We acknowledge your comments. We will try to clarify.
Albert	Knight	Section 3.3.1, second paragraph, notes that the SCCIC provided studies which have been submitted to the State Historic Preservation Officer (SHPO). This is incorrect – not all reports submitted to the SCCIC repository have been submitted to SHPO for review and comment. This is important to note since previous studies may not be sufficient to meet Section 106 obligations, and should not be treated as such.	We acknowledge your comment.
Albert	Knight	In Section 3.3.3.3, the DEIS states that an “archaeological survey of 100 percent of NASA-administered lands at SSFL” has been performed, however based upon the subsequent description of the survey methodologies employed, we feel that this is an inaccurate statement. Typical archaeological survey transects in the region range between 10-15 meters (32-49 feet), depending on the terrain and ground visibility. The DEIS notes transect spacing of twice this range, so smaller sites such as lithic scatters could easily be missed. The DEIS also acknowledges that areas of slope greater than 25% were not surveyed. These statements clearly indicate that less than a 100 percent survey was achieved and we recommend that the DEIS text be corrected to reflect a more accurate survey coverage area.	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior’s Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>The DEIS goes on to state that all rock outcrops were investigated for the presence of rock shelters. In addition to these features, rock outcrops in the area may also include petroglyphs (including cupules), bedrock milling stations and water basins (tinajas). It is not clear in the DEIS, based on the background research noted, if the field archaeologists were surveying for these types of resources as well. Rather than listing only one specific archaeological feature type, survey methodology should include a consideration for all possible features, and we recommend correcting the DEIS accordingly.</p>	<p>NASA will clarify the text.</p>
Albert	Knight	<p>The DEIS notes that an updated records search was conducted in February 2013 to cover “an additional 9 acres on Boeing property just north of the NASA-administered area,” however the APE map (Figure 3.3-1) shows several areas that extend beyond the NASA- administered portions of SSFL on all sides and seem to add up to more than 9 acres. Did the records search encompass all of these areas as well? We are concerned that some of the resources identified during the EPA Radiological Characterization of Area IV and the Northern Buffer Zone may fall within the DEIS APE as shown and are not being accounted for in the cultural resources inventory.</p>	<p>Yes, all of the areas outside NASA's boundary that are shown in the APE were researched and surveyed. NASA has identified those archeological resources which fall within the boundary of the APE.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	The DEIS repeatedly refers to the “Burro Flats Painted Cave” site which is actually only Locus 10 of the much larger archaeological site complex, CA-VEN-1072. The continued focus on the rockshelters (note that these features are not true “caves”) containing pictographs and cupules, while almost ignoring the extensive midden and other bedrock features that also are present in site holds huge implications for discussing project effects on historic properties. Basic documentation done 20 years ago by Al Knight for research purposes and excavations done over 50 years ago by a partly avocational group are provided in lieu of modern site recordation. Current inventory work should have used standard practices of detailed site mapping with GPS/GIS technology and controlled test excavation to determine vertical and horizontal site parameters; further, no recommendations were made for additional site evaluation testing to identify or evaluate archaeological characteristics such as artifact assemblage composition, constituents, or chronometry.	<p>The name of CA-VEN-1072 will be corrected in the EIS text (Sections ES, 3.3, and 4.3) and Appendix C. The Burro Flats site was revisited and resurveyed with GPS in June 2007 to reassess the nature and extent of the previously recorded Burro Flats site in NASA’s Area II. As a result, of this investigation, California Department of Parks and Recreation Primary Record forms for Burro Flats were updated and submitted to SHPO. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. NASA has identified that any excavation within CA-VEN-1072 is likely to have an adverse effect as it could affect buried deposits.</p> <p>Thank you for your comments regarding the archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional information.</p>
Albert	Knight	In fact, the entire paragraph describing the context of the site on page 3-16 shows a general lack of understanding and poor research breadth of the site complex. For example, only three references are given that all are related to very limited work done in the past two years, however, several reports and records have been written on the site in the past forty years. A period of significance is stated with no accompanying reference to support it. And rather than obtaining a copy of the complete NRHP nomination packet, the DEIS merely references the highly limited data available on the NRHP website. This not only suggests poor scholarship, but gives us additional concern about the level of sufficiency of NASA’s cultural resource inventory under the requirements of Section 106 of the National Historic Preservation Act (NHPA).	NASA appreciates the comment and will update its references. NASA reviewed all previous reports available and incorporated a summary of that which could be made public in the Appendix. NASA notes that much of the information provided in those reports are confidential.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	The DEIS states that CA-VEN-1072 has been recorded numerous times and that NASA re-recorded the site in June 2007. Again, this statement is incorrect. Based on the records available at the SCCIC, the Burro Flats site complex was originally recorded by Charles Rozaire in 1959 and 1960 as eleven individual sites (CA-VEN-151 through CA-VEN-161). In 1991, Al Knight recorded four additional sites (CA-VEN-1065 through CA-VEN-1068), then later that same year, based on guidance from the SCCIC, which at that time was located at UCLA, incorporated all fifteen individual sites under one site complex, designated CA-VEN-1072. Not only do the consultants for the NASA DEIS not give credit to Knight for this work, but they openly plagiarize complete sections from his site record and subsequent 1995 report that described the recordation process without proper reference.	We acknowledge your comment. These inconsistencies will be corrected in the EIS text (Section 3.3) and Appendix C.
Albert	Knight	Further, the DEIS refers to the "... full recordation of Burro Flats Painted Cave," by CH2M Hill in 2007. We have reviewed this site record update and find it to be poorly executed and in no way complete for a resource of this significance. For comparison, a recent update for a complex prehistoric and historic-period archaeological site in nearby Santa Susana Pass State Historic Park is 68 pages long, including feature descriptions, sketch maps and photos. The 2007 "update" for CA-VEN-1072 does not even include a photo or sketch of the famous rock art!	Please refer to the Programmatic Agreement and/or ROD which takes into account these concerns.
Albert	Knight	Sections 3.2.2 and 3.4 describe biological species with traditional importance to native people. This list was constructed solely from a response by the Santa Ynez Band of Chumash Indians on an account of currently-identified onsite species. We believe that this is an inadequate level of inventory, and that consideration be made to species that may have been present at the site historically, as well as expanding consultation to include state-recognized descendant communities.	NASA endeavored to analyze impacts to multiple cultural resources including Indian Sacred Sites and TCPs as well as known and unknown archeological sites and features and plants of interest to Native Americans.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>The DEIS notes in several places that a Traditional Cultural Property (TCP) study is underway. Since this type of study is used to inventory historic properties that may be present within the project APE, we believe that this study should have been completed prior to the issuance of the DEIS. Without a complete inventory of historic properties, the DEIS cannot properly assess project impacts, again violating the intent of NEPA and the Section 106 process. Simply delaying the determination until the final EIS does not allow for public comment and input.</p>	<p>NASA has conducted a preliminary investigation of the potential for a TCP. The Santa Ynez band of Chumash Indians, the SHPO and ACHP will have an opportunity to review the findings of the investigation prior to signing the agreement document. The EIS analysis includes the likely impacts of the proposed action on a TCP in advance of finalization of the study.</p>
Albert	Knight	<p>We agree with the NRHP determinations of eligibility for the three test stand historic districts (Alpha, Bravo and Coca). The DEIS description of each resource is concise and highlights the NRHP eligibility characteristics that are relevant to assessing project effects.</p>	<p>We acknowledge your comment on architectural resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>Demolition – The DEIS notes that proposed building demolitions and removal of ancillary structures would result in a no adverse effect finding for archaeological resources because these areas have already been disturbed. Similarly, NASA maintains that by locating stockpile and staging areas in previously disturbed areas, such as roads or parking lots, no impacts on archaeological resources would occur.</p> <p>We find that the wholesale assumption that areas associated with existing structures, infrastructure, and other disturbance have rendered the integrity of any archaeological resources destroyed is dubious. In fact, roadways, parking lots and sometimes even buildings can act as a cap to protect subsurface archaeological deposits. And even if there was localized disturbance during installation of such structures, the footprint for removal has the potential to exceed the area of the original installation if techniques such as over-excavation are required. The conclusion that undisturbed soils of appropriate age and association to contain significant prehistoric archaeological resources are present is unwarranted. The only way to make a determination of effects on archaeological resources under and around existing infrastructure is through an archaeological testing program to determine presence/absence and integrity of deposits; this is where a phased approach may be appropriate.</p>	<p>NASA agrees that not all previously disturbed areas will have no worthwhile deposits. In accordance with the PA NASA will work with the SYBCI and the SHPO to identify areas for additional survey prior to any cleanup activities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	Soil Cleanup to Background – The DEIS notes that “there would be a low to moderate potential of encountering buried archaeological deposits outside the boundaries of the significant archeological sites.” Terms such as “moderate potential” imply that more resource inventory work needs to be done before project effects can be fully assessed. Additionally, the DEIS notes that “the proposed cleanup areas include roughly 0.65 acre of the Burro Flats site.” There is no indication of how this number was calculated – was soils testing completed within the site, and if so, was the testing monitored by an archaeologist and Native American consultant?	The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. The potential 0.65 acre impact from cleanup activities would be outside the National Register boundary, but within the Archeology Resource Management Area. The soil testing within the Archeology Resource Management Area has not yet been carried out; the 0.65 acre of potential impact was an estimation. Please refer to the Programmatic Agreement and/or ROD which addresses archeological resources.
Albert	Knight	We recommend that an Extended Phase I testing program be conducted to verify the boundaries of the known archaeological resources, especially CA-VEN-1072, and to assess the presence of subsurface resources in those areas the DEIS has described as having a “moderate potential” for encountering buried archaeological deposits. Given the significance of the archaeological resources at stake, relying solely on construction monitoring and a stipulation for unanticipated discoveries do not constitute a good faith effort in the identification of historic properties under Section 106.	No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.
Albert	Knight	Once boundaries are established through subsurface testing, we ask that NASA fully explore the exception option provided in the 2010 AOC for “Native American artifacts formally recognized as Cultural Resources” and request that DTSC fulfill its promise to exclude all mapped archaeological resources from soil cleanup requirements. Even though the in situ treatment options would not require as much excavation, the installation of wells, boreholes, pumps and piping would create nearly identical adverse effects to CA-VEN-1072 and CA-VEN-1803 as the excavation and ex situ treatment options, thus the only way to reduce impacts to archaeological resources would be through avoidance.	NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further information.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	Further, we request that DTSC provide a full definition for the 2010 AOC exception and explain how the exception percentage calculation was determined. Comments submitted in 2010 by some current LanVen participants expressed concern about the vague language that was used when clear definitions for what constitutes a historic property or historical resource are available in federal and state statutes. And no where do the existing cultural resource laws provide for the preservation of a set percentage of a site without first fully understanding the site parameters and level of effects.	NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts and the exceptions clause.
Albert	Knight	Groundwater Cleanup – As in Comment #17 above, we propose that Extended Phase I testing be conducted to confirm archaeological site boundaries in order to plan for avoidance when installing the infrastructure required for groundwater treatment.	No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.
Albert	Knight	Demolition – The same comments as in #16 above would apply for an Indian Sacred Site or TCP. NASA cannot assume that removal of all existing infrastructure would necessarily be a beneficial impact if there is the potential to adversely affect prehistoric archaeological deposits that may contribute to the significance of the Indian Sacred Site or TCP.	The assessment of impacts in Section 4.3 considers the impacts to the Indian Sacred Site and archeological resources (known and unknown) separately.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	Soil Cleanup to Background – We agree that the proposed removal of at least 320,000 yd3 of soil would constitute a significant, adverse and unmitigable effect to the Indian Sacred Site and TCP. We advocate for re-visiting the project Purpose and Need to consider additional, less damaging alternatives that would still clean up to levels that protect human health and the environment.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Albert	Knight	Strangely, the DEIS states that, taken alone, in situ soil treatment options would have a minor impact on the Indian Sacred Site and TCP and result in no adverse effect to the resource. We disagree, as the need for wells, boreholes, pumps and piping has the potential to introduce visual impacts and adversely affect prehistoric archaeological deposits that may contribute to the significance of the Indian Sacred Site or TCP.	We acknowledge your comment on impacts to the Sacred Site and TCP from in situ soil treatment options. NASA has considered the overall impact of the boreholes and piping on archeological resources and Indian Sacred Site and understands that the placement of these items can be controlled to minimize effects to these resources.
Albert	Knight	Groundwater Cleanup – Similar to soil in situ treatment options, the DEIS states that groundwater treatment would be minor and result in a finding of no adverse effect on the Indian Sacred Site and TCP, despite introducing wells, boreholes, piping, manifolds, tanks and power sources. We disagree with this determination and find that the required infrastructure has the potential to introduce visual impacts and adversely affect prehistoric archaeological deposits that may contribute to the significance of the Indian Sacred Site or TCP.	NASA acknowledges your comments on impacts to the Sacred Site and TCP from in situ soil treatment options. NASA has considered the overall impact of the boreholes and piping on archeological resources and Indian Sacred Site and understands that the placement of these items can be controlled to minimize effects to these resources.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	Demolition – We agree that demolition of individually eligible structures or contributors to an eligible historic district would constitute an adverse effect. However, we argue that these effects would be regional since these historic resources have been determined to be eligible at the national level of significance.	Thank you for your comment. The EIS will be revised to indicate that demolition of these structures would be a regional impact (Sections ES 5.1.2, 4.3.1, 4.13.2; and Tables ES-4 and 4.13-2).
Albert	Knight	Further, we request that the DEIS make a clear statement on the requirement for 100% structure demolition, given that the 2010 AOC only requires that soil be cleaned up to background levels. Our understanding is that a significant portion of the test stand infrastructure is built upon bedrock, and therefore, would not be subject to the terms of the 2010 AOC cleanup, and that DTSC will not be considering structure demolition in their CEQA review. If demolition is proposed as part of the “preparation for transfer,” then the DEIS should be jointly prepared with GSA and consider the end use of the property, as noted in Comment #5 above.	NASA's proposed action includes the demolition of 100% of the structures as they are no longer needed. Future Use is the responsibility of GSA and outside the scope of this EIS. DTSC will prepare a CEQA document and GSA will develop a NEPA document that will address the futures uses of the site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	Soil Cleanup to Background – NRHP-eligible historic structures will be affected by soil cleanup inasmuch as they are proposed to be removed in order to treat the soils beneath them. We recommend then, that all options be explored to address soil treatment under and around the historic structures using in situ technologies to the extent possible. Further, structures built directly onto bedrock should not be affected by soil cleanup and we advocate retention of these until an end use for the property is determined. These structures may serve as important interpretive elements should the land be transferred as parkland or any other preservation purpose (which we support). In particular, we support the retention of the Alpha and Coca Historic Districts.	<p>The test stands sit on top of bedrock which will not be removed during the cleanup. NASA is conducting sampling around the test stands to determine the location of contamination that needs to be cleaned up to meet the 2010 AOC and 2007 Consent Order. NASA is also evaluating in situ technologies that may be capable of removing contaminants without demolishing the structures.</p> <p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p> <p>The test stands have been evaluated and identified as eligible for listing on the National Register of Historic Properties. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. Comments such as yours are considered during that process. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects. Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Albert	Knight	Groundwater Cleanup – We advocate for installation of groundwater treatment infrastructure such that physical and visual impacts on NRHP-eligible historic structures are avoided or minimized.	Thank you for your suggestion.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	Cultural Mitigation Measure 1-We do not believe that the retention of one test stand should be considered mitigation for an unsupported 100% structure demolition proposal. Instead, we recommend that preservation of all or some of the NRHP-eligible historic districts, including test stands and associated contributing structures, be considered in a more robust alternatives analysis for the proposed cleanup action, as discussed in Comment #23 above. The scope and scale of these facilities are a truly awe-inspiring piece of our American history and can really only be appreciated in person, and would provide a tremendous future interpretive opportunity. We recognize that structural stabilization, safety and long-term preservation issues should be considered, and a preservation plan should be developed as a mitigation measure. Additionally, consideration for an endowment fund for long-term preservation should be explored.	Thank you for your MM suggestions. NASA will consider these and other recommendations as it finalizes the Programmatic Agreement and/or ROD stipulating NASA's commitments.
Albert	Knight	Cultural Mitigation Measure 2 – We agree that HABS/HAER documentation is appropriate as partial mitigation prior to demolition of structures, but we also recommend that the same documentation be completed for any NRHP-eligible structures that will not be demolished in order to complete the record. We also recommend that documentation take advantage of modern technology, including LiDAR scanning and high resolution photography, which could be used to develop web and mobile applications for interpretive purposes.	Thank you for your MM suggestions. NASA will consider these and other recommendations as it finalizes the Programmatic Agreement and/or ROD stipulating NASA's commitments.
Albert	Knight	Cultural Mitigation Measure 3 – NASA proposes to develop an ethnographic study to build upon the results of the TCP study. We assert that this should be included as part of the inventory process to identify historic properties within the APE, not as mitigation.	NASA has proceeded with identification requirements in accordance with 36 CFR 800. Please refer to the final Programmatic Agreement and/or ROD.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	Cultural Mitigation Measure 4 – NASA proposes to delineate the boundaries of CA-VEN-1072 as mitigation for significant impacts to the site if it cannot be avoided by cleanup activities. As noted in Comment #17 above, this boundary testing should be completed as part of the historic property inventory process, not as mitigation, in order to assess the potential for complete avoidance or minimization of impacts. Recommended mitigation measures include a thorough update of the National Register nomination for the Burro Flats Painted Cave site, completion of analysis of previous collections from the site, and preparation of a comprehensive synthesis of past and current work, including the results of any archaeological testing, and/or data recovery which may need to be implemented for portions of the site which cannot be avoided or excluded by the 2010 AOC exception rule. Archaeologists who are familiar with the site as well as the regional research in the Simi Hills and western San Fernando Valley/eastern Simi Valley should be contracted to perform this work to ensure a thorough treatment.	Thank you for your MM suggestions. NASA will consider these and other recommendations as it finalizes the agreement document stipulating NASA's commitments.
Albert	Knight	Cultural Mitigation Measure 5 – NASA proposes a temporary protection measure for CA-VEN-1072, but does not describe what such measure(s) might include. Would this include fencing, security systems, a program of site monitoring?	In consultation with ACHP, SHPO and the tribes, NASA is developing appropriate protection measures for the Burro Flats site.
Albert	Knight	LanVen maintains that by defining the project Purpose and Need to the guidelines of the 2010 AOC, and not by accepted standards of cleanup protecting human health and the environment, the resulting limited range of alternatives included in the DEIS holds little utility for agency decision-makers and violates the spirit and intent of NEPA and Section 106.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>We support a reasonable cleanup effort, taking into account standard science-based risk assessment methodology, as well as considerations for end land use. We further support an end use as parkland or open space for the entire SSFL property.</p>	<p>Thank you, your comments, they have been noted.</p>
Albert	Knight	<p>Additionally, we hold that NASA’s level of effort on identification of cultural resources within the project APE is incomplete and not sufficient for the purposes of Section 106. If NASA intends to use a phased approach on identification and evaluation, then the DEIS should state as much. Further research, documentation and subsurface testing are required before project effects can be completely assessed, and avoidance and mitigation measures are able to be determined. Simply delaying this work to the final EIS or calling it mitigation is not sufficient.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior’s Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Knight	<p>Finally, NASA has made it clear in Section 106 consultation that it intends to use substitution under 36 CFR 800.8(c) of NEPA review procedures in lieu of the Section 106 process defined in 36 CFR 800.3-800.6. As noted in the recently published NEPA and NHPA: A Handbook for Integrating NEPA and Section 106 (CEQ and ACHP, March 2013), “there are instances where the substitution approach might not work as well....where a high level of public controversy or complex procedural issues have emerged over the potential impacts to historic properties, an agency might recognize the benefit of keeping the review processes separate so that attention can be focused on managing and resolving discrete controversies.”</p>	<p>The ongoing Section 106 consultation are expected to result in a Programmatic Agreement that will be included in the ROD.</p>
Albert	Knight	<p>We are concerned that since the level of effort for identification of historic properties is incomplete, the current NASA schedule for completing the EIS and issuing the Record of Decision (ROD), which will document the agency’s commitments to resolving adverse effects on historic properties, will not allow for enough time to develop adequate mitigation measures with opportunity for public comment. We are uncomfortable with setting up commitments within the ROD in a tiered approach as this leaves too many unknowns to chance. Therefore, as we represent several Section 106 consulting parties, we find that the DEIS has not met the identification and assessment of effects standards set forth in 36 CFR 800.8(c)(2)(ii), and request that NASA terminate the substitution process and follow the standard Section 106 process. We fully support the recent NASA decision, at the urging of SHPO, to enter into a Programmatic Agreement and believe that this is a more appropriate procedure.</p>	<p>The ongoing Section 106 consultation are expected to result in a Programmatic Agreement among consulting parties that will be included in the ROD.</p>

In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Dawn	Kowalski	<p>My main thing here is we need to clean up this site. And I say thank you, NASA. Thank you, DOE, signing the AOCs. They may be costly, but when it's all done and said and we get a beautiful park up there, because Boeing says they will do that and hopefully you will hold off and give us the land for park. We will have a wildlife corridor. We will have a beautiful park where we can all go with our children and grandchildren and not fear contamination. And that's why we need it cleaned up to background. We don't want things capped, because we want a beautiful park.</p>	<p>Your comment is noted.</p>
Dawn	Kowalski	<p>As far as the test stands are concerned, the shuttle came to L.A. It would be really meaningful to have those test stands down with the shuttle. They could be taken down and reconstructed there if deemed unpolluted, and I think that would be an absolutely great place for it. And then the museum can take the liability, because if it was left in a park we'll have, you know, very scary situations with children climbing with it, I'm sure. That would be the first thing I would have done as a kid.</p>	<p>Thank you for your MM suggestion. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dawn	Kowalski	<p>As far as the trucks, the cleanup has been going on with Boeing for years. And I think if you talk to any Woolsey Canyon resident they could tell you that they've seen many, many trucks. We protested outside Rocketdyne when they were shipping mixed waste to Buttonwillow, and the trucks were coming out much faster than six an hour, ...</p> <p>So also, when you do calculate, if you put the soil -- keep some of the soil and do in situ, it would seem that that would reduce your trucks. I think you said to 34 in a day rather than 50 something if I remember rightly.</p>	<p>The number of trucks required is predominately a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus not being a valid option. Section 4.5 in the EIS discusses transportation routes further (also see Alternate routes do exist, see Figure 4.5-1).</p> <p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

