Brandon	Pipersky	In 2010 NASA signed an agreement with California to clean up all the contamination to background levels, restoring the site to the condition it was in before it was polluted. NASA is responsible for the contamination, has promised to clean it all up, and should live up to those commitments and promptly and thoroughly clean up the site and carry out all the obligations it assumed when it entered into the cleanup agreement.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.
Eddie	Pistolessi	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Phyllis	Pivo	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Shel	Plotkin	The EIS should be revised so that there is absolutely no question about NASA's commitment to live up to the AOC in full and to its commitments to the Congress and the impacted population near the site.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.
Shel	Plotkin	The draft EIS is curiously deficient in examining the environmental impacts of the extensive contamination of soil, groundwater, surface water, structures, and other media, the whole purpose of the cleanup action.	The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. However, based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).
Shel	Plotkin	On the other hand, the discussion of potential negative impacts of cleanup seems quite overblown.	NASA believes the negative impacts presented in the DEIS for conducting a soil cleanup that meets the 2010 AOC are fair and accurate. As for the beneficial impacts, based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place (Section 3.9.5) as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).

Shel	Plotkin	The mitigation sections are weak.	NASA made adjustments to the mitigations in the EIS.
Shel	Plotkin	Similarly, there is no real site restoration plan provided, e.g. re-vegetation. As indicated earlier, the site is already badly degraded by decades of NASA activities. But once the pollution is remediated, NASA needs thoughtful plans for restoring the native vegetation that had been there before NASA was. That is lacking in the Draft EIS at present.	Please refer to Section 4.4.2. for BMPs associated with biological resources

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alan	Podber	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Jennifer	Porzio	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Niccolo	Posarelli	<p>I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Niccolo	Posarelli	<p>NASA activities led to widespread contamination of soil and groundwater with very toxic materials such as perchlorate, dioxins, and TCE. Some of the contaminants have been migrating offsite. As a local resident, I am very concerned about the potential health impacts of these materials and want the site cleaned up properly.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Niccolo	Posarelli	In 2010 NASA signed an agreement with California to clean up all the contamination to background levels, restoring the site to the condition it was in before it was polluted. NASA is responsible for the contamination, has promised to clean it all up, and should live up to those commitments and promptly and thoroughly clean up the site and carry out all the obligations it assumed when it entered into the cleanup agreement.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dianne	PunKay	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dianne	PunKay	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Corazon	Punzalan	What would be the consequences, or are there any precautions that'll be in place while the clean up and demolition of structures are being undertaken?	Most of the consequences (or impacts) identified in this DEIS are a result of requirements imposed by an agreement entered into between the state regulator, the DTSC, and NASA, known as the 2010 AOC. We estimate that 105 acres may have to be disturbed, which would equate to 500,000 cubic yards of soil removed from the site or treated onsite. This amount could result in significant impacts to habitat / natural resources, cultural resources, soil in general, and traffic and transportation. Several precautions (also referred to as BMPs or MMs) have been identified in the DEIS for managing the demolition and cleanup activities at SSFL. These precautions are described primarily within Section 4 (for example, potential air emissions and fugitive dust emissions from demolition activities are discussed in Chapter 4.7. and potential impacts to water resources are analyzed and discussed in Chapter 4.6) of the DEIS document and also are summarized in Section 6.
Corazon	Punzalan	What would be done to prevent air pollution or dust allergens that could possibly escape in the air during the clean up and demolition?	Fugitive dust emissions would be controlled by measures prescribed by Ventura County Air Pollution Control District Rule 55. The relevant measures available to reduce both onsite and offsite fugitive dust emissions are summarized in the DEIS on pages 4-109 and 4-110. These measures include such items as: apply water at a sufficient quantity and frequency to prevent wind-driven dust; not perform loading during unfavorable weather conditions (such as high winds or storms); use properly secured tarps that cover the entire surface area of the load for hauling.

Dorri	Raskin	And I feel that the test stands need to be taken down. Too much contamination there.	<p>Section 106 of the NHPA requires federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement and/or ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Dorri	Raskin	<p>On the issue of trucks, I feel that the numbers were inflated, and I feel that the trucks could take -- the routes could be split. And as I mentioned a little bit earlier, using natural gas type of trucks.</p> <p>I felt that you failed to mention about, by not cleaning up, the negative effects. I feel that you've been trying to scare us by talking about the number of trucks that are going to schlep up and down...</p>	<p>NASA has revised the DEIS estimates of the number of trucks based on additional information on demolition materials (Sections 2.2.1, 2.4.1, 4.5, 4.5.1, 4.7.1, 4.8.1, and 4.11.1) . NASA may also have to modify the number of trucks based on success of pilot tests of in situ and ex situ treatment. However, based on current information, NASA has provided the best analysis based on information available.</p>

Dorri	Raskin	...and also harming the sacred sites. I feel that, according to the AOC, it protects the sacred site, and the whole area is not a sacred area.	NASA and DTSC, along with SHPO and the Tribes, will have to work together so that the identified archaeological resources will be avoided where possible. NASA will develop an inadvertent discoveries plan.
Dorri	Raskin	We need to clean up to background, period. No ands, buts. I have too many friends who have cancer from this place, and I have friends who lost their kids because of cancer. And as I say, we need to clean up to the AOC.	Your comment is noted.
Dorri	Raskin	Well, the comment would be like how they did it -- oh, I'm sorry, Dorri Raskin -- like how they do with freeways or to protect the animals, they could build like a bridge for underneath or over. So then there would be -- then you would have the animals going around.	NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with the USFWS and has coordinated with other natural resource agencies, such as the USACE, with respect to wetlands. NASA believes that the assessment of impacts and findings is reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS; however, as a federal agency, NASA is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.

First Name	Last Name	Comment	NASA Response
Dorri	Raskin	<p>And I appreciate Brian, who spoke so eloquently, and everything that he had to say. And I think what was lacking in this report are reports from Southern California Federation of Scientists, UCLA, and 14 other agencies that discusses the toxic effect on people's health -- on workers and people's health. And I think this is really important.</p> <p>For the people that have cancers, my friends -- my friend who was young and his brother walked around the site, and he got cancer and he died. I mean, how could a parent -- a parent is always going to think about that son that has -- who died before the parent. And that's really difficult.</p> <p>For my friends who live below the site who got thyroid cancer, breast cancer, leukemia, we're talking about people's health, and the site needs to be completely cleaned up to AOC standards. And please use what UCLA says about what happened to the workers who got sick and who died. I have a friend who worked at the site, and he has cancer. And this is very important.</p> <p>And this is what was missing from your presentation.</p>	<p>NASA respects public concerns regarding offsite health issues. According to DTSC, they have conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>Additionally, DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm). According to the DTSC summaries there were two UCLA studies, one in 1997 dealt with radiation exposures and a second in 1999 which dealt predominantly with hydrazine exposures. Both were funded by DOE.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David, Lisa, Cheryl	Raskin	<p>For decades, NASA ignored fundamental environmental requirements in operating SSFL, creating a toxic mess in the soil and groundwater. Dioxin, perchlorate, PCBs, TCE-all sorts of horrible hazardous materials were just spilled on the gorund and released into the air. That contamination has already migrated offsite. A TCE plume extends off the property, and nearly everytime it rains or the wind blows, toxic material spreads to the communities nearby. Elevated cancer rates have been found by federal and state studies associated with living near SSFL.</p>	<p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David, Lisa, Cheryl	Raskin	<p>After years of resisting its fundamental obligations to clean up the toxic contamination it created, finally, in 2010, NASA signed a legally binding agreement to cleanup all the contamination that could be located.</p> <p>Now NASA has issued for public comment a Draft Environmental Impact Statement (DEIS) for the cleanup. But it appears that some at NASA are working to try to break the solemn commitment the agency made, break out of the cleanup agreement, and walk away from most of the contamination.</p>	Your comment is noted.
David, Lisa, Cheryl	Raskin	<p>We strongly urge NASA to live up to its promises. You polluted our community through irresponsible environmental practices; you finally agreed to cleanup all the contamination you created. Do not break your word. Do not leave contamination in our community, posing a threat to us for decades to come. If test stands have to come down to clean up contamination beneath them, then they have to come down. If trucks have to take contaminated soil out of our community, then that must be done. Behave honorably. Rigorously adhere to the cleanup agreement you signed.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dorri	Raskin	<p>NASA needs to include in your EIS- studies by UCLA School of public Health that it did on the workers.</p> <p>Another study done by ATSDR (federal agency for toxic substances and disease registry).</p> <p>Another study by ATSDR by UCLA's Professor Yorum Cohen and his UCLA team.</p>	<p>DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm).</p> <p>With respect to the UCLA studies you reference, the first study was published in 1997 and according the DTSC's summaries, dealt only radiation and bases conclusions on workers exposed to radiation. NASA did not do any radiological research and as such would not have any workers in this category.</p> <p>The second UCLA study, published in 1999, was also funded by DOE and primarily dealt with presumptive exposures to hydrazine. It was a review of no-site workers, not neighboring populations.</p> <p>The third study you reference, by ATSDR, was published in 1999. According to DTSC's summary, "The preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects."</p> <p>Information summarizing these studies will be added to the EIS (Section 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dorri	Raskin	Live up to the agreement that you signed! Do not break your word! Stop dragging your feet! Now is the time to fully clean up SSFL. If test stands have to come down to clean up the contaminated soil beneath them, then they need to be removed.	Your comment is noted.
Dorri	Raskin	Trucks have to take contaminated soil out of our community, then that must be done. Use non-diesel trucks-use electrical and natural gas trucks. You inflated the number of trucks too.	NASA has revised the DEIS estimates of the number of trucks based on additional information on demolition materials (Sections 2.2.1, 2.4.1, 4.5, 4.5.1, 4.7.1, 4.8.1, 4.11.1) NASA may also have to modify the number of trucks based on success of pilot tests of in-situ and ex-situ treatment. However, based on current information, NASA has provided the best analysis based on information available. Non-diesel, electric, and natural gas truck usage will be considered.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dorri	Raskin	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dorri	Raskin	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Reback	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Toby Ann	Reese	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Stephen	Reo	<p>Do you know the true nature of the chemical hazards that exist in the soil and groundwater at SSFL? Granted, there is a list of *known* contaminants and hazardous wastes that were dumped or spilled onto the ground, into the burn pits and other on-site repositories. Those are the chemicals and other materials purchased in their "pure" state. However, those have potentially recombined with hundreds of other chemicals and known carcinogens that may now be more hazardous than the sum total of what was initially introduced. These new molecular compounds may be resistant to present filtration methods (requiring new technology), and may result in sending more waste to the dumps as untreatable and potentially volatile hazardous materials. Have any such "super compounds" been discovered/identified? If so, what action, if any, has been taken to attempt to neutralize them? If action was taken, what were the results?</p> <p>Nobody knows exactly how much hazardous waste remains in the soil or the groundwater at this point. How will you know when you've finished removing it? If you didn't get it *all*, the material will move upwards and effectively recharge the area (Nature abhors a vacuum). Within a few years you'll have contaminated soil again, or possibly unsafe water from a contaminated water table. What filtration and/or monitoring methods will be kept in place to insure this doesn't occur?</p>	<p>NASA followed DTSC approved protocols and procedures for sampling and analysis. Numerous information meetings were conducted with regulatory and community groups to monitor and discuss procedures and sampling plans.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Stephen	Reo	<p>I recall during the session (Wednesday, August 28) a presenter (Allen Elliott?) mentioned that commercial hauling trucks could carry 19 cubic yards of material, with a potential for some 26,000+ loads being hauled. However, on Page 2 of the "FieldNOTES" we were provided (April, 2013), it was stated in paragraph 2 (bottom of page) that ..."Typical commercial U.S. dump trucks carry about 10 cubic yards" (emphasis mine). Given that this capacity is approximately half of what the presenter indicated could be carried per truck, and that there will likely be a combination of the two sizes used, I would suggest that the number of truck loads may increase substantially. Additionally, it wasn't known how many such trucks are available locally for this type of activity. As a consequence, calculations of the number of loads, drivers, trucks needed, increased traffic pattern disruptions, the potential for increased hazards/accidents and damage to the roadways and other concerns will also have to be figured into the total cost. What efforts are underway, if any, to line up the additional trucks and to train the additional drivers needed?</p>	<p>NASA appreciates the comment regarding the trucks that will be required to implement the proposed action in the EIS. Trucks are available in multiple sizes that can haul soil. NASA anticipates using trucks capable of hauling approximately 19 cubic yards of soil during the cleanup activities.</p> <p>Securing trucks and drivers would occur closer to the planned haul dates of 2016 and 2017.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Stephen	Reo	<p>I can't imagine putting that much loose waste material in a truck, with the only protection being a flimsy tarp to contain the contaminated soil and dust that would inevitably be released from each truck in the course of its long journey. And what would contain the hazardous soil in the event of a roadway accident? (and it will happen).</p> <p>Will the soil be placed in 55-gallon drums inside of a metal sided dump truck or trailer, or will it be dumped loose inside of a 10- or 19-cy truck with a tarp for the long haul to the waste sites? You wouldn't (shouldn't) haul liquid hazardous waste in anything less than 55-gallon drums; so-called "dry waste" (soil, rock and other media) must be treated the same. If nothing else, hauling these hazardous wastes in containers will minimize the amount of time and expense in leaning/decontamination of the trucks once their load has been delivered.</p>	<p>NASA is aware of the processes and procedures used to test rocket engines and the chemicals that were used; therefore, the proper analyses were selected to evaluate contamination in soil and groundwater.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Stephen	Reo	<p>Have cost/safety comparisons been made regarding short-hauling the material in trucks to train depots and letting the nation's railway system transport this material to the hazardous waste repositories? That keeps it off the roadways and away from major metropolitan areas for the majority of the trip. There is an active train station located in Chatsworth, CA, just ten minutes away from the SSFL. If that doesn't work for some reason, there were other loading points identified in the DEIS within a reasonable distance. The nation's railway system was designed for and is capable of hauling heavy materials. This minimizes most of the negative impacts of hauling the full distance using small-load, over-the-road (OTR) trucks and their impacts on the roadways and traffic patterns.</p> <p>While the trains are transporting waste, the trucks can be loaded with sanitized fill dirt obtained locally, minimizing interruptions in present traffic patterns.</p>	<p>Since the rail options NASA evaluated were either not able to meet the 2010 AOC requirements (conveyor to rail and new haul road) or did not alleviate the impacts of truck traffic on local roads (truck to rail and rail to disposal site), no cost/safety benefit analyses were done.</p>
Stephen	Reo	<p>As you may know, late fall/winter weather patterns bring the Santa Ana winds to this area.</p> <p>What happens to on-site work during those days? Do you suspend all work until the wind falls below 1-2 m.p.h., or will you continue regardless? If you continue, what safeguards will be put in place to minimize fugitive dust from being blown around? This will affect not only the on-site workers' exposures, but the community at large (local residents, children playing at home and at school, people operating businesses, etc.).</p>	<p>NASA appreciates your comment regarding weather patterns that bring unfavorable conditions to SSFL. NASA suspends investigation work during periods of high winds.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Stephen	Reo	<p>It sounds like there will be a good deal of work in the other Areas as well at some point. There may be so much work in progress that trucks and other mechanized equipment will be raising a substantial amount of dust, as well as causing traffic (both on- and off-site) and noise problems. What efforts will be made to minimize the footprint of vehicles moving around the site at any given time? Too many vehicles, workers, dust and noise leads to accidents. There are so many back-up beepers going at clean-up sites that the workers eventually tune them out.</p> <p>Stiff fines should be levied against contractors that exceed the maximum numbers of people, noise, dust and equipment without the express written consent of the Site Superintendent. Safety first, last and always.</p>	<p>As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p>