Dawn	Kowalski	As far as the archaeological site, I, too, believe that the AOCs will provide you some discretion and not rummaging through sites. Also, I'm pretty sure that there is a Native American expert that is present during all of the demolition, so I'm sure that you will be well guided in that area. And I'm sure when you went before to build your buildings and do your test stands that you probably disturbed a hell of a lot of stuff then, which is unfortunate, but I'm sure that there's been a lot of damage already done on site, to the Native American site.	We acknowledge your comment regarding archeology. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts and the exemption clause.
Dawn	Kowalski	Off-site contamination. Well, we know we have off-site contamination. Not all yours, because some of it's radiological contamination off site.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Dawn	Kowalski	<p>Environmental justice. That was an interesting quote you had there, because you mentioned children and trucks. You didn't mention children with retinal blastoma, cancer of the eyes. They can never see. You know, there are other problems other than the trucks, and we who live directly below the site in our community, we are concerned with the wind blowing, with the contamination that comes off site. ... The water that comes down Black Canyon runs right through neighbors' houses. The water that comes through my yard comes off the mountain. I'm a cancer survivor. I'm not blaming anyone. I don't know where I got my cancer from, breast cancer. ... But, you know, there are a lot of people in the community who suffer from cancer, and they don't know either.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dawn	Kowalski	<p>I was disconcerted when I attended your meeting on the draft EIS and felt that NASA was skirting around the issue of cleaning up the contaminated soil. The AOC's clearly state to cleanup to background, and the EIS determines where that is, test stands, artifacts and truck trips should not stand in the way. It seemed instead that NASA was doing everything it could to divert attention from the contamination and try to find excuses to not do what it promised in the AOC.</p> <p>Yes, Native American artifacts are important but they are already protected by the AOC. If cleanup could impact them, they are exempted. It is not honest to raise the issue when NASA knows all along it is not an issue. As to vegetation, we are talking about a site that has had many years of grading, construction, parking lots, roadways, and these areas contain most of the pollution. Again, the EIS is misleading in this regard. The site is not pristine; NASA stripped away much of the vegetation when it built up its facilities and used them for decades. And then NASA spilled huge amounts of pollution onto the soil. The cleanup is to restore the degraded land; instead the EIS makes it appear that the land is untouched and cleaning it up will damage it. The situation is just the opposite. NASA damaged the land with huge activities and pollution, and now it needs to be restored to a safe condition.</p> <p>...</p> <p>We have waited patiently for 24 years. I thank NASA and the DOE for stepping up to the plate, signing the AOC's and remaining true to your commitment. We are in the home stretch now. Do not let anything steer you away from the prime focus, the CLEANUP. Live up to the requirements of the AOC--cleanup to background-- to the letter.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dawn	Kowalski	<p>The test stands should be dismantled and the area cleaned, we know that half a million gallons of TCE was lost at the site. If it is worth reconstructing them after the cleanup and they don't pose a threat then so be it. But one can't clean up the contamination beneath them with them in the way, and raising the prospect of not removing them seems just another excuse to violate the AOC and not clean up.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dawn	Kowalski	<p>I see a lot of talk about truck traffic in the EIS . But decades of activity at SSFL have entailed huge numbers of truck and car trips. The EIS doesn't put in perspective by disclosing how many car and truck trips have occurred at the site while it was operating. A fraction of that to clean up the mess is no big deal. Furthermore, it appears we are really only talking about a few trucks an hour for cleanup, particularly if one spreads them out over the various possibl routes.</p>	<p>NASA is required by NEPA to report the potential impacts due to transportation requirements that are estimated for each alternative. NASA reported the potential impacts of the trucks on the basis of current LOS information for the roadways in each of the transportation routes and not on the basis of past transportation requirements at the site. The current LOS information for the roadways provides information that can be used to evaluate the potential impacts due to the trucks that will occur in the near future.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dawn	Kowalski	<p>The EIS fails to take any real look at mitigating the matter anyway, such as electric or natural gas powered trucks, more focus on in situ treatment, rail, use of more routes, etc. Again, the EIS seems to be a polemic designed to inflame people against the cleanup, rather than a real evaluation of the ways to mitigate the inconvenience that would be entailed by cleanup. And there is no real consideration of the environmental damage done by all the pollution, the impacts on those of us nearby who can continue to be exposed to those pollution if you don't clean it up and it keeps migrating offsite.</p>	<p>Section 2.4 in the EIS discusses alternate transportation considerations (1) overland conveyor and rail transport of soil; (2) build a new haul road (3) truck from site to rail and transport by rail to disposal facility.</p> <p>(1) NASA considered alternative rail or conveyor system for hauling materials from SSFL. The analysis showed that a conveyor system would require building the system over private land and constructing a railroad facility to keep trucks off the local roads. NASA concluded that the system could not be built in the AOC timeframe requirement, there could be opposition to acquiring rights-of-way over private lands.</p> <p>(2) NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements.</p> <p>(3) NASA considered a truck-rail combination for soil disposal. Using existing local roads to rail would not alleviate traffic on local community roads.</p> <p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dawn	Kowalski	Living directly below the site, our focus is on Health and the safety of our Community. We know there have been studies showing that the health of the workers and the health of people living near the site has been affected. We know contamination has been found both on and off site. We also know that there is a higher level of Breast Cancer on the East end of Simi.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>
Donna	Kowzan	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Margaret	Krpan	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Christine	Kuester	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Kuhn	<p>The heart of NEPA is that the sponsoring agency should rigorously explore and objectively evaluate all reasonable alternatives. The DEIS limits its alternatives to: 1) cleanup to background and 2) the "do nothing option." The "do nothing" alternative is not an alternative for cleanup of the site. Both the cleanup to "recreational standards" and the cleanup to "residential standards" must be considered. Both of these standards would require much less soil removal, would ultimately result in less soil erosion and destruction of the natural setting, including possibly rock outcroppings, natural vegetation and wildlife habitat. It is likely to require less destruction of buried, disturbed and relatively undisturbed cultural resources.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>In addition to the Proposed Action, NASA considered alternatives other than a cleanup to background as stipulated in the 2010 AOC. The action alternatives considered and evaluated would implement the soil and groundwater remediation technologies previously discussed to achieve various risk-based cleanup levels, specifically the Suburban Residential, Commercial/Industrial, and Recreational risk-based cleanup levels. These risk-based alternatives were eliminated from further consideration because they would not meet the requirements of the 2010 AOC. In addition, a CEQ letter dated June 19, 2012 (Appendix A), states that NASA is not compelled to consider comprehensive cleanup measures as alternatives that are less than the cleanup to local background levels described in the 2010 AOC. Additional information regarding these alternatives is provided on NASA's SSFL website.</p>
Michael	Kuhn	<p>The DEIS should include a discussion of the ultimate land use of the site. If it is anticipated that the ultimate land use will be for recreational or residential purposes, then it is fiscally wasteful to attempt a cleanup to background standards.</p>	<p>Future use is the responsibility of GSA and outside the scope of this EIS. DTSC will prepare a CEQA document and GSA will develop a NEPA document that will address the futures uses of the site.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Kuhn	<p>Finally, to restrict the cleanup of the NASA property to one alternative, i.e., the to background readings, seems to have been a political decision, which seems to have swept aside the requirement to include in an EIS an objective evaluation of all reasonable alternatives. That decision has made a mockery of the federal review process as prescribed in the NEPA legislation and would not serve the public interest.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>In addition to the Proposed Action, NASA considered alternatives other than a cleanup to background as stipulated in the 2010 AOC. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Kuhn	<p>This alternative is characterized as an initial removal of two feet of soils wherever soil contamination has been or will be identified. If the underlying soils are found to still be contaminated, then excavation would continue until background, i.e., natural, readings are achieved. This procedure may require removal of all soils and ripping up the weathering front of the underlying bedrock. The resulting landscape may well resemble a moonscape or an array of "borrow pits." The report commits to replace of up to one third of the soil removed by imported clean fill - if such material in sufficient quantities can be found and made available. The availability of such materials seems unlikely. Even if one third of the volume of the exported soil is replaced by alluvium from outside the project area, the character of the site would be altered for the foreseeable future. Over the long term, the NASA lands would never fully recover.</p> <p>Any relatively clean backfill is unlikely to resemble on-site soils geologically and would contain exotic unwanted plant seeds and organisms.</p> <p>A benefit of the removal of so much soil is stated to be fewer animals dying from toxins in the soil. As far as I am aware there have not been any studies made to determine whether or not wildlife has been adversely impacted by soil contamination on site. A benefit should not be forecast for an impact that has not been demonstrated .</p>	<p>Your summary here is accurate. NASA acknowledges your comment.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Kuhn	<p>Coast live oaks represent the dominant native tree on the site. Coast live oaks are near and dear to the hearts of people in the southern California area. Trying to determine whether only a few, many or nearly all of the trees are slated for demolition during soil cleanup operations is difficult to achieve based upon viewing a digital file of the Draft EIS and is not disclosed in the document. It may well be desirable to leave health oak tree undisturbed - thereby leaving some contamination behind. During demolition and soil removal operations the trees should be fenced off beyond the driplines of the trees using chainlink fencing. Any removals should be replaced with ten (10) or more seedling with a deep-root water program for a two-year period.</p>	<p>As a federal facility, NASA is not required to comply with the Ventura County ordinances. We do strive to comply with state and local ordinances when feasible.</p>
Michael	Kuhn	<p>The NASA properties was a heavily utilized area by native Americans. Much focus is relating to rock art sites and other ceremonial features, such as cupules, bedrock mortars, rock alignments, and shadow and light effect, which may have been associated with ceremonies. However, the site the site of the SSFL was probably used seasonally throughout the year for thousands years to gather food and other resources as well as for hunting. Nearly all of the structures and associated road grading, paving activities, and emplacement of utilities during the historic period were conducted without environmental reviews. At the time, there seemed to have been an awareness of the spectacular rock art panel associated with CA-VEN-1072 and its possible significance, and efforts seem to have been made to protect that rock art panel. However, it is likely that many archaeological loci were destroyed, disturbed or buried during grading activities. Those sites, disturbed or not, may be impacted by cleanup activities.</p>	<p>We acknowledge your comment regarding archeological resources. Please refer to the Programmatic Agreement for stipulations related to cultural resources such as historic properties.</p>