Stephen	Reo	<p>How will dust be contained during the excavation process (removal and containerizing)? When removing lead or asbestos, the area must be tented in to prevent the material from becoming airborne or, in the case of lead paint on a bridge, dropping onto a waterway. What procedure(s) will be in place for these and other hazardous materials? I assume you intend to use excavators and loaders with water sprayed to keep the dust down as material is removed and stored for loading. If using water to keep the dust down, how will they capture and contain this now-contaminated media?</p>	<p>NASA will use water for dust suppression during soil cleanup activities. The soil becomes wet, but not saturated, and dust levels are maintained at a level below acceptable levels. Because the soil is not saturated with water during dust suppression activities, there is no waste water generated to manage.</p>
Stephen	Reo	<p>What process/procedures will be used to decontaminate hauling trucks, bulldozers, loaders and other equipment used at the jobsite? How frequently will decontamination be carried out, especially on the trucks hauling the material?</p>	<p>Heavy equipment will be positioned on a heavy tarp and wire brushes or similar equipment, will be used to remove the soil from the equipment. The soil collected on the tarps will be disposed of along with the soil removed from the area. This method of decontamination is commonly referred to as dry decontamination because liquids are not involved as part of the process.</p>

Stephen	Reo	<p>Who will perform oversight of day-to-day operations? You'll need a Toxicologist to characterize liquid waste materials, to catalog them for site records and to advise workers how to handle them. An on-duty nurse with Emergency Room (trauma) experience would be desirable, but perhaps is not cost-effective. Many emergencies can probably be handled by the Safety Officer (see below). Staff members will also need to know the locations and telephone numbers for all local area hospitals, fire departments and the Los Angeles Police Department (LAPD).</p> <p>Site Inspectors are needed at each work area to insure work is done correctly. He/She will be the first point of contact with the contractor(s) and its (their) employees. A Safety Officer will be needed to insure workplace safety, investigate accidents, perform first aid, offer morning safety talks and suggest safer means of accomplishing work with the contractor(s)' employees. He/She will also advise the Site Superintendent whether to allow work to continue in the event of storms or other issues which could compromise safety. Remember, these operations are being conducted in a seismically-active zone; what safeguards will you have in place to protect the workers and the public in the event of an earthquake? Local hospitals could be overrun with patients seeking medical help, and may even be taken out of service by the event itself.</p> <p>The Site Superintendent will supervise/monitor overall operations and insure goals are met; determine how to proceed if problems arise; to stop work if necessary for safety issues (high winds or lightning storms; unexpected chemical contamination that bubbles up), negotiate change orders, etc. The Superintendent may already have an Asst. Superintendent on staff to take over in his/her absence, or may elect to appoint someone else based on their construction knowledge and engineering skills. Administrative (Secretarial) Staff will be required to take care of preparing correspondence and other lower-tier administrative matters. An Administrative Officer and a</p>	<p>NASA appreciates the comment regarding the types of trained personnel that will be required onsite during demolition and remediation activities. NASA will have the appropriate personnel onsite during demolition and remediation activities in order to conduct the work in manner that is consistent with approve plans, implement the project in a safe manner, and monitor the cultural resources that may be encountered.</p>

Stephen	Reo	<p>There has been some discussion about leaving one of the Test Stands in place as a historic reminder of the space program and the part Rocketdyne played in that. While visually appealing, the concept of leaving one Test Stand in place absent all of the other support buildings and structures doesn't make much sense. The stand may restrict removal of the liquid hazardous waste and contaminated soil, which is the focus here. Beyond that, removing the soil, storage tanks, etc., beneath it may lead to the stand's collapse. There are plenty of photos and videos extant showing what the Test Stands looked like during their heyday if an on-site museum/memorial is contemplated.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Robert	Rhein	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Ritvo	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Ritvo	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Ritvo	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Ritvo	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Ritvo	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Katherine	Roberts	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Marion	Rodd	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Nick	Rodin	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alex	Rooker	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Paul	Rosenberger	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Paul	Rossilli	Through decades of sloppy environmental practices, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been migrating off the property.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6)</p>

Christine	Rowe	I respectfully request an extension of time should I not have the opportunity to complete written comments on the NASA DEIS by the deadline on the federal notice.	NASA extended the public review from 45 to 60 days.
Christine	Rowe	I would like the opportunity to speak to you late in the afternoon regarding the NASA DEIS and my plans for submission. Can you please indicate what days that you may be free in the late afternoon, and how late I could call you on PST time.	Comments on the DEIS must be submitted through the means identified in the notice posted in the Federal Register on August 2, 2013, to be considered official comments.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>I did see that you had included some of the alternatives that would not meet the AOC in this document. Will there be further information in the whole document to reflect those scenarios? Because from what I have seen so far, it appears that all structures would be removed, the archaeological sites could be impacted, and all vegetation and therefore all habitat would be removed?</p>	<p>NASA appreciates your comments regarding the risk posed by soil and groundwater at SSFL. NASA has compared the risk for cleanup to residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment based on three factors: 1) application of cleanup levels that are 2 to more than 1 million times more conservative than risk-based levels; 2) potentially requiring cleanup of up to 51 chemicals that do not pose risk; and 3) potentially affecting 87 additional acres when compared to a suburban residential risk-based cleanup.</p> <p>Consequently, the benefit to human health and the environment of cleaning up to background is questionable for several reasons. The more aggressive remediation of the site that would occur under the background cleanup (more soil removal, more trucks entering the site, more emissions, more road miles, more soil to dispose of in landfills, etc.) could result in an increase in traffic accidents, spills, and habitat modification and disturbance of wildlife, all of which might result in reduced net benefits when compared to the risk-based cleanup scenario. Because only 10 percent of those analytes detected in soil are identified based on risk estimates as requiring remediation under the background cleanup scenario, the overall net benefit of cleaning up to background for all chemicals as opposed to a risk-based cleanup is low.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	You refer to a conveyor system that would meet up with a train. That would require eminent domain. It is my understanding that Simi Valley does not have a policy of eminent domain. Have you consulted their City Manager on this issue?	NASA has not consulted with the Simi Valley City Manager. We concluded the conveyor system option could not meet the AOC schedule requirements and did not pursue it as a viable option.
Christine	Rowe	Eminent domain requires its own Environmental Impact Studies. This is what my nephew does for a living - accesses the cost of the property and purchases for the U.S. Government to gain the right of way. I believe this is at least a five year process according to him.	NASA concluded the conveyor system option could not meet the AOC schedule requirements and did not pursue it as a viable option.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	Mobile Source Air Toxics - this action only refers to NASA's contribution to the air quality = not the cumulative impact of the remediation of the whole SSFL site. I therefore think that the total potential emissions for all three parties needs to be addressed at the same time.	In addition to DTSC, NASA has been coordinating with USFWS, USACE, SHPO, DOE, Boeing, consulting parties, Tribes, and National Park Service. CEQA analysis typically includes private and public property impacts. Currently there are no cleanup efforts on private lands associated with this project. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.
Christine	Rowe	One more question that is not clear regarding air quality. It is in reference to the statement about highways. Valley Circle, Roscoe Blvd, and Topanga Canyon are all classified as highways. These highways will be impacted by this project. Please clarify this comment relative to air quality and highways.	The air quality conformity analysis is in Appendix I. Valley Circle, Roscoe Blvd., and Topanga Canyon are in the South Coast Air Basin.
Christine	Rowe	I have been, and I continue to be concerned, that NASA signed the 2010 Agreement in Principle and the 2010 Administrative Order on Consent - to my knowledge - without review by NASA personnel or consultants that are qualified to understand Section 106, NEPA, and CEQA.	We acknowledge this comment.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>I researched the Section 106 Archaeology guidance, and while the term artifact is used, I do not see it defined. (document date 1/1/ 2009)</p> <p>In the context of the Section 106 documents - in fact - I believe that they misuse the term artifact because they imply that an artifact is something is portable - it can be found on the surface or excavated and studied. I disagree with that interpretation.</p> <p>The buildings that remain, the Space Shuttles, the Santa Susana Field Laboratory NASA test stands; all will be artifacts made by humans. So too are the cave paintings and other markings on these natural features at Santa Susana. While a cave or a stone outcrop may be a natural feature, it is the evidence of human activity that makes them artifacts or archaeological sites in my opinion.</p>	<p>The terminology "Native American Artifacts" is derived from the Agreement in Principle of the AOC. It is not defined in that document and NASA and DTSC will have to come to an agreement in regard to which areas are covered under the clause in the AOC referencing Native American artifacts.</p>
Christine	Rowe	<ol style="list-style-type: none"> 1. NASA is aware and has been aware of the many "artifacts": middens, mortar basins, tools, cave paintings, and other evidence of human activity on the U.S. Government property. 2. NASA is now aware that the Santa Ynez Band of Chumash - and many other Native American tribes - believe this area to be sacred land. 4. While we may not see evidence of human activity from the past on the surface, digging in any area could potentially reveal or permanently damage unknown human remains, animal remains, or artifacts at depth. 5. The actions that NASA takes on the U.S. Government property at the level stated in the NASA DEIS under the clean up to the AOC is irreversible. 10. No sampling should be done in any known archaeological site areas without the concurrence of the NAHC and the SHPO. 	<p>We acknowledge your comment and suggestions.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	12. NASA needs to renegotiate the Administrative Order on Consent to reflect the new status of the U.S. Government property as Sacred Lands.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Christine	Rowe	13. NASA needs to more accurately define and use more words which reflect the cultural aspects of this site historically in any future agreements with the State of California.	Thank you for your suggestion.
Christine	Rowe	Archaeologists have placed the Burro Flats complex into the context of a discontinuous archaeological district. That term was first used in relation to this site to me by John Romani, and it has subsequently been used by Dan Larson of Compass Rose Archaeological.	We acknowledge this comment.
Christine	Rowe	While NASA mentions "bounding" the Burro Flats site and data recovery - it is my belief that this action diminishes the sacredness of the site; it takes the artifacts from their place which removes their value of place and time; and there is the potential to encounter both human and animal remains that could be placed in burial positions with specific religious and ritual significance.	We acknowledge your comment and concerns. NASA is in consultation with the SYBCI and SHPO regarding any further archeological investigations and/or data recovery. Please refer to the Programmatic Agreement and/or ROD.
Christine	Rowe	Leave the Burro Flats site alone!	Please refer to the Programmatic Agreement (PA) and/or ROD. NASA proposes to avoid cleanup within the boundary of the archeological site. However, the PA and/or ROD outline in what instances NASA may have to proceed with cleanup activities in and around Burro Flats Cave Site and any other archeological sites.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	I respectfully request that NASA request information from the Native American Heritage Commission (NAHC) or other applicable agencies to determine the MINIMAL boundaries of the Burro Flats complex location. In consultation with local archaeologists, it is the opinion of those archaeologists that NASA's archaeologists have reduced the size of the known area of the complex.	The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. The potential 0.65-acre impact from cleanup activities would be outside the National Register boundary, but within the Archeology Resource Management Area.
Christine	Rowe	It is my opinion that this location (Burro Flats) should be fenced off and left undisturbed - permanently - as has been done at Lascaux or at the Painted Cave near Santa Barbara .	NASA is consulting with SHPO and Native Americans about appropriate protection measures for the site.
Christine	Rowe	DTSC can state in their final release of the property that this fenced area is to be used only by the Native Americans for ceremonial uses or language of a similar nature in a land covenant).	Thank you for your suggestion.
Christine	Rowe	No. 2, I don't know that you are aware when you were doing your traffic study that a new development in Dayton Canyon will be going in at the corner of Roscoe and Valley Circle. They're hoping to start grading next year, and 130-plus homes, multi-mansions. So you will be competing with that truck traffic at that same intersection.	Dayton Canyon is the site of a proposed Centex Homes housing development called Sterling Properties (also known as Dayton Canyon Estates). The FEIR for the project was released in 1999. Since its approval in 2001, residents have opposed the Sterling Properties project, and have been working with local and federal agencies to restrict development. In 2008, the DTSC released a Preliminary Endangerment Assessment, which concluded that there is no significant risk to public health or the environment at the site, and no further action is required. No new permits or approvals associated with this development have been sought since the DTSC memo was released. Given the uncertainty of when or if this project will be constructed, this project was not included in the cumulative analysis at this time.
Christine	Rowe	Primary concern that I have had is health risk. As Allen has stated, DTSC has said at this time there's no known off-site risk except we do know that the groundwater is moving to the northeast, and we try to pull back that plume with some plumping so it doesn't go down toward Bell Creek.	NASA appreciates the comment regarding health risks, and it has been noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>...when I was reading the document, because it is so large and there are appendices, the way I was kind of interpreting it is, well, we've got about 40 percent that is infrastructure, that's structures and roadways or whatever, and about another 60 percent is the...earlier said that it was 50 percent...rock outcrops or something. ...maybe you'll clarify with this. But I saw you say, you know, in this document that all vegetation was going to be removed and then the potential for landslides and things like this. ... I mean my interpretation when I was reading remove all vegetation meant those oak trees were going to go. And -- but then earlier today you talked about hand shovels around the oak trees, so I think some things weren't clear when I was reading.</p>	<p>As a federal facility, NASA is not required to comply with the Ventura County ordinances. We do strive to comply with state and local ordinances when feasible.</p>
Christine	Rowe	<p>But in the end of the day, the most important issue on this site is the impact on the local communities. And I don't want the cure, the cleanup, to be worse than the risk to the community today.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	I would like to see air monitoring system put in place up at the top of Woolsey Canyon and if that's Black Canyon or wherever, where you've just left the site, so we can detect those emissions as those trucks are leaving and we can be aware of the impact of that air on my local community. And maybe another air monitoring station on Roscoe between Valley Circle and Topanga Canyon, because that is going to be a tremendous impact.	<p>Emissions occurring at the top of Woolsey Canyon Road would be largely associated with trucks hauling material to and from the site. As listed in Tables 4.7-4 and 4.7-5 of the EIS, the offsite NO_x emissions occurring in the South Central Coast Air Basin (where Woolsey Canyon Road is located) are only 1 to 2 tons per year, which is only 2 to 4 percent of the NO_x significance threshold for this air basin. Offsite emissions for all other pollutants in this location are negligible. Because emissions at the top of Woolsey Canyon Road are so small relative to the applicable significance thresholds, there is no need to install an air monitoring station at this location.</p> <p>Similarly, an air monitoring station would not be warranted on Roscoe Boulevard because this road is used frequently and is of a higher rating such that the additional trucks from NASA's activities would be negligible. Installing an air monitor in this location would not be representative of impacts associated with NASA's activities, but of impacts associated with vehicular traffic in general, which would fall under the authority of the California DOT.</p>
Christine	Rowe	I think -- I have read all the health studies, and I think we have to look at this site what it was when it was an active site versus what it is today. And as I've stated previously, we've had the ISRA action both in parts of Boeing property and parts of NASA's property. And I hope we would not have to go back and remediate those.	ISRA areas were surface soils only and limited to a few chemicals that had demonstrated concerns with meeting the NPDES permit discharge limits. Those areas will have to be evaluated to see if further AOC driven actions are required. This evaluation has been done in the determination of cleanup areas in the EIS.
Christine	Rowe	I think that there are many people here that are well intentioned that are deliberately -- you know, obviously concerned about their health and off-site health risks. But I think they don't understand dose, and I don't think they understand pathways. And they are being alarmed by the media.	NASA appreciates the comment regarding health risks, and it has been noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>I think we needed all the alternatives. I was so disappointed to see what I consider the rape of the site, the NASA property. It's about balance. That's why I brought up the nine balancing criteria earlier and -- but I do -- again, I want to reiterate the most important thing is public health. But I am concerned that this cleanup will be -- and when you add it in with Boeing and DOE's, the cleanup will be worse than leaving some of this in place. And we're not even considering the naturally occurring radionuclides, the naturally occurring arsenic, and other things that are on the site that people generally probably don't understand.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.</p>
Christine	Rowe	<p>I would like to say I read Nancy Sutley's letter from CEQ in your appendices. She didn't say that you couldn't do all the alternatives. She said because you've signed the AOC that you don't have to do all the alternatives.</p> <p>I would really like to see all the alternatives spelled out so that we, as the stakeholders, can pick and choose which are the best alternatives, to weigh them in an intelligent manner. We are not being given an opportunity to balance and weigh these things.</p>	<p>Prior to the discussions with CEQ, Senator Boxer, and DTSC, NASA had evaluated the other alternatives. This information is summarized in Section 2.4 of the EIS and further described on our website at: http://ssfl.msfc.nasa.gov/documents/eis/NASA_SSFL_EIS_Risk_Alternatives_20130813.pdf.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>And then it does, in the NEPA/CEQA March 2013 document, talk about NASA and DTSC working together under NEPA and CEQA. And again, I'm concerned NASA's going to go through this process. DTSC hasn't even started theirs.</p> <p>I have said to DTSC many times I think a full-site EIR should have been started 20 years ago. If there was new information over that time, then you could have supplemented it. If there was a biological survey, supplement it.</p>	NASA has been coordinating with DTSC, USFWS, USACE, SHPO, and DOE. The DTSC has started its CEQA process.
Christine	Rowe	<p>One concern that I have is if you remove all the vegetation, you're going to expose more archaeological sites potentially. That's what happened in Area 4. Then what are you going to do with all these exposed archaeological sit?</p>	Archaeological sites found during remediation, if any, will be treated with the same care as previously identified sites on NASA-administered property.
Christine	Rowe	<p>So there's a lot of information that we need. I want to encourage you to go back to what you did a year ago, which showed us the alternatives. It showed us the amount of trucks Boeing and DOE would potentially also use. I concur that we need to hear DOE's updated information. They're still waiting for some collocated soil sampling and other things.</p>	NASA is coordinating with DOE and will include updated information about trucks and any other germane information in the EIS (Section 4.13).
Christine	Rowe	<p>And now we have three lawsuits that are all impacting this site. I think -- I think that NASA has been working in good faith, trying to meet a 2017 deadline. That 2017 deadline came out of the 2007 consent order, but I think it's not reasonable to really believe, based on the number of trucks, that we will see 2017 for soil.</p>	NASA recognizes public concerns regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>Furthermore, the NASA Draft EIS only considers the impact of NASA's actions on the approximately 450 roughly of 2850 acres of Santa Susana Field Laboratory site and not the cumulative impact of the work that is necessary for Boeing and the Department of Energy to complete. This is why we not only need a full-site Environmental Impact Report done by DTSC, sooner than later, but we need to consider the full impact of all these projects on the local communities.</p> <p>When DTSC does their EIR for Santa Susana, they will have to consider a Boeing cleanup based on health risk and a cleanup standard to a suburban residential standard and a NASA and DOE cleanup based on the AOC. Just how is this going to work?</p>	<p>In addition to DTSC, NASA has been coordinating with USFWS, USACE, SHPO, DOE, Boeing, consulting parties, Tribes, and National Park Service. CEQA analysis typically includes private and public property impacts. Currently there are no cleanup efforts on private lands associated with this project. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.</p> <p>Questions about the EIR should be directed to DTSC.</p>
Christine	Rowe	<p>Why did NASA sign an agreement that is not based on health risk when, in my opinion, most of the statements from local community members are regarding their fears of off-site risk.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>We need to understand if all three responsible parties will be taking the same route, the NASA DES refers to protecting children. I thought that you also had to consider the location of senior facilities and hospitals when you were looking at the impact of emissions.</p>	<p>The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. It will be updated to include the latest estimates from Boeing and DOE (Section 4.13).</p> <p>As a BMP for efficient and safe traffic management, a N-CTCP will be developed; similar to Boeing’s existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the numbers and impacts of incidents.</p> <p>As described in the EIS, after trucks leave Woolsey Canyon Road, project-related traffic is negligible as compared to the existing traffic levels. Therefore, typical incident response procedures should sufficiently address transportation-related needs.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	Now we also have to consider the Santa Ynez Band of Chumash have taken action to consider all of the Santa Susana site as sacred lands. What does that mean in terms of how the site is cleaned up? What are their intentions for future use? Do they want the test stands to remain in place or do they want all evidence of the United States Air Force and NASA activities to be removed?	<p>Section 106 of the NHPA requires federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement and/or ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Christine	Rowe	Yesterday it was mentioned, the use of water, how valuable water is. We're in a drought period. And then we look at the fires nationwide. And how could we use a lot of water to both clean up this site and to revegetate?	NASA will update the EIS to evaluate the potential impacts to water resources as a result of water usage during the remediation activities (Sections 4.10 and 4.10.1.2).
Christine	Rowe	The impact of energy use. Where are you going to get the energy for the equipment that you're running if you're treating soils on site? For example, is that going to be from sources of coal?	Electricity used onsite is purchased from Southern California Edison and uses the sources provided by that company.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	The sensitive receptors -- again, I mentioned the nursing homes -- the environmental justice communities that I was reading about, a lot of those are Canoga Park and Chatsworth from what I saw on Route 27. I need a better map. I have to look more closely at that. But I doubt if those Canoga Park and Chatsworth people that live along there are at this meeting today or are reading that document. And yet all these trucks are going to impact those environmental justice communities.	Nursing homes would only be included in the environmental justice section if they were located in a minority or disadvantaged area, as determined by the census data.
Christine	Rowe	The reality is I don't believe that we're going to be able to get this done by 2017.	NASA recognizes public concerns regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Christine	Rowe	We need a toxicologist to be looking at these documents. We need an epidemiologist to discuss the impact of both the cleanup of this site versus the amount of trucks that are taking this soil. What is that impact on our local communities?	Based on these and other comments, NASA will revise the EIS to reflect the impacts of contaminants if left in place, as well as to include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).
Christine	Rowe	And the soil on the site is compacted. The more that we dig, the more that there will be airborne. ... The risk to my community, in my opinion, from reading these documents and attending these meetings, will become greater the more you dig. The more that you expose of the bedrock, you will be exposing more of the naturally occurring uranium thorium.	NASA has explored techniques for reducing the amount of material to be moved offsite. Excavation of large amounts soils is the only alternative the will meet the current AOC cleanup requirements and schedule. NASA will comply with the current AOC or future revisions/modifications of the AOC as agreed to by appropriate parties.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>There is no sodium reactor experiment. It was not on NASA's property. It's no longer there, and according to the federal EPA, there is no way we can show any evidence today of one discrete incident. So while there are some radionuclides in Area 4, that should not be addressed on the NASA EIS, in my opinion. But that's what is used to create alarm in my community.</p>	<p>NASA conducted no radiological activities at SSFL. NASA has reviewed the results of EPA's radiological study at SSFL. This study does not identify any radiological contamination migration from Area IV onto the NASA-administered portion of SSFL. However, the 2010 AOC does require NASA to dispose of any soils that have trace levels above the DTSC radiological LUTvalues.</p> <p>NASA screens excavated soils and debris from structures to confirm that the excavated materials have no radiologic restrictions or local, state, and federal requirements regarding management, handling, or disposal.</p>
Bruce	Rowe	<p>It seems like clean to background is a mantra. And I think that the site should be cleaned on the basis of health risk, current health risk, not on the basis of proposed things, actual things, and supposed things that happened in the past.</p>	<p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bruce	Rowe	So there needs to be epidemiologists who study this. There needs to be toxicologists. There needs to be studies of what the current risk is. Anecdotal comments, suppositions have no place in scientific analysis.	Information summarizing the health studies previously conducted as well as the risk assessment of potential exposures from current chemical contaminants at the site will be added to the EIS (Sections 3.9.5 and 3.9.6).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>We need to look at the site. What were the activities there? What was released there 50 years ago? But in reality, what is there today? I think it needs -- the picture needs to be painted better. For example, in 2005 we had a major fire. Burned about 70 percent of the site. So you have a lot of dioxins and these types of chemicals there. But a lot of those chemicals have had to be remediated under ISRA. ...</p> <p>So when people refer to these surface water runoff reports and things, we have to put them in perspective of what's been happening in the past few years. There has been a reduced number of violations.</p>	<p>Those are valid concerns in implementing the soil cleanup required by the 2010 AOC.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	I'd like to see NASA come back with all the alternatives. I know many people want to clean up to the suburban residential standard with the end use being parkland.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.
Christine	Rowe	And -- but we still need to look at all that because we aren't just looking at NASA's trucks. We are looking at all the trucks. And again, yesterday it was brought up, where are you going to get the back soil off site that meets the AOC requirements?	<p>Section 2.2 of the EIS identifies potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California. According to the 2010 AOC backfill soil must meet the LUTvalues. These sources have not been evaluated to determine if they can meet the 2010 AOC requirement.</p> <p>The following potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California:</p> <ul style="list-style-type: none"> - P. W. Gillibrand Company, located in Simi Valley, California - Rindge Dam, located in Malibu Canyon, California - Santa Paula Materials, Inc., located in Santa Paula, California - Grimes Rock, Inc., located in Fillmore, California - Tapo Rock and Sand Products, located in Simi Valley, California

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>In terms of the health studies, people refer to the UCLA study on former employees. But there's a better study done by Boeing-United Auto Workers that looks at the history of that employee, from prior to working for Atomics International and after their work, done by Dr. Boyce, and it's much more comprehensive. And it doesn't show the same types of level of cancers and correlations that the UCLA study does show. A third of us will get cancer at some time in our life. We know that as a fact. But just because someone has gotten cancer it doesn't mean that they got it from the site. I am not saying that someone didn't get it from the site. I'm just saying that it's not possible to prove it.</p>	<p>NASA appreciates the comment regarding health risk, and it has been noted.</p>
Christine	Rowe	<p>But I think that we do, as I said earlier, need to look at the health studies and -- but we need to look at the site status today and the impact of the work that you're proposing under the AOCs, and I would like to see the AOCs renegotiated.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christine	Rowe	<p>I just want to state that I have personal communication with both the epidemiologist who did the retinal blastoma studies and with Dr. Morgenstern, who addressed them at the SSFL work group, that there is no way to correlate that illness with the Santa Susana Field Lab, yet alone do causation.</p> <p>And so while I feel terrible for the parents and the children that have this tremendous illness, we cannot allow people who do not have the credentials to make these kinds of statements. So we need epidemiologists to be the ones who address them.</p>	<p>NASA appreciates the comment regarding health risk, and it has been noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	Please include this letter that I sent to DTSC's legal counsel regarding CEQA in my NASA DEIS comments. I believe that DTSC should have begun their full site Environmental Impact Report (EIR) a long time ago. It is my opinion that as new information came along, the data the was prepared for the EIR could have utilized a supplemental or an Addendum to that EIR.	NASA acknowledges your comment. This comment regards the DTSC EIR.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>1. It is my understanding that the Federal Department of Justice consulted with the Federal Agencies - I assume with NASA. It is my interpretation of the DOJ's conclusion that the Administrative Orders on Consent (AOC) was not signed to comply with SB 990. (1) - (page 20 Adobe)</p> <p>2. As a technical stakeholder at many DTSC meetings on the 2009 Proposed Consent Order - I respectfully disagree with that interpretation. The 2010 AOCs were written, in my opinion, to comply with the 2007 Consent Order and SB 990. See page one of the Power Point by DTSC. (And please see the attachment called the 2.0 version of the 2009 Draft Consent Order - page 7 Adobe)</p> <p>3. If the 9th Circuit Court upholds the lower courts ruling on SB 990, in my opinion, then SB 990 should be null. NASA therefore should consider renegotiating the AOC for a number of reasons.</p> <p>4. According to the Power Point by DTSC, CEQA review should have been started in 2011 - we are almost into 2014. (page 13 of the Power Point by DTSC) We have not started a CEQA review.</p> <p>5. With three Responsible Parties all cleaning the SSFL site at one time, it will be detrimental to my community and the environment to send so many trucks down one route over a very short period of time.</p> <p>6. The AOC's will not bypass CEQA, the Endangered Species Act, and Historic preservation. (page 10 of the Power Point by DTSC)</p> <p>7. The first thing that a scientist or an educator does is to define a term that they are going to use. The term: "Historic preservation" is not defined in this Power Point, therefore, it can refer to historic structures or archaeological sites - in my opinion. (see page 10 of the Power Point by DTSC)</p> <p>8. In the NASA AOC with DTSC, under possible exceptions, this line discusses the cultural aspects of the site: "Native American artifacts that are formally recognized as Cultural Resources ". This term artifact is not defined. (page 43 Adobe of the NASA AOC).(2)</p> <p>9. Please refer to my email regarding the definition of an artifact and other similar terms dated September 5th, 2013.</p> <p>10. In our Section 106 Consultation meeting, someone that is much more</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	It is my strongest opinion that it is irresponsible of NASA to consider this one cleanup alternative (the AOC) as the only possible alternative under NEPA despite all political pressures.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.
Christine	Rowe	Why are we not being briefed by Fish and Wildlife representatives and other environmental agencies that understand the applicable laws, and the true risk of this cleanup under the Administrative Order on Consent (AOC) level to the environment?	Federal agencies, including the USFWS, are part of the NEPA process through direct consultation with NASA. Impacts on resources under those agencies jurisdictions, such as listed wildlife for USFWS or wetlands for the USACE, are assessed by those agencies. Those impacts are in turn reflected in the EIS, including design criteria and MMs employed to reduce or eliminate those impacts.