Michael	Kuhn	Figure 2.1-1: The Brandeis Bardin Institute has been the Brandeis Bardin Campus of the American Jewish University since 2007.	The FEIS will be revised to accurately reference the American Jewish University (Figure 2.1-1).
Michael	Kuhn	Figure 3.10-1 Box Canyon Road is shown as an arterial street. The text mentions Box Canyon Road only in the context of it being a road that cleanup and demolition workers might use to get access to and from the work site on their way to and from work. I assume, therefore, that it is not being considered as a route to and from State Route 118 by heavy trucks for the removal of contaminated waste and demolition debris and the return of those trucks to the SSFL. An argument could be made that the road is hazardous even for cars and light trucks, let alone for heavy construction vehicles.	You are correct, Box Canyon Road was evaluated for impacts with regards to worker commutes to and from SSFL only.
Natalie	Kuhny	I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Betsey	Landis	I'm with the California Native Plant Society. I got mixed up in this because I am the expert on astragalus brauntonii, and NASA, if you have it there, you're not talking about it, and I want it protected.	Please refer to Section 4.4. Astragalus brauntonii has not been observed on NASA-administered land. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with the USFWS and has coordinated with other natural resource agencies, such as the USACE, with respect to wetlands. NASA believes that the assessment of impacts and findings is reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS; however, as a federal agency, NASA is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.
Betsey	Landis	DOE and DTSC have worked extremely hard taking soil samples all over their site. I don't see any of that here. And NASA, you're scientific. It really hurts not to see you doing a detailed study of the soil to give us facts about what contamination is where.	NASA followed DTSC-approved protocols and procedures for sampling and analysis. Numerous informational meetings were conducted with regulatory and community groups to monitor and discuss procedures and sampling plans.
Betsey	Landis	I also say it's totally false to say that if you have three contaminants in one section you can't take them out.	In the EIS, NASA defines non-treatable soils as those that contain dioxins, PCB, metals, pesticides, or energetics, or a combination of these constituents. Although some technologies might be able to treat some of the constituents in a class (one type of metal in the class of all metals, for example), even if one in the class is not able to be treated, then the class is considered nontreatable. Mixed soil is considered a co-location of treatable and non-treatable soils that would require some excavation and some potential use of technical alternatives.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Betsey	Landis	<p>The problem here is you think you have to have it all out by 2017. What we need here is a mitigation change, a mitigation that says that the AOC condition is that you have your schedule in place and how you're going to do these things and layer them so that over time you can mitigate on site, because it makes a lot more sense for the health of the people around not to disturb the soils any more than you have to or remove the vegetation, because you have a lot of wind coming through there. Constant problem for the people that live around it.</p>	<p>The 2017 schedule is aggressive and if it were changed to a date further out, it would remove some of the pressures driving the cleanup actions. Any changes to the 2017 deadline may reduce impacts, but will not eliminate all significant impacts.</p>
Betsey	Landis	<p>So I would suggest -- one of your proposed mitigations was to land farm, which means if you dig up the soil take it somewhere else on the site, pile it up, and let all the volatile organics just disseminate into the air, I guess. Then you put it back. I would say if you've looked at that site, those plants, those native plants, are encroaching on every bare area. They are already mitigating.</p>	<p>NASA considered a range of remedial action technologies to comparatively identify what impacts may result from the background cleanup to meet the AOC deadline of 2017. Technologies analyzed in the EIS included options to soil removal. The EIS considered the effectiveness of each technology and effects of impacts on items such as native vegetation, air quality, truck traffic, noise, wildlife, and cultural resources at SSFL. Some of the technologies considered include excavation (not applicable to groundwater or bedrock), enhanced biological treatment, in-situ treatment, and ex-situ treatment. Thank you for your observation.</p>
Betsey	Landis	<p>What you need to do is to work with bioremediation, phytoremediation, fungi. There's a lot of things that work. It's a very active site. Unfortunately, they're kind of slow so they don't know they're supposed to be done by 2017.</p>	<p>NASA must continue to abide by its obligations under the AOC as drafted. It is NASA's understanding that DOE is conducting studies with phytoremediation. Should those studies prove effective, NASA would be able to use this information.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Betsey	Landis	If you want to maintain the integrity of the site, the integrity of its history, ancient history, whether you have a remnant of present history that's safe to leave there, that would be neat, but we have this unusual site that has a great deal of integrity of everything. Vegetation, Native American history, people history. And it is a major fauna linkage and migratory pathway and resting spot for a number of -- a broad number of animals and insects. So you haven't covered that at all.	NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area. The EIS text will be revised to reflect the migration corridor may include SSFL (Sections 3.4.2, 4.4.1.2, and 4.4.1.3).
Betsey	Landis	So -- but I would say that your major mitigation you have yet to do is to change the AOC so you can do the job properly.	Thank you, your comment has been noted.
Betsey	Landis	<p>1) Why is there no environmentally superior alternative in this DEIS</p> <p>2) Isn't an EIS supposed to provide several alternatives utilizing different approaches to minimize environmental impacts? The DEIS admits the two proposed alternatives both have severe environmental impacts.</p> <p>2) Why are there only two alternatives (No Action or Soil Removal and Structure Demolition) proposed in this DEIS?</p> <p>3) If the AOC and Consent Order previously described require vegetation removal, soil removal to the sandstone bedrock, destruction and destabilization of the site with resulting long-term severe air pollution (dust and sandstorms), water pollution (silted flows, mudslides), changes in groundwater retention and natural drainage patterns, firestorms swept by high winds through weed-choked arroyos, and damage to urban infrastructure such as roadbeds, why doesn't this DEIS include an environmentally superior alternative that includes a modification of the AOC and Consent Order to fix 2017 as the timeline for scheduling and beginning a short- and long-term set of remediations?</p>	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Betsey	Landis	4) The best management way to do the “clean up” is to retain the native vegetation, the natural drainages and much of the soil as possible. This would protect the health and well-being of the urban population in the vicinity of the SSFL site, as well as protecting all the natural and cultural resources: important native American sites, resident and visiting wildlife, the vital wildlife linkage between the Santa Monica Mountains and Los Padres National Forest, and the natural vegetation supporting migratory and native bird populations.	In NASA's opinion your proposed option does not comply with the 2010 AOC.
Betsey	Landis	5) Air Quality- Wouldn't the loss of mature oaks, shrubs and other native vegetation result in increased dust/sand storms in residential areas, not only from the site itself, but from the surrounding hills to the north and northeast of the site? This area is very windy. Leafy canopies act as dust catchers. Extensive root systems retain water and nutrients, supporting a complex understory that maintains healthy habitats and supports a rich biodiversity of species. Wouldn't the removal of these complex native habitats and the organism-filled soil system result in an invasion of non-native flammable plant species, raising the frequency of wildfires?	We recognize that existing vegetation provides many benefits. The MMs described in the biological resources and air quality sections of the EIS would help to offset these impacts.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Betsey	Landis	<p>6) Biological Resources- Where is the inclusion and discussion of a federally-listed endangered plant, Braunton’s Milkvetch (<i>Astragalus brauntonii</i>) in this DEIS? Where is a discussion of the uses of the habitats on this land by many species of fauna, from mountain lions to birds and raptors, reptiles and many pollinators. SSFL is a valuable traditional resting, nesting and foraging location for migrating fauna. How many species may perish if the vegetation and water sources are destroyed?</p>	<p>Please refer to Section 4.4.</p>
Betsey	Landis	<p>6) Greenhouse Gas Emissions and Carbon Sequestration- Does NASA realize the high carbon sequestration of the native vegetation on the site, e.g. long-lived Coast Live Oak (<i>Quercus agrifolia</i>), chaparral shrubs that resprout from their root collars or root systems (<i>Quercus berberidifolia</i>, <i>Malosma laurina</i> et al) over and over again for possible hundreds of years? Removing this native vegetation will cause a huge release of carbon into the air. Restoring the carbon-sequestering underground root systems to their current state would take centuries. Isn’t one short-term impact the immense soil removal proposed, involving large numbers of greenhouse gas emitting machinery? How does that impact local air quality? Isn’t a better choice to remediate most of the contamination on site? NASA should consider some useful remediation methods being developed at two local universities under contract to DOE.</p>	<p>NASA has addressed impacts and mitigation related to air quality and GHGs in Section 4.7 of the EIS. We recognize that remediation onsite may reduce some emission impacts and we balance that consideration with the alternatives necessary for us to employ to meet the AOC.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Betsey	Landis	<p>7) Hazardous Materials / Hazardous Waste- How can the DEIS say that this is a minor impact? Why are the following facilities on a list to receive possibly hazardous soil from the SSFL site? Lancaster Landfill, Antelope Valley Landfill, Chiquita Canyon Landfill are all Class III municipal landfills which are not legally allowed to accept any hazardous materials. Why are DeMenno Kerdoon Wastewater Treatment facility in Santa Fe Springs and Lakeland Ridgeline Processing in Compton also designated as receivers of possibly hazardous soil from the site? Compton is in the middle of the Los Angeles Basin, Santa Fe Springs is in the eastern Los Angeles Basin. What are levels of contamination in the material being sent to these locations?</p> <p>If the soil is not hazardous that is being taken to these facilities, why isn't the soil being left on the SSFL site?</p>	<p>Before waste is removed from the site, waste generated at SSFL will be tested to identify the appropriate disposal facility. The waste will be generated when soil is excavated to comply with standards established in the AOC. Lancaster, Antelope Valley, and Chiquita Canyon Landfills were proposed as disposal facilities for nonhazardous wastes only. Each of these disposal facilities require testing and review of results before waste is accepted for disposal. Any waste not meeting acceptance conditions is not granted permission for disposal. In addition to these nonhazardous disposal facilities, Kettleman Hills, Buttonwillow, U.S. Ecology, and Energy Solutions Landfills were also provided as possible disposal facilities for contaminated soil. These facilities accept hazardous wastes and require testing and review of analytical results prior to acceptance for disposal. Wastewater will also be generated and is not acceptable for disposal in landfills. Lakeland Ridgeline Processing and DeMenno Kerdoon Wastewater Treatment facility are proposed for management of wastewater. These facilities also have requirements for testing and approval prior to accepting wastes. Cleanup standards applied to soil at the site were established in the AOC. These standards are lower than federal and California hazardous waste limits. Accordingly, to meet these restrictive cleanup standards, soil that contains chemicals at concentrations that are not hazardous yet exceed cleanup standards must be removed from the site.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Betsey	Landis	8) Health and Safety- If neither of the alternatives offered by the NASA DEIS protects either the short-term or the long-term health and safety of the population (whether human, plant, animal, local geology, local hydrology or the ancient cultural heritage on the SSFL site) why is NASA even proceeding with this DEIS?	Cleanup in accordance with the AOC or typical CERCLA standards are protective of the health of the community. NASA will follow the AOC. By following the NEPA process, NASA complies with its statutory requirements (42 U.S.C. 4321 et seq.) and Section 4.0 of the AOC. NASA continues to work expeditiously with DTSC and the public to complete the actions called for in the AOC. NASA realizes that the EIS describes the negative impact of cleanup to background, as required by NEPA. The 2017 schedule and cost for completion are a function of the AOC. If the AOC is revised, NASA will comply with the appropriate NEPA analysis and documentation.
Betsey	Landis	9) Land Use- The best use of the SSFL site is national park land, preserving magnificent sandstone geology, many unusual niche habitats of native flora and fauna, natural drainages supporting riparian habitat not only on the site but through lower elevations surrounding the site. As not only an outstanding natural resource, but as an ancient cultural heritage site where native Americans studied outer space and as a modern site of human endeavors to explore outer space, SSFL is worthy of careful, thoughtful remediation and restoration.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lama	Lane	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lama	Lane	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Kenton	Lane	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Maryann	LaNew	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Melissa	Langdell	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Julio	Lara	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Julio	Lara	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC) with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Jennifer	Larkin	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Craig K.	Larsen	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Dan	Larson	<p>The boundaries of the Traditional Cultural Property (TCP), CA-VEN-1072 and CA-VEN-1803, must be determined prior to any soil test excavation or proposal of any mitigation measures.</p> <p>A sampling strategy of hand controlled excavations (e.g., Surface Scrapes, Excavation Units, and Shovel Test Pits) should be implemented to systematically define the boundaries of CA-VEN-1072 and CA-VEN-1803, and establish the ESAs.</p>	<p>NASA's priority is not to disturb any Native American resources. Should the AOC or human health safety requirements drive an action in those areas, then NASA will conduct data recovery in coordination with the Tribes and SHPO.</p>
Dan	Larson	<p>Environmentally Sensitive Areas (ESAs) should be established, including a buffer zone (15m-30m?), around CA-VEN-1072, as well as CA-VEN-1803.</p> <p>The establishment of the ESA and the completion of the additional work in the previously excavated areas of CA-VEN-1072, should also be part of the 36 CFR 800 compliance process.</p>	<p>CA-VEN-1072 and CA-VEN-1800 have a buffer zone that constitutes the archeological resource management areas for each site.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	<p>In consultation with Native Americans, archaeologists should complete an intensive re-survey of the area, using transects spaced in 5-15 meter intervals. Whichever cultural resource firm is hired, it would be highly advantageous if a few of the archaeologists had rock climbing experience (with credentials?), so that at least some of the normally inaccessible rock shelters, rock crevices, and rock ledges where artifact caches and/or rock art may have been hidden, could be inspected for their presence - particularly in the area of the Coca Test Stands.</p> <p>Each controlled excavation should be monitored by a local Native American with artifact identification experience. The results of the findings should be catalogued, analyzed, and presented as a written document to be included as part of the 36 CFR 800 compliance process.</p> <p>As part of 36 CFR 800, CA-VEN-1072 must be properly evaluated. Minimally, a complete evaluation needs to include all the information available about the site.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>Native American monitors will be provided for excavations within the Burro Flats site boundary.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	<p>If Cultural Mitigation Measure #4 depends solely on the current knowledge of local archaeologists and anthropologists, then it must be considered inadequate.</p> <p>Greater data sets from CA-VEN-1072 would also allow the relationship to the archaeological sites located in Area IV (Boeing) to be analyzed and comprehended. To complete the analyses, monies would be needed to conduct special studies, including C14 dating, obsidian hydration and sourcing, botanical studies, as well as report write-up. This, however, would not constitute a complete mitigation. The Burro Flats collections of the 1950s and 1960 were excavated under different circumstances. Both the excavation and artifact identifications were conducted by relatively inexperienced students and volunteers. Screening of the excavated soils, when it occurred, was done in the field using relatively large-meshed screens (i.e. ¼ inch mesh) Units were not necessarily completed to sterile soil or bedrock; some were probably stopped at the end of the field class. Units were excavated in different sized levels, some were 12" thick and others were 6" thick.</p>	<p>Thank you for your MM suggestion. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	<p>NASA has chosen to ignore the potential information contained in the prior excavations completed in 1953, 1954, 1959, and 1960 at the site midden component.</p> <p>Both NASA and Boeing should contribute monies to complete the analyses of the past collections of CA-VEN-1072 in order to comply with 36 CFR 800.</p> <p>In addition to completing the analyses of the prior collections, control samples should be taken from previously excavated areas to determine the types and diversity of small artifacts missed during the earlier collections. Further, samples should be obtained from the oven features at CA-VEN-1072 to determine what was processed and during what time periods.</p> <p>I believe that a complete analysis of the prior collections at CA-VEN-1072 will greatly help in defining the relationship with the sites in Area IV, which are owned by Boeing.</p>	<p>Thank you for your MM suggestion. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p>
Dan	Larson	<p>The fact that the land containing CA-VEN-1072 is owned by NASA (Area II) and Boeing (Area III and the Southern Undeveloped Area), makes them both equally responsible for 36 CFR 800 compliance. Therefore, both NASA and Boeing should be jointly responsible for the costs incurred for completing the part of 36 CFR 800 compliance described above. This work should be completed prior to any further soil test excavations or proposal of any mitigation measures.</p> <p>The fact, according to archaeologist Al Knight, that both NASA and Boeing have land within the archaeological site, CA-VEN-1072, should have made them share responsibility for the cultural resources within the entire SSFL, or minimally, for all of Area II.</p>	<p>Thank you for your MM suggestion. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	<p>...all vegetation removal around each individual or group of soil test sample(s) within the ESAs should be monitored by a qualified archaeologist and a local Native American, who has artifact identification experience. Each soil test hole in the ESAs should then be monitored by a qualified archaeologist and local Native American.</p> <p>Minimally, in areas outside the ESAs, all soil test holes should be monitored by a local Native American with artifact identification experience, after the vegetation removal is monitored by a qualified archaeologist and a local Native American.</p>	<p>NASA has a process for utilizing Native American monitors and employs an archeologist to assist in monitoring. A process for monitoring in known archeological sites will be developed in consultation with the SHPO and tribes and will be included in the agreement document, which will be signed by SHPO.</p>
Dan	Larson	<p>A predetermined area around demolition of any rocket test stands (minimally, the Coca Test Stands) and any associated soil test holes, should first be surveyed and then monitored during vegetation removal by a qualified archaeologist and a local Native American. Finally, each test hole should be monitored by a local Native with artifact identification experience, since the test stands exist on the same landform as the Summer Solstice sunrise notch, which was undoubtedly sacred to the local Native Americans.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	<p>The use of such terms as “minor” impacts in the Draft EIS is considered to be highly inappropriate to both the Native Americans and archaeologists. If a 4.5 to 8 inch hole was drilled through a sacred artifact or human bone, these impacts would not be considered “minor” to a Native American or an archaeologist, especially within a sacred site. The areas within and outside the ESAs where all “minor” earth disturbing activities, will be conducted, such as drilling holes, creating fences, etc., should be surveyed first, then monitored as described above.</p>	<p>Please refer to the Programmatic Agreement (PA) and/or ROD. NASA proposes to avoid cleanup within the boundary of the archeological site, however the PA and/or ROD outlines in what instances NASA may have to proceed with cleanup activities in and around Burro Flats Cave Site and any other archeological sites.</p>
Dan	Larson	<p>Further, to describe archaeological negative effects as “local,” may not be correct. It was hypothesized by John Romani in his MA thesis (1981) that CA-VEN-1072 was the “private” viewing area for religious practitioners during the Winter and Summer Solstices. The site may also have been used to prepare the cerebral and physical necessities for at least the “public” Winter Solstice (and possibly the fall Hutash Festival) ceremonies held at the village of Huwam/Jucjauybit (CA-LAN-413), located several miles downstream in lower Bell Canyon. Therefore, if this hypothesis is correct, any archaeological negative effect has the potential to be more “regional,” and not merely “local.”</p>	<p>We acknowledge your comment.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	<p>The 1967 revised Calabasas USGS topographic map depicts Bell Creek as a “blue-line” stream that flows next to (within 100 feet) or through CA-VEN-1072, depending on the outcome of the boundary investigations, thereby requiring a Section 404 Permit as issued by the Army Corps of Engineers. From the consultants meetings to date, it does not appear that the Army Corps of Engineers has even been considered as a consulting party, a point brought up by the SHPO in their comments on the Draft EIS on September 25. This may be considered quite egregious, since in fact the Army Corp should be a cooperating, or even a responsible federal agency. Under any circumstance, their participation would assure an additional voice in the protection of the cultural resources on the SSFL. This is a grievous error and omission in the NEPA and Section 106 process so far, as well as in the Draft EIS.</p> <p>Again, the Army Corps of Engineers should be a cooperating or responsible agency (minimally a consultant) under NEPA and the Section 106 process.</p>	<p>Biology BMP-5: NASA would obtain a CWA Section 404 Permit from the USACE and a CWA Section 401 permit from the RWQCB for the discharge or dredge of material into jurisdictional waters of the U.S. The Section 404 and 401 permits would include necessary measures to avoid, minimize, or otherwise mitigate impacts to wetlands and other waters of the U.S.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	Compass Rose would like to see all nine of the test stands preserved, since, as understood, they are the least contaminated of the structures since they are located on or within bedrock. Most of the other contaminated structures (control buildings, pill boxes, etc.) can be demolished, with the preservation of at least single examples of the least contaminated of each).	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	<p>The Coca Stands may be the most important to our history of space flight, since they are associated with engine testing of both the Apollo and the Space Shuttle rockets. Unfortunately, they are the most contaminated and were also subjected to many structural changes.</p> <p>Compass Rose would like to see the Coca Test Stands preserved for their association with the advancement of space travel. The Chumash Native Americans from the Santa Ynez Reservation would like to see them demolished, since they claim there is an effect on the sense of place within the Sacred Site (CA-VEN-1072) below. However, based on our experience while monitoring the Winter and Summer solstice events, the only structure visible from CA-VEN-1072 is a single tank (possibly Vessel V 100, LH2 tank or Vessel V 99, GH2 tank). If this structure is demolished, then no structures associated any with any of the nine test stands will be visible from CA-VEN-1072.</p>	<p>We acknowledge your suggestions regarding the Coca Test Area. NASA is weighing all of the considerations by all consulting parties in making its decisions.</p>
Dan	Larson	<p>It is the opinion of Compass Rose that from the very beginning, the environmental process for the SSFL clean-up has proceeded incorrectly. There never should have been two entirely separate processes, CEQA for Boeing and NEPA for NASA, along with the completely different scheduling.</p>	<p>The AOC requires NASA to develop a NEPA document.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	<p>The SSFL consists of a continuous landform with a continuous prehistory and a continuous history.</p> <p>As a result, the entire SSFL should be nominated as a single archaeological district.</p> <p>...the archaeological district should also encompass the site complex in lower Bell Canyon that includes the village of Huwam/Jucjauybit, Bats Cave (the cave of Munits), Castle Peak (a shrine mountain), and several other sites. Compass Rose and the late John Romani, believe that the area of the entire SSFL was a “private” viewing site for the solstices and preparation area for the “public” ceremonies held downstream at the village of Huwam/Jucjauybit and Castle Peak, for the Winter Solstice and possibly for the fall Hutash Festival).</p> <p>The tie between upper (SSFL) and lower Bell Canyon is also supported on a more practical level. Groundwater chemical contamination has been found in test wells in lower Bell Canyon as a result of NASA rocket engine testing activities, as stated by NASA in a previous consultation meeting. Thus, the entire SSFL and lower Bell Canyon site complex should be considered as a single discontinuous archaeological district.</p>	Your comment is noted.
Dan	Larson	<p>Also, a series of easements called “outgrants,” allow NASA and Boeing to cross each other’s land. There are also outgrants for water, utilities, etc., without which Boeing would not be able to operate. The easements (outgrants) were granted to Boeing (originally Rockwell International) by the U.S. government. Even though the outgrants were granted prior to any of the present environmental laws, this would still seem to tie the two entities together at the federal level.</p>	Truck dust will be mitigated by covering the truck loads. Trucks will be cleaned prior to travel off SSFL. NASA will follow current procedures for hauling materials.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dan	Larson	Based on the arguments above, NASA should have been the lead agency, Boeing a cooperating agency, and the Army Corps of Engineers a responsible or cooperating agency under NEPA, with all subject to Section 106, since NEPA tends to supersede State law (CEQA). In the worst case, this entire undertaking of the entire SSFL clean-up should have been subjected to a single, combined, EIR/EIS, subject to one schedule and one set of mitigation measures and procedures.	NASA is complying both with NEPA statutory requirements and regulations and with the AOC. Law allows for a combined EIS/EIR or separate documents. Because NASA made a commitment to meet the stringent time requirements of the AOC, we concluded that we needed to initiate our NEPA process as soon as possible.
Dan	Larson	Finally, although the environmental process completed thus far for the SSFL clean-up is totally inadequate and inappropriate by combining Federal and State and with different completion schedules, the overly strict requirements of the 2010 A.O.C. is probably the main underlying problem.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments.
Dan	Larson	The 2017 deadline for the total completion of the SSFL clean-up is unrealistic given the inadequacies in the Draft EIS and the NEPA and Section 106 process so far. The deadline must be extended so that at least most of these major problems can be resolved.	NASA must continue to abide by its obligations under the AOC as drafted.
Dan	Larson	Furthermore, the presence of two "blue-line" streams (one being Bell Creek) that extends through the entire SSFL – thereby crossing both the NASA and the Boeing properties - means that a Section 404 permit is required by the Army Corps of Engineers, a federal agency. Since Bell Creek extends next to or through CA-VEN-1072, means that the Army Corps should have been involved in the process from the beginning as a responsible or at least, a cooperating agency. Since Bell Creek crosses both NASA and Boeing land and a Section 404 permit is required by the Army Corps, this would seem to tie both agencies/entities together at the federal level!	Biology BMP-5: NASA would obtain a CWA Section 404 Permit from the USACE and a CWA Section 401 permit from the RWQCB for the discharge or dredge of material into jurisdictional waters of the U.S. The Section 404 and 401 permits would include necessary measures to avoid, minimize, or otherwise mitigate impacts to wetlands and other waters of the U.S.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dena	Larson	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jason	LaVoie	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dale	LeFevre	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dale	LeFevre	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Stephen	Lenske	<p>As residents of West Hills and former members of the West Hills Neighborhood Council, we would like to reiterate our concerns related to the limited Draft Environmental Impact Statement that NASA has just produced, and we support the votes of the West Hills Neighborhood Council that we submitted in resolution approved on August 3rd, 2011 and May 17, 2013.</p> <p>For the protection of our community, we respectfully request that NASA do an Environmental Impact Statement that addresses all of the alternative scenarios as was presented at NASA's March 27, 2012, NASA Environmental Impact Study Meeting.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Norman	Levine	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David	Levy	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Joseph	Lilli	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Elizabeth	Lincoln	Through decades of sloppy environmental practices, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been migrating off the property.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6)</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Lindquist	<p>SSFL is heavily contaminated from decades of rocket and reactor testing, sloppy practices, improper waste disposal, spills, and releases. We are here focused on NASA's portion of the property, Area 2, and NASA's section of Area 1. Decades of gross violation of fundamental environmental rules led to contamination of soil, structures, groundwater, and surface water. Indeed, the Draft EIS discloses NASA's testament that its prior practices led to contamination of half a million cubic yards of soil alone.</p> <p>Contaminants include various extremely toxic dioxins, PCDBs, numerous heavy metals, TCE, and other volatile organic compounds, perchlorate and other hazardous materials. Perchlorate is a component of solid rocket fuels that disrupts human development, has been found to have mitigated offsite and contaminates a third of the wells of Simi Valley monitored for it.</p> <p>Half a million gallons of TCE, a carcinogen, were dumped directly into the ground and now contaminate groundwater. TCE has also mitigated off site. Annual monitoring reports for surface water contamination show rain carrying off toxic materials off site at levels exceeding health-based benchmarks hundreds of times in recent years.</p>	<p>During the early years of rocket engine testing, chemicals were released to the environment. During that timeframe (1950s, 1960s, and early 1970s), environmental laws such as RCRA did not exist. Therefore, the chemical releases that occurred prior to the enactment of environmental laws were not a "gross violation of fundamental environmental rules." Since the passage of environmental laws such as RCRA, NASA has conducted operations at SSFL according to the current laws and regulations as they were enacted.</p> <p>NASA respects public concerns regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except in small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. In groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate, but this chemical was not detected. Therefore, NASA operational history with regard to perchlorate and sampling results indicates, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Lindquist	<p>A study of the UCLA School of Public Health found elevated cancer rates/death rate among both nuclear workers and the rocket workers from exposures to these toxic materials.</p> <p>Another study by UCLA found that rocket testing had led to off-site exposures to hazardous chemicals by neighboring population at levels exceeding EPA standards. A study performed for the Agency for Toxic Substances and Disease Registry found elevated cancer rates in the off-site population associated with proximity to SSFL.</p>	<p>With respect to the UCLA studies you reference, the first study was published in 1997 and, according to the DTSC's summaries, dealt only with radiation and bases conclusions on workers exposed to radiation. See DTSC website at: http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm. NASA did not do any radiological research and, as such, would not have any workers in this category.</p> <p>The second UCLA study, published in 1999, was also funded by DOE and primarily dealt with presumptive exposures to hydrazine. It was a review of onsite workers, not neighboring populations.</p> <p>The third study you reference, by ATSDR, was published in 1999. According to DTSC's summary, "<i>The preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects .</i>"</p>
Brian	Lindquist	The remarkable fact about NASA's Draft Environmental Impact Statement on the cleanup of the toxic contamination at its portion of SSFL is that there is almost nothing in the EIS about toxic contamination. Just a few sentences.	NASA respects public concerns regarding site contamination and health issues. Additional information regarding risks from potential exposures to current chemical contaminants at the site will be added to the EIS (Section 3.9.5).
Brian	Lindquist	Hundreds of pages are spent trying to scare people about a few trucks per hour that will be needed to transport the waste to an appropriate waste disposal facility. Far fewer trucks than were going in and out of the facility for decades. But virtually not a word about the toxic contamination that necessitates the cleanup. This is the fundamental flaw that must be corrected.	Based on these and other comments, NASA will revise the EIS to reflect the impacts of contaminants if left in place, and also will include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Lindquist	The Draft EIS identifies the impacts of cleaning up the contamination, but it is essentially silent on the impacts of not cleaning it up. The no-action alternative, unquote, you focus on matters on which the scheme of things are small and leave unaddressed this tremendous amount of contamination your sloppy environmental practices created.	NASA respects public concerns regarding site contamination and health issues. Additional information regarding risks from potential exposures to current chemical contaminants at the site will be added to the EIS (Section 3.9.5).
Brian	Lindquist	The Draft EIS creates an impression of an agency that signed a legally binding agreement to clean up toxic mess it made but is now trying to get out of the solemn commitments entered into.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. To meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.
Brian	Lindquist	SCFS's recommendations, thus, are: Provide extensive detailed description of the contamination NASA's poor practices created over decades; identify in detail what the site characterization has found as to the contaminants are found in what concentrations and what areas and in each environmental medium; give us solid details about the groundwater contamination; tell us about each violation or exceedence of surface water discharges leaving the site with contaminants above benchmark; detail which dioxins have been found in what concentrations, in what soil, and to what depth; and the same for all the toxic materials found.	NASA respects public concerns regarding site contamination and health issues. Based on these and other comments, NASA will revise the EIS to reflect the impacts of contaminants if left in place, as well as to include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Lindquist	An EIS about toxic cleanup that is silent about toxic materials is misleading and unscientific at best. Not cleaning up the toxic contamination would result in perpetual releases of contaminants from the site. Whenever the wind blows, carrying suspended and resuspended toxic materials to the communities nearby, whenever the rainfall, surface runoff will continue to carry hazardous materials off site at levels that are deemed unsafe.	including data collected by other government agencies,
Brian	Lindquist	No. 2, as to the impacts of cleaning up, very much manageable in the scheme of things, require A, the use of natural gas or electric-powered trucks so as to reduce particulate and greenhouse gas emissions;	NASA is looking further into that option; however, early indications are that there are not enough trucks of this type to meet the job requirements.
Brian	Lindquist	B, disperse the trucks among the several available routes, which should result in only two or three trucks per hour, per road, and only in primary working hours. This is trivial given the large number of trucks that have gone in and out during the years of operation and still do for the existing cleanup.	As detailed in the EIS, after trucks leave Woolsey Canyon Road, project-related traffic is negligible as compared to the existing traffic levels.
Brian	Lindquist	Letter C, use on-site soil wherever possible for regrading the cleaned up areas. There should be no need for off-site soil. But if there is some such need, use, for bringing in soil, the otherwise empty trucks that are going to the site to pick up waste, reducing further the number of trips mentioned.	NASA anticipates needing offsite soil to backfill the excavations that will be required over approximately 105 acres. NASA will consider transporting clean soil with the trucks used to transport excavated soil from the site. There are logistical factors that will be considered such as the location of the backfill soil in relationship to the landfills and properly cleaning the trucks used to haul the excavated soil prior to loading the clean soil.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Lindquist	Letter D, use in situ treatment wherever possible. The Draft EIS makes it clear that this could reduce the soil removed and the truck trips by a huge amount, in order of a third. Use on-site treatment to the maximum extent possible.	The soil treatment technologies selected for evaluation have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. NASA will conduct treatability studies (field-scale or lab-scale) to evaluate the effectiveness of the proposed technologies to achieve the cleanup levels required by the 2010 AOC. (Further information can be found in Section 2.2.2.3, Soil Cleanup Technologies, of the DEIS).
Brian	Lindquist	No. 3. But at the end of the day, the toxic contamination is so much of a health problem, including to neighboring communities, irrespective of eventual end use of SSFL itself because of the contamination otherwise would keep mitigating off site, the full cleanup is scientifically and environmentally mandatory.	NASA respects public concerns regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).
Brian	Lindquist	A few trucks an hour, not dissimilar to what has gone on in the facility anyway, is just a red herring to divert the attention from the massive contamination of this site and the need to clean it up.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chris	Lish	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chris	Lish	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Georgia and John	Locker	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Luck	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Luck	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Alethea	Ludowitz	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Keth	Luke	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Keth	Luke	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
John	Luker	<p>This DEIS is incredibly flawed. It needs to be sent back and redone completely. There needs to be more alternatives. The biggest flaw is not NASA's fault. The reason why this EIS is the way it is, is because they have been compelled to do it by these AOCs and the political forces behind them. These AOCs put a remedy in front of deliberations for cleanup. You're supposed to look at alternatives, and the decision makers get a full range of idea so they can make an informed decision.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
John	Luker	<p>NASA committed to an excessive and unnecessarily costly cleanup.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Luker	NASA's remediation plan commits the agency to a cleanup standard not based on risk to health. ... You can get the same effect at less cost by not cleaning up to background.	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted. NASA has compared the risk for cleanup to residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment based on three factors: (1) application of cleanup levels that are 2 to more than 1 million times more conservative than risk-based levels, (2) potentially requiring cleanup of up to 51 chemicals that do not pose risk, and (3) potentially impacting 87 additional acres when compared to a suburban residential risk-based cleanup.</p> <p>Consequently, the benefit to human health and the environment of cleaning up to background is questionable for several reasons. The more aggressive remediation of the site that would occur under the background cleanup (more soil removal, more trucks entering the site, more emissions, more road miles, more soil to dispose of in landfills, etc.) could result in an increase in traffic accidents, spills, and habitat modification and disturbance of wildlife, all of which might result in reduced net benefits when compared to the risk-based cleanup scenario. Because only 10 percent of those analytes detected in soil are identified based on risk estimates as requiring remediation under the background cleanup scenario, the overall net benefit of cleaning up to background for all chemicals as opposed to a risk-based cleanup is low.</p> <p>Additional information can be found at NASA's SSFL website.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Luker	<p>Those -- this report details out a corrupt process where political and lobbying forces have gotten the upper hand. Now, this archaeology that I was talking about earlier is a prime example. I personally had conversations with Rick Brausch, Dan Hirsch, and members of the work group. And they all assured me in 2010, before these documents were signed, that my archaeology was safe. All archaeology was protected under these agreements. ... And now I'm finding out that it's actually pretty much the opposite of what Mr. Brausch and what Mr. Hirsch were telling me. ... I believe that there's been a lot of misrepresentation about these AOCs. I believe that NASA's got to stand up and start pointing out how these things have been misrepresented. I think DTSC needs to come out and start making some clarifications on things. I think we've all got to sit down and look at the IG report.</p>	<p>Please refer to the Programmatic Agreement (PA) and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 will be incorporated in the PA and/or ROD.</p>
John	Luker	<p>... I think the vast majority of the community that I have talked to want two things: preservation of the site for habitat, cultural, and historic reasons, and a reasonable cleanup. Nobody doesn't want a cleanup. Nobody wants to clean this up to less standards than suburban residential. The 2007 consent order is fully protective of human health and the environment, and I urge you guys to dump the AOCs in favor of the 2007 consent order.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Luker	Providing only two alternatives, clean up to background or no cleanup is not appropriate, other alternatives need presented such as a clean up to suburban residential or recreation standard.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
John	Luker	The DEIS is flawed since the level of cleanup is not balanced against costs, cultural impacts, and environmental impacts, required by NEPA and CEQA.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
John	Luker	Protection needs to be established before the cleanup for archaeological sites, such as the Burro Flats site VEN-1072 and any other archaeological sites on the property.	In consultation with SHPO, ACHP and the tribes, NASA is developing appropriate protection measures for the Burro Flats site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Luker	Protection needs to be established before the cleanup for structures such as Alpha, Bravo, and Coca rocket test stands and their related structures, eligible for protection as historic structures and districts.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
John	Luker	Moving contaminated soil, and only replacing 1/3 of the removed soil is bad for the community that will receive the water runoff and bear the burdens of 80,000 trips carrying contaminated and new soil over two years, just from the 450 acre NASA site.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Luker	Alternative clean up methods to clean up soil on site, even if recovery in 10 years occurs, needs considered due to reduced environmental impacts in neighboring community.	NASA considered a range soil cleanup technology and the viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.
John	Luker	The 2017 deadline is an artificial one not based on science, but creates an "emergency" type pressure that seems to be causing creation of environmental decision documents prior to completion of studies or input from DTSC that needs to interpret vague language that controls many sensitive decisions about historic properties. Adequate studies and interpretations must be provided to have a valid decision making document.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Luker	<p>Pressure to complete the cleanup to meet the 2010 AOC deadline by 2017 may cause illegal destruction of historic and archaeological resources on the property. Removal of key cultural resources likely will significantly decrease interest in the property from state and federal park agencies, generally identified as the likely optimum long term holder of the property.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
John	Luker	<p>The long term use of the property needs to be considered in the cleanup approach, and the 2017 AOC deadline may need to be extended to prepare adequate foundation for the cleanup.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures. The 2017 schedule is very aggressive and if it were changed to a date further out it would remove some of the pressures driving the cleanup actions. Maybe it could help mitigate the impacts from large numbers of trucks by spreading out the frequency or allowing time to build a conveyor system. Maybe it could give time to see if a future land owner wants to preserve and maintain some of the historic structures. However, it would not aide in the reduction of impacts to biological resources.</p>

Lewis	MacAdams	<p>We feel that a proper cleanup as outlined in the 2010 Administrative Orders on Consent (AOC) is essential. This is what NASA has committed to, and we trust NASA will live up to, those commitments.</p> <p>The AOC must be complied with in full.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lewis	MacAdams	To clean up the contamination the test stands must be removed.	<p>The test stands sit on top of bedrock which will not be removed during the cleanup. NASA is conducting sampling around the test stands to determine the location of contamination that needs to be cleaned up to meet the 2010 AOC and 2007 Consent Order. NASA is also evaluating in situ technologies that may be capable of removing contaminants without demolishing the structures.</p> <p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p> <p>The test stands have been evaluated and identified as eligible for listing on the National Register of Historic Properties. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. Comments such as yours are considered during that process. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects. Please refer to the PA and/or ROD for further information.</p>
Lewis	MacAdams	The EIS needs to make this clear there is no risk whatsoever to the Burro Flats cave paintings because the AOC exempts such artifacts from the clean up to background requirements.	<p>NASA will clarify the text. The Burro Flats site includes many rock features and areas of soil too. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the exception clause in the 2010 AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marlene	MacAulay	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marlene	MacAulay	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marlene	MacAulay	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marlene	MacAulay	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marlene	MacAulay	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	MacGregor	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daryl	MacLaren	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kris	Mae	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kris	Mae	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kris	Mae	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kris	Mae	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Kris	Mae	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Eugene	Majerowicz	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Debra	Mancuso	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Debra	Mancuso	Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Debra	Mancuso	I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Debra	Mancuso	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.