Christine	Rowe	Page 157 Adobe of Appendices Part 2, the Northern Drainage is defined."The Northern Drainage passes through the southern portion of Area I and the northeastern portion of Area II (Figures 3-1 and 3-2). Is this definition correct? I thought the Northern Drainage in AREA I stopped just near the entrance of the SSFL site since that area becomes rather steep Page 167 - Appendix A - Canoga Park Pierce Coll, California Canoga Park Pierce Coll, California (041484) That would be t "Los Angeles Community College District's Pierce College weather station. http:// piercecollegeweatr.com	The Northern Drainage is described accurately in the text and depicted correctly on Figures 3-1 and 3-2 of the EIS. The weather station link provided in Appendix A of the EIS generates a report showing weather data and the heading of the report is as depicted on Acrobat Page 167 of Appendix A in the EIS and as shown in the comment.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>In completing the review of Part 3 of the Appendices, I think that the physical contact addresses of the Native Americans should have been redacted. I also do not believe there should have been a sign in sheet for Section 106 consultants included - couldn't minutes of the meeting have been provided in lieu of that document? I am sure my contact information is all over the internet. However, this is an FYI for future documents. If you use a sign in sheet - couldn't contact information have been redacted? And there are many more Section 106 consultants than on that sign in sheet. Please don't post all of those in the future. Did anyone at NASA get approval to post those lists which contain private home phones, personal addresses, etc?</p>	<p>NASA will remove personal information.</p>
Christine	Rowe	<p>Your document stated that there has not been an earthquake greater than 6.0 in the region.</p> <p>It is my understanding that the consultants for this project should have done a literature search regarding earthquake history in the region. Had they done a competent literature search, and an actual review of those documents, they would have discovered both the original sources (their 1978 source), the more recent documents related to the Northridge quake of 1994, and the location of the fault systems related to that Northridge quake.</p> <p>I believe that the attached statement was not the appropriate statement to quote from the 1978 source considering the earthquake history of California - and the potential for another major quake in California within our lifetimes.</p> <p>While I did a search for the key word earthquakes in your document, and while your references do mention the Northridge Earthquake, I do not believe that the author of this section realized the regional impact of that earthquake.</p>	<p>You are correct about earthquake magnitudes. The EIS will be changed in Section 3.7.4 to reflect your comment.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	As someone stated at the DEIS meeting, digging up the ground around here is correlated with Valley Fevr. There is a health risk which could be correlated to the more that you dig up that top soil. <u>Appropriate mitigation methods need to be in place.</u>	Revisions to the EIS will be made to reflect valley fever concerns. See EIS Section 4.7, Air Quality BMP-1, and Air Quality MM-3.
Christine	Rowe	First, I want to say I was extremely disappointed in the documentation related to the cultural resources of the United States Government property. I recommend that a local archaeological consulting firm perform this Information Center search (again) because they know the project area better than any other local groups in my opinion. Therefore, the two consulting firms that I would recommend for this project are Compass Rose Archaeological and Topanga Archaeolocal.	We acknowledge your comment and suggestions.
Christine	Rowe	Second, before I would hire a consulting firm, I would want to make sure that preservation in situ of the archaeological materials was the agreed upon recommendation of whatever archaeological firm that you hire. I do not support excavation of any archaeological resources for research purposes.	We acknowledge your comment and suggestions. Please refer to the Programmatic Agreement and/or ROD for the resolution of adverse effect to historic properties including archeological resources.
Christine	Rowe	Third, this firm should review the records including any in consultation with the Native American Heritage Commission and the appropriate point of contacts for the federal register of historic places to determine the exact acreage and GIS coordinates so that the Burro Flats complex is appropriately bounded.	We acknowledge your comment and suggestions. Please refer to the Programmatic Agreement and/or ROD for the resolution of adverse effect to historic properties including archeological resources.
Christine	Rowe	Fourth, the Burro Flats complex should be fenced in a protective yet decorative manner so that the fencing can be kept in place in perpetuity. Any additional significant sites should be fenced in a similar manner	In consultation with SHPO and the tribes, NASA is currently developing appropriate protection measures for the Burro Flats site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>Sixth: According to this document: http://www.kshs.org/p/shpo-s-guide-to-archeological-survey/15783 A Phase I survey i "the research and review portion of any project is referred to as Phase I background researc. "The actual survey of the project area, whether reconnaissance or intensive, is called a Phase II survey, and the assessment of archeological sites, which determines the eligibility of a site for listing on the National Register of Historic Places, is referred to as Phase III testing. Phase IV testing refers to the recovery of artifacts for mitigation purpose " Burro Flats has already had Phase III testing, and I believe some Phase IV testing? I believe that some of the Burro Flats materials had been taken to the Southwestern Museum, and other artifacts may be world wide</p>	<p>The website and document referenced are for the state of Kansas and would not apply in California. NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>
Christine	Rowe	<p>Seventh: We know that as the result of the need to remove all vegetation for the radiological survey and chemical co located surveys of AREA IV, that many new archaeological sites were discovered. It is my opinion therefore, that while buildings are demolished, archaeological and Native American monitoring is required.</p>	<p>A process for monitoring in known archeological sites will be developed in consultation with the SHPO and tribes and will be included in the agreement document, which will be signed by SHPO.</p>
Christine	Rowe	<p>Eighth: Whenever any vegetation is removed, before any demolition activity or sampling or soil removal action is taken, a new Phase II survey should be performed of that area.</p>	<p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	I have found this CEQA document that I believe supports my definition of historical resources as applying to both the the structures and the archaeological.	Thank you for sending this document.
Christine	Rowe	<p>Also, since this document is old, are you aware that the Native American Heritage Commission has been relocated? This is a concern since there is a deadline for public comment.</p> <p>Please see the area highlighted in yellow. It is important to notice that what I have highlighted in RED is in reference to the requirement of nondisclosure of archaeological sites to the public - the key word being "withhold".</p>	<p>Yes. NASA is aware of the Native American Heritage Commission's location. Thank you for you comments.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>On NASA DEIS Figure 3.12.- 3, the Figure shows Schools, Parks, and Open Space. It shows the Region of Influence Roadways.</p> <p>Because this map shows areas of open space that are not along the proposed traffic routes, it is not clear to me if this document should show all schools in West Hills, both public and private including preschools and Pierce College. I include Pierce College because I have read their traffic study, and some of the roads that you will be accessing will also be impacted by Pierce traffic. Pierce College is roughly two miles east of Topanga and Victory.</p> <p>This is one link that I found for schools in the LAUSD.</p> <p>http://laschoolboard.org/sites/default/files/images/maps/2012-13BoardDistrict4Map.pdf</p> <p>I have also taken screen shots of other LAUSD maps which I have attached. I have attached all of the elementary school maps for West Hills that I am familiar with.</p> <p>Based upon my research, if you wanted to indicate the major schools in West Hills (I do not know what ones you missed in other Neighborhood Council areas), I believe that you have not noted the following schools:</p> <ol style="list-style-type: none"> 1. Enadia Way Elementary 2. Welby Way Elementary (which also is a Magnet school) 	<p>Schools have been added to Figure 3.12-3 that are in the ROI. Schools were also added to Table 4.8-2.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>I am making reference again to your Figure 3.12 - 3. This time I am referencing the locations of parks in West Hill</p> <p>One of these parks is Shadow Ranch Park - which has historical status in the City of Los Angeles. It is used by the New Community Jewish High School football and other athletic activities; it also still has preschool programs to the best of my knowledge. It is across the street from the New Community Jewish High School to the north. It is also most likely in your Region of Influence Roadways.</p> <p>Other parks that are in West Hills that I do not see located are closer to Valley Circle. Some of these may fall into your Upper Las Virgenes Canyon Open Space Preserve? But they include:</p> <ol style="list-style-type: none"> 1. Castle Peak Par 2. El Escorpion Par 3. West Hills Baseba 4. Knapp Ranch Park West <p>In Woodland Hills on Topanga and Oxnard is Warner Ranch Park. You also missed a major park Woodland Hills on Shoup which is south of Oxnard and north of Burbank I believe).</p> <p>I have attached the Neighborhood Council maps for the four communities that will be potentially impacted by your truck.</p> <p>I have done this for a number of reason:</p> <ol style="list-style-type: none"> 1. I think that all of these Neighborhood Councils (NC) need to be made aware of the NASA DEIS and the potential for all of this future traffic. This is particularly true for the Canoga Park NC which may not have been as actively engaged in the project. A second NC which should be consulted is the Woodland Hills Warner Center N. 2. Both Canoga Park and Chatsworth have census tracts that have a higher 	<p>Thank you for this information, it was considered during the update of the EIS.</p>

Christine	Rowe	<p>I am sending you the Traffic Study for the New Community Jewish High School. This school has been in West Hills with ever expanding enrollment for about a decade. Until just last week, the high school was located on the campus of Shomrei Torah Synagogue on Valley Circle in West Hills. ...</p> <p>Please consider that these will be affluent high school students driving to and from school - there will be very few school buses. The reason that I state that these students are affluent is that their parents will be paying about \$30,000 per year per student. Therefore, it is highly unlikely that they will walk to school - many come from Calabasas, and other places in Ventura County; a number of them come from the West Los Angeles area and will be taking the Topanga or Shoup exits and entrances to go and from school if their parents don't drive them. Please consider this as a new unforeseen impact if your traffic study was prepared in 2011.</p>	<p>The traffic study used to support the EIS was developed during 2013. NASA will evaluate the study you provided to determine if there is additional information not covered in the study we used.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>On Table 2.5 - 1 reference is made to flooding at Santa Susana. While I do recognize that NASA's property is pretty much a mountain top area shaped with a bowl type of interior, if you remove the vegetation and two feet of soil at a minimum over 105 acres, if you remove all of the structures that are in place without the Best Management Practices in place, we could have major flooding and landslides if we were to have a major flood like a hundred year flood.</p> <p>In fact, I believe that the original treatment train that was being designed for Santa Susana by the Boeing Expert Storm Water Panel was supposed to be able to mitigate the impacts of a major flood. I believe that NASA chose to do the ISRA removal action rather than put these more massive treatment systems into place.</p> <p>Table 2.5 - 1 talks about the fact that FEMA has not created any flood insurance maps for the area.</p> <p>I believe that if the DOE and NASA have to remove a great deal of vegetation as the result of their respective AOCs, parts of Santa Susana will be tremendously denuded. This would be similar in nature to the impacts of a brush fire.</p> <p>Since a major brush fire did blow through about 70% of the Santa Susana site, I have attached 2005 maps showing the direction of impacts of the various drainages - some of which could potentially impact my community of West Hills.</p> <p>We also must consider that our local weather patterns nationwide are not the same as they were in the recent past. We have had prolonged periods of drought locally. Other areas of the United States have had tremendous flooding.</p> <p>I don't believe that even NASA can predict future floods - when they will occur. Maybe NOAA can in the short term.</p>	<p>NASA believes the resource areas selected for evaluation are related to the proposed site activities. The rationale for not evaluating the potential impacts of flooding is provided in Table 2.5-1. The EIS describes the potential impacts on the local communities resulting from cleaning up to AOC standards in Section 4 of the document.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>NASA and DTSC with the assistance of the California Department of Health and agencies such as the SCAQMD need to access the health risk of the trucks for demolition and remediation on my community. Can this risk assessment be done before any demolition of the NASA structures begins? We need a risk based cleanup - please.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christine	Rowe	<p>I have asked many times why there was no CEQA analysis for the ISRA action. While I do understand that NASA was under Boeing's NPDES permit, please read the following document. It is my understanding that Boeing's permit is up for renewal next year. NASA may want to take these requirements below into consideration.</p>	<p>Thank you for your comment. NASA will take it into consideration.</p>
Christine	Rowe	<p>To conclude, taking the artifacts from the Southwest Museum is like trying, as some people have suggested, to take a test stand from Santa Susana and send it to the Science Center.</p> <p>While the Southwest Museum is not the original location of these artifacts, it is the collection and the history of this collection, the artifacts and the artifact displays within the context of that museum, that has made it what it has been historically.</p> <p>In turn, if we want to preserve and to protect the historic significance of our recent relationship with the stars, and the prehistory of earlier cultures with the skies, we must leave in place what objects we can at Santa Susana. No museum on site could be worth excavating the Burro Flats site.</p> <p>No museum on site let alone a museum off site could ever replace the sense of history that a person feels when they first stand in awe of the technology that made the people who created these test stands a part of the "greatest generation" in American History.</p>	<p>NASA is in consultation with the SYBCI and SHPO regarding any further archeological investigations and/or data recovery. Please refer to the Programmatic Agreement and/or ROD for additional information.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>As I read this article today on a water fund in Mexico, I thought of NASA Santa Susana. What will happen to our watersheds if you remove all of the vegetation and at least two feet of the top soil on more than 100 acres - a quarter of the U.S. Government property?</p> <p>http://blog.nature.org/conservancy/2013/09/18/new-water-fund-in-mexico-for-people-and-nature/</p> <p>How many wetlands areas will remain after all of the holding ponds on the U.S. Government property have been remediated? Isn't what the NASA DEIS proposes, and what DTSC agreed to in the Administrative Order on Consent, extremely short sighted?</p>	<p>Removal of the topsoil and vegetation may increase the amount of soil in the watershed runoff. Removal of soils will affect approximately 2 acres of the total 3.20 acres of wetlands</p>
Christine	Rowe	<p>I respectfully request that NASA and DTSC take the AOCs back to the "drawing board" - and maybe lose them in a stack of paper.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>While NASA is not the only agency or party that is responsible for the contamination at Santa Susana, NASA should be making a decision on cleanup that is not just based on "Background" or the ability to detect a chemical or radionuclide in a lab - the lowest repeatable level. There must be a real health risk based decision before NASA digs more soil above the levels cleaned up to date under the Imminent and Substantial Endangerment Order for the Northern Drainage ordered by DTSC, and the Interim Source Removal Action ordered by the Waterboard.</p> <p>Based on these articles, just a few spores is enough to cause this disease - especially in a period of drought such as the one that we are facing at Santa Susana today.</p> <p>I respectfully request that NASA approach their medical doctors - I know that NASA does have MDs on their staff - to discuss the real risks to the community from illnesses such as Valley Fever.</p>	<p>NASA recognizes public concern regarding the AOC. The impacts related to the AOC alternative have been addressed in the EIS. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>Valley fever is caused by a fungi, <i>Coccidioides immitis</i> or <i>Coccidioides posadasii</i>, found in arid desert soils. When the soil is disturbed, spores are released into the air and can be carried on the wind. People are exposed when they breathe in the spores. Most people who are exposed do not get sick; however, valley fever can cause flu-like symptoms and, in rare cases, cause meningitis and even death. The soils at SSFL have not been sampled for the fungi that cause valley fever. To meet the AOC cleanup requirements, approximately 500,000 cubic yards of soil will be disturbed. If cleanup alternatives other than soil removal could be used, the amount of soil disturbed would be reduced by approximately 180,000 cubic yards and the dust emissions reduced by approximately 19%. Release of dust during remediation and demolition will be controlled by wetting the soil, limiting the stockpile area to 0.14 acre and height to 8 feet, covering roads with gravel, etc., limiting speed of vehicles, placing tarps over or barriers around stockpiles of soil, ceasing loading during high winds or storms, and removing bulk material from trucks. After remediation, the previously vegetated areas will be planted with a native seed mix.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>I'm writing to state that this action alert was posted on FACEBOOK. The person that posted this does not, to the best of my knowledge, live within the area that could be impacted by Santa Susana at this time, or by the planned trucks that will be used by this site.</p> <p>Furthermore, it is my understanding, that to the best of my knowledge, the person that has posted this letter on the FACEBOOK page, has not been attending the public meetings at DTSC or NASA related meetings in the time that I have been involved in this project. ...</p> <p>Furthermore, I believe that just too much misinformation is getting out related to the current risk from the SSFL site today.</p>	<p>NASA recognizes that some misconceptions exist regarding the history and current status of the site. We try to present the facts clearly and consistently.</p>
Christine	Rowe	<p>It is my hope that NASA will consider all the alternatives that it presented to the community in 2012.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	Please work with DTSC and CDPH as well as the federal EPA to get us a risk based cleanup where the cleanup will not do more harm to the community than what is in place today.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Christine	Rowe	This action alert was posted on a website on FACEBOOK that I am a member of. I erased the preprogrammed message that was on this alert - below in red. I put in my own comments. Unfortunately, I sent the message without copying my comments.	NASA recognizes that some misconceptions exist regarding the history and current status of the site. We try to present the facts clearly and consistently.