(see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

(see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
R	Marshall	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Sandrine	Marten	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David	Martin	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

David	Martin	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
David	Martin	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David	Martin	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Raychel	Martinez	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Kathleen	Martyn Goforth (EPA)	<p>The Proposed Alternative represents that action, and we understand that the Council on Environmental Quality has advised that NASA is not obligated, under NEPA, to consider other alternatives, given NASA's commitment in the AOC to cleanup chemical and/or radiological contaminants to local background levels.</p> <p>We agree that cleanup of radioactively contaminated soil to background is imperative.</p>	NASA will comply with the AOC (as written).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	The increase in traffic and associated air emissions that would result from this action would create an unnecessary added burden to communities with environmental justice concerns near the potential receiving facilities, such as Kettleman City and Buttonwillow, as well as to the local community at the cleanup site.	<p>NASA respects the concerns of the burdened and vulnerable minority and low-income populations that live in the vicinity of these two landfills, the Chemical Waste Management (CWM) Inc - Kettleman Hills Facility (Kettleman landfill) and the Clean Harbors LLC, Buttonwillow Facility (Buttonwillow landfill). The impacts of air emissions associated with truck traffic is evaluated in Section 4.7 Air Quality and Greenhouse Gas Emissions of this EIS, including Ventura, Los Angeles, Kern, San Bernardino, Kings, and Inyo counties in California (as well as counties in Nevada and Utah for other landfills). The EIS found that there will be moderate impacts in those areas. Impacts will be minimized, to the extent possible, through MMs that are very briefly summarized here.</p> <p>Under Air Quality MM-1, which specifically applies to the moderate, negative, regional, and short-term impacts to air quality associated with Air Quality Impact-2a, NASA would purchase NOX offsets for the affected counties and adhere to an annual truck limit. As a result, Air Quality Impact-2a would be reduced to minor, negative, regional, and short term. The annual truck limit will also serve to reduce traffic impacts affecting the communities near the landfills. In addition, implementation of Air Quality MM-2 would reduce moderate climate change impacts, largely due to exhaust emissions released during material hauling over lengthy routes, to minor or negligible, negative, regional, and short term. Air Quality MM-2 states that NASA might consider using newer model-year haul trucks or alternative-fueled construction equipment, which would have the additional benefit of reducing emissions of concern to the communities near the landfills.</p> <p>NASA is also aware that the California DTSC has evaluated environmental justice concerns, including air emissions from heavy-duty trucks, in considering the Class 3 Permit Modification Request for the Kettleman landfill. DTSC prepared an Environmental Justice Review and conducted an expanded public outreach effort in late 2012, in which “the community identified air pollution and water quality as significant community concerns.” To address the issue of air pollution, CWM has agreed to a plan to reduce diesel truck emissions that will substantially reduce the impact of</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	Additionally, the total volume of soil would consume a notable portion of the hazardous waste landfill capacity in the State of California. DTSC has announced a commitment to reduce by half the amount of hazardous waste disposed in the State by the year 2025, and EPA supports that effort.	NASA has reassessed the available capacities of the potential landfills listed in the EIS, and there is adequate available capacity. A table has been added to Section 4.13 showing the available capacities of nearby landfills. Based on this information, there is a total available capacity of 64 million cubic yards for non-hazardous waste, 12 million cubic yards for hazardous waste, and 18 million cubic yards for low level radiological waste. While final waste profiles cannot be determined at this time, NASA's experience has shown that about 20 percent (approximately 100,000 cy) of the total soil volume has been classified at hazardous.
Kathleen	Martyn Goforth (EPA)	Based on the above concerns, we have rated the DEIS as Environmental Concerns - Insufficient Information (EC-2). We recommend that the Final Environmental Impact Statement offer a specific preferred treatment option for soil removal and groundwater cleanup.	<p>The EIS identifies potential treatment alternatives for both soil and groundwater. The general size and location of these options has been identified. For some of the options, the effectiveness towards meeting the cleanup goals are not known. NASA soil and groundwater cleanup will be one or a combination of these technologies. Final selection will occur once DTSC finishes its CEQA process and agrees to a remedial action.</p> <p>Specifically, for soil, excavation with offsite disposal is known to meet the cleanup goals. It has been evaluated and represents the option with the most environmental impacts. Other onsite treatment technologies may prove to have limited effectiveness and NASA will choose a combination of excavation and other proven technologies. These combinations were evaluated in the EIS.</p> <p>Currently NASA utilizes a groundwater pump and treat system as part of an interim action. Additionally we have ongoing routine groundwater monitoring. In coordination with Boeing and DOE, NASA is evaluating possible in situ groundwater technologies. NASA will choose one or a combination of these as its final action.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	As you know, NASA has trust responsibilities to the Santa Ynez Band of Chumash Mission Indians. We encourage NASA to continue to consult with the tribe and address their concerns about the archaeological investigation performed to date. If NASA determines that any part of the federal land is a Sacred Site or Traditional Cultural Property, we also encourage you work proactively with the California Department of Toxic Substances Control and tribal representatives to mitigate the project's impacts.	<p>NASA has engaged the Santa Ynez Band of Chumash Mission Indians as part of the Section 106 consultation process and DTSC has also been included in the S106 consultation. Please refer to the Programmatic Agreement and/or ROD for resolution of adverse effects to archeological sites.</p> <p>The Santa Ynez Band of Chumash Indians have already declared the NASA-administered Area an Indian Sacred Site under EO 13007.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>The California Department of Toxic Substances Control recently committed to reducing disposal by 50% at both of the state's hazardous waste landfills - Clean Harbors Buttonwillow and Chemical Waste Management Kettleman Hills Facility -- by 2025.2 NASA's soil removal could consume as much as 4% of the permitted capacity at CH Buttonwillow or 8% of the volume at CWM Kettleman Hills pending expansion of that facility.3 NASA's contaminated soil could increase total annual disposal at these facilities collectively by more than 60% for two years. These estimates do not include contaminated non-hazardous soil, nor concrete contaminated with hazardous waste, from demolition. The DEIS does not discuss coordination with these facilities or with U.S. Ecology in Beatty Nevada, the other hazardous waste landfill identified in the DEIS. While all three facilities have large permitted capacities, NASA should verify that they have current landfill space available to accept such large quantities of waste. If CH Button willow is selected for both hazardous and nonhazardous waste, NASA would consume nearly 50% of the facility's current 950,000 cubic yard capacity. For U.S. Ecology, which has approximately 1.1 million cubic yards of capacity, NASA waste would consume nearly 36% of the facility's landfill volume.4 To accept waste on the schedule proposed in the DEIS, the facility may need to speed the construction of additional landfill space. Please note that the discussion above does not consider waste generation by the Department of Energy (DOE) or Boeing at the other portions of the Santa Susana Field Laboratory site. Boeing and DOE are expected to increase the quantity of contaminated soil to be removed by more than 65% (387,585 cubic yards per Table 4-13.1). The DEIS does not identify the disposal location for that waste.</p> <p>Recommendation: The FEIS should summarize NASA's discussions with receiving facilities regarding their ability to handle the potential volumes of contaminated soil from the proposed alternative. NASA should consider shipment to multiple facilities as a means to reduce impacts at the receiving facilities. To the extent possible, NASA should coordinate with Boeing and the Department of Energy on their remediation projects (e.g. schedules, disposal facilities and changes in soil volumes), so that its FEIS may contain as comprehensive a discussion of cumulative impacts as possible</p>	<p>NASA contacted the receiving facilities regarding their ability to handle the potential volumes of contaminated soil from the proposed alternative and cumulative actions. A table summarizing this information is provided in Section 2.2.2.3.</p> <p>Recommendation 1: Text will be added to the EIS summarizing NASA's communications with disposal facilities (Section 2.2.2.3).</p> <p>Recommendation 2: The EIS identifies nine potential disposal facilities (Section 2.2.2.3). NASA plans to utilize multiple disposal facilities during remediation activities.</p> <p>Recommendation 3: In order to better coordinate remediation activities, NASA, DOE, and Boeing are developing a transportation plan.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>The soil removal action, a component of the proposed alternative, includes many treatment options (Section 2.2.2.3). While we understand the urgency to complete soil removal by 2017 to comply with NASA's Agreement on Consent with DTSC (p. 1-7), the options of the DEIS create substantial uncertainty regarding the impacts of the proposed action, which should be avoided in the FEIS.</p> <p>Recommendation: The FEIS should identify one preferred treatment option for contaminated soil.</p>	<p>For soil, excavation with offsite disposal is known to meet the cleanup goals. It has been evaluated and represents the option with the most environmental impacts. Should other onsite treatment technologies prove to be effective, NASA could choose a combination of excavation and other proven technologies. These combinations were evaluated in the EIS. Final selection will occur once NASA completes the Soils Remedial Action Implementation Plan and DTSC agrees with the remedial action.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>While the DEIS considers environmental justice impacts near the Santa Susana Field Lab, it specifically eliminated consideration of the effects around designated landfills and disposal facilities (Table 2.5-1). The DEIS states that "siting and licensing of these facilities includes consideration of the potential effects of bringing designated and permitted waste to the sites." In view of the burden imposed on the communities near receiving facilities, particularly in light of the cleanup to background, a more detailed evaluation of environmental justice impacts would be valuable for those communities. Additionally, a facility permit could be many years old, offering NASA an opportunity to implement more recently developed mitigation measures. DTSC's proposed permit for CWM Kettleman Hills, for example, would require trucks hauling waste to the facility to meet 2007 emissions standards immediately, and meet 2010 emissions standards by 2018.5</p> <p>Recommendation: The FEIS should consider impacts to communities with environmental justice concerns near facilities receiving substantial quantities of waste from demolition and soil removal. The FEIS should also commit to using on-road heavy duty diesel trucks that meet or exceed EPA's emissions standard for 2010.</p>	<p>Where possible, NASA's contractors will use on-road heavy duty diesel trucks that meet or exceed EPA's emissions standards for 2010. However, these emissions standards are not mandatory until 2023, so there may be a limited number of these trucks available at the time cleanup activities will be ongoing at SSFL between 2016 and 2017.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>The DEIS estimates that the proposed action will generate 50,000 cubic yards of mixed waste, both low level radioactive and hazardous waste (Table 2.4-2), but does not indicate the source of radioactive contamination. While the DEIS mentions the potential for mixed waste from contaminated industrial or research waste, it also mentions that NASA operations did not use or generate radioactive waste (p. 2-12). Demolition wastes appear to contain minor amounts of radioactive waste, such as smoke detectors, batteries in emergency lighting, exit signs, electric control panels, and building surfaces, equipment and or debris (radiological materials) (p. 3-48). The list of demolition wastes (Table 2.2-2), however, does not include large quantities of radioactive waste and the amount of demolition waste is shown as a separate quantity from that of contaminated soil estimated in Table 2.4-2.</p> <p>Recommendation: The FEIS should clarify the composition of the material that NASA expects to comprise the 50,000 cubic yards of mixed waste (Class A low-level radioactive waste and hazardous waste).</p>	<p>Experience shows that some unexpected background radiological concentrations are found in some soils which by the 2010 AOC require them to be disposed of at a LLRW facility. NASA will make the recommended clarification in the EIS in Section 3.8.2.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>NASA's Santa Susana Field Lab website discusses a past waste shipment from the site that was halted due to concerns that the receiving facility was not appropriate for the waste. Based on our historic involvement with the site, we are aware that this was not an isolated incident. We recommend as much transparency in the matter of waste composition and management as possible. NASA would be better served to hear concerns regarding receiving facilities following publication of the FEIS or the public release of BMPs, than much later in the soil removal process, when delays may hinder NASA's ability to meet its commitment under the 2010 AOC.</p> <p>Recommendations: The FEIS should include, or commit NASA to develop and publicly release, best management practices that include the following:</p> <ul style="list-style-type: none"> • a description of debris and soil screening or testing procedures for radiation and chemical contamination • a decision matrix that identifies specific facilities or types of facilities (e.g. solid waste landfill, hazardous waste landfill) for debris and soil based on the screening or testing protocol. Particular focus should be given to debris and waste that may be contaminated, but not regulated by EPA or the Nuclear Regulatory Commission (e.g. hazardous waste exceeding background levels of radionuclides, soil exceeding the Look-up Table values that is not considered hazardous waste etc.). 	<p>These topics will be addressed in the Soils Remedial Action Implementation Plan required by the 2010 AOC.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>The DEIS does not describe groundwater cleanup in the same level of detail as it does demolition and soil removal. The description of the no action alternative for groundwater cleanup, described as a "groundwater interim measure and interim source removal," (p. 2-33) does not show the location of the current extraction well, the lateral or vertical volume the well is intended to capture, the volume of water removed from the aquifer, or the weight of trichloroethylene (TCE) removed from groundwater over time; nor does it describe the treatment method for extracted groundwater or identify its discharge location. The DEIS includes one figure showing the two-dimensional extent of trichloroethylene (TCE) in groundwater (Figure 2.2-4). Even though other contaminants are mentioned, such as TCE degradation products and n-nitrosodimethylamine (p. 2-27), none are mapped. The DEIS does not discuss the thickness of groundwater contaminant plumes. It mentions treatment of metals as an advantage of pump and treat technology but does not indicate elsewhere that groundwater is contaminated by metals. From the reports cited by the DEIS, such as RCRA Facility Investigation reports (p. 3-42), we presume that a considerable amount of additional information that would be useful for disclosure and decision making could have been summarized in the DEIS. The DEIS does not discuss criteria for selecting a groundwater cleanup remedy. What factors will NASA or DTSC consider in deciding between the technologies described in the DEIS (e.g. short and long term effectiveness; reduction in contaminant mobility, toxicity or volume; implementability; community acceptance)? The timeframe for treatment technologies is discussed (e.g. pump and treat technology would take "decades to centuries" achieve groundwater cleanup levels, p. 2-28), but further refinement of the estimates would increase the value of this information. While the DEIS discusses the advantages of each technology, it does not consider disadvantages. At some VOC sites, depending on the geochemistry, In-Situ Chemical Oxidation and Enhanced Bioremediation can break down TCE to form vinyl chloride, which is more toxic (i.e. has a lower Maximum Contaminant Level) than TCE. The DEIS does not include actual or preliminary groundwater cleanup levels. It does clarify that the values will be based on a standardized risk assessment methodology (p. 2-27) but</p>	<p>The details of the groundwater investigation effort are included in the RI report that is referenced in the EIS. NASA continues to characterize and evaluate the groundwater, and a Final Remedial Investigation Report is expected to be issued in 2015. The cleanup technologies continue to be evaluated and will be included in a Corrective Measure Study. A discussion onsite geology will be added to Section 3.7 of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>NASA has excavated 4,800 cubic yards of contaminated soil, and expected to remove another 7,580 cubic yards by the end of this year at the Expendable Launch Vehicle area, the Sewage Treatment Plant, the former Liquid Oxygen Plant and an area identified as A2LF (p. 4-156). The DEIS notes that the cleanup levels are consistent with DTSCs values, except for dioxins which are elevated in the area due to past wildfires. It does not provide a map of these areas nor indicate whether additional soil removal is required for NASA property in the Northern Drainage, which leads to Outfall 9. Some of NASA's property in the Southwestern Drainage drains through Boeing-owned property back onto NASA property where it flows to Outfall 18 (Figure 3. 6-1). (See NASABoeing Cross Contamination below.) The Regional Board's Stormwater Permit describes a sophisticated temporary treatment system at the Silvernale Pond, upstream of Outfall 18, which includes filtration, metals precipitation, and activated carbon treatment prior to discharge. The DEIS does not include a description of this system. Based on discussions with the Regional Board, our review of their permit, and our limited review of the Interim Source Removal Action reports, surface water appears to be a subject of substantial focus for the entire Santa Susana Field Lab. This focus is not apparent from the DEIS. While the DEIS includes a mitigation measure (Water BMP-1, p. 4-80) to develop a Stormwater Pollution Prevention Plan and Erosion Control Plan (i.e. collections of BMPs), it provides no specific information on current or past BMPs.</p> <p>Recommendations: The FEIS should include</p> <ul style="list-style-type: none"> • a more comprehensive description of the interim source removal action, including BMPs developed through that process; • a discussion of coordination between the interim source removal, demolition, and soil removal actions, including a map showing remaining demqllition and soil removal actions in the Northern Drainage; • a summary of BMPs currently in place, outside the Northern Drainage, to control the movement of contaminated sediment as well as any planned BMPs that will be used during demolition and soil removal; and • a more recent description of compliance with the Regional Board's permit 	<p>The ISRA is not part of the proposed action. It is included as a cumulative activity in Section 4.13. The ISRA work has been completed. Proposed action cleanups within the Outfall 9 drainage area is identified on Figure 2.2-3. The BMPs implemented as part of the ISRA activities will be added to Section 4.13.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>Boeing and NASA appear to be using different standards for soil remediation. As riskbased standards may allow more contamination to remain at the site than the Look-Up Table values, post-cleanup concentrations of soil contamination will differ between Boeing owned property and NASA-administered federal property. Figure 3.6-1 appears to show that federal property drainages extend into Boeing property, and Boeing drainages extend into federal property. The DEIS does not describe the timing of cleanup for the two properties. If Boeing completes soil removal prior to NASA, contamination from the NASA property might migrate to Boeing property. While the same is true for Boeing contamination to migrate onto federal land, we are particularly concerned that, following the remediation of both properties, Boeing's property may still pose a risk of contamination to federal property.</p> <p>Recommendation: The FEIS should discuss the timing of the cleanup for the Boeing and NASA properties, as well as measures to prevent cross-contamination (pre-and post remediation) to Boeing and federal property.</p>	<p>Boeing will be cleaning up the non-DOE portion of their property to standards that are risk based and appropriate for the future use of the site. NASA is currently working with DTSC and Boeing regarding the difference in standards for drainages that could affect each other.</p>

Kathleen	Martyn Goforth (EPA)	<p>The extent of jurisdictional waters of the U.S. (waters) is unclear in the DEIS. Figure 4.10-1 shows the potential impacts of the project to streams and ponds from the estimated soil cleanup activities. Several of these features are not identified in the Appendix G Wetlands Delineation Report or Figure 3.4-5 (Wetlands). In addition, Figure 3.4-5 identifies many of the features as man-made, which, according to the discussion in Section 3.4.5, are not considered as part of the impacts analysis. Also, the discussion of wetlands in section 3.4.5.1 appears to only consider aquatic features, such as palustrine and riverine wetlands that meet the three parameter wetlands test. Based on the information provided, it is difficult to determine the extent of jurisdictional features at the project site and whether the features are wetlands or non-wetland waters. Additionally, the DEIS does not sufficiently describe the condition and functions of the wetland and non-wetland waters on the project site. An approved assessment method, such as the California Rapid Assessment Method (CRAM), should be used to measure baseline conditions as this type of information will be needed as part of the 404 permit application to the Corps.</p> <p>We also note that the DEIS does not include potential mitigation measures to offset unavoidable impacts to jurisdictional waters of the U.S. Mitigation measures in the DEIS are limited to Table 6.1-1, which includes best management practices such as erosion control, revegetation, and permits from the Corps and the Regional Water Quality Control Board. The DEIS does not address how lost functions of jurisdictional waters could be offset through on-site restoration or through the purchase of credits at an approved mitigation bank or in-lieu fee program. As part of the 404 permit application, and to comply</p>	<p>Appendix G of the EIS contains NASAs wetlands and Waters of the U.S. delineation report along with the USACE's jurisdictional determination within the NASA-administered property of SSFL.</p> <p>Section 4.4.2 identifies how NASA will address mitigating impacts to jurisdictional waterways as described in Biology BMP-5 below.</p> <p>Biology BMP-5: NASA would obtain a CWA Section 404 Permit from the USACE and a CWA Section 401 permit from the RWQCB for the discharge or dredge of material into jurisdictional waters of the U.S. The Section 404 and 401 permits would include necessary measures to avoid, minimize, or otherwise mitigate impacts to wetlands and other waters of the U.S.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>Please note that a project using offsets to demonstrate conformity must fully offset its emissions (i.e. to 0), not offset the emissions to the de minimis thresholds.</p> <p>If peak emissions occur in 2016 and 2017, per Tables 4.7-3 and 4, then the General Conformity analysis should consider the emissions from groundwater cleanup response actions along with soil removal.</p> <p>The DEIS discusses but does not commit to a mitigation measure to use newer model year trucks to reduce local criteria pollutants and GHGs (Air Quality Mitigation Measure - 2, p. 4-111). The DEIS also discusses the use of offsets to comply with General Conformity.</p> <p>NASA is likely to find cleaner trucks a cost effective project element to reduce the amount of offsets required by Air Districts.</p> <p>Recommendation: If NASA plans to use offsets to demonstrate compliance with General Conformity: the FEIS should commit to fully offset emissions (i.e. to zero) of any pollutants for which the projected emissions would exceed the de minimis thresholds. NASA should begin discussions with the appropriate air quality management districts on the emission offsets as soon as practical. The FEIS should include emissions from groundwater response actions in 2016 and 2017 in the General Conformity analysis, in addition to emissions from demolition and soil removal actions. The FEIS should also commit to using on-road heavy duty diesel trucks that meet or exceed EPA's emissions standard for 2010 and raise awareness of California's anti-idling rule among drivers (http://www.arb.ca.gov/msprog/truck-idling/factsheet.pdf).</p>	<p>The air conformity regulations do require you to offset to 0 if the project exceeds the air conformity limits. However, many projects in California successfully avoid this by including a MM in their EIS and General Conformity assessment that agrees to purchase offsets so that the project stays below the air conformity limits. This is the approach taken in the NASA EIS / General Conformity assessment.</p> <p>Discussions with air quality management districts on the emission offsets have already been started. Emissions from groundwater response actions are discussed in Section 4.7.1.3. NASA will consider using on-road heavy duty diesel trucks that meet or exceed EPA's emissions standard for 2010 and raise awareness of California's anti-idling rule among drivers.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>We are concerned that the truck routes described for soil removal may not represent a reasonably expected route.</p> <p>Two of the three hazardous waste facilities that could accept hazardous waste are northeast of the site. To reach these sites, a route traveling south on Topanga Canyon Boulevard to 1-101 and 1-405 would appear to take trucks several miles further on highways likely to be as crowded or more so than 1-118. Even for waste traveling to U.S. Ecology in Beatty, Nevada, or Energy Solutions Landfill in Clive, Utah, the route suggested by Google Maps would travel north on Topanga Canyon to 1-118.</p> <p>Closer to the Santa Susana Field Lab, the DEIS identifies several possible routes as Region of Influence Roadways. Although Box Canyon Road and Plummer Street appear to offer a slightly shorter route to 1-118, the DEIS does not clarify the reason for assuming that all trucks will use Roscoe.</p> <p>Recommendations: The FEIS should:</p> <ul style="list-style-type: none"> • designate truck routes, particularly for the largest (Class VIII) trucks; • explain the reason(s) more trucks would not travel North on Topanga Canyon Boulevard; • evaluate the possible effects of landfill selection (or other receiving facility) on the truck route to ensure that all reasonably foreseeable traffic analyses are considered; • to the extent possible, based on coordination with Boeing and the Department of Energy, NASA should update its traffic analysis to consider the cumulative impacts; and • offer rideshare or carpool program for construction workers to further reduce traffic impacts. 	<p>Trucks leaving SSFL travel Woolsey Canyon Road to Valley Circle Boulevard to Rosco Boulevard to Topanga Canyon Boulevard. Then they will either travel north to the 118 or south to the 101. This route is shown in Figure 4.5-1. Additional text will discuss the basis of the number of trucks traveling north or south on Topanga Canyon Boulevard in Section 4.5. Since the DEIS was released, DOE and Boeing have provided updated soil removal volume estimates. Section 4.13.2 (Cumulative Impacts) will be updated with these estimates</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>We commend NASA for its consideration of the impact of truck traffic on school children. As the analysis is novel, we offer some recommendations for improvement. We noted that the DEIS did not include childcare centers, preschools, parks nor recreation centers in its evaluation of truck traffic and children. While fewer children may walk to these facilities than to schools, their safety is relevant for consideration. Additionally, the DEIS does not consider the role of crossing guards at intersections near schools, nor educational outreach to schools, childcare centers and residents.</p> <p>Recommendation: The FEIS should:</p> <ul style="list-style-type: none"> • consider childcare centers, preschools, parks and recreation centers as well as schools in the evaluation of truck traffic and potential exposure to children; • provide additional funding for crossing guards, if busy intersections near schools are not currently staffed; • target outreach material about the construction schedule and truck routes to schools and childcare centers and residents. 	<p>Major schools were considered in the analysis in Section 4.5. As expressed in the EIS, after trucks leave Woolsey Canyon Road, project-related traffic is negligible as compared to the existing traffic levels, so additional crossing guards and target outreach material should not be necessary.</p>
Kathleen	Martyn Goforth (EPA)	<p>While the DEIS provides additional waste volumes and trucks for the Boeing and DOE cleanup, it does not model the cumulative impacts to children, traffic, and air quality. A cumulative model of these impacts is likely to be of much more interest and value to the public than the individual analysis of impacts from NASA, Boeing, or DOE.</p> <p>Recommendation: To the extent possible, in coordination with Boeing and the DOE, NASA should update its analysis to consider the cumulative impacts (including Boeing and DOE soil removal) on traffic, children and air quality.</p>	<p>The cumulative analysis section (4.13) of the EIS shows the cumulative impacts of NASA, Boeing, and DOE activities based on current information.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>Many factors should be considered in making a remedy selection for soil removal. For example, EPA uses nine criteria to evaluate cleanup alternatives under the Comprehensive Environmental Response, Compensation, and Liability Act, commonly known as Superfund. For the most part, the DEIS and the public comment period address these factors, except cost. The cost of a cleanup should play an important role in screening and selection of alternatives. The DEIS contains no information on the cost or costeffectiveness of the treatment technologies for soil removal.</p> <p>Recommendation: The FEIS should include an estimate of the cost for each element of the cleanup (i.e. demolition, soil remedial activities and groundwater remedial activities), as well as the options within each element (e.g. soil excavation and off-site disposal, soil excavation and ex-situ treatment, soil vapor extraction etc.</p>	<p>Cost estimates are not part of an EIS evaluation. For both groundwater and soil cleanups, NASA will be evaluating the feasibility of applicable cleanup technologies. The reports for these studies will include cost as one of the evaluation criteria.</p>
Kathleen	Martyn Goforth (EPA)	<p>The DEIS does not appear discuss the removal, encapsulation or other methods to minimize hazards associated with retained historic resources.</p> <p>Recommendation: To enable broader access to the retained historic resources, Cultural Mitigation Measure-1 should include a commitment to remove, encapsulate or otherwise prevent visitor exposure to, potential hazards, such as lead paint, asbestos and PCBs.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until January 2016. NASA will identify whether these structures must be demolished to achieve the required cleanup goals and which structures could be preserved. Upon completion of cleanup activities, based on consultation with the SHPO and GSA, NASA will provide and maintain a fenced enclosure around any remaining test stands until property is transferred. Decisions regarding abatement, encapsulation, or other methods to minimize hazards associated with the retained historic structures will be a part of the transfer process.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathleen	Martyn Goforth (EPA)	<p>We offer the Principles, BMPs, and Methodology for use at remediation sites on a voluntary basis, but we also note that these resources may help to identify additional topics that should have been included in the DEIS, and should be included in the FEIS, depending on the potential significance of the impact [40 CFR 1502.2(b)]. For example, the DEIS does not consider: quantifying certain aspects of the remedy such as the amount of water and materials used; extending the scope to off-site support activities, such as laboratory analysis and waste management; and identifying opportunities for reduction for these aspects of the remedy. Karen Scheuermann is available to assist NASA in understanding and applying the Greener Cleanups approach at the Santa Susana Field Laboratory. Ms. Scheuermann can be contacted at (415) 972-3356 or scheuermann.karen@epa.gov. We also note that DTSC's Advisory for Green Remediation¹⁷ is compatible with EPA's Principles for Greener Cleanups.</p> <p>Recommendation: NASA should consider EPA and DTSC resources for Greener Cleanups and take advantage of any aspects of these resources that may be beneficial in the cleanup of the Santa Susana Field Lab.</p>	Thank you for your suggestions.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patti	Mascarenas	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Marie	Mason	<p>I have been involved with the effort to get this site cleaned up since 1989. I have spent time going to endless meetings, time that I should have spent with my family. Now after all these years when I finally thought we had achieved our goal with the signing of the AOC's by NASA we are again faced with your agency just walking away and leaving all the contamination behind.</p> <p>Now with the release of your Draft Environmental Impact Statement it is clear that your agency has no plans for follow the signed agreement. Our community viewed this signed agreement as a commitment between your agency and the families of our community. This seems to be a commitment that your agency signed but had no intention of keeping.</p>	<p>Your comment is noted.</p>
Marie	Mason	<p>NASA dumped huge amounts of contaminates, just one of the most toxic TCE was poured onto the ground in so many gallons that can't even be counted or accounted for. We have always been told it will take to the end of time to clean up this ground water contamination.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marie	Mason	<p>This EIS just wants to leave all the rocket test stands because they are historical but everyone knows and it is well documented that is exactly where most of the TCE was dumped on the ground. If you leave these stands than you are planning on walking away from your responsibility and commitment to this community to follow the AOC agreement you signed.</p>	<p>The test stands sit on top of bedrock which will not be removed during the cleanup. NASA is conducting sampling around the test stands to determine the location of contamination that needs to be cleaned up to meet the 2010 AOC and 2007 Consent Order. NASA is also evaluating in situ technologies that may be capable of removing contaminants without demolishing the structures.</p> <p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p> <p>The test stands have been evaluated and identified as eligible for listing on the National Register of Historic Properties. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. Comments such as yours are considered during that process. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects. Please refer to the PA and/or ROD for further information.</p>
Marie	Mason	<p>There is much talk about how awful the truck traffic will be so we should just leave it all there. The trucks have been going up and down to this facility for over 50 years and no one seemed to be worried about what was in the trucks or how it would affect the surrounding communities. NASA could have cared less about this issue until you faced cleaning up the mess you want to leave behind.</p>	<p>NASA acknowledges your comment.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marie	Mason	<p>This EIS has almost no discussion about all the contamination you have placed there or any discussion on how you plan to clean it up. There is only discussion on how you can walk away and leave it behind hiding behind the words Historical, Truck Traffic, Native American Artifacts. These are all issues your agency could have cared less about when you were trying to get to the moon. Well you got there and you have reason to be proud but now to just walk away and leave it for generations to come is more than criminal its immoral.</p> <p>There are many families in our community, Simi Valley and the San Fernando Valley that have real health issues. Allen, you have heard these sad stories with your own ears but I guess it all fell on deaf ears.</p>	<p>Details about past releases and the nature and extent of the contamination can be found in the RI reports that are referenced in the EIS and available on DTSC's website. NASA is working with DTSC to comply with the AOC and complete the cleanup.</p>
Marie	Mason	<p>The sole purpose of an EIS is so everyone will know all the issues both large and small and how these issues will be addressed. This EIS just is lots of words with no real substance. No real solutions only words about how we need to save our test stands. Words about saving the Native American artifacts when you know that the AOC's provide for that along with native or endangered plants.</p>	<p>Your comment is noted.</p>
Marie	Mason	<p>NASA made a commitment to this community and the people who live here and we expect nothing less than your agency making good on your end by cleaning up this site to the levels required by the AOC.</p> <p>I can only hope that you will follow through on this commitment so my grandchildren and all the children that will live in the communities that are below this site won't live in fear, the fear that I have lived with since 1989.</p> <p>DO THE RIGHT THING AND FOLLOW THE AOC'S YOU SIGNED</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marie	Mason	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marie	Mason	Through decades of sloppy environmental practices, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been migrating off the property.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6)</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Susan	Mathison	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
James	Mc Farland	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	McCarty	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	McCarty	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	McCarty	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	McCarty	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>
Christina	McCarty	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
J	McGraw	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
B. L.	Melton	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
B. L.	Melton	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Rose Marie	Menard	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michelle	Merrit	<p>As a homeowner and concerned citizen of Los Angeles, I strongly recommend that the clean up proceed at the Santa Susana Field Laboratory. For the health and safety of all of the west San Fernando Valley residents; adults, children, the elderly, wildlife and pets, employers, employees, please consider using rail to dispose of the contaminated soil.</p> <p>It would be "crime" to haul the hazardous material via trucks on the city streets, for up to three years, no less. I would guess that no one would want noisy, air polluting, street damaging trucks rolling down the hills and onto the already too busy streets.</p> <p>I strongly urge the use of rails. The main line is already in existence in the west valley.</p>	<p>Section 2.4 in the EIS discusses the following alternate transportation considerations: 1) overland conveyor and rail transport of soil; 2) build a new haul road; and 3) truck from site to rail and transport by rail to disposal facility.</p> <p>(1) NASA considered an alternative rail or conveyor system for hauling materials from SSFL. The analysis showed that a conveyor system would require building the system over private land and constructing a railroad facility to keep trucks off the local roads. NASA concluded that the system could not be built in the AOC timeframe requirement, and there could be opposition to acquiring rights-of-way over private lands.</p> <p>(2) NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission to, current private property. Alternative access was dismissed due to the inability to obtain access permits and environmental assessments, and to construct the road in time to meet NASA's 2010 AOC schedule requirements.</p> <p>(3) NASA considered a truck-rail combination for soil disposal. Using existing local roads to rail would not alleviate traffic on local community roads.</p> <p>Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Eric	Meyers	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