Christine	Rowe	<p>As the result of finding the action alert on FACEBOOK, I decided to do a GOOGLE search to find out what else I could find. Not only did I find that the Los Angeles City Council had voted to support the cleanup to the AOCs (I had no knowledge of this action since I no longer read Council files). But I then found this other action alert.</p> <p>Did Congressmember Brownley have NASA appear before her committee on September 20th, 2013, and ask NASA to promise to clean up to the AOC level? Can you please send me the transcripts of what NASA said to this committee?</p> <p>Where is the transparency by NASA to tell the rest of the community that it is taking this action in Congress?</p> <p>Why is there a DEIS process if the cleanup standard is predetermined by Congress?</p>	Congress is not setting the soil cleanup standard, DTSC has done that through the chemical and radiological look-up tables. Congress members have and continue to encourage NASA to follow a strict interpretation of the 2010 AOC.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	It would be nice if NASA posted this kind of information on its website in addition to letters related to the DEIS. I do not live in Congresswoman Brownley's district, and I do not receive emails from her.	NASA will consider that in the future.
Christine	Rowe	<p>On my previous comment related to schools and parks as indicated in Figure 3.12 - 3, I would like to make clarification.</p> <p>There are schools and parks that I listed in my previous comments that are missing on that map such as the New Community Jewish High School.</p> <p>I would like to make it clear that by comparing the map in that figure mentioned above, with maps on Figures 4.5 -1, 4.5 - 2, and 4.5 - 3; there are many more school locations listed - but there are still some schools and parks missing. However those later maps related to schools and parks are more reflective of the actual school locations, and those figures do show Pierce College which is within 1 - 2 miles of the Topanga rote.</p> <p>I respectfully request that you recalculate your numbers for impacted schools based on some real research. Have your consultants contact these schools and find out how many students walk to school, how many are bused, how many bike, and how many are driven. If there are more cars, then that will impact your numbers for intersections your LOS as per Table 4.5 - 2.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	Are you aware that there is a bike plan for Los Angeles that will also be impacted by your trucks? http://www.bicyclela.org/maps_main.htm	
Bruce	Rowe	It appears to me that the cleanup of the Santa Susana Field Lab (SSFL) is being based on a political agenda created by antinuclear activists and not on any logical, practical, or scientific thinking. I am addressing the radiological contamination of the site. At the meeting that I attended on the NASA Draft Environmental Impact Statement, NASA personnel made it clear to those in attendance that NASA did not do any nuclear research in their areas of the SSFL site. However, in my opinion, that is not the general understanding of most people in the community who believe the whole SSFL site is highly radiologically contaminated.	NASA recognizes that some misconceptions exist regarding the history and current status of the site. We try to present the facts clearly and consistently.
Bruce	Rowe	The AOCs are not based on any health risk based factors. There is no evidence that people off site or people currently who are onsite are getting cancers from exposures to radiation on the site. If "hot" areas are found, they should be cleaned up. Are there any "hot" areas in the NASA administered property of the SSFL site?	NASA did not conduct any radiological work and has not found any "hot areas."

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bruce	Rowe	<p>The entire site should be cleaned up to the standards for an end use. However, by removing the amount of soil and therefore vegetation called for in the AOCs, an enormous amount of damage will be done and the risk to the surrounding community will most likely be much greater than the risk presented by the site if the site was cleaned up to a suburban residential standard.</p> <p>The AOC "cure" will or might lead to:</p> <ol style="list-style-type: none"> 1. Increased pollution from the trucks used to carry away soil, vegetation, and the structures. This pollution would come from the fuel emissions from the trucks, the rubber from tires, the materials from brake linings, and so on. There would also be materials (dust) coming off the trucks from its cargo unless strict containment measures were taken to prevent that from happening. These air borne pollutants would increase the health risk to the community. 2. The trucks could also present traffic problems and increase the chance of traffic accidents. 3. Adherence to the AOCs would have a negative effect on cultural resources. The removal of all the test stands and associated structures would remove the opportunity for further generations to see, in situ, some of the remarkable technological achievements that were made during the Cold War generation which were used to protect the United States against attacks from foreign countries which also lead to the United States winning primacy in the space race. The Santa Susana Field Lab was primary and unique in this part of U.S. history. 4. The removal of the top two feet of top soil is also sure to destroy archeological information about the Native American presence in the area. 5. The destruction of the natural habitat will adversely affect the wildlife in the area in obvious ways. Of course, it will simply remove potential habitats. It will remove a part of the 	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bruce	Rowe	<p>I believe that support for the AOCs is driven by propaganda and lobbying by antinuclear groups. It is my opinion that many of the most vocal members of these groups who have been participating in this cleanup – some for decades - have little to no scientific credentials or understanding of the current condition of the site. They often base their scare tactics on old and out dated reports that have no relevance to conditions that exist today. They create and propagate myths about what happened in the past and use anecdotal stories with no scientific relevance at all. They use dogmatic ideas based on a political, not a health and safety, agenda. Therefore, I believe that the AOCs should be rejected and a new agreement should be negotiated that is based on the real health risk of the site in relationship to an end use. By not basing the clean up on an end use, more damage will be done to the area in question than needs to be done and the surrounding community will be exposed to increased health and safety risks.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christine	Rowe	<p>One issue related to the Administrative Order on Consent, and therefore there is concern related to the cultural / archaeological aspects of the SSFL site is addressed on this DTSC power point which I have named the Nine Balancing Criteria of the AOC.</p> <p>Please see page 6 adobe - am I correct in interpreting this as - under exceptions -</p> <p>There is: "No cap on exceptions on detection limits, Native American artifacts / sites, or endangered species?"</p> <p>How does NASA interpret this slide and language related to artifacts and sites? Was this just a community recommendation - or did DTSC accept this in their responses?</p>	<p>NASA is working closely with DTSC to further define Native American Artifacts under the 2010 AOC. In accordance with the Programmatic Agreement and/or ROD NASA has identified Native American Artifacts that it will seek to avoid.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bruce M.	Rowe	<p>The NASA portion of the Santa Susana Field Lab (SSFL) is both historically and archeologically important –one could argue that the site is of prime importance in its role in this country’s Cold War efforts, the space program, and the understanding of the prehistory of this part of California. To remove all physical traces of this history and to potentially disrupt important archeological sites would be a disservice to the men and women who worked to make this country strong and to the earlier inhabitants who lived for thousands of years in this area. It would also be a disservice to the generations to come in not having the opportunity to see the context in which these historical and prehistoric events played out.</p>	<p>NASA appreciates your consideration and comment on the DEIS. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. Comments such as yours are considered during that process. The Programmatic Agreement and ROD will identify MMs selected to address the effects. Please refer to the Programmatic Agreement for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Bruce M.	Rowe	<p>I therefore believe that the AOCs should be rejected and a new agreement should be negotiated that is based on the real health risk of the site in relationship to an end use. This new agreement should include the preservation of at least one of the test stands, perhaps Bravo, and the protection of already discovered and potential archeological materials.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bruce M.	Rowe	<p>Removing all of the buildings and two feet of top soil as proposed in the AOCs will destroy the historic value of the site for all times and potentially also remove important information about the prehistoric past of the area. This would be done without any known benefit to the health and safety of the surrounding community.</p>	<p>NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>NASA plans to enter into a Programmatic Agreement with the California SHPO and the ACHP that identified protection and MMs for historic structures and archaeological resources at the site.</p>
Bruce M.	Rowe	<p>There are no convincing scientific studies that show that the site should be cleaned up to the AOC's standards in terms of reducing the possibilities of diseases such as cancer—if the site's end use is parkland. In fact, there is good reason to believe that such standards will increase both health risk and lead to environmental degradation that will have many negative effects.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bruce M.	Rowe	The number of trucks needed to remove soil and structures presents accident risks to the surrounding community as well as environmental problems in terms of pollution from emissions, the breakdown of truck parts such as brake linings, and dust coming off of the trucks from their cargo of soil. The removal of so much soil will destroy the natural environment used by animal and reduce vegetation that absorbs CO2, a green house gas. Soil removal will also increase the chance of flooding.	NASA notes the impacts that you mentioned. Each are discussed in the EIS.
Bruce M.	Rowe	So why not come up with a plan to save the history, prehistory, and the site's environment. Please look for a way to negotiate a new cleanup plan for the site.	NASA notes your recommendation to negotiate a new cleanup plan for the site. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. NASA plans to enter into a Programmatic Agreement with the California SHPO and the ACHP that identified protection and MMs for historic structures and archaeological resources at the site.

First Name	Last Name	Comment	NASA Response
Christine	Rowe	I have broken the Power Point that I tried to submit yesterday into two parts. I also tried to reduce the resolution. Attached is Part 1 of the two parts of my Power Point for my Section 106 comments and these comments would apply to the NASA DEIS as well.	Thank you for providing this information.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>Due to the current government shutdown, many of the responses that I get from emailing NASA come back with a response that states that the NASA employee has been furloughed.</p> <p>I do not know why NASA chose the NEPA process in which to consider the Section 106 process. However, as a result, our opportunity to meet as Section 106 consultants, and to discuss one of the most critical aspects of the NEPA DEIS document, will most likely be taken away from us because the October 1st, 2013 date has passed.</p> <p>Therefore, the discussion for Section 106 and how to protect the archaeological / cultural aspects of the U.S. Government property now that the whole SSFL site has been declared Sacred Lands by the Santa Ynez Band of Chumash will fall outside of the general public comment period. Our last two meetings focused completely on the preservation of the three historic districts without real discussion of the impact of the cleanup on the archaeological / cultural.</p> <p>I respectfully request that NASA either extend the date for the NASA EIS for one month after the government shutdown has ended, or one month after the project director has the opportunity to consult with the NASA Federal Preservation Officer, and after both employees have the opportunity to consult with their superiors . I suspect that others may have asked for an extension to comment as well.</p> <p>NASA Santa Susana is a unique environment in many ways. The cultural / historical significance of the earliest inhabitants of this site cannot be ignored, and our ability to consult and to be educated by other consultants in regards to this aspect should not be denied. I believe that our focus was taken away from this important aspect</p>	<p>Due to the furlough, NASA will accept comments through October 17, the day NASA returned from the furlough.</p>

Christine	Rowe	<p>I have now found a second error in my written comments to you as a former Board member. Those comments were also supported by Donn Howell and Steve Lenske - former members of the West Hills Neighborhood Council. I was in a rush to get my comments in by the 30th knowing that the U.S. Government was preparing to shut down on October 1st - the deadline of the comments.</p> <p>Please see the letter attached that was used by me and Donn Howell as our former Board member comments. Steve Lenske made personal changes to my draft. The minor corrections are made in red.</p>	Changes noted
Christine	Rowe	<p>I cannot find the article that I was reading two weeks ago. But here are two I think that I read:</p> <p>http://www.upi.com/Science_News/2013/10/02/Pollution-near-high-volume-roadways-said-risk-in-muchof-US/UPI-20781380749594/</p> <p>http://www.latimes.com/science/sciencenow/la-sci-sn-air-pollution-causes-lung-cancer-20131017,0,981625.story#axzz2j8bGUFgS</p>	We will consider the content at these links as we finalize the EIS.
Christine	Rowe	<p>As residents of West Hills and former members of the West Hills Neighborhood Council, we would like to reiterate our concerns related to the limited Draft Environmental Impact Statement that NASA has just produced, and we support the votes of the West Hills Neighborhood Council that we submitted in resolution approved on August 3rd, 2011 and May 17, 2013.</p> <p>For the protection of our community, we respectfully request that NASA do an Environmental Impact Statement that addresses all of the alternative scenarios as was presented at NASA's March 27, 2012, NASA Environmental Impact Study Meeting.</p>	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christine	Rowe	<p>Please also consider our comments in our letter to the City attorney including:</p> <ul style="list-style-type: none"> -the request for the U.S. Government property to not be used for residential use; the use of the Nine Balancing Criteria of CERCLA; -the need to monitor airborne emissions and dust from remediation; -the need to monitor surface water and groundwater; -to monitor soils at the Santa Susana Field Laboratory site until DTSC deems that the site is cleaned to all relevant and applicable laws; -the future use of the site should be parkland or open space based upon the final characterization of the site; -the WHNC recommended preservation of some of the test stands on the NASA property if it can be done in a manner that is protective of public safety and will not impede the cleanup beneath the test stands; -the WHNC supports all environmental laws that are applicable to this site that were protective of endangered species and wildlife that uses the site as a major wildlife corridor; -the WHNC supports all laws that are applicable for the protection of the Native American community and the archaeological sites that are on the National Register of Historic Places. 	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.</p>
Christine	Rowe	<p>In the letter that was attached as coming from former WHNC Board members, I made that initial draft. In reading another former Board member's comments, I discovered a small error. The sentence should state: "When NASA and the DOE signed the 2010 Administrative Order on Consent (AOC) with DTSC, the WHNC considered potential conflicts between the AOCs with the DOE's need to comply with a court order to perform an Environmental Impact Statement." Please add this note to letters that were submitted by me, Stephen Lenske, and Donn Howell.</p>	<p>Thank you for your comment on the DEIS. Your correction is noted here.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
D	Rowe	<p>Over many decades, NASA’s poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	<p>Several aspects of the compliance effort are problematic with regard to the treatment of historic properties. These include NASA’s decision to limit alternatives under consideration, statement of purpose and need for the project, as well as NASA’s level of efforts in identification and evaluation of historic properties, and proposed process to resolve adverse effects to historic properties.</p> <p>Through this letter, the SHPO is notifying NASA of its concerns with these aspects of the Draft EIS and with the successful fulfillment of the 36 CFR 800.8(c) substitution process by which NASA has attempted to satisfy its Section 106 responsibilities.</p>	<p>Please refer to Section 2.4 for the rationale for the changes in alternatives considered. NASA recognizes public concern regarding the AOC and the alternatives in the EIS. NASA will comply with the AOC which will accommodate any future use. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA will comply with the current AOC or future revisions/modifications of the AOC as agreed to by appropriate parties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. Comments such as yours are considered during that process. The Programmatic Agreement and/or ROD will identify MMs selected to address the effects. Please refer to the Programmatic Agreement or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	<p>In 2007, NASA signed a Consent Order for Corrective Action with Boeing, the US Department of Energy, and the California DTSC. This order “identified the required activities for cleanup of soil, groundwater, and surface water at SSFL” (Draft EIS, ES-1).</p> <p>In 2010, NASA and DTSC executed an Administrative Order of Consent (AOC), which “stipulates specific remedial requirements, including characterization and cleanup of soil contamination on the NASA-administered areas of SSFL to Look-Up Table values” (Draft EIS, ES-1).</p> <p>NASA references these two agreements throughout the Draft EIS to justify the restriction of alternatives considered through the NEPA process and as evidence that NASA has committed to soil cleanup at SSFL to Background levels and the remediation work that entails.</p> <p>According to its Federal Preservation Officer, NASA conducted no NEPA review or Section 106 consultation with the Advisory Council on Historic Preservation (ACHP) or the SHPO (or any other parties) regarding either of these documents (Consulting parties’ conference call, August 29, 2013). By signing these two agreements, NASA committed to a course of cleanup activities that has the potential to cause adverse effects to historic properties at SSFL. Additionally, by signing these two agreements without conducting Section 106 consultation, NASA appears to have foreclosed on the opportunity of ACHP to comment on those two undertakings. By continuing to limit alternatives under consideration in the current Draft EIS based upon these two agreements, NASA is approaching a third instance of foreclosure regarding cleanup activities at SSFL.</p>	<p>We acknowledge your comments however NASA has confirmed with the ACHP that the Agreements themselves do not foreclose the ACHP’s ability to comment on these actions. This EIS and related S106 consultation afford every opportunity to comment in accordance with the regulations.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	The SHPO previously raised these concerns in conversations with NASA and in the December 3, 2012, comment letter. No response has been received as of the date of this letter.	NASA has been conducting ongoing consultation with regards to the issues raised by SHPO and has conducted multiple telephone conversations as well. The consultation is ongoing and should result in a Programmatic Agreement with SHPO and NASA among the signatories.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	<p>In the June 30, 2011, letter initiating Section 106 consultation, NASA defined the undertaking as demolition and cleanup activities on the NASA-administered portion of SSFL. In the December 3, 2012, comment letter, the SHPO stated that the Draft EIS should “contain a clear and complete explanation of any and all actions that are anticipated to follow from the cleanup and remediation activities that may affect cultural resources, including any possible excess property declaration and plans for disposal that may include transfer out of federal ownership. Demolition, cleanup, and disposal all constitute Undertakings as defined in 36 CFR Part 800.”</p> <p>NASA responded that the purpose of the undertaking was remediation of contaminated soils and groundwater, and that General Services Administration (GSA) will be conducting separate environmental compliance for the disposal of the property.</p> <p>The Draft EIS states the following Purpose and Need for the Action: “The purpose of the Proposed Action is to remediate the environment to a level that meets NASA’s environmental cleanup responsibilities and to undertake the demolition actions necessary to support both remediation and property disposition of the NASA-administered portion of SSFL (emphasis added).”</p> <p>Inclusion of “disposition” in the Purpose and Need presents several problems for this consultation. The Draft EIS contains no analysis or specifications for what portion of demolition of architectural resources is related to cleanup, and what portion of demolition is related to disposition.</p> <p>NASA representatives stated that demolition of up to 100% of the buildings and structures is intended to prepare the property for disposal rather than to facilitate soil or groundwater cleanup.</p>	<p>Demolition is NASA's action, not disposition. NASA decided SSFL property and structures were no longer required to support its mission and, on September 14, 2009, NASA reported the property to the GSA as excess. GSA conditionally accepted NASA's report of excess pending NASA's certification that remedial action necessary to protect human health and the environment with respect to hazardous substances on the property has been completed. The GSA will conduct a separate environmental review under NEPA for the action of transferring the land out of NASA stewardship (which is NASA's understanding of the "disposition action"). NASA and the GSA are coordinating during the preparation of the two environmental documents.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	In a meeting on September 18, 2013, the state DTSC clarified that neither the 2007 Consent Order nor the 2010 AOC mandates demolition of buildings and structures. Instead, the documents requested that NASA submit a demolition plan, and DTSC would determine if it was sufficient to facilitate soils and groundwater remediation. If buildings not proposed for demolition hindered full cleanup to background levels, DTSC could require further demolition. If NASA has submitted a demolition plan, the SHPO has not received a copy of it.	NASA agrees with SHPO's interpretation that neither the 2007 Consent Order nor the 2010 AOC mandates demolition of buildings. What you refer to as a "demolition plan" is NASA's Standard Operating Procedures: Building Demolition Debris Characterization and Management for SSFL (SSFL). It is general procedures that were developed within the framework established by applicable federal, state, and local regulations, and will govern NASA's characterization and management of wastes generated during building demolition at SSFL. A copy will be forwarded to your office.
Carol	Rowland-Nawi (SHPO)	It appears that total demolition to facilitate disposal is a discretionary decision on NASA's part that is not mandated by the cleanup agreements, and nothing restricts NASA from considering alternatives that include something less than total demolition. Yet, the DEIS does not contain sufficient analysis of such alternatives, because NASA maintains that their "hands are tied" by the AOC which, in their interpretation, precludes all other alternatives except those included in the DEIS.	NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others.
Carol	Rowland-Nawi (SHPO)	Furthermore, it is the SHPO's opinion that splitting environmental compliance for cleanup activities from compliance for disposition artificially and improperly segments the undertaking, which appears to be NASA's disposal of its property at SSFL. The Section 106 consultation and EIS should take into account both the cleanup activities and disposition of the property rather than falsely contend that they are separate and unrelated activities.	NASA's proposed actions include only the cleanup and demolition activities at the site. NASA has formally requested that GSA commence excess procedures, and GSA is responsible for following 36 CFR 800 for the disposal.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	Other than the No Action alternative, which is mandated by NEPA, NASA has not given full consideration to reasonable alternatives that would avoid the adverse effects to historic properties that will result from the Proposed Action. The Draft EIS contains no evidence that NASA has made an effort to analyze the feasibility of retaining any of the historic buildings and structures or to avoid large-scale soil removal at SSFL.	NASA recognizes public concern regarding the AOC and the alternatives in the EIS. NASA will comply with the AOC which will accommodate any future use. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA will comply with the current AOC or future revisions/modifications of the AOC as agreed to by appropriate parties. NASA appreciates your consideration and comment on the DEIS. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. Comments such as yours are considered during that process. The Programmatic Agreement and ROD will identify MMs selected to address the effects. Please refer to the Programmatic Agreement for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.
Carol	Rowland-Nawi (SHPO)	The magnitude of adverse effects / significant impacts that will result from the Proposed Action warrants serious consideration of alternatives that avoid or minimize effects / impacts. These should be analyzed at the alternatives stage rather than suggested as possible mitigation measures at the end of the process.	NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	When a federal agency chooses to use the NEPA process for Section 106 purposes, the documentation submitted must meet the standards outlined in 36 CFR Part 800.8(c)(1)(i-v), which are intended to accomplish the goals of the consultation process outlined in 36 CFR Part 800.3 through 6. The SHPO finds that these standards have not been met during this consultation and that the substitution process has not been sufficient for the following reasons.	NASA has been in consultation with SHPO and ACHP and has met the standards. NASA additionally has opted to revert to consultation under 36 CFR 800.3 through 6 at the request of the SHPO.
Carol	Rowland-Nawi (SHPO)	NASA has excluded disposition of its property from the undertaking and consultation, but is using disposition as justification for an unspecified amount of demolition of historic structures at SSFL. The undertaking should properly consider both cleanup activities and disposition if disposition influences the Proposed Action. If it does not, then disposition should not factor into the Purpose and Need for the Proposed Action / Undertaking.	Demolition is NASA's action, not disposition. NASA decided SSFL property and structures were no longer required to support its mission and, on September 14, 2009, NASA reported the property to the GSA as excess. GSA conditionally accepted NASA's report of excess pending NASA's certification that remedial action necessary to protect human health and the environment with respect to hazardous substances on the property has been completed. The GSA will conduct a separate environmental review under NEPA for the action of transferring the land out of NASA stewardship (which is NASA's understanding of the "disposition action"). NASA and the GSA are coordinating during the preparation of the two environmental documents.
Carol	Rowland-Nawi (SHPO)	Given NASA's agreements with DTSC and reliance upon the Consent Order and AOC for determining the level of cleanup, the consultation should properly include active participation from DTSC. On several occasions, NASA has told the SHPO that DTSC has not only mandated cleanup to Background levels, but any work NASA proposes will have to be approved by DTSC. As stated above, NASA, SHPO, and Santa Ynez Band of Chumash Indians met on September 18, 2013, (ACHP declined to participate). This meeting provided much needed clarity regarding the two DTSC agreements with NASA. It would have been ideal to hold discussions such as this one early in the process as mandated by 36 CFR 800.8(c), and the SHPO encourages ongoing coordination between these consulting parties in an effort to resolve adverse effects.	NASA will continue to coordinate with SHPO, DTSC, and the Santa Ynez Band of Chumash Indians.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	It is not clear that all other potential consulting parties have been identified or contacted, such as the U.S. Army Corps of Engineers (for a Section 404 permit).	<p>NASA established early on a process for applying to be a Section 106 consulting party. The request form is open to the public and available on the NASA SSFL website.</p> <p>Biology BMP-5: NASA would obtain a CWA Section 404 Permit from the USACE and a CWA Section 401 permit from the RWQCB for the discharge or dredge of material into jurisdictional waters of the U.S. The Section 404 and 401 permits would include necessary measures to avoid, minimize, or otherwise mitigate impacts to wetlands and other waters of the U.S.</p>
Carol	Rowland-Nawi (SHPO)	In spite of previous requests and comments from the SHPO and other consulting parties, Historic Property Identification and Evaluation remains incomplete. Most recently, the SHPO's letter dated May 20, 2013, provided comments on archaeological identification efforts that have not been fully addressed by NASA.	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>
Carol	Rowland-Nawi (SHPO)	In order to inform and seek comments from the public, Tribal groups, agencies, and stakeholders regarding impacts to the cultural resources, the following items should be completed and the results of these studies should be included in the draft EIR.	NASA acknowledges your comment.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	NASA's archaeologist(s) should write an archaeological context for the area and use it to address the potential presence of an archaeological district. The Traditional Cultural Property (TCP) study and Cultural Landscape Assessment that are currently under preparation do not substitute for this analysis. The archaeological district identification and evaluation should take into consideration the known properties resulting from the 1-mile literature survey. There are several cultural resources on the Boeing property that may very well be considered part of an archaeological district with Burro Flats as a focal point.	A potential archeological district would likely include the majority of sites off NASA-administered property. NASA is required to identify historic properties within its Area of Potential Effect which includes NASA owned portions of SSFL and a few small portions of Boeing land.
Carol	Rowland-Nawi (SHPO)	Restricting the study area to the boundaries of the NASA-administered property is insufficient. NASA contends that it is unable to conduct identification and evaluation efforts on property it does not own. The scale of adverse effects from soil removal and other remediation efforts warrants a broad study of resources in the area, including on Boeing and Department of Energy (DOE) property, because of the potential for effects to resources that span the property boundary.	NASA is required to identify historic properties within its Area of Potential Effect which includes NASA owned portions of SSFL and a few small portions of Boeing land. The EIS does note likely cumulative impacts of activities in and around NASA's impact area.
Carol	Rowland-Nawi (SHPO)	The Draft EIS states that NASA is consulting exclusively with the Santa Ynez Band of Chumash Indians with regard to the designated Sacred Site, TCP, and Cultural Landscape Assessment (Draft EIS, 4-19). Nothing in the regulations requires or justifies exclusion of the SHPO and ACHP from this consultation, and both play a regulatory role in the evaluation of historic properties such as TCPs and Cultural Landscapes.	NASA received a specific request from the Santa Ynez Band of Chumash Indians to consult independently from other consulting parties. NASA respects their request. On occasion the Santa Ynez have attended consulting parties meetings in person at the request of NASA for the benefit of the consultation, but NASA has also been conducting its consultation in private with the Tribe at their request. SHPO and ACHP, as well as the Santa Ynez, will receive the TCP and cultural landscape report for review and comment. It is a highly confidential document, so will not be circulated for public review.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	Along with the archaeological context and district evaluation, the TCP study and Cultural Landscape Assessment should form the cornerstone for historic property identification and evaluation efforts. Failure to complete these studies in time for them to inform alternative selection will result in a failure to adequately comply with 36 CFR 800.8(c)(1)(ii), which compels the federal agency to identify historic properties and assess effects consistent with the standards and criteria of 36 CFR 800.4 through 800.5. Inclusion of historic preservation issues. Completion of this identification effort is especially vital given the destructive nature of the remediation efforts and potential effects to the archaeological resources, as well as impacts to traditional cultural values and practices.	The TCP and cultural landscape study will be completed and reviewed by SHPO prior to the completion of the FEIS. The DEIS provided analysis of the potential impacts to a TCP of the proposed action in Section 4.3.
Carol	Rowland-Nawi (SHPO)	<p>The Burro Flats site (as well as the other two identified archaeological properties) needs to be analyzed under all National Register of Historic Places (NRHP) eligibility criteria, not just Criterion D.</p> <p>NASA should not be relying solely on a 38-year old NRHP nomination. NASA should consider updating the NRHP nomination to reflect current site conditions and also addressing all NRHP criteria.</p> <p>NASA should reconcile all of the available information on the Burro Flat site, including but not limited to a resurvey of the site, locating / spot-checking all of the identified loci from the previous surveys and studies, etc.</p>	<p>NASA relied on information collected between the 1950s and 2007. The Burro Flats site was revisited and resurveyed in June 2007 to reassess the nature and extent of the previously recorded Burro Flats site in NASA's Area II. As a result, of this investigation, California Department of Parks and Recreation Primary Record forms for Burro Flats were updated and submitted to SHPO.</p> <p>Thank you for your suggestions regarding additional investigations that could be carried out.</p>
Carol	Rowland-Nawi (SHPO)	Boundary delineation should occur at this stage to fully inform the assessment of adverse effects, rather than postponing it and considering it a mitigation measure.	The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA also conducted studies in 2007 to reaffirm the boundary. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. Since it is already listed in the National Register, there is no requirement under the law for additional boundary delineation as part of identifying historic properties.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	The SHPO disagrees with NASA's assertion that the boundaries of a potential archaeological district at SSFL are limited to the boundaries of the Burro Flat National Register Archaeological District.	There is some confusion as NASA has not asserted any boundaries of any historic district for archeological resources.
Carol	Rowland-Nawi (SHPO)	The SHPO concurs that the Proposed Action will adversely affect historic properties. The scale of adverse effects, while still being determined, is disturbing and disappointing. The extent of adverse effects remains unknown until the full scope of cleanup activities is known and identification and evaluation efforts are complete. NASA does not intend to complete these steps prior to its Record of Decision (ROD), making it extremely difficult to agree upon appropriate resolution of the adverse effects.	NASA notes your concurrence and your comments on the extent of the adverse effect. The Programmatic Agreement and/or ROD identifies considerations of multiple steps leading to the cleanup activities.