John	Miles	<p>Just now, with 97% of your staff about to be furloughed, NASA needs all the friends it can get. In Southern California, you have the chance to make a few friends by proving yourself good for the earth, our own California, earth and not just good for space exploration.</p> <p>NASA badly contaminated its part of the Santa Susana Field Laboratory, and the poison is now spreading off the site. After years of ducking the problem, you finally agreed in 2010 to do the right thing and clean up all the contamination down to background.</p> <p>But now your Draft Environmental Impact Statement has us worried. Somebody up there seems to be trying to undermine the agreement that you made and that we've been counting on you to carry out.</p> <p>With respect, Mr. Elliott, do the right thing. Live up to NASA's commitments in the 2010 cleanup agreement. Don't try to minimize the problem at this point. No weaseling out of it. You know what real cleanup requires. Win NASA a few California friends. Do the right thing.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bill	Miley	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
RL	Miller	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Martha Martha	Milne	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Lewin	Minter	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lewin	Minter	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lewin	Minter	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

First Name	Last Name	Comment	NASA Response
Lewin	Minter	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. Ronnie	Mitchell	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronnie	Mitchell	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Taiji	Miyagawa	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Damon	Moglen	<p>Nonetheless, we were pleased to see NASA's commitment to carrying out fully the requirements of the AOC explicitly reiterated to the House Science and Technology Committee on September 20. Associate Administrator Richard Keegan testified there, "The Draft EIS is open for public comment until October 1 and we expect the FEIS in November and NASA is committed to fulfilling our obligations under the AOC. There is sufficient funding in our FY 14 request to accomplish all the activities that are planned for FY 14 leading to fulfilling our commitments under the AOC." Congresswoman Brownley, who represents the area and serves on the Committee, followed up, saying, "So, regardless then of what the IG may be recommending, your commitment is still to the agreement with the AOC?" And Associate Administrator Keegan responded, "We are committed to the agreement under the AOC."</p> <p>FOE strongly urges NASA to live up to the requirements in the AOC in its entirety and to the commitments NASA has made to Congress and to the people who live near this badly polluted site. Full cleanup to background, as required in the AOC, should now proceed expeditiously.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Pattie	Montgomery	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Pattie	Montgomery	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kristy	Moorman	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Ryan	Moorman	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ryan	Moorman	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ryan	Moorman	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ryan	Moorman	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Audrey	Moskowitz	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.
Jamie	Mosley	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jamie	Mosley	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jamie	Mosley	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jamie	Mosley	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Jamie	Mosley	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ann	Moyer	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Helen	Murphy	<p>Providing only two alternatives, clean up to background or no cleanup is not appropriate, other alternatives need presented such as a clean up to suburban residential or recreation standard.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Helen	Murphy	<p>The DEIS is flawed since the level of deanup is not balanced against costs, cultural impacts, and envimonmental impacts, required by NEPA and CEQA.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Helen	Murphy	Protection needs to be established before the cleanup for archaeological sites, such as the Burro Flats site VEN-1072 and any other archaeological sites on the property.	In consultation with SHPO, ACHP and the tribes, NASA is developing appropriate protection measures for the Burro Flats site.
Helen	Murphy	Protection needs to be established before the cleanup for structures such as Alpha, Bravo, and Coca rocket test stands and their related structures, eligible for protection as historic structures and districts.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Helen	Murphy	Moving contaminated soil, and only replacing 1 /3 of the removed soil is bad for the community that will receive the water runoff and bear the burdens of 80,000 trips carrying contaminated and new soil over two years, just from the 450 acre NASA site.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Helen	Murphy	Alternative clean up methods to clean up soil on site, even if recovery in 10 years occurs, needs considered due to reduced environmental impacts in neighboring community.	
Helen	Murphy	The 2017 deadline is an artificial one not based on science, but creates an "emergency" type pressure that seems to be causing creation of environmental decision documents prior to completion of studies or input from DTSC that needs to interpret vague language that controls many sensitive decisions about historic properties. Adequate studies and nteipretations must be provided to have a valid decision making document.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Helen	Murphy	<p>Pressure to complete the cleanup to meet the 2010 AOC deadline by 2017 may cause illegal destruction of historic and archaeological resources on the property. Removal of key cultural resources likely will significantly decrease interest in the property from state and federal park agencies, generally identified as the likely optimum long term holder of the property.</p>	<p>NASA appreciates your consideration and comment on the DEIS. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. Comments such as yours are considered during that process. NASA is proposing to defer demolition of the historic Alfa and Bravo structures. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects and protection measures. Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Helen	Murphy	<p>Trucks hauling dirt will endanger children at nearby schools.</p>	<p>Section 4.8 of the EIS presents the effects of truck traffic related to children. With implementation of MMs, impacts would be moderate, negative, local, and short term. As stated in the EIS, NASA cares about the safety of children, and even one injured child is unacceptable and significant. All possible truck safety precautions would be taken throughout the duration of the project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sean	Murphy	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Lorlee	Murray Murray	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lorlee	Murray Murray	NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lorlee	Murray Murray	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lorlee	Murray Murray	This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lorlee	Murray Murray	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Elizabeth	Murrell	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Tom	Nachtrab	<p>NASA must acquire from DTSC important missing information, and NASA must issue a corrected, comprehensive DEIS that provides decision makers adequate information to make an informed decision on how the cleanup should proceed.</p> <p>DTSC must provide guidance to NASA on many subject areas before they complete its DEIS. The type of information that would appear in an EIR-type document. DTSC does not expect to deliver its EIR until some fuzzy time in the future. NASA needs information from such an EIR to complete a valid EIS that can be used as a decision-making guide.</p>	<p>NASA has been coordinating with DTSC and multiple agencies to meet its cleanup goals and will continue to seek information as needed from them.</p>
Tom	Nachtrab	<p>Does this lack of a realistic schedule where everything is yet to be done between now and 2017, does not this lack of a realistic schedule not fall into -- call into question the feasibility of the AOC-mandated completion date of 2017? And can the governing AOC, therefore, any longer be considered realistic and binding?</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Thomas	Nachtrab	<p>NASA's DEIS does not serve its intended purpose. It does NOT fully inform decision makers so they can decide how to best execute the cleanup. The DEIS should be re-issued after critical missing information is determined.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Thomas	Nachtrab	<p>The DEIS is incomplete because it excludes analysis of all possible levels of cleanup except the “cleanup to background” alternative. Other reasonable cleanup alternatives must be evaluated. To accept that the 2010 Administrative Order on Consent (AOC) prohibits consideration of all alternatives defies both the letter and the spirit of the past half-century’s environmental legislation, state and federal.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Thomas	Nachtrab	<p>The DEIS lacks guidance on situations and actions that depend on vague language in the AOC that governs the cleanup. DTSC must provide NASA with an authoritative and binding interpretation of the language of the AOC. ...The incompleteness of the DEIS reveals that so much is yet to be decided, planned, and executed that the AOC-mandated completion date of 2017 has become unrealistic. The rules of the game must change to target completion for a realistic date such as 2020 or beyond.</p>	<p>As you have noted, there are many difficulties in implementing the 2010 AOC. DTSC and NASA are working closely to clarify and implement the 2010 AOC.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Thomas	Nachtrab	The DEIS is incomplete because it does not specify expected outcomes for cultural resources, both archeological and architectural.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Thomas	Nachtrab	<p>Some see the AOC as a guarantee that NASA will “take us and the Hill home again.” For better or worse, no one has ever been able to go “home again.”</p> <p>Some interpret the AOC to mean that a cleanup to no less than background level is both possible and desirable. The AOC is sometimes interpreted to mean that we can “return the site to its natural state.” The unspoken assumption is that Background = Natural.</p> <p>Yet, how can the result of any technological cleanup yield a natural result?</p> <p>Unfortunately we may have to accept some reality. Man (our grandparents, parents, and we ourselves) made a mess in fifty years of the Hills that Nature crafted over millennia. Can Man now be expected to (play God) and re-Create in a handful of years, what Nature made? Presumptuous, no? Maybe we need to accept that Man screwed up here, and the best we can do is atone for our sins by cleaning up to a reasonable, very low level of risk; humbly learning from our arrogance; and preserving the scene of the offence against Nature as a reminder not to screw up so bad the next time.</p> <p>Finally, I also fully endorse the comprehensive “Comments on Draft Environmental Impact Statement” separately submitted to you by the Santa Susana Mountain Park Association (SSMPA).</p>	Thank you, your comment has been noted.
Donna	Nachtrab	<p>Most importantly, I fully endorse the comprehensive "Comments on Draft Environmental Impact Statement" separately submitted to you by the Santa Susana Mountain Park Association (SSMPA).</p>	Thank you for your comment. NASA will consider the comments of SSMPA.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Donna	Nachtrab	On a personal level, as a resident of Chatsworth, I wish to emphasize my belief that implementation of the DEIS as it stands would be a massive disservice to the communities surrounding SSFL. The DEIS must be re-issued, based on facts, not emotions, political promises or unrealistic deadlines.	NASA acknowledges your recommendation.
Donna	Nachtrab	The re-written DEIS must follow, not precede, DTSC's final DEIR.	The AOC requires NASA to develop a NEPA document, the EIS. The AOC also requires NASA to have cleanup completed by 2017. In order to meet the 2017 deadline, NASA must proceed with the EIS as NEPA must be complete before activity can begin.
Donna	Nachtrab	The re-written DEIS must include comprehensive analysis of all alternatives, not exclusively "clean-up to background level".	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Donna	Nachtrab	The re-written DEIS must include comprehensive analysis of the effects of transportation of soil removed from SSFL through surrounding communities.	Impacts from transportation of excavated soil is described in various sections within the EIS. Section 4.5 identifies the impacts to roadway operations, truck traffic exposure on school children, safety effects from truck traffic, and pavement conditions (Roscoe Boulevard, Valley Circle Boulevard; and Woolsey Canyon Road). Section 4.7 identifies impacts associated with criteria pollutant and green house gas emissions from trucks. Section 4.8 identifies potential safety risk due to increased truck traffic and potential health risk due to increased truck emissions. NASA believes these evaluations are adequate.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Donna	Nachtrab	The re-written DEIS must include scientific studies of health effects on surrounding communities.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>Additionally, DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm). We will add a summary of these studies to the EIS.</p>
Donna	Nachtrab	The re-written DEIS must evaluate the impacts of disturbing the site (soil and rocks), from environmental, health and esthetic viewpoints.	Impacts related to soil disturbance are included in Section 4.2.
Donna	Nachtrab	My greatest fear is that the "cure" will be worse than the problem it is seeking to fix - that the proposed solution, if implemented, would cause more harm to surrounding communitiethan simply doing nothin.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lana	Nardiello	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dency	Nelson	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Amy	Nowak	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Anita Cannata	Nowell	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Olsen	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Patricia	Olsen	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Patricia	Olsen	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Olsen	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Polly	Omalley	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Alejandro	Oro	<p>I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alejandro	Oro	<p>NASA activities led to widespread contamination of soil and groundwater with very toxic materials such as perchlorate, dioxins, and TCE. Some of the contaminants have been migrating offsite. As a local resident, I am very concerned about the potential health impacts of these materials and want the site cleaned up properly.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Melissa	Orozco	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

Melissa	Orozco	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Osokow	<p>There's been several comments made about the truck traffic, and I don't know how this fits in with the plans, but the -- any projections about truck traffic and the hazards regarding the truck traffic has to be put in the context of the developments, the housing developments and other developments that are on that -- in the planning stages for the 118 freeway area in particular, the Santa Susana Mountain area.</p> <p>That's going to increase the truck traffic along those roads and also ultimately when those developments are built, which probably won't be that long -- it will probably overlap the period of the cleanup -- there will be a lot more traffic in those areas from residential traffic and commuting and things of that nature. So that all needs to be taken into consideration. It needs to be projected out.</p> <p>To that, there are going to be a lot more traffic jams caused by this along the route, which will increase the potential for accidents and other hazards along the routes as well as additional pollution from the trucks going down those routes.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Osokow	<p>I'm very disappointed in the EIS because it -- the surveys that deal with birds, in particular, which I know the most about, up at the site don't take into consideration the -- most of the calendar year. There are some surveys done during the -- during September and October, in that period. I think it's a week or two at the most during which those surveys were done. Those are completely inadequate.</p> <p>I think -- I believe they listed about 51 or 50 -- somewhere between 51 and 58 species. I counted them at the time I read that section, but I've forgotten since. There's actually more like 118 species on the site there, not just Area 2 but including the sites that border Area 2 and Area 1, which should be included since Area 2 is only a section of the larger habitat that is going to be frequented by all those different species of birds. You can't simply isolate that particular area and pretend that that exists as an island. It's not an island. It's going to be influenced by whatever habitats and wildlife are around it.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources, and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with the USFWS and has coordinated with other natural resource agencies, such as the USACE, with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations, as concurred by the USFWS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Osokow	<p>I think, about Silver Nail Pond, which is drying up for the first time in 30-plus years as a result of a lack of water being input. And there's nothing in the Draft EIS that deals with that issue. It seems to be that NASA has a responsibility to at least participate in the maintenance of that pond. So I would strongly recommend that something along those lines be included in the Draft EIS.</p> <p>And, of course, Silver Nail Pond is related to the Bell Canyon Creek watershed as well. So there needs to be something in the EIS that addresses that issue and some kind of commitment from NASA to maintain some water that goes into Silver Nail Pond. It is a rich wildlife resource, and it would be a shame, a great shame, to see that resource simply dry up and be lost forever. It's been supported by the activities on the site pretty much. The history of the pond itself is uncertain. So it seems to me that the reasonable thing to do would be to assume that it should be maintained in some kind of condition that supports wildlife, as it does -- as it had done until it dried up recently.</p>	<p>Silvernale Pond is on Boeing property and thus will be considered in Boeing's remediation plans, as well in DTSC's CEQA review.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Osokow	<p>But given the nature of the survey they did in September and October, it limited it to that time period. So we have much more extensive data, and I can't help but noticing little errors in the conclusions in the EIS. One that I just happened to remember, I should have written this all down before I came here, but the one I just happened to remember was the reference to the Loggerhead Shrike as a transient.</p> <p>The Loggerhead Shrike is becoming a species of special concern, if it's not listed that way already. That is found on Area 2. It's also found throughout the site. And it's present there pretty much from July to March. It's not a transient. It's a species that disperses from their breeding sites probably around July. At least that's what I'm assuming is occurring. But we do see them from July to March. It's not correct to call that species a transient, a transient being defined as a bird that will just pass through on migration such as what we would ordinarily call formally what's known as a passage migrant. So that use of that term transient is incorrect. That's just one of the many errors that applies to birds.</p>	<p>The EIS notes the loggerhead shrike, a CDFW SSC bird species. Biology BMP-4: Individuals working on cleanup and demolition activities would be trained to identify federal- and state-listed species. If a listed species were observed during operations, operations would halt and a qualified wildlife biologist would be called to the site. If the species were validated as a listed species, the USFWS or CDFW would be consulted.</p>