Carol	Rowland-Nawi (SHPO)	The Draft EIS contains language that, "Appropriate measures, such as preparing a plan for unanticipated discoveries, should be implemented to address the possibility of impacts on buried resources from the undertaking" (Draft EIS, C-52). However, the document does not specify when this plan will be written, how or when consulting parties will be able to review and comment on it, or how NASA will demonstrate its commitment to following the plan.	NASA is considering developing a Programmatic Agreement to stipulate MMs and other commitments, rather than codifying those commitments in the ROD as originally planned. The Programmatic Agreement and/or ROD would include an unanticipated discoveries plan.
Carol	Rowland-Nawi (SHPO)	The full extent of adverse effects remains unknown. NASA proposes to continue working on the TCP and Cultural Landscape analysis and will adjust the Area of Potential Effects in accordance with the findings of these studies. However, NASA has offered no plan to allow consulting parties to comment on this analysis, either prior to release of the Final EIS or after it is released.	The Traditional Cultural Properties and Cultural Landscape Assessment report is a confidential document. SHPO and ACHP will have the opportunity to review the report but it will not be made available to the public.
Carol	Rowland-Nawi (SHPO)	The mitigation measures included in the Draft EIS are premature and insufficient.	NASA will consider MM recommendations submitted by the public and consulting parties as it finalizes the agreement document stipulating NASA's commitments.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	<p>NASA proposes the retention of a single test stand as a mitigation measure.</p> <p>Retention of a test stand would properly be considered an avoidance or minimization measure, but first should be included in the alternative analysis.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others.</p>
Carol	Rowland-Nawi (SHPO)	<p>NASA proposes HABS / HAER recordation of the nine individually-eligible structures at SSFL.</p> <p>The nine individually-eligible structures are not the only historic properties proposed for demolition. Recordation should properly include all contributors to the three historic districts associated with the test stands, too.</p> <p>No level of recordation is specified.</p>	<p>Documentation is part of the discussions NASA and SHPO are conducting and will be included in the final Programmatic Agreement and/or ROD.</p>
Carol	Rowland-Nawi (SHPO)	<p>NASA proposes to produce an in-depth ethnographic study based upon research from the TCP study.</p> <p>An ethnographic study should be produced prior to issuance of the Final EIS so NASA can use it to identify and evaluate historic properties, assess effects, and develop appropriate avoidance, minimization, and mitigation measures.</p>	<p>We acknowledge your comment on the MMs proposed in the DEIS. The TCP investigation meets the requirement to identify historic properties; the proposed mitigation would provide a more in-depth ethnographic study to build on the investigations carried out for the TCP assessment.</p>
Carol	Rowland-Nawi (SHPO)	<p>NASA proposes to delineate the boundaries of the Burro Flats Painted Cave archaeological site, which was listed in the NRHP in 1976.</p> <p>As with the ethnographic study, the boundaries of this site (and a possibly associated archaeological district) should be delineated prior to issuance of the Final EIS so NASA can use it to identify and evaluate historic properties, assess effects, and develop appropriate avoidance, minimization, and mitigation measures.</p>	<p>The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. Since it is already listed in the National Register, there is no requirement under the law for additional boundary delineation as part of identifying historic properties. As part of the Programmatic Agreement and/or ROD NASA will provide additional research and archeological investigations to update the NRHP form.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	<p>NASA proposes to design and install temporary protection measures for the Burro Flats site during implementation of the proposed action.</p> <p>The SHPO appreciates NASA's willingness to implement protection measures, but these should be part of the scope of work rather than a mitigation measure.</p> <p>Consultation regarding protection measures should also include Tribal groups.</p> <p>NASA has not proposed protection measures for any of the other historic properties at SSFL</p>	<p>In consultation with SHPO and the tribes, NASA is currently developing appropriate protection measures for the Burro Flats site.</p>
Carol	Rowland-Nawi (SHPO)	<p>NASA also should prepare a permanent protection plan for Burro Flats that extends beyond the duration of cleanup activities, and propose a Section 106 consultation plan for its implementation.</p> <p>As discussed in the August 29 consulting parties' conference call, the SHPO agrees that existing historic property recordation and nominations should be updated as a mitigation measure.</p>	<p>Thank you for your MM suggestion. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p>
Carol	Rowland-Nawi (SHPO)	<p>Throughout the consultation process and in the Draft EIS, NASA states that resolution of adverse effects and the Section 106 process will be finalized in the Record of Decision for the Final EIS. Given the schedule NASA has for adoption of the ROD and the limits of current cultural resource identification noted above, a resolution of adverse effects that would meet minimum standards consistent with 36 CFR Part 800.8(c)(1)(i-v) cannot be reasonably achieved. Without a substantive and enforceable agreement document, the requirements of 36 CFR 800(c) are not satisfied and the SHPO would have to consider submitting objections to NASA in accordance with 36 CFR 800.8(c)(2)(ii).</p>	<p>NASA is developing a Programmatic Agreement to stipulate MMs and other commitments. SHPO would be a signatory to that agreement document.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Rowland-Nawi (SHPO)	The SHPO continues to believe, as stated on several occasions during this consultation, that an agreement document would be a more appropriate vehicle for resolving adverse effects, given the complexity of the undertaking, phased identification contemplated, scale of adverse effect, and multiple years required to implement the undertaking. Whichever document is utilized, it is essential that NASA enter into a legally-binding and enforceable agreement to resolve adverse effects to historic properties.	NASA is developing a Programmatic Agreement to stipulate MMs and other commitments. SHPO would be a signatory to that agreement document.
Carol	Rowland-Nawi (SHPO)	Finally, outstanding issues remain from the 2010 AOC, including the definition of "Native American artifacts" and the manner by which NASA can apply the 5% exception provision to historic properties. Per the September 18, 2013, meeting with DTSC, NASA, SHPO, and Santa Ynez Band of Chumash Indians, neither NASA nor DTSC could provide an explanation of how the 5% exemption was determined or what scientific or other basis informed this decision. It appears that the exemption of 5% is arbitrary and capricious and artificially limits the consideration of alternatives, options for avoidance and minimization, and mitigation of adverse effects to historic properties. Along with discussions about extending the timeline, the SHPO recommends ongoing discussions with DTSC and signatory parties to resolve these issues.	NASA acknowledges your comments. NASA will follow the AOC. By following the NEPA process, NASA complies with its statutory requirements (42 U.S.C. 4321 et seq.) and Section 4.0 of the AOC. NASA continues to work expeditiously with DTSC and the public to complete the actions called for in the AOC. NASA realizes that the EIS describes the negative impact of cleanup to background, as required by NEPA. The 2017 schedule and cost for completion are a function of the AOC. If the AOC is revised, NASA will comply with the appropriate NEPA analysis and documentation. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Rowley	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Rowley	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Yves	Rubin	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Joseph	Rund	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chris	Saia	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Chris	Saia	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>In National Park Service's (NPS) scoping letter dated September 22, 2011, NASA was asked to consider three topics relevant to conservation planning at the site:</p> <p>1.NPS manages the National Register of Historic Places. SSFL was a center of scientific research during the Cold War and during early to recent space exploration; several structures from this era remain on the site. The 2008 NASA Historic Resources Survey and Assessment (revised 2009) concluded that nine structures and three historic districts are eligible for the register. In addition, SSFL contains a prehistoric site complex that was listed on the National Register in 1976.</p> <p>2.SSFL is adjacent to the Santa Monica Mountains National Recreation Area. As such, it provides a wildlife linkage between lands within the NPS boundary and the adjacent Simi Hills and Santa Susana Mountains. SSFL also contains archeological sites related to archeological sites found within the NPS boundary.</p> <p>3.SSFL is part of the Rim of the Valley Special Resource Study (RIVA SRS), authorized by Congress in the Consolidated Natural Resources Act of 2008 (P.L. 110-229-May-2008).</p> <p>The NPS is concerned that the Draft EIS inadequately addresses these three topics.</p>	<p>NASA has been working with SHPO, Tribes, and many consulting parties to address these structures. Please refer to the Programmatic Agreement (PA) or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 were incorporated in the PA and/or ROD.</p> <p>NASA recognizes that SSFL is important habitat recognized in linkages by local agencies. It is NASA's understanding that the Rim of the Valley study will be concluded in 2014. This is at least a year before on soil cleanup work is scheduled to start. DOI or NPS would have time to engage NASA and DTSC before any actions resulting in significant impacts to the biological resources occur. NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>Section 3.3 of the EIS discusses the historic significance of the three historic districts identified in NASA's 2009 Historic Resources Survey and Assessment (see document at http://ssfl.msfc.nasa.gov/documents/historical/NASA_Historic_Resources_Survey_2009.pdf).</p>
Patricia	Sanderson Port (DOI)	<p>Furthermore, NPS finds that expressed purpose and need will not be fulfilled by the action alternative, as currently proposed. Our concerns and suggested modifications are summarized below; in addition we have enclosed a table with more detail on specific issues and text corrections.</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>SSFL's and the NASA component's location within the greater public park land and open space setting is not adequately disclosed (Affected Environment).</p> <p>There is no regional vicinity map to illustrate the contextual setting of SSFL and the NASA portion among protected parkland, open space, and surrounding communities. The attached Figure 1 clearly illustrates the nexus of the proposed Project site and the surrounding regional parkland and open space setting. Maps in the Affected Environment and Appendices D and E either have no parkland identification or are missing several areas of public park land and protected open space. None of the maps includes the NPS-SMMNRA boundary. The SMMNRA boundary is shared with the southwestern boundary of SSFL. As noted previously, SSFL is ecologically continuous with the NPS-administered SMMNRA. The prehistoric archaeological sites are also connected to the greater prehistory and Native American cultural heritage of the Simi Hills and Santa Monica Mountains. It is critical to illustrate the parkland setting to more accurately disclose the project's potential for impacts to natural and cultural resources beyond the boundaries of SSFL and the NASA portion and to more fully disclose the site's current and potential future role in the region's ecology and recreation.</p> <p>Regional Park Land Setting, Affected Environment, Section 3 and Appendices D & E: Maps in Section 3 and Appendices D and E either have no parkland identification (Figures 3.4-2, Wildlife Migration Corridor and 3.10-1, Transportation Network), or are missing several areas of public parkland and protected open space (Figure 3.12-3). Several maps in the Draft EIS appendices are also absent any parkland identification (Appendix D, E). None of the maps include the NPS-administered Santa Monica Mountains National Recreation Area boundary. The SMMNRA boundary is shared with the southwestern boundary of SSFL.</p>	<p>NASA will update Figure 2.2-1 to reflect nearby parkland as appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	The Draft EIS has an incomplete description of important cultural resources in the Affected Environment (Section 3.3) and defers essential treatment to the subsequent planning (Section 4.3).	NASA's EIS identified potential historic properties including archeological sites, Traditional Cultural Properties, Indian Sacred Site and historic structures and the likely impacts of the proposed action on those resources. NASA has been working with over 35 consulting parties including Native Americans under Section 106 of the NHPA to identify and determine effects to historic properties. Potential impacts have been noted by the public during the scoping period and the EIS comment period. The efforts to minimize, avoid or mitigate adverse effects are identified in the Programmatic Agreement and/or ROD.
Patricia	Sanderson Port (DOI)	The impacts to cultural resources clearly are adverse and significant for both historic architectural features and archeological resources. Section 106 consultation is still underway. The Draft EIS only suggests mitigation measures that might be considered, with nothing certain and final impacts stated as "Pending consultation" in Table ES-4. Thus, both the impact analysis of cultural resources and consideration of mitigation measures are difficult to evaluate. Because of the preliminary nature of information on archeological resources, clean-up impacts, and mitigation measures, the EIS does not allow for meaningful public input on cultural resource impacts. Instead, the only option for input is through participation in the limited group composed of community consulting parties that advise NASA on Section 106.	NASA's EIS identified potential historic resources and the likely impacts of the proposed action on those resources. NASA has been working with over 35 consulting parties including Native Americans, National Park Service and State Historic Preservation Office under Section 106 of the NHPA to identify and determine effects to historic properties. Potential impacts have been noted by the public during the scoping period and the EIS comment period. The efforts to minimize, avoid or mitigate adverse effects are identified in the Programmatic Agreement and/or ROD.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	The Draft EIS does not have complete information on any aspect of the cultural resource setting. The impacts on archeological resources are uncertain because very limited information is available on the significant site complex associated with the Burro Flats Painted Cave, much of the data being extremely outdated. In addition, the analysis of impacts to cultural resources is also likely inadequate because of the limited soil testing for contaminants in areas rich in archeology, such as the Burro Flats area. Should testing at the outer limits of the cleanup footprint indicate additional soil removal to reach the Look-Up Table values, additional impacts to archeological resources would follow. These uncertainties increase the need to presently identify feasible mitigation measures for the extensive archeological resources in this site complex. The ongoing Traditional Cultural Property and cultural landscape studies and the ongoing consultation on the Native American Sacred Site make impacts and appropriate assignment of mitigation measures even more difficult to consider.	Please refer to the Programmatic Agreement and/or ROD. NASA will undergo additional archeological testing in consultation with SHPO and SYBCI. The SHPO and SYBCI have been provided a copy of the TCP and cultural landscape assessment for comment.
Patricia	Sanderson Port (DOI)	The inventory of architectural resources representing the rocket test stands and related facilities is not well described in the Draft EIS, although an in-depth study was conducted by NASA contractors. Lack of comprehensive descriptions of the nationally significant historic districts and lack of images of the test stands make it difficult for readers of the EIS who have not visited the site to understand the full potential of these historic resources and the possible impacts of their removal.	Several paragraphs on the history of each of the historic districts will be added to the technical report in Appendix C of the EIS. The full ACI and WR report will not be attached to the technical report in Appendix C.