First Name	Last Name	Comment	NASA Response
Mark	Osokow	<p>One more thing I want to mention pertains to the health of the environment there in terms of the ecosystem. And if that site were so full of hazards, in terms of hazardous chemicals, we wouldn't see the richness of wildlife that we see there currently.</p> <p>We see every level of the food chain represented there, and we see the top predators there. Mountain lions, for example, golden eagles among the birds. We see coyotes that are fairly abundant there. Those animals could not exist there if there wasn't a healthy system, a healthy ecological system, to support them at that high level of the food chain.</p> <p>So this idea that that site is so unhealthy, there's all this chemical contamination, is -- it just doesn't fly.</p>	<p>NASA acknowledges the reasonableness of your assessment.</p>
Mark B.	Osokow	<p>Regarding the removal of contaminants from soil, the DEIS considers only the "no action" alternative and the Administrative Order on Consent (AOC) alternative of cleaning up to "background" standards. Cleaning up to such a standard will be devastating to the natural, cultural, and historical environments at SSFL. This is indicated to some extent in the DEIS. However, as discussed below, the DEIS does not fully reflect comprehension of or describe the severity of the adverse impacts that will occur; including, the potential for harm to public health. Under these circumstances, SFVAS has no choice but to recommend that the deciding official select the "no action" alternative, which will be less adverse to the environment and more protective of public health.</p>	<p>NASA acknowledges your comment.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>Unfortunately, NASA has chosen a course of action precluding reasonable alternatives less damaging to the environment. Such alternatives will only be available under a revised DEIS, if, and only if, the AOC is modified or thrown out entirely. SFVAS favors the latter approach, as it is unlikely that modification will correct the many flaws in the AOC, which underlies much of the purpose and need of the action.</p> <p>Looked at another way, implementation of the “no action” alternative will be less hazardous to human and ecological health and more protective of vegetative cover, topographical, hydrological, and geological features that protect communities and ecological systems down-slope from landslides, slippage, erosion, dry creep, flooding, dust, and pollution from runoff, dust, vehicular traffic, and potential spills of soils containing toxic materials than the alternative of clean up of soils to the AOC’s background standard. To use a seemingly worn out but apt cliché, the cure that NASA has proposed is worse than the disease.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Mark B.	Osokow	<p>The DEIS contains, in an appendix, only one of the letters reproduced in the OIG’s report; namely, the letter from Nancy Sutley justifying the consideration of only the two alternatives for soil clean-up indicated. It does not include the OIG report in its entirety, nor does it include the letter from SFVAS challenging the assumptions of the Sutley letter. Therefore, the DEIS is inherently incomplete both in its statement of Purpose and Need and in the ensuing analysis. The failure to include the OIG Report or any reference to it or the SFVAS letter appears deceptive, and it may be reasonable to infer that this was done deliberately in order to deprive the public and other governmental agencies of information that does not favor NASA’s approach to the clean-up as represented by the DEIS.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>Moreover, the OIG Report states “According to NASA officials, input from members of Congress and local California leaders as well as advice from the CEQ played a significant role in the Agency’s decision to agree to the terms of the AOC and in its subsequent decision to exclude clean-up alternatives other than background levels from further consideration in the NEPA process.” Such “input,” particularly when it arises from a U. S. Senator, must be regarded as inherently threatening to NASA officials and biases the NEPA process towards a particular outcome that tends to favor certain groups while others, possibly representing a majority of constituents, are effectively excluded. The deliberative processes of NEPA cannot take place effectively in such an atmosphere of intimidation. Furthermore, this type of meddling may be construed as a violation of the doctrine of separation of powers between the Executive Branch of government (viz. NASA) and the Legislative Branch, i.e., Congress.</p>	Thank you for your comment.
Mark B.	Osokow	<p>However, as should be clear from the comments below, it appears that, based on the DEIS, NASA has no intention of implementing a program that will achieve cost avoidance and protection of resources. Instead, we are witnessing what appears to be a decision-making process that is arbitrary, capricious, an abuse of power, or otherwise not in accordance with law.</p>	<p>The conditions of the December, 2010, AOC compel NASA to meet cleanup standards set by the DTSC. The EIS describes the environmental impacts connected with NASA meeting its obligation to comply with the State’s order. The NEPA alternatives of the EIS are limited to a “no action” alternative and the alternative of complying with the conditions set out in the order.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>The DEIS is extremely vague regarding the purpose and need for the project. Section 1.1.3 indicates that metals, dioxins, polychlorinated biphenyls, volatile organics including TCE, and semivolatile organics are present in the soils and upper groundwater, known as the Surficial Media Operable Unit (SMOU), while volatile organics, metals, and semivolatile organics also are present in the deeper groundwater, known as the Chatsworth Formation Operable Unit (CFOU). However, the statement fails to relate the presence of these contaminants in any rational or reasonable way to a need for the clean-up being proposed.</p> <p>The RI reports referenced do not suggest that there is undue risk to human or ecological health from the presence of these contaminants such that the clean-up of soils to the AOC's background standards would reduce those risks to an acceptable level while avoiding the added risks to human and ecological health from the clean-up action itself. The RI reports are, therefore, disconnected from and irrelevant to the determination of purpose and need, without specific reference to risk levels that are consistently sought in other NASA projects.</p>	<p>Thank you for your comment regarding the groundwater contamination detected beneath SSFL. The need for groundwater cleanup will be determined by the risks calculated according to the processes described in the SRAM. A brief description of the SRAM and the basis for the risk-based cleanup is provided in Sections 2.2.3 and 2.2.3.1 of the EIS.</p>
Mark B.	Osokow	<p>Implicit in NEPA is that the public has a right to expect that reasonably consistent clean-up standards will be applied in cases where a clean-up is necessary. Yet, as noted in the OIG Report, "According to [NASA] environmental management officials, several other projects pose greater risks to human health and the environment than Santa Susana." Such inconsistencies are, in this case, the probable result of political meddling that has forced the application of a peculiar standard based on emotion rather than on objective criteria governing risk to the extent practicable.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>Furthermore, that standard is not consistent or applicable with the expected land use following the clean-up; namely, as open-space parkland. The parkland clean-up standard does not require meeting background values for contaminants. It, and the more stringent suburban residential standard, is more realistic and a far less costly standard to meet, as is indicated in the DEIS itself.</p> <p>As noted above, the Proposed Action, with respect to the AOC, is not needed to protect human health and the environment, contrary to the statement in Section 1.2, and the assumption that it is needed for the benefit of property disposition is without basis. Numerous other properties have been disposed of without such a clean-up.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Mark B.	Osokow	<p>As a general rule, no structure should be demolished during the bird nesting season, if the structure supports nesting birds. Outside of the nesting season, structures that are to be demolished but have supported bird nesting should be replaced with nesting structures prior to the next nesting season. Special attention should be given to owls and hawks, which may nest at any time of year. In such cases, new nesting structures should be provided before old ones are demolished.</p>	<p>Please refer to Section 4.4.2. for BMPs associated with biological resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	Section 2.2.1.3 states that “[d]emolition would include the removal of structures and soil under the structures up to 5 ft below grade.” The inclusion of soil removal in demolition adds to the volume of soil to be removed in the Proposed Action and the additional amount should be added to the total. The soil volume, haul trips, and related items should then be re-calculated to accord with this reality. Along these same lines is the failure to include the total number of haul trips for demolished material (3476 trips) in the total for the number of haul trips from the site. Thus, the DEIS is misleading in that regard and underestimates the impact.	Demolition does not include removal of soil, that is a typo. NASA has included the soil volumes underneath buildings that are anticipated to require removal. The soil removal areas are shown in Figure 2.2-2. The haul trips associated with demolition are shown in Table 2.2-2 and were considered in the analyses performed in the EIS.
Mark B.	Osokow	A very serious defect in the DEIS is the failure to describe the timing of demolition activities or of efforts to avoid unnecessary destruction of habitat or soil compaction during that process. In particular, there is no mention of planning the demolition to avoid bird nesting seasons.	Please refer to Section 4.4.2. for BMPs associated with biological resources.
Mark B.	Osokow	Table 2.2-3 SSFL AOC Soil Cleanup Values Comparison–April 2013 speaks very loudly against imposition of the AOC background standard for cleanup. Little more need be said on this point. The AOC is at the core of problems with the DEIS. Its defects have been noted above to some extent and in the OIG Report.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>Section 2.2.2.3 Soil Cleanup Technologies notes that technologies were eliminated if they were not in compliance with the 2010 AOC or were considered likely to be ineffective given the geologic setting or contaminant profile. Here, again, the AOC is responsible for the presumed requirement to implement environmentally damaging excavation when other, less damaging, technologies are available. Part of this problem is that the AOC mandated completion date of 2017 limits the use of some alternative technologies, which, though less damaging or costly, may require more time to implement.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.</p> <p>NASA is evaluating several treatment technologies that have the potential to reduce the truckloads by 36% (9,500 truckloads). The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC.</p>
Mark B.	Osokow	<p>Table 2.2-5: Estimated Total Soil Volumes and Truck Requirements under the Proposed Action Excavation and Offsite Disposal Cleanup Technology contains additional serious errors. The number of trucks required for soil removal is underestimated by more than half, as it does not include trips by trucks coming to the site, nor, as noted above, does it include the number of trips to and from the site in connection with hauling of demolished materials. Thus, the actual number of one-way trips to or from the site will be closer to 82,000! The number of trips per day, as well as the contribution to pollution, must be re-calculated based on this figure.</p>	<p>The number of one way trips was provided in the EIS was one way trip numbers. However, the potential impacts for the various resource areas included round trips in their evaluations.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>This section states that “risk-based alternatives were eliminated from further consideration because they would not meet the requirements of the 2010 AOC. In addition, a CEQ letter dated June 19, 2012 Appendix A), states that NASA is not compelled to consider comprehensive cleanup measures as alternatives that are less than the cleanup to local background levels described in the 2010 AOC.” Once again, NASA’s commitment to the AOC will result in unnecessary adverse environmental impacts and waste of funds. Per the OIG Report, the court found that the less restrictive standards [than background] were fully protective of public health. As noted in the SFVAS letter to Olga Dominguez, the skirting of NEPA required analyses and the lack of consideration of reasonable alternatives by engaging in, what is essentially, nullification of the law by prior agreement is contrary to the entire intent of NEPA and may, in fact, be a violation of law. There are certainly grounds for civil action.</p>	<p>Following lengthy discussions with the Department of Justice and other involved Federal agencies, NASA senior leadership signed the AOC on December 6, 2010. NASA has been advised that the specific language of paragraph 1.5 of the document compels NASA to comply with the terms of the AOC regardless of the legal status of California State Law SB990. That paragraph has been interpreted to require NASA to comply with the special stricter standards of the AOC in order to achieve compliance with California Hazardous Waste laws. NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	Phytoremediation was eliminated as a soil treatment technology without proper study. In this case, NASA chose to wait for DOE to complete its feasibility study, in spite of the fact that phytoremediation techniques exist now and have been used for years for eliminating some contaminants from soils, especially TCE, the most widespread contaminant at SSFL. All of the technologies listed in Table 2.2-7 were eliminated because they might not meet the standards of the AOC. Yet, some or all of them might meet standards of suburban residential or others.	NASA must continue to abide by its obligations under the AOC as drafted. Additionally, since DOE is conducting studies with phytoremediation, should they prove effective NASA would be able to utilize this information.
Mark B.	Osokow	Land use: This summary is speculative and should be modified to reflect changes that may be necessitated by interest in the property expressed by the Santa Ynez Band of the Chumash.	NASA will comply with the AOC (as currently written) and cleanup to background which will accommodate any future use. Future Use is the responsibility of GSA and outside the scope of this EIS. DTSC will prepare a CEQA document and GSA will develop a NEPA document that will address the futures uses of the site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	Reclaimed Water: System Infrastructure: Dismantling of system infrastructure will create an adverse impact. The reclaimed water system could be re-activated and used to provide water to the various ponds at SSFL that support wildlife. If dismantling occurs, a new system would have to be constructed at significant cost and will create further disruption to the environment. The summary is incorrect and short-sighted.	Since NASA no longer has a use for the facility the man-made structures are not needed. Dismantling will return the site to a more natural condition that is closer to conditions prior to NASA's use.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>Particulate Matter Hot Spot: As noted above, calculations regarding the number of truck trips up and down Woolsey Canyon have been severely underestimated in the DEIS. More than 80,000 truck trips down Woolsey Canyon Road must constitute a particulate matter hotspot during the two years or so of the action. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.</p> <p>Mobile Source Air Toxics: See comment at "Particulate Hot Spot." In addition, toxic discharges will be concentrated in the area of Woolsey Canyon Rd. and Valley Circle Bl. between Woolsey Canyon. Rd. and Roscoe Bl. The former accommodates, at most, only a few thousand cars per day. Thus, the contribution from trucks approaches 10% or more trips locally and diesel fumes are not controlled as well as regular auto exhausts. The analyses also fail to include cumulative impacts arising from area construction projects occurring simultaneously, such as The Village at Westfield, the Dayton Canyon development, Woolsey View Estates, as well as the clean-up of the DOE and Boeing portions of the SSFL.</p>	<p>The truck trips presented in Table 2.2-5 of the DEIS represent the number of daily trucks needed to off-haul the volume of excavated soil. While it may seem that we are not accounting for the roundtrip nature of these trucks, our emissions estimates are based on the roundtrip distance for each truck (going to the disposal facility and returning to the site). Therefore, our truck trip estimates are not underestimated. As indicated in Comment 0255-14, the demolition truck trips are not included in Table 2.2-5 of the DEIS. This exclusion was intentional as the demolition activities were considered separately from the excavation activities; the truck trips specifically associated with the demolition activities are presented in Table 2.2-2 of the DEIS. Because the evaluation of truck trips currently presented in the DEIS is correct, a PM hot spot would not be appropriate for this project, as described in Table 2.5-1.</p> <p>Per the Interim Guidance Update on Mobile Source Air Toxic Analysis in NEPA, prepared by the U.S. Department of Transportation Federal Highway Administration (December 2012), there are 3 options for the type of Mobile Source Air Toxic analysis, depending on the category the project falls into:</p> <ol style="list-style-type: none"> 1. Project is categorically exempt per 23 CFR 771.117(c) or 40 CFR 93.126, or the project has no meaningful impact on traffic volumes or vehicle mixes. 2. Project has a low potential Mobile Source Air Toxic effect, which generally means the project has AADT less than 140,000 to 150,000. 3. Project has a higher potential Mobile Source Air Toxic effect, which generally means the project will create or significantly alter a major intermodal freight facility or add significant capacity to major roadways (i.e., more than 140,000 to 150,000 AADT) and be located near populated areas. <p>Based on the above criteria, it may be argued that the project falls into the</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	Geology: Removal of test stands would impact geology locally. The actual impact will depend on the depths of excavations and other factors.	We acknowledge your comment. NASA is working closely with DSC to minimize impacts.
Mark B.	Osokow	Seismicity: The assumptions are unduly optimistic. They fail to consider the impact on traffic from added contribution of truck trips. This could lead to interference with emergency operations, especially if trucks are involved in accidents. It is easy to imagine that this could easily result in serious injury or death of some earthquake victims, who might otherwise be spared.	NASA acknowledges your comment and believes the analysis is adequate.
Mark B.	Osokow	Socioeconomics: The constant passage of trucks carrying waste will cause a general deterioration of quality of life in the neighborhoods along the routes from traffic, noise, and the potential hazards from spills and truck accidents. These neighborhoods will become less desirable as places to live resulting in erosion of property values and efforts by current residents to relocate to less disturbed areas.	NASA appreciates the comment but believes the analysis is adequate.
Mark B.	Osokow	Effects around Designated Landfills and Disposal Facilities: Regardless of the accuracy of the findings here, the impacts would be greatly lessened if the AOC background standard was not imposed. It is suspected that the actual impacts have been greatly underestimated.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Mark B.	Osokow	In addition to the above, it is felt that potable water supply infrastructure should be retained to the extent that it will be needed to provide make-up water to the various ponds supporting wildlife on site. Electrical connections sufficient to power the pumps that might be needed to circulate water for this and other purposes should also remain.	The AOC requires that the site be returned to a condition as close as possible to that condition prior to NASA's use. The infrastructure will, therefore, need to be removed unless it supports remediation.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>The DEIS contains insufficient information to formulate coherent comments in the absence of an actual proposal affecting specific cultural areas or sites. Therefore comments are being withheld until such a time as more specific proposals are put forward. In general, however, cultural areas or sites, including historical areas (such as test stands and support facilities) should be free from adverse impact to the maximum extent possible. The AOC should be thrown out, as it will necessitate the maximum adverse impact.</p>	<p>Perhaps DTSC's EIR will provide more specific data to assist you in make further comments. NASA must continue to abide by its obligations under the AOC as drafted.</p>
Mark B.	Osokow	<p>The vegetation and land cover types described in this section appear to be adequate, except that Venturan coastal sage scrub could have been better delineated as Type I or Type II formations.</p>	<p>It is our understanding that the term 'Formation' is used to describe higher order classifications that relate to physiognomic , rather than floristic, characteristics. It is not clear how mapping different portions of the survey area at different levels would benefit the analysis.</p> <p>The 2010 habitat mapping was intended to update the existing SSFL habitat mapping after the 2008 Topanga Canyon Fire for NASA-administered properties. The methodology was also consistent with updated mapping completed by SAIC for the nearby Boeing-managed property.</p> <p>For this reason, NASA believes the original analysis to be adequate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>Figure 3.4-2 Purports to illustrate the wildlife corridor that traverses SSFL. This figure is extremely inaccurate and misleading, as it suspiciously truncates the corridor to the west just at the boundaries of NASA areas I and II. It is unlikely that this rendition of the corridor was actually produced by the U. S. Fish and Wildlife Service or any other responsible government wildlife agency. There is ample evidence for this.</p> <p>In actuality the entire area of SSFL, including the NASA portions, is used by wildlife as a corridor. One example will suffice. Mountain lion ranges in the area have been carefully documented by radio tracking. Some ranges include the entire area of SSFL and adjacent areas to the west in the Upper Las Virgenes Canyon Open Space (Mountains Conservancy property), and the cats have been observed passing through the area from the Santa Susana Mountains and Los Padres National Forest on the north via the Simi Hills to the Santa Monica Mountains to the south. A recent sighting of a young mountain lion in the vicinity of SPA provides additional confirmation, as it is unlikely that this animal was born at SSFL.</p> <p>Deer and other mammals, as well as birds and other wildlife, undoubtedly utilize the entire SSFL area as a corridor in a like manner. Wildlife does not alter its movements simply because a line is drawn on a map. There are no geological or other features on the site that would restrict animal movement across the NASA areas.</p> <p>At the same time, the existence of the corridor on the rest of the site does not relieve NASA of its responsibility for this sensitive habitat in its areas. It must be kept in mind that the entire area will be subject to adverse impacts from clean-up activities, and NASA should be willing to do its part to maintain the existing ecological functions of the area and to restore lost functions in cases where NASA is responsible for the loss. The failure of NASA to honestly address this issue in the DEIS is inexcusable and reflects a lack of willingness to deal honestly with the environmental impacts of the Proposed Action based, in large part, on its unwise commitment to the AOC. The statement that the "NASA administered portions of SSFL are</p>	<p>NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area and have noted impacts to biological resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	The list of Sensitive Species found on NASA administered property is deficient in a number of respects. The list should include the coast patch nosed snake, Golden Eagle (fully protected; nesting and wintering), and Oregon Vesper Sparrow (wintering). While these species may not have been observed during the very brief biological surveys conducted, they have been observed elsewhere at SSFL and are expected to occur on the NASA areas. Observations have been made by SFVAS or Southwestern Herpetologists Society volunteers as part of regular surveys or set-up activities. Furthermore, there are numerous other special status species recognized by DFW as watch list species and by USFWS as bird species of conservation concern that have been observed by SFVAS volunteers on neighboring areas. These have all been ignored in the DEIS. Hence, the importance of these areas to wildlife has been severely underestimated and understated as has the estimated adverse impact to them as a result.	NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.
Mark B.	Osokow	A statement on p.204 defines the nesting season considered as Feb 1 to Aug 15; however, in Southern California, owls, Anna's Hummingbirds, Mourning Doves, House Finches, and some other species may nest well outside this period. Caution must be observed so as not to disturb nesting birds at any time of year. However, in this case, what is being proposed is not mere disturbance but outright destruction of both nesting and foraging habitat. The destruction of nesting habitat itself at any time of year will have severe adverse impacts on birds at the time nesting is attempted. Disturbances to foraging areas within or outside of the nesting season as, for example, will occur with the removal of all vegetation and soils in large areas, will likewise have severe adverse impacts. The upshot is that there will be nothing for birds to nest in or eat, when all vegetation and soil containing seeds and insects and burrowing animals are removed. Yes, birds can fly away to avoid immediate harm, but they will be harmed just the same.	Please refer to Section 4.4.2. for BMPs associated with biological resources which includes surveys for migratory birds nests.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>Similar impacts will occur to those mammals and reptiles that survive the destruction by not being killed outright. Virtually all burrowing animals will be eliminated in the cleared areas. Backhoes will dump the living animals (including legless lizards, slender salamanders, voles, harvest mice; ground-nesting bees and numerous others) and those crushed by heavy equipment while still in their burrows, along with the soil, into dump trucks. Raptors, predatory mammals (including ring -tailed cats) and snakes will be deprived of their food source and are likely to perish. While some of these impacts may be unavoidable, they can be sharply reduced by NASA abandoning the ruinous, costly, excessively stringent background standard for clean-up unwisely agreed to in the AOC.</p>	<p>NASA recognizes that impacts to some resources will be significant. Please refer to Section 4.4 for numerous references to impacts of the cleanup on biological resources including both negative and beneficial impacts. Additionally Section 4.4.2 includes mitigation and BMPs intended to help reduce significant impacts.</p>
Mark B.	Osokow	<p>As noted, NASA should participate in a program to maintain wetlands for the long-term. Perhaps, a fund could be set up in cooperation with DOE and Boeing for the purpose, since all of the responsible parties should bear some responsibility for this important maintenance of wildlife habitat.</p>	<p>Please refer to section 4.4.2 for BMPs and mitigations intended to help reduce impacts to the Santa Susana Tarplant and other biological resources.</p>
Mark B.	Osokow	<p>In this section the Loggerhead Shrike is described as a transient. It is unclear what is intended by this term. However, numerous observations of Loggerhead Shrikes have been made by volunteers of SFVAS over the past three years. This species is more accurately described as a post-breeding and winter visitor, present continuously from approximately late-July through mid-March. Although the population may be small, that is the nature of this predatory species, which requires a fairly large territory. The area is more important to this species than the DEIS indicates.</p>	<p>The word "transient" will be removed from the EIS (Section 4.4.1.1)</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>The DEIS states “Most wildlife would vacate the operation areas and return once vegetation had been reestablished.” There is simply no basis for the assertion that wildlife will “return” to an area where existing vegetation has been replaced by an array of aggressive, invasive species. Continuous disturbance over a period of years will disrupt historical migration patterns. In addition, there may be no source population supporting such a return, after the populations have been reduced by the Proposed Action combined with the clean-up actions of DOE and Boeing. Likewise, there is no basis for the assertion that “mortality would be individualized.”</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.</p>
Mark B.	Osokow	<p>Furthermore, there is no basis for the assertion that “[t]he beneficial impacts of the incremental excavation of treatable soils, because of the reduction in soil contamination, would be moderate, beneficial, local, and long term (Biology Impact-3e).” NASA has not demonstrated that soil contamination has caused any harm to wildlife at SSFL; therefore, there can be no basis for any inference that its removal will be beneficial. The DEIS contains no information bearing on wildlife population sizes, sampling of wildlife for contaminants in blood or other tissues, etc. While models exist and may have been presented in RFI Reports, they have not been validated with real data from on site. Moreover, the DEIS admits that, when exaction and removal are employed, “Once the soil was removed, the existing micro-ecosystem might never be restored.” P.4-35.</p>	<p>While there are many studies on this subject a quick reference by EPA notes that contaminants in soil can adversely impact the health of "animals when they ingest, inhale, or touch contaminated soil, or when the eat plants or animals that have themselves been affected by soil contamination. Animals ingest and come into contact with contaminants when they burrow in contaminated soil." http://www.epa.gov/superfund/students/wastsite/soilspil.htm</p>

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>The above is emphasized by another section of the DEIS, Section 3.1.2, where it is stated that "(at a minimum) the top 2 ft of soil would be excavated, all existing biological resources within the contaminated areas, including 32 acres of sensitive habitats, would be eliminated. The Proposed Action would result in a significant, negative, regional, and long-term impact because of the amount of ground disturbance that would occur. Additionally, changes to soil profiles (the micro and macro fauna of the soil ecosystems) are expected to be significant. The extensive level of excavation necessary to meet the 2010 AOC would lead to soil instability, decreased vegetative biodiversity, and increased spread of invasive weeds." This is completely unacceptable and would be unnecessary if the AOC was thrown out.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>Concerning surveys of birds by NASA consultants, it is noted that "migratory breeding birds were not [present] during surveys." It is further stated that</p> <p>"The time spent at each site within the study area was limited; therefore, wildlife observations were opportunistic rather than systematic. . . Active survey techniques, such as the use of kicknets to identify benthic invertebrates or searches under logs, rocks, and debris for herpetiles were not used due to time constraints."</p> <p>This represents yet another serious deficiency in the attempt to characterize wildlife at SSFL. SFVAS has conducted systematic bird monitoring at SSFL since 2011. This includes monthly point counts and bi-weekly bird banding, as well as general surveys of the area by car, and occasional owl/poorwill surveys conducted at night. During this time, more than 115 species of birds have been observed. All of these, with the possible exception of a few water bird species found at Silvernale Pond, are expected to occur on NASA administered property, yet the consultant surveys have yielded only 61 species. Doubtless, the SFVAS species count would be higher if permitted access to the NASA sites; however, except for informal observations made during NASA-sponsored site visits and a few owl/poorwill surveys, this permission has not been granted. Nevertheless, NASA's estimates of environmental impact are not in accordance with actual importance of the area to wildlife.</p> <p>Bird species overlooked, in addition to those mentioned above, include White-tailed Kite, Merlin, Sharp-shinned Hawk, Golden Eagle, Red-shouldered Hawk, Townsend's, Black-throated Gray, Yellow, and Hermit Warblers, Great Horned, Barn, and Western Screech Owls – just to name some. Notoriously absent is the Lesser Goldfinch one of the commonest species in the area.</p> <p>The deficiency, however, is not limited to birds. A common reptile species, the side-blotched lizard is also overlooked, as is the amphibian, slender salamander</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark B.	Osokow	<p>In discussing wetlands, the DEIS fails to address the need to provide at least some water to drainages feeding Silvernale Reservoir, Coca Pond, and R2 ponds. Although these ponds may be man-made or highly modified natural depressions that held water on a primarily seasonal basis, over the years they have become important sources of water and habitat for wildlife. It does not seem too much to expect that the responsible parties be required to cooperatively draw up a plan to assure at least some continued water supply to these ponds and associated drainages sufficient to support their now historical functions on behalf of wildlife. After importing water and modifying the environment for more than 60 years, within the context of ever-expanding urban expansion that has turned much of SSFL into a habitat island, it would be the height of irresponsibility for NASA to simply to walk away from what they have created -- whether or not there is any specific regulatory authority that would require such action. It is likely that the modifications of drainages that have occurred will, in the absence of imported water, cause more rapid drainage of surface water from the site than was true historically. Thus, wildlife will be deprived of water that might otherwise have been available in the absence of these modifications -- only, now these habitat islands are far more critical to the health of wildlife populations than was true historically. This is especially important with respect to the areas function as a wildlife corridor or linkage.</p>	<p>NASA has no plans to eliminate Coca pond and R2 ponds; the fate of Silvernale is not in NASA's control. The final cleanup methods for the NASA ponds have not been determined yet, but likely will require significant disturbance of sediments.</p>
Mark B.	Osokow	<p>For the reasons described above, NASA should either discard the AOC and begin afresh with a new DEIS that seriously considers alternative clean-up standards and actions or should adopt the "no action" alternative.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Osokow	Attached is a revised page 12 of comments submitted yesterday on behalf of the San Fernando Valley Audubon Society. The revision only adds signatories to the original letter. No other changes were made. Please replace the original page 12 with the revised page 12 to include the additional signatories inadvertently not included in the original.	NASA acknowledges your comment
Mark	Osokow	Providing only two alternatives, clean up to background or no cleanup is not appropriate, other alternatives need to be presented such as a clean up to suburban residential or recreation standard.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Mark	Osokow	The DEIS is flawed since the level of cleanup is not balanced against costs, cultural impacts, and environmental impacts, required by NEPA and CEQA.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Mark	Osokow	Protection needs to be established before the cleanup for archaeological sites, such as the Burro Flats site VEN-1072 and any other archaeological sites on the property.	In consultation with SHPO, ACHP and the tribes, NASA is developing appropriate protection measures for the Burro Flats site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Osokow	Protection needs to be established before the cleanup for structures such as Alpha, Bravo, and Coca rocket test stands and their related structures, eligible for protection as historic structures and districts.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Mark	Osokow	Moving contaminated soil, and only replacing 1/3 of the removed soil is bad for the community that will receive the water runoff and bear the burdens of 80,000 trips carrying contaminated and new soil over two years, just from the 450 acre NASA site.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Osokow	Alternative clean up methods to clean up soil on site, even if recovery in 10 years occurs, needs to be considered due to reduced environmental impacts in neighboring community.	NASA considered a range soil cleanup technology and the viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.
Mark	Osokow	The 2017 deadline is an artificial one not based on science, but creates an "emergency" type pressure that seems to be causing creation of environmental decision documents prior to completion of studies or input from the California Department of Toxic Substances (DTS) that needs to interpret vague language that controls many sensitive decisions about historic properties. Adequate studies and interpretations must be provided to have a valid decision making document.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Osokow	<p>Pressure to complete the cleanup to meet the 2010 Administrative Orders on Consent (AOC) deadline by 2017 may cause illegal destruction of historic and archaeological resources on the property. Removal of key cultural resources likely will significantly decrease interest in the property from state and federal park agencies, generally identified as the likely optimum long term holder of the property.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Mark	Osokow	<p>The long term use of the property needs to be considered in the cleanup approach, and the 2017 AOC deadline may need to be extended to prepare adequate foundation for the cleanup.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures. The 2017 schedule is very aggressive and if it were changed to a date further out it would remove some of the pressures driving the cleanup actions. Maybe it could help mitigate the impacts from large numbers of trucks by spreading out the frequency or allowing time to build a conveyor system. Maybe it could give time to see if a future land owner wants to preserve and maintain some of the historic structures. However, it would not aide in the reduction of impacts to biological resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Page	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Page	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Brian	Page	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Page	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Violet	Paley-Conway	I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Violet	Paley-Conway	<p>NASA activities led to widespread contamination of soil and groundwater with very toxic materials such as perchlorate, dioxins, and TCE. Some of the contaminants have been migrating offsite. As a local resident, I am very concerned about the potential health impacts of these materials and want the site cleaned up properly.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Yvonne	Pangramuyen	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Rosiris	Paniagua	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sungmun	Park	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Deborah	Parpovich	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

First Name	Last Name	Comment	NASA Response
Deborah	Parpovich	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Deborah	Parpovich	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Deena	Parry	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Deena	Parry	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Deena	Parry	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

First Name	Last Name	Comment	NASA Response
Deena	Parry	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Caesar	Pascual	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dianne	Patrizzi	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Peter	Perigo	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	Table ES-1 identifies various impact evaluation criteria. Short term impacts are defined as limited to the immediate demolition and remediation period. The Department is concerned with this definition being applied to the groundwater remediation period, as the remediation activities themselves could extend across a timeframe of years, decades, or centuries (Table 2.2-8). The Department considers impacts extending beyond five years to be long term.	As you have noted, the definition of short term is impacts that would occur only during the proposed demolition and immediate remediation period. For groundwater "remediation period" would be that of the construction of remedies. Operations, which could last for many years is outside of this period.
Edmund	Pert (California Department of Fish and Wildlife)	Evaluation criteria are defined as local where impacts are confined to within the boundaries of the NASA properties, and regional when they extend beyond those boundaries. The Department notes that impacts from ground water remediation treatments are frequently described in the DEIS as local and our review suggests impacts should be defined as regional because downslope and off site areas could be affected by altered hydrology.	It is unlikely that the cleanup at SSFL is going to affect regional hydrology, pump and treat may affect the local hydrology. It is possible that a large reduction in seasonal flows through the Bell Canyon drainage could result in localized impacts on some ecological receptors. However, only limited pumping is proposed in the drainage, and data suggests that the pumping required will not have a significant widespread impact.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The groundwater cleanup component of the Proposed Action will involve testing various technologies before they are employed across the groundwater treatment area. There is little description or quantitative information regarding the direct and indirect impacts to biological resources from implementing these technologies. The Department estimates that approximately 1/3 of the NASA lands could be physically impacted by groundwater treatment technologies (Fig 2.2-4). Associated alterations in hydrology, including potential dewatering, could directly and indirectly affect additional habitat areas. Adverse impacts are likely to occur to on site and downstream/downslope habitats reliant upon surface, subsurface and groundwater from the project area.</p>	<p>The effects of dewatering on groundwater and surface water are discussed in Section 4.6.1.1</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS states that additional habitat areas would be subject to topsoil removal for groundwater remediation in areas outside the soil cleanup footprint (DEIS 4-41). The Department was unable to find specific information regarding the extent and location of these additional soil removal areas, and impacts do not appear to be addressed.</p>	<p>NASA is still investigating groundwater so the locations cannot yet be identified. Clearing and grubbing of areas to allow drilling equipment would be required. These areas would be approximately the width of a road. Most of the groundwater contamination is in industrial areas where habitat does not exist.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	Wells would be installed under various technologies and could extend 50 - 900 feet below the ground surface. The Pump and Treat technology is described as requiring the installation of "additional wells". The Department requests more information be provided regarding the number of new wells that are anticipated, well locations, and the impacts to biological resources from installation, operation and, maintenance. The DEIS also describes that 13,000 feet of aboveground pipeline would be added under Pump and Treat. The amount of pipeline necessary to implement other treatment technologies is not described.	No new wells for the interim pump and treat system are planned at this time. The additional pipeline is part of an already DTSC-approved groundwater interim measures plan that will be constructed in 2014. EIS text will be added in Section 2.2.3 and 4.3.1.3 to describe the technologies and clearing and grubbing required.
Edmund	Pert (California Department of Fish and Wildlife)	Three additional technologies would involve installation of a network of wells described as being spaced 10 - 20 feet apart with interconnecting pipes (DEIS Sec. 2.2.3.2). There is little information regarding how much physical habitat would be disturbed to install and maintain these wells and pipelines, or how they would be installed on steep rock outcrops and habitat areas. The Department anticipates additional adverse effects to occur from removal of wells and pipelines; impacts from removal are not identified.	These potential groundwater treatment technologies are discussed in general terms and the impacts are based on assumed sizes and locations. The details you are asking about will not be determined until the remedial action plans and designs are developed.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS describes clearing vegetation to create pathways for well and borehole installation and pipeline configuration (DEIS pg. 2-31) under the In Situ Chemical Oxidation description, but it would appear that all the technologies that use wells, bore holes and pipes have potential to result in extensive clearing of vegetation in habitat areas, which could lead to mortality or displacement of wildlife in the Department's opinion. The DEIS analysis concludes that impacts to wildlife are minor and short term in areas subject to ground water remediation; in part because the "wells would be located far apart". At a spacing of 10 - 20 feet apart, the entire treated area would likely be adversely affected by habitat removal, ground disturbance and equipment. It is possible that the In Situ Chemical Oxidation technique may result in fewer impacts to biological resources and may better protect local soil moisture and hydrology, but the DEIS does not provide detailed analysis to evaluate whether or not certain technologies may pose fewer risks to on-site and off-site biological resources and habitat function.</p>	<p>Clearing and grubbing to install wells in a "habitat" will be narrow paths and the pipelines will require narrow paths. It will not be necessary to "blade" the whole area and it should revegetate pretty quickly because native plants will remain around the remediation system.</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>Effects on biological resources from the potential use of chemical oxidation, heat, and vacuum extraction are largely not described. The Department recommends that technologies be evaluated for their impacts to physical habitat features, biological resources and watershed function, and those with fewer adverse impacts on the environment should be employed. The Department would appreciate the opportunity to review and provide input to this evaluation.</p>	<p>Section 4 evaluates the impacts in as much detail as can be performed at this time. The details you are asking about will not be determined until the remedial action plans and designs are developed. NASA notes a desire to review future implementation plans as they relate to biological resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The Department is concerned that surface water is being collected for treatment from specific local subwatersheds, but is released at outfalls located in a different subwatershed. Residents of Bell Canyon have raised this concern with the Department. We recommend that the GWIM be modified such that current and future pumping activities include new outfall locations which better maintain surface and subsurface hydrology for on-site and downslope biological resources. The DEIS does not seem to address impacts to biological resources from constructing additional outfalls and associated pipe systems necessary to reach those outfalls. Biological resource assessments for areas that could be impacted outside the NASA property do not appear to have been conducted.</p>	<p>The Bell Canyon resident concerns regarding GWIM modifications and operations are part of Boeing's NPDES permit activities, and as such, are being worked in conjunction with Boeing, RWQCB, and DTSC. It is unlikely that the cleanup at SSFL is going to affect regional hydrology; pump and treat may affect the local hydrology. It is possible that a large reduction in seasonal flows through the Bell Canyon drainage could result in localized impacts on some ecological receptors. However, only limited pumping is proposed in the drainage, and data suggest that the pumping required will not have a significant widespread impact.</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>The Department is concerned that seeps and springs may support unique biological resources and that adverse effects to these biological resources have not been addressed, while some seeps and springs have already been dewatered (DEIS 4-79). Impacts to water associated with seeps and springs are described as negligible and local, but should be described as moderate and regional.</p>	<p>Impacts to seeps and springs are analyzed in the EIS, under both Biological Resources (see Impact Biology-2d) and Water Resources (see Impacts Water-2a through Water-3c). It should be noted that many of these impacts are already considered moderate, depending on the remediation technology being proposed, and all impacts are only considered negligible with the implementation of MMs (specifically Biology MM-4, Water MM-1 through Water MM-3, and Air Quality MM-3). NASA disagrees, however, that the impacts would be regional. The definition of "local" (i.e., occurring within the NASA-administered property at SSFL) is generally accurate for surface water and groundwater hydrology (including seeps and springs). The intent is not to create a hard line at the property boundary, but rather to acknowledge the impacts that are occurring onsite versus what might affect the larger community. NASA affirms its determination that hydrologic impacts are local due to their site-specific nature.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>There is potential for springs and seeps to be recharged following soil excavation and disposal, via local infiltration associated with the creation of a series of shallow ponds that would replace ephemeral and intermittent stream reaches in specific locations (DEIS 4-77). The groundwater treatment component overlaps with these locations in several areas, which suggests that infiltration may be hampered by long term dewatering activities. Additional planning and study, with input from the Department, would appear necessary to precisely determine how to recharge specific springs and seeps, including those downslope and off site.</p>	<p>NASA will inform DTSC that your Department wishes to be a part of the discussions around the final remedy decisions regarding groundwater cleanup. These plans are currently scheduled for the 2015-16 timeframe.</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>Figure 2.2-2 shows the estimated boundaries of areas that would be subject to soil remediation, habitat removal, and subsequent excavation. This figure also depicts access and staging areas. There are numerous areas depicted on this figure where isolated areas are shown and are not located by existing dirt or paved roadways. The DEIS states that NASA would develop temporary access roadways (pg. 2-13) in those situations. The Department is concerned that direct and indirect impacts to habitat and wildlife from "temporary" roadways are not included in the impact analysis. Single or repeated passes of heavy equipment traversing such areas is likely to cause long term impacts along access routes, additional habitat removal, introduce weeds, alter runoff patterns, compact soils, and cause direct mortality to wildlife.</p>	<p>New access roads, staging areas, and stockpile areas would follow natural contours and be graded such that cut-and-fill would be minimized. Also, these areas would be sloped and, if necessary, compacted to prevent the possibility of slope failure. Where new roads and other facilities were necessary, they would be located as to avoid areas identified by the State of California (1998) and those areas identified by geologists in field inspections as having the potential for rock falls. Where such avoidance was impossible, appropriate engineering design and construction measures would be incorporated into the project designs to minimize potential damage to project facilities. Access roads periodically would be inspected, particularly after heavy rains or earthquakes. Access roads and staging in steep portions of the site would be avoided, if possible, after heavy rain events, when increased loads could lead to slope failure.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS describes that additional on-site borrow sites would be excavated to provide some fill material for remediation areas (DEIS 2-19; 4-77). The Department could not locate any further information regarding proposals for on-site borrow pits. Impacts to biological resources associated with this component of the project should be specifically addressed in the DEIS . .</p> <p>Soils BMP-1 (associated with landslides) seems to be the only measure describing that following soil excavation, backfilled areas would be "sloped and if necessary compacted". We assume this likely applies to all areas that might receive backfill. The DEIS should identify the characteristics of the finished slopes, how they would be configured, and the degree of compaction proposed. Compaction rates need to be designed to ensure that native vegetation including shrubs and trees can successfully root into the new material.</p>	<p>Once the soil investigations are complete, there may be unimpacted soil at SSFL that could be used for backfill. Until the soil investigation is complete, potential locations for backfill and their impacts can not be assessed.</p> <p>The specifics for slopes and compaction designs will be developed within the remedial action planning phase of the cleanup. Standard processes are anticipated for the EIS evaluation.</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS should further describe if acreage impacts include those required to create finished slopes at locations where excavations and backfill abut natural topography. If, as described, backfill volume is about one-third of the volume that would be removed, it is not clear how finished slopes would meet up with natural topography in areas with shortfalls of backfill (Table 2.4-1). It seems likely that adjacent acreage would be affected to achieve finished slope requirements beyond the boundary of excavation areas, and those impacts have not been identified.</p>	<p>The specifics for slopes and grading designs will be developed within the remedial action planning phase of the cleanup.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>On-site plant communities were mapped in fall 2010 using a Holland 1986-based plant community classification (Appendix D). This mapping does not meet current standards for incorporating floristic based classifications that better describe local, regional and state-wide botanical diversity. The second edition of the Manual of California Vegetation should be utilized for the purposes of describing on-site vegetation at the alliance level (Sawyer et al. 2008). Additionally, the project area lies within the Santa Monica Mountains National Recreation Area, and vegetation in this general area has been addressed at a more specific local and regional level (Keeler-Wolf and Evens, 2006). It should be noted that this evaluation did not include field sampling of vegetation stands supporting Santa Susana tarplant.</p>	<p>The habitat mapping was undertaken between September 28 and October 8, 2010 to update SSFL mapping for the NASA-administered portion of SSFL after the 20005 Topanga Canyon Fire. Base maps for field use in updating the habitat mapping were made using aerial photographs and the existing SSFL facility-wide habitat mapping by Technology Associates International Corporation (TAIC) [GIS metadata dated November 2002].</p> <p>The Fall Biological Survey Report for SSFL Area IV and Northern Undeveloped Area (SAIC 2009) was reviewed before initiating the Fall 2010 surveys on the NASA-administered property. That report (page 2, second full paragraph) states that ‘Vegetation categories are consistent with Preliminary Descriptions of Terrestrial Natural Communities of California (Holland 1986), except where no suitable category exists’. No other vegetation classification system was referenced in the SAIC 2009 report. Because the Fall 2010 habitat mapping effort was intended primarily as an update in response to changed conditions since the 2005 Topanga Canyon Fire, it was decided to use the same vegetation classification system that was already in use throughout SSFL facility. It did not seem reasonable to change the vegetation classification system for just a portion of SSFL facility. However, recognizing that the Holland 1986 system was out-of-date by the time of the mapping, the Fall 2010 report presented cross-walk information to relate the mapping units (already in place) to the California Natural Diversity Data Base CNDDB Natural Communities List (1990). Mapping to the alliance level, as documented in the more recent Sawyer et al. 2008, was not done at that time because of the system’s reliance on dominant plant criteria, which would require field sampling of vegetation stands (whose absence was also noted in the CDFW comment). This approach would have been complicated by the fact that mapping was occurring in late September/early October, when only perennial and late-season plants would have been blooming or recognizable. As discussed in the 2010 Fall Habitat Report, the mapping was done from visual field observations and mapping onto detailed aerial photographs. In fact, it was not physically possible to access many locations due to extremely steep and dangerous terrain and/or dense vegetation. Because mapping to alliance level was not how the habitat mapping was originally conducted (by CH2M</p>

Edmund	Pert (California Department of Fish and Wildlife)	<p>The unique local and regional character and sensitivity of key on-site habitats and species were missed in the general nature of the vegetation analysis. Since sandstone rock outcrops are inherently valuable to plant and wildlife species and represent a specialized niche, vegetation types associated with sandstone outcrops are locally and regionally unique and therefore are considered sensitive by the South Coast Region of the Department. For example, two sensitive vegetation communities were identified on adjacent Boeing properties and are described below:</p> <p>Steep Dipslope Grassland-this unique vegetation type was identified by SAIC (2009) during assessments of adjoining land in Area IV and the northern buffer. Stands are dominated by outcrops and varying depths of thin soil overlaying rock, creating conditions for dominance by bushy spike moss (Selaginella bigeovii) and a suite of associated species including native wildflowers and local, endemic geophytes (Calochortus sp); typically this habitat is on north facing slopes. This same habitat would be classified floristically as Selaginella bigeovii herbaceous alliance, and is state-ranked S3, which the Department considers to be locally and regionally rare (Sawyer et al. 2008). The DEIS should identify that this sensitive habitat type could be present on site and would be adversely affected by soil and groundwater remediation and impacts are potentially significant and long term. Areas supporting this unique habitat type should be identified on maps and marked in the field and stands of bushy</p>	<p>NASA recognizes there are many definitions for sensitive areas. As a federal entity NASA recognizes federally and state high-priority conservation natural habitats as sensitive areas within the EIS. Any other areas are inferred in the general discussion of vegetation communities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>Additional on-site habitat types reported in the DEIS are considered sensitive by the Department because of their high value for wildlife, proximity to stream channels, and continued declines in the local and regional area. Southern coast live oak riparian forest is considered regionally sensitive by the Department, and typically, these areas lie within the Department's streambed jurisdiction as they represent riparian resources. Coast live oak woodland is also reported from the area, and is also declining in the regional area. Vegetation affiliated with springs and seeps does not appear to be described in the DEIS. On-site and off-site woodlands, forests, riparian areas, springs and seeps are considered sensitive by the Department. The DEIS does not identify these habitats as sensitive and there are no proposals to ensure these specific habitats are replaced or restored. Impacts to oak woodlands and forests are potentially significant, regional and long term, especially given the time frame necessary for replacement oaks to mature sufficiently to provide shade, forage, acorns, cavities and crevice habitats.</p>	<p>NASA recognizes there are many definitions for sensitive areas. As a federal entity NASA recognizes federally and state high-priority conservation natural habitats as sensitive areas within the EIS. Any other areas are inferred in the general discussion of vegetation communities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS analysis of impacts to vegetation communities and sensitive plant associations relative to groundwater remediation activity seems to be limited in scope and analysis. The DEIS should describe the physical impact area necessary to access and install a system of wells and pipes and to maintain it over a protracted timeframe. Impacts are briefly identified as:</p> <p>1) dewatering to remove subsurface moisture affecting vegetation; 2) vegetation could be physically disturbed; and 3) weeds could increase or spread. Adverse effects to habitats downslope from changes in soil moisture due to remediation activities are not addressed.</p>	<p>NASA recognizes there is community concern regarding several items noted in the DEIS. NASA will implement the requirements of the 2010 AOC. By following the NEPA process, NASA complies with its statutory requirements (42 U.S.C. 4321 et seq.) and Section 4.0 of the 2010 AOC. The cleanup will meet the established requirements for the protection of human health and the environment. NASA must continue to abide by its obligations under the 2010 AOC as drafted.</p> <p>Section 4.6.1.3 describes effects of pumping and dewatering.</p> <p>In section 4.4, Biology MM-1 says NASA would implement a weed management plan to eradicate noxious an invasive species as they appear onsite using federally approved methodologies.</p> <p>In section 4.2, Water BMP-1 says, Site activities would take place in accordance with the statewide General Permit for Stormwater Discharges Associated with Construction Activity (Order No. 2009-0009-DWQ [NPDES No. CAS000002]). As required by this permit, NASA would prepare an SWPPP and an ECP that specified site management activities to protect stormwater runoff and to minimize erosion during construction, operation, and maintenance of the project. NASA also would continue monitoring offsite drainages for increased sediment load and contamination. The SWPPP would include the protocol for proper storage and use of hazardous materials, as well as spill response procedures.</p> <p>These management activities would include construction stormwater BMPs (silt fences, sand bags, straw waddles, and tire washes), dewatering runoff controls, containment for chemical storage areas, and construction equipment decontamination. The combined effect of demolition and remediation activities on the potential to increase surface water and groundwater pollution would be minor, given the regulatory controls in place to protect water quality and the assumption that NASA would adhere to these requirements.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS indirectly describe how the function of stream channels would be altered by proposed soil and groundwater remediation activities. The DEIS concludes that impacts to topography from soil removal are negligible and short term, despite proposals to only backfill about 1/3 of the volume removed. Alteration of natural topography affects habitat development and function. Where stream courses are altered by excavation, how would stream flow and sedimentation processes be affected? If stream courses are replaced by instream "shallow ponds", will these reaches continue to transmit natural sediment loads to downstream areas? Where substantial soil volumes are removed and not replaced, how will this affect ground water recharge within local watersheds and downslope areas?</p>	<p>On an acreage basis approximately 25% of the NASA area will be impacted. The EIS states that the likely outcome of this significant excavation would be to create new ponded areas. Although surface flows would be decreased, the additional infiltration would increase discharges from existing seeps, thus increasing surface flows downstream of the seeps. A portion of the increased infiltration, however, would be lost to deep percolation, resulting in an overall net decrease in surface flows. The small overall net decrease in surface flows would be considered a minor, negative, local, and long-term impact (Water Impact 2a). Further, the EIS analyzes impacts to surface water hydrology from demolition soil remediation activities, and from groundwater remediation activities (see EIS Section 4.7). Impacts are determined to range from negligible to moderate, but all impacts would be reduced to negligible with the implementation of MMs Water MM-1 through Water MM-3.</p> <p>NASA understands that CDFW requests additional, detailed information in order to fully understand potential impacts to resources under its jurisdiction; however, NASA believes the level of detail in the EIS is acceptable under NEPA. NASA recognizes the parallel DTSC processes under CEQA, and the additional level of detailed review that will be conducted in project-specific EIRs that evaluate localized remedial activities. This EIS describes the context and intensity of impacts under NEPA, including the expected nature and extent of hydrologic changes locally and regionally. As individual remedial technologies are further developed and deployed, additional site-specific information (e.g., grading and drainage plans) will be developed and used to evaluate hydrologic impacts at a greater level of detail in project-specific EIRs.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS concludes that impacts to native vegetation from soil excavation are significant and long term, after mitigation. Impacts to "high priority conservation areas" (ie. southern willow scrub and Venturan coasts sage scrub) are also considered significant and long term, but with mitigation, the DEIS concludes impacts are moderate. Biology Mitigation Measure-1 addresses this impact and indicates soil might be removed using pick axes, shovels, or vacuum trucks in sensitive habitats. Such methods would still result in disturbance to sensitive habitat areas and are unlikely to meaningfully reduce impacts. It may be feasible and beneficial to reduce impacts to adjoining woody vegetation such as trees and shrubs, located at the edges of excavation areas, by using such methods and immediately protecting exposed roots to prevent desiccation.</p>	<p>EIS will be revised to explain the differences in species protection offered by the MM (Biological MM-1) (Section 4.4.2).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS does not address local, regional, and state wide rare plants which the Department tracks through the CNDDDB. Special status vascular plants on Rare Plant Lists 1 and 2 generally are considered to meet the definition of threatened or endangered species and should be addressed in the DEIS. The DEIS does not address the potential for impacts to rare nonvascular plants which are also tracked in CNDDDB.</p> <p>The DEIS should address locally rare plant and animal species that have been identified in Ventura County and are currently listed as Locally Important Species. These lists have been developed in consultation with local experts and represent local and regionally rare species that are not represented on state-wide or national lists. Species on these lists are considered to generally meet the definition of threatened, endangered, or rare, as defined in the California Environmental Quality Act (CEQA) Section 15380. The lists are updated annually through a documented process of consulting with local experts. The current lists can be found at this link: http://www.ventura.org/rma/planning/conservation/locally-important-species.html</p>	<p>As a federal entity NASA recognizes species listed by the USFWS as threatened or endangered, though we further recognize state listed species for the purpose of this EIS. While we recognize there are many other definitions of threatened or endangered species there are no regulatory requirements to address these species specifically. NASA recognizes impacts to any wildlife or vegetation present in excavation areas would be significant.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The general project area at the SSFL supports habitat essential for the continued persistence of Santa Susana tarplant, a state-listed rare plant species, and its native insect pollinators. The project site is in the center of this species' limited geographic range where the majority of the tarplant populations occur on the local Chatsworth Formation (sandstone). The DEIS indicates the species was observed in numerous locations on NASA properties and is distributed throughout Ventura and Los Angeles counties (DEIS 3-23). The DEIS should be modified to indicate this species is a highly restricted endemic and occurs only in localized areas in the Santa Monica Mountains and Simi Hills (CNDDDB, 2013; Baldwin et al. 2012). The Chatsworth Formation in and around the SSFL area is the core habitat for this species.</p>	<p>NASA recognizes the rarity of the Santa Susana Tarplant and its presence within the ROI. Further NASA has developed Biological MM-2 specifically to mitigate and reduce potential impact to the Santa Susana Tarplant.</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS provides no quantitative evaluation of the numbers of individuals or acreage extent of occupied habitat for Santa Susana tarplant that would be directly or indirectly affected by remediation activities. Individual tarplants were mapped in the field with a global positioning satellite unit, but the DEIS does not overlay impact areas with this information (Figure 3.4.3). The amount of habitat occupied by Santa Susana tarplant that would be unaffected by direct and indirect impacts from the Proposed Action should be identified in the DEIS. The Department is therefore unable to fully evaluate the environmental consequences of the proposed action.</p>	<p>The vast majority of Santa Susana tarplants at the NASA site reside in bedrock outcrops. There are no planned cleanup activities for these areas. Therefore impacts after mitigation would be minor. Additionally, as a precaution, NASA will implement a mitigation (Biological MM-2) to further protect these species.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>Groundwater remediation technologies will also capture and remove subsurface water potentially leading to desiccation of surrounding habitat areas across a long time frame. The DEIS states that impacts to vegetation from changes in ground water availability would be minor, as plants around the SSFL are adapted to drought and repeated fires. In the Department's opinion, impacts of long term dewatering are likely to adversely affect most species of plants occupying the treatment zones. Even in summer months or during droughts, specific species of plants have their own unique soil moisture requirements that must be met or they will die. Santa Susana tarplants also utilize subsurface moisture for their survival and therefore, groundwater remediation could potentially reduce soil moisture below a level where they can survive dry periods and droughts; tarplant vigor, biomass, and reproductive output could be adversely affected.</p>	<p>Groundwater investigations and studies comply with the 2007 Consent Order. Groundwater monitoring will be on-going during remediation to evaluate the effects of the remedial technologies selected for cleanup. Final remedy selection of cleanup technologies will take into account, among other things, the impacts of dewatering.</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>It should be noted that native insect pollinators are essential components of Santa Susana tarplant habitat, and service a broad array of on-site and nearby off-site native plant species. Many native insect pollinators are various types of ground nesting solitary bees and flies. These insects have their own requirements for nesting, and often, areas with specific soil texture and soil moisture are relied upon for successful production of larvae. Dewatering and soil excavation could adversely affect such species.</p>	<p>Groundwater investigations and studies comply with the 2007 Order. Groundwater monitoring will be on-going during remediation to evaluate the effects of the remedial technologies selected for cleanup. NASA acknowledges that there could be reduced impacts by using risk-based alternatives which require less soil excavation. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS concludes that, with implementation of Biology Mitigation Measure-1 , impacts to Santa Susana tarplant are minor, negative, local, and short term. The Department does not agree with this conclusion. Impacts to tarplant would be moderate to significant, negative, regional, and long term in our opinion. Impacts to tarplants are likely long term in areas where soil and groundwater remediation would: a) remove soils derived from Chatsworth Formation; b) where the proposed reseeded does not successfully restore native natural communities; and c) where topsoil is not replaced and no revegetation occurs. Impacts from groundwater remediation would also be long term at locations where the technology may operate for years to centuries (Table 2.2-8). We agree with the statement on page 4-43, indicating it can take years for native species (ie. plants) to re-establish in disturbed areas and for that reason, impacts to tarplant should be described as long term.</p>	<p>The impacts from the removal of native soils the lack of reseeded and replacement of topsoil to restore native habitats are addressed in Section 4.4.1.3 . The impacts to the tarplant will be changed to long-term.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The Department recommends additional mitigation measures and impact avoidance be incorporated into the final DEIS to more specifically address adverse impacts to Santa Susana tarplant.</p> <p>A dedicated biological monitor should be present during grubbing and vegetation clearing in order to identify tarplants to be avoided in all areas where demolition, soil removal or groundwater treatments occur and including adjoining access and staging areas. A biological monitor should identify travel routes for drilling equipment and access which avoid tarplants and other sensitive plant resources. This information shall be mapped using geographic information systems. Acreage impacts and a tally of individuals affected should be provided.</p> <p>Santa Susana tarplant growth and vigor should be monitored during groundwater remediation activities in representative areas to determine whether groundwater treatments are causing adverse effects.</p> <p>A Santa Susana tarplant restoration plan should be prepared for Department review and approval and this plan should detail how tarplant habitat would be restored to conditions suitable for re-occupation by tarplants and other appropriate on-site local native species. Tarplant seed should be successfully re-introduced into localized restored habitats areas.</p> <p>Enhancement of existing Santa Susana tarplant habitat in locations outside</p>	<p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate. Biological monitors will survey areas before they are disturbed for presence of selected species.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The Department is therefore concerned with the potential that Braunton's milkvetch may in fact occupy suitable soils in Areas II and Area I. The suitability of habitats in this area combined with the response of Braunton's milkvetch dormant seedbank to disturbances in nearby areas at SSFL suggests that the DEIS should in fact recognize the potential for adverse impacts to potentially occupied habitat. Loss of soil seed bank and/or individuals producing flowers and fruits would be a significant adverse and long term impact.</p>	<p>Biological surveys did not identify Braunton's milkvetch on NASA administered property. Biology MM 2 will include the biological monitoring for Braunton's milkvetch by biological monitors before areas are disturbed.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS does not evaluate the environmental consequences of the Proposed Action on local, regional, and state tracked rare plant species.</p> <p>A state rare plant species was identified in the 2011 spring surveys conducted on NASA lands. Slender mariposa lily (<i>Calochortus clavatus gracilis</i>) is state ranked S-2, and a California Native Plant Society (CNPS) list 1 B-2 (threatened). Another regionally rare lily, <i>Calochortus plummerae</i>, was also observed. The DEIS does not address impacts to these species. The Department observed a previously undetected population of <i>Calochortus fimbriatus</i> (state ranked S-3 and CNPS list 1 B) in mowed habitat in Area IV in July 2013. Downslope of Area II in Bell Canyon, a population of tiger lilies has been verified (<i>Lilium humboldtii</i> ssp. <i>oscellatum</i>) (CDFW files). These types of rare geophytes have narrow habitat preferences and are vulnerable to changes in soil moisture and herbivory pressure when they are exposed by removal of adjoining vegetation.</p> <p>The Department is concerned that the imperiled shrub, <i>Malibu baccharis</i> (<i>Baccharis malibuensis</i>) may be present on NASA lands. This native shrub is extremely rare (state-ranked S-1 very threatened) and exists at a handful of locations with very few individuals (CNDDDB, 2013). Vegetation mapping and surveys conducted by SAIC in 2009 for DOE in Area IV did not identify <i>Malibu baccharis</i>, but it was subsequently detected in 2010 during <u>vegetation trimming</u>.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate. Biological monitors will survey areas before they are disturbed for presence of selected species.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>Department staff previously reviewed a seed mix proposed by Boeing for a nearby on-site demolition project and we raised a number of concerns regarding the proposed mix which we reiterate here. Commercially available native plant seed often is from limited, non-local sources that are potentially poorly adapted to local conditions and do not capture local genetic diversity. Few plant species on Boeing's palette with commercially available seed were sourced from within 30 miles of the SSFL area. Some species included in the Boeing palette were not known to occur in the project area and other important species in the project area were not included in the seed mix. Additionally, annual non-native grasses and forbs were included in the seed mix and could reduce establishment of shrubs and trees.</p>	<p>Revegetation using the Boeing seed mix and resulting impacts are addressed in Biology BMP-1 and BMP-3 The Boeing seed mix was developed by the Storm Water Expert Panel. There are two seed mixes, one for "dry" areas and one for areas that retain a bit more moisture. BMP-1 will be revised in the EIS to reflect the planting of shrubs and trees.</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>On-site propagules should also be obtained for important tree species such as coast live oak (<i>Quercus agrifolia</i>), sycamore (<i>Platanus racemosa</i>), and California black walnut (<i>Juglans californica</i>). An on-site nursery could be established to produce and maintain material for subsequent outplanting. There may be challenges re-establishing vegetation due to the presence of herbivores such as mule deer, which are attracted to young plants and favored browse species. It may be necessary to use temporary fencing or caging to allow for favored browse species to re-establish, including oaks.</p>	<p>Where feasible, NASA will provide trees and shrubs for revegetation.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	Biology BMP-1 discussion suggests that seeding would only occur at locations where topsoil is available. What is the source of top soil? If it is from off-site sources, it would likely contain weed and non-local plant propagules. Additional information is needed to evaluate the environmental consequences of using this material. If the topsoil contains weeds or a lot of annual grasses, re-establishment of native species could be impaired. It might be possible to control weeds on imported topsoil and then introduce new seed thereafter.	Offsite sources of potential replacement top soil have been identified. The cleanup levels in the AOC require the removal of large amounts of soil. To replace just one third of the soil, NASA must seek offsite soil. Potential offsite soil sources are listed in Section 2.2.2.3. Noxious weeds and invasive species would be controlled through Biology MM-3..
Edmund	Pert (California Department of Fish and Wildlife)	What is the expected outcome for future vegetation and soil protection where topsoil is not available and no seeding would occur? The DEIS does not identify what proportion of the excavated areas would be left in this condition. At such locations, impacts are potentially long term and permanent. The Department recommends that soil amendments be evaluated for use in locations where topsoil is unavailable. Certain native species may perform better than others and test outplantings could be used to determine appropriate palettes for such locations.	This will be included in the grading plan as specific remediation treatments at specific locations are finalized. As part of the remedial action designs NASA will develop a grading plan that covers revegetation, storm water drainage, patterns, topography, etc. Impacts to backfilling one third of the soil are described in Sections 4.4 and 4.6.
Edmund	Pert (California Department of Fish and Wildlife)	The Department recommends that local palettes be developed for each plant community to be removed by soil remediation or other forms of disturbance. Slope and aspect as well as local reference sites can be used to inform recommendations for revegetation for specific treatment areas. A site-specific revegetation plan is necessary in order to develop effective strategies to replace habitats impacted by soil remediation and ground water cleanup.	This will be included in the grading plan as specific remediation treatments at specific locations are finalized. As part of the remedial action designs NASA will develop a grading plan that covers revegetation, storm water drainage, patterns, topography, etc. Impacts to backfilling one third of the soil are described in Sections 4.4 and 4.6.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>Biology BMP-1 includes a restoration goal of 50 percent native cover three years after disturbance in areas subject to seeding (DEIS 4-43). This standard would allow as much as 50 percent of the seeded area to be dominated by non-native weeds. Native cover is not defined (i.e. relative cover, foliar cover or absolute cover). Three years is generally not considered an adequate amount of time to restore native shrub communities such as coastal scrub and chaparral. It will be necessary to effectively control weeds prior to seeding with natives, which would extend the restoration period. Five to seven years seems more appropriate, and survival through at least one year of drought is necessary to demonstrate the re-established vegetation is resilient. The Department recommends that cover standards be developed for each plant community target, and that cover values be established for each layer, i.e. herb, shrub, and/or tree layers. Woodland and forest habitats should include a longer revegetation period spanning at least ten years to ensure re-establishment has occurred and new individuals will survive periods of drought</p>	<p>NASA agrees with your assessment on the likelihood of vegetation success. However, NASA also recognizes the species composition post restoration will not represent what is currently present, further the 50% goal is includes grass and herbaceous species. NASA recognizes shrub and tree species will take considerably longer. NASA also recognizes there will likely be a resurgence of invasive and non-native species, this issue is discussed in Bio BMP-3. Text has been added to the EIS to clarify the 50% goal represents grass and herbaceous species and it would take much longer for trees and shrubs to establish (Section 4.4.2)</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>The discussion at Biology BMP-1 indicates it could take years for native species to re-establish in disturbed areas, but the DEIS concludes that after implementation of this BMP, impacts would be short term (i.e. over once remediation is complete). This conclusion is not supported by the information provided.</p>	<p>Impact to native species will be changed to long-term in BMP-1.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>Biology BMP-2 describes various soil stabilization measures that could be used in conjunction with reseeding or in locations where topsoil is unavailable. Some erosion control products such as erosion mats, straw wattles and others, contain non-biodegradable mesh which can entrap and kill wildlife. To avoid adverse impacts to wildlife, the Department requests that this measure be modified to ensure that such products are specifically prohibited. Most erosion control products are designed for temporary, short term use and it is not clear how such products would be effective at preventing long term erosion in locations where revegetation does not occur or is unsuccessful.</p> <p>The Department also requests that no gabions be installed along or within stream channels, as the wire and mesh associated with these structures are also hazardous to wildlife and can break down and become a nuisance. For the purposes of stabilizing soils along stream channels, we recommend that only natural rock be used. Boulders, rocks and cobble associated with on-site stream channels should be retained or stockpiled for reuse following remediation, to the degree that this is feasible. Limbs, trunks, and woody debris could be retained onside and distributed to protect soil and increase habitat availability. Brush piles could also provide additional soil protection and cover for wildlife and could be placed in revegetation areas. Chipped native biomass free of weeds could be used to protect exposed soil surfaces, but should not be placed</p>	<p>Biodegradable controls that are intended to be left in place and will degrade over time will be used where feasible. NASA will minimize the use of gabions in our designs</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>Biology Mitigation Measure-3 indicates NASA would implement a weed management plan to eradicate noxious and invasive species. This measure should be modified to also address prevention of new weed invasions and spread of existing on-site weeds. The Department recommends that protocols be established to ensure that all vehicles and equipment that would operate in habitat areas are cleaned of soil and weed seeds prior to arriving at the SSFL site. Personnel and hand equipment/tools should also be checked and cleaned before accessing the area. On-site biological monitors should inspect equipment and personnel.</p> <p>Equipment and personnel staging in disturbed areas on site may also convey weeds into currently weed free areas, so measures to prevent this from occurring are recommended. The California Invasive Plant Council has useful protocols for addressing weed invasion for land managers (http://www.cal-ipc.org/ip/prevention/landmanagers.pup).</p> <p>The Department would appreciate the opportunity to review and provide input to the weed management plan proposed under Biology Mitigation Measure-3.</p>	The weed management plan will be available for review.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>Wildlife surveys conducted for the DEIS are based upon a fall 2009 field survey (DEIS pgs. 33-23) documented in Appendix D. This fall evaluation states that wildlife surveys were opportunistic. Systematic active searches for specific non-federally listed wildlife species were not conducted (Appendix D pg. 3-2). During field surveys conducted in spring 2011 , additional opportunistic wildlife species surveys were conducted concurrently with special status plant surveys (Appendix E pg. E-28) and are described as not systematic. Under these scenarios, on-site sensitive wildlife species could easily be missed or their extent underestimated, based upon the timing, weather, survey limitations and level of effort.</p> <p>DEIS Table 3.4-3 lists the results of these field assessments and sightings are plotted in Figure 3.4-4. Four sensitive wildlife species were confirmed on site and include a single August sighting of the state and federally endangered least Bell's vireo; species of special concern: coast horned lizard, loggerhead shrike, and two-striped garter snake. A ringtail (California Fully Protected Species) was sighted just off site in rock outcrop habitat near a spring but is described as not present in the ROI (region of influence, Table 3.4-3). Boeing has documented additional sensitive wildlife species on adjoining properties and in the Department's opinion, these species have a high likelihood of occurring on NASA lands and/or downslope off site. Documented observations of species which could be adversely affected by the proposed project</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS. Biological monitors to be utilized in accordance with the Biology MMs.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>To avoid direct mortality to ringtail, the Department recommends that rock outcrop habitats and other locations slated for soil remediation or ground water remediation be evaluated by a knowledgeable biologist in order to locate all potentially ringtail-suitable caves, and crevices and this effort should include searches for hibemacula, and bat roosting and colony sites. Once located, these areas should be mapped and appropriate avoidance buffers should be established in consultation with the Department in order to prevent the location from being adversely affected by human activity and/or damaged by ground water boring, wells, or travel and access routes.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>A ring-tailed cat, a CDFW fully protected species, was observed outside, although near, NASA Area II (Figure 4.4 1). Because no specimens were identified within the cleanup area and the species likely would avoid human activity, there would be no expected impacts to the ring-tailed cat. Individuals working on cleanup and demolition activities would be trained to identify federal- and state-listed species. If a listed species were observed during operations, operations would halt and a qualified wildlife biologist would be called to the site. If the species were validated as a listed species, the USFWS or CDFW would be consulted. NASA will also comply with the Biological Assessment and mitigations as concurred by the USFWS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The impact analysis for project impacts to birds underestimates the severity of impacts from soil and groundwater remediation. The DEIS addresses only migratory birds and impacts are described as short term for the soil remediation component, while impacts to the native vegetation communities which support nesting and foraging bird populations are described as long term (DEIS pg 4-35). The DEIS states that it could take years for native vegetation to reestablish in disturbed areas and the species composition would likely be different, which suggests that impacts to wildlife including birds who rely upon native vegetation communities would likely extend over years as well, and therefore, this appears to be a long term impact.</p>	<p>The impact to wildlife would be noise from the remediation construction and operation. Wildlife will return when activity ceases, thus a short-term impact.</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>Impacts to birds and other wildlife from the groundwater remediation component are also considered short term (DEIS 4-42), and described only as a minor disruption to wildlife. The DEIS states that ground water treatments would involve additional wells that "would be located far apart"; thereby limiting disturbance during installation (DEIS 4-43). This description conflicts with the description of various ground water treatment technologies which would involve wells or bore holes installed 10-20 feet apart and operating for years, decades, or centuries. It is likely that installation and maintenance activities including the interconnected systems of pipes and electricity could cause further disruption of vegetation and associated wildlife.</p>	<p>The impact to wildlife would be noise from the remediation construction and operation. Wildlife will return when activity ceases, thus a short-term impact.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>Furthermore, the DEIS should acknowledge that Biology Mitigation Measure-4 does not address the permanent loss of nesting and foraging habitats for bird species should habitats no longer be suitable following remediation activities. The Department recommends that NASA undertake a more intensive effort to restore on-site habitats following remediation. The Department is available to work with NASA to develop goals and objectives for a more effective restoration effort.</p>	<p>NASA is willing to meet with the Department to discuss additional restoration efforts. It makes sense for these discussions to take place at the time of the development of soil cleanup remedial action plans. NASA cannot commit at this time to any additional mitigations and restoration than is stated in the ROD.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>Fish and Game Code Section 3503 prohibits the take of birds and their nests regardless of their status under the Migratory Bird Treaty Act (MTBA). Fish and Game Code Sections 3503.5 and 3513 provide additional protection for raptors and other migratory nongame birds listed under the MBTA. Biology Mitigation Measure-4 addresses only migratory birds and indicates mitigation could include scheduling activities outside the nesting season, relocation, or compensatory mitigation. The Department recommends that work occur outside the active bird nesting season, as relocation or compensatory mitigation could still result in take of birds or their nests.</p> <p>Proposed project activities (including, but not limited to, staging and disturbances to native and nonnative vegetation, structures, and substrates) should occur outside of the avian breeding season which generally runs from March 1-August 31 (as early as January 1 for some raptors) to avoid take of birds or their eggs. Take means to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture or kill (Fish and Game Code Section 86), and. includes take of eggs and/or young resulting from disturbances which cause abandonment of active nests. Depending on the avian. species present, a qualified biologist may determine that a change in the breeding season dates is warranted.</p> <p>If avoidance of the avian breeding season is not feasible, the Department recommends that, beginning thirty days prior to the initiation of project activities, a qualified</p>	<p>The AOC requires that cleanup be complete by 2017. To meet this deadline, it is impossible to avoid avian breeding season. NASA must continue to abide by its obligations under the AOC as drafted. NASA will survey work areas prior to work commencing and will comply with the Biological Assessment and mitigations as concurred by the USFWS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The DEIS does not discuss measures to reduce mortality of bat species likely to reside on the project site. The project may result in injury or death to bats including special status bats which reside in the natural rock outcrops, in riparian areas, within trees slated for removal, or manmade structures that would be demolished on the project site. The Department recommends the following additional avoidance and minimization measures be incorporated into the project work plans and mitigation measures--</p> <ol style="list-style-type: none"> 1. To avoid direct loss of bats in the rock outcrop habitats slated for soil or ground water remediation, a qualified bat specialist should identify all potential locations that may serve as maternity roosts or colonies, these areas should be mapped and avoidance buffers should be established in consultation with the Department. 2. To avoid the direct loss of bats that could result from removal of trees and/or structures that may provide maternity roost habitat (e.g., in cavities or under loose bark), the following steps would be taken: <ol style="list-style-type: none"> a) Tree removal should be scheduled between October 1 and February 28, outside of the maternity roosting season. b) If trees and/or structures must be removed during the maternity season (March 1 to September 30), a qualified bat specialist should conduct a pre-construction survey to identify those trees and/or structures proposed for disturbance that could provide hibernacula or nursery or colony roosting habitat for bats. 	<p>The rock outcrops are not proposed for remediation. Biological monitors will survey areas before they are disturbed for presence of selected species.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The proposed project will result in a substantial increase in traffic on local roads leading to and from the SSFL site. Heavy truck traffic will primarily use Woolsey Canyon Road and Valley Circle Boulevard. Local vehicles may utilize Box Canyon Road. Truck trips to remove contaminated soil are estimated at 26,441 and trips to bring in backfill from off site are estimated at 8,814 extending across a period of about two years (Table 2.4-1).</p> <p>The truck and access routes traverse areas identified as a local and regional wildlife movement corridor (DEIS 3.4-2), and also go through local open space areas and natural preserves (Figure 4.5-2). The DEIS does not identify impacts to wildlife from roadkill associated with the increased traffic traversing off site and on site areas. Roadkill could be reduced by: a) including time restrictions that limit truck travel to full daylight hours only, thereby avoiding dawn and dusk when movement activity is high; and b) limiting speeds to 25 mph or less.</p>	<p>The project will obtain all necessary transportation permits for truck travel on City, County, and State roadways. Federal and state regulations also govern the operation of commercial motor vehicles. These regulations, among others, have been established to help reduce or prevent truck crashes, fatalities, and injuries.</p> <p>As part of Traffic MM-1, NASA will develop an N-CTCP during the implementation of the demolition and environmental cleanup activities. Implementation of the N-CTCP will minimize traffic impacts to the extent feasible, including minimizing impacts to wildlife movement.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edmund	Pert (California Department of Fish and Wildlife)	<p>The proposed project will result in clearing natural habitat that supports many species of indigenous wildlife. To avoid direct mortality, the Department recommends biological monitors be on site prior to and during ground disturbance activities to relocate special status species and other wildlife species of low mobility that will be killed or injured by grubbing and ongoing remediation activities. Wildlife should be relocated to adjacent appropriate habitat out of harm's way. Should state listed threatened or endangered species be encountered, incidental take authorization from the Department may be required.</p> <p>The DEIR should acknowledge that capture and relocation of on-site common and special status species does not constitute effective mitigation for the purposes of offsetting project related impacts stemming from habitat loss.</p>	<p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate. Biological monitors will survey areas before they are disturbed for presence of selected species.</p>
Edmund	Pert (California Department of Fish and Wildlife)	<p>The Department notes that under Alternative 3, soil would be cleaned up to a level which is safe for recreational use of the project area (Table 2.4-1), which is a potential end use for the NASA properties as well as the adjoining Boeing properties. Alternative 3 would result in far fewer acres of impacts to habitat (6 acres) and cubic yards of soil removal (58,000) compared with the Proposed Project, and therefore this alternative would have far fewer substantial long term adverse impacts to biological resources and requires less backfill and restoration. Groundwater cleanup levels do not vary across the range of alternatives (Table 2.4-1), but there is potential for different treatment options to vary in terms of their impacts to biological resources.</p>	<p>NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Peterson	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jeff	Pettus	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Jeff	Pettus	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Jeff	Pettus	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
J J	Phillips	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Antonio	Pierola	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Brian and Peggy	Pierotti	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.