Patricia	Sanderson Port (DOI)	The Draft EIS presents the possibility that some historic structures could be preserved, however it does not define how preservation of any structures would be reconciled with project goals and objectives. The Purpose and Need statement requires cleanup to background levels and the project description calls for complete demolition and hauling away of virtually all structures.	Please refer to the Programmatic Agreement and/or ROD. NASA will retain historic structures only if the cleanup goals can be achieved or through the use of exceptions in accordance with the AOC.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>The Draft EIS has substantial shortcomings in describing biological resources and characterizing the severity of the proposed action’s impacts. The Draft EIS also does not disclose adequate, feasible mitigation measures for either cultural resources or biological resources.</p>	<p>The EIS will be revised to better explain cultural and biological mitigations (Sections 4.3.2 and 4.4.2). Please refer to the Programmatic Agreement and/or ROD for additional on cultural resources avoidance and mitigation plans. NASA will comply with the Biological Assessment and mitigations as concurred with by the US Fish and Wildlife Service.</p>
Patricia	Sanderson Port (DOI)	<p>However, Table ES-4 also lists a moderate, beneficial, regional, long-term impact attributed to increasing the area of undeveloped habitat and from removing contamination. After mitigation, the Draft EIS finds impacts from the action alternative on the majority of topics are mostly at the level of impact of the no action alternative (Table ES-4).</p> <p>We find this conclusion to be potentially incorrect due to the insufficiency of biological resource surveys and the potentially incorrect assumption that remediated areas will recover their biological diversity and ecological function. Extensive research in remediation of abandoned mine sites indicates that restoration of functional soil and vegetation communities after remediation is extremely difficult to achieve. However, the post-mitigation final impact level on both cultural and biological resources is still pending agency consultations. NPS finds the action alternative, as currently proposed, has the potential to have great irreversible negative impacts on native habitat and associated flora and fauna and wildlife movement.</p>	<p>NASA recognizes that impacts to some resources will be significant and cannot be fully mitigated. NASA reassessed the potential for beneficial impacts in this area, and agrees the impacts should be less. The EIS will be modified from moderate to minor. Please refer to Table 4.4-1 for a better explanation of impacts (Table ES-4).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>The Draft EIS undervalues the NASA property’s open space and habitat contribution to wildlife movement through the greater SSFL and surrounding open space setting (Section 3.4.2). NPS cannot overemphasize that SSFL, including the NASA property, contributes to habitat connectivity owing to juxtaposition with contiguous open space and park land and because of the diversity and overall quality of the on-site native habitat.</p> <p>“SSFL habitat and species diversity, physical attributes, and geographic location make the area a potentially important route for species migrations. Open space at SSFL could play a role for habitat linkage among the Santa Susana Mountains, the Simi Hills, and possibly, the Santa Monica Mountains (NASA, 2011b). However, the NASA-administered portions of SSFL are outside of the critical habitat corridors in the region identified by the U.S. Fish and Wildlife Service (USFWS) (Figure 3.4-2) (Ventura County, 2005)” (pg. 3-23).</p> <p>There are several errors in this statement. The citation is incorrect and fails to reference the key report on the habitat linkage between the Sierra Madre and the Santa Monica Mountains (South Coast Missing Linkages Report, Penrod, et al. 2006). The presentation that SSFL could only “possibly” play a role connecting habitat into the Santa Monica Mountains illustrates a lack of familiarity with research on habitat connectivity in this region. The exclusion of NASA property from the habitat linkage is overly conservative and presents a narrow interpretation of the complex set of factors used to model and map a wildlife habitat linkage.</p> <p>The Environmental Consequences assessment of wildlife impacts (Section 4.4.1.3, pg. 4-36) perpetuates the Affected Environment’s inaccurate presentation that the NASA portion of SSFL is not part of any wildlife movement corridor. By asserting that the NASA property is not part of a wildlife movement corridor, the Draft EIS inappropriately lacks analysis of effects on wildlife movement through the cleanup areas.</p>	<p>NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. The EIS text has been revised in section 4.4.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>The Draft EIS minimizes the extent of impacts on several sensitive species owing to non-systematic wildlife surveys.</p> <p>The Draft EIS bases impacts on listed species on wildlife surveys that were opportunistically conducted during the special-status plant surveys (Appendix E, Section 2.2, pg. E-28). Therefore, no USFWS or other rigorous protocols were followed when looking for species that were endangered, threatened, or of special concern. Appropriate survey protocols may have led to discovery of several more sensitive species than observed in the fall 2010 and spring 2011 biological surveys, with associated negative impacts to those species.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>The Environmental Consequences' contaminant impacts on wildlife are not substantiated (Section 4.4.1.3) and impacts from loss of native habitat are not considered.</p> <p>The Draft EIS states that contaminants on-site, such as mercury and polychlorinated biphenyls (PCBs), could result in wildlife mortality owing to ingestion that becomes concentrated in animals higher in the food chain. This may be occurring at the site, although the Draft EIS offers no studies to substantiate contaminant levels in wildlife either residing within or moving through the site. It is possible that a more significant impact could result from the removal of native habitat and soils and following habitat type conversion than the negative impact of ingestion of contaminated vegetation or soils.</p> <p>The subsequent EIS should provide an analysis of the impacts of contaminant ingestion on wildlife based on contaminant levels in vegetation and typical ingestion rates and possible accumulation rates in the food chain versus impacts on wildlife from the complete loss of native habitat for the foreseeable future.</p>	<p>NASA recognizes a significant long term impact to vegetation communities and a moderate impact to wildlife. Please refer to Section 4.4 of the EIS. NASA has modified the EIS to reflect comments raised by DOI.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>The Draft EIS references an inadequate vegetation survey and obscures the importance of rocky outcrop habitat by including it within other vegetation types.</p> <p>The Draft EIS refers only to Appendix D, the 2010 fall field work report dated February 2011. However, Appendix E does provide a more extensive list of species observed in spring, 2011, and the information is presented accurately and more comprehensively. Relevant information in Appendix E should be incorporated in the analysis prepared for the subsequent EIS.</p> <p>Rocky outcrop habitat should be included as a habitat type in Table 3.4-1. The incorporation of rocky outcrops into other types, as presented in Appendix D, limits the disclosure of rocky outcrop habitat as a critical substrate for the state-listed Santa Susana tarplant. Appendix E has a much more comprehensive description of the rocky outcrop habitat on-site and its value as substrate for the Santa Susana tarplant. The Draft EIS project description and impact analysis notes that excavation of rocky outcrops would be avoided, yet rocky outcrops are part of other habitat types that will be destroyed during soil removal. The rare plant surveys conducted also incorrectly conclude that no <i>Astragalus brauntonii</i> (Braunton's milkvetch) is present on site.</p> <p>This species has an extensive and long-lived seedbank and NPS and others' research indicates that it can appear in sites where it was not previously seen after a vegetation clearing event such as a fire. The fact that appropriate habitat is present should be taken as an indication that the species may be present and impacts to the species from clean up may occur.</p>	<p>Table 3.4-1 will be revised to include rocky outcrop. NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Inadequacy of Mitigation measure Biology BMP-1 (Section 4.4.2). Mitigation measure Biology BMP-1 should not be considered either a best management practice (BMP) or a mitigation measure for the irreversible effects of habitat and native soil removal. Biology BMP-1 recommends reseeding with a commercially available native seed mix that is of the same composition of plants that currently exist at SSFL. A three-year implementation program is recommended, with a goal of 50% native cover at the end of the timeframe. The Draft EIS offers no long-term management plan for restoration. Lack of long-term monitoring is a primary reason for revegetation failure. In addition, obtaining native seed can be difficult and ensuring genetic appropriateness of seed is also difficult.</p> <p>Numerous invasive species are also present on site and are likely to colonize disturbed soils and outcompete native plants seeded on disturbed soils. NPS finds that it is likely that Biology BMP-1 would result in habitat type conversion and loss of biodiversity.</p> <p>Biology BMP-1 should also not be considered an effective mitigation measure for long-term wind and water erosion. Without the long-term monitoring and ongoing treatment, erosion of soils would become a long-term negative impact if restoration of plant cover is not successful.</p>	<p>The Biology BMPs should be considered in conjunction with other BMPs offered for soils and water (SWPPP). NASA recognizes that by implementing the AOC, the natural environment from the AOC soil cleanup would remain significant after the BMPs are implemented.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>The action alternative project description does not identify any confirmed replacement soil source.</p> <p>The proposed action would replace removed soils at a backfill volume of one-third of the removed volume. The Draft EIS lists potential sources of backfill topsoil (Section 2, pg. 2-19), but fails to analyze whether the suggested sources would be the same soil type(s) as removed soils and whether or not the soils would be guaranteed uncontaminated and free of invasive weed seeds. Given that soil treatment is the key element in the cleanup action alternative, a clear identification of the replacement soil source and its suitability is a critical factor in defining a viable cleanup program which needs to be included in the subsequent EIS.</p>	<p>The one third backfill estimated was based on historic cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets 2010 AOC requirements.</p>
Patricia	Sanderson Port (DOI)	<p>The 500,000-cubic-yard estimated maximum soil removal could be significantly increased based on the need to resolve unforeseen unstable soils. There is also an inherent risk of determining the point at which the soils meet the Look-Up Table's background levels and limits on detectability. Unanticipated expansion of the grading footprint has the potential to exacerbate potential impacts on archaeological resources or sensitive species and native habitat.</p>	<p>You are correct that the cleanup are footprints are estimated based on current data and may increase in the future. NASA and DTSC will have to come to an agreement (in coordination with SHPO and the tribes) in regards to which areas are covered under the exception clause in the 2010 AOC referencing Native American artifacts.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Supplemental or the FEIS should consider Santa Ana wind events to fully assess fugitive dust impacts (Section 4.7).</p> <p>The Draft EIS asserts that fugitive dust is likely to be deposited within or near the project site (pg. 4-104). The Draft EIS fails to consider Santa Ana high-speed wind conditions that occur throughout the year, and mostly during the fall through early winter months. Santa Ana winds come from the northeast and would carry contaminated fugitive dust onto state and federal park land within SMMNRA in the Simi Hills southwest of SSFL. The subsequent EIS should fully consider how to contain contaminated fugitive dust during Santa Ana high- speed winds and low humidity conditions when 105 acres of ground surface may be exposed.</p>	<p>NASA plans to mitigate fugitive dust impacts by ceasing soil loading during high winds or storms. Other mitigations are wetting the soil, limiting the stockpile area to 0.14 acre and height to 8 feet, covering roads with gravel, etc., limiting speed of vehicles, placing tarps over or barriers around stockpiles of soil, and removing bulk material from trucks. After remediation, the previously vegetated areas will be planted with a native seed mix.</p>
Patricia	Sanderson Port (DOI)	<p>Supplemental or the FEIS should address land use as an impact topic (Section 2).</p> <p>Land use as an impact analysis topic was dismissed (Table 2.5-1). The Draft EIS states: "Existing and proposed land uses do not conflict with federal or state land use plans, policies, regulations, or laws. Therefore, no impacts to land use would occur". NPS has several concerns about dismissing land use from impact analysis.</p>	<p>NASA believes that the proposed demolition and environmental cleanup activities would not result in a change in land use on the NASA-administered property; implementation of the Proposed Action or action alternatives would not require a change in zoning, and no easements or land encroachments would be necessary. No land use acquisitions or transfers would be required.</p> <p>The impacts to soils, topography, and biological resources are discussed in Section 4.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>The NPS Rim of the Valley Corridor Special Resource Study is not referenced.</p> <p>As set forth by Congress, the purpose of the special resource study is to determine whether any portion of the Rim of the Valley Corridor study area is eligible to be designated as a unit of the National Park System or can be added to an existing NPS unit through a boundary adjustment to Santa Monica Mountains National Recreation Area. The NPS anticipates providing the public with a draft study report early in 2014, and the final report will be transmitted to Congress at the end of 2014. NPS staff is currently completing environmental analysis of a range of alternatives and developing recommendations for the study area. All of the preliminary alternatives include SSFL and the NASA property, and consider the cultural resources at SSFL nationally significant.</p> <p>The study also recognizes the natural landscape at SSFL that contributes to the critical habitat linkage between Los Padres National Forest and the Santa Monica Mountains. The NPS urges that the forthcoming study be referenced in the subsequent EIS under a land use topic that informs the public of this and other studies or plans which may be affected by the action alternative.</p>	<p>NASA recognizes the study is being conducted and results will be available in 2014.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>NPS finds the resulting landscape from cleanup to background needs to consider impacts to the management goals and objectives of surrounding park agencies.</p> <p>The greater land use setting around SSFL is largely public native open space parkland—the vast majority of which is managed by agencies with missions to preserve and protect natural and cultural resources and to provide resource-dependent public recreation. SSFL open space is continuous with both the ecological and cultural resource setting associated with NPS-administered Santa Monica Mountains National Recreation Area. In its current state, SSFL provides ecological benefits for NPS and other park lands. These benefits include wildlife corridors and population “reservoirs” of rare plants. The subsequent or FEIS needs to consider the project’s consequences for the surrounding parkland land use and other agencies mandates for managing these parklands.</p> <p>The possible action by Congress affecting the future of the SSFL area should also be considered.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>The action alternative, as currently proposed, does not fully meet the stated need to protect the environment.</p> <p>Based on our previous comments on the inadequacy of biological surveys, the inadequacy of evaluation of impacts, and the inadequacy of mitigation measures, we are concerned that the action alternative, as currently described, is not capable of meeting the goal of protecting the environment. Although the action alternative would remove contaminants – a benefit – as currently proposed it also would adversely impact soils, habitats, corridors and vegetation – long term unacceptable consequences.</p> <p>The action alternative seeks to achieve “background levels” for contaminants at the site. Based on the need to remove or treat 500,000 cubic yards of native soil, the resulting disturbance will render the landscape into an unnatural assemblage of vegetation, soils, topography, and wildlife diversity, and the overall aesthetic and ecological condition will be artificially disjointed from the surrounding natural parklands. In this sense, the post-cleanup environment would be very unlike the reference sites on NPS lands within the SMMNRA used for the chemical and radiological background level studies. Indeed, the proposed cleanup may exacerbate negative site conditions, such as non-native invasive plant proliferation, habitat type conversion, and reduced wildlife diversity.</p>	<p>Thank you for your comment it has been noted. NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.</p>
Patricia	Sanderson Port (DOI)	<p>The Draft EIS does not demonstrate the project would reduce maintenance costs.</p> <p>NPS did not find in the Draft EIS adequate discussion of the costs to be incurred in order to adequately implement the action alternative.</p> <p>Therefore, it is unclear whether the action alternative, as currently described, is capable of achieving the stated need to reduce maintenance costs, particularly compared to the no action alternative.</p>	<p>The EIS states "...Proposed Action is needed to protect human health and the environment, to meet the requirements of the 2010 AOC by the completion date of 2017, to reduce ongoing maintenance costs, and to prepare the property for disposition." The reduction of maintenance cost comes from demolition of the structures which NASA no longer has a mission need.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Cultural Resources, Executive Summary, pg. ES-7, Table ES-4, pg. ES-12: The Executive Summary states "Demolition would have a significant, negative, local, and long-term impact to all of the historic architectural resources."</p> <p>The historic structures have been deemed eligible for the National Register. Thus, the impact would be beyond local since the Determination of Eligibility deemed the test stand resources were of national significance. Impact would be national.</p>	<p>Thank you for pointing out this discrepancy. The text will be changed to reflect this comment (Section ES-5.1.2 and Table ES-4).</p>
Patricia	Sanderson Port (DOI)	<p>Cultural Resources, Affected Environment, Section 3.3: The archaeological resources in Area II have been identified through surface surveys in a heavily vegetated and rugged, sometimes inaccessible landscape that precludes reliable identifiable of archeological resources in much of the project area. The Draft EIS assumes that subsurface archeological resources throughout the developed areas are likely to be disturbed. At the one clearly significant archeological site complex (Burro Flats Painted Cave), site boundaries were left undetermined. Either a thorough review of the existing documentation or intensive surface survey/mapping would have resolved this, but neither appears to have been conducted. The 1975 National Register nomination form, based on a 1973 archeological survey report, describes a huge midden area within the extensive site complex (CA- VEN-1072) that should have been mapped in order to define the affected environment at this location. As described in the Draft EIS and the associated cultural resource study (Appendix C), the site would appear be focused on the main pictograph panel, but the midden area could be an equally significant site component, one that might contain buried house structures and human burials. At present, all knowledge about this area is based on unpublished and largely unanalyzed data collected by avocational and field school excavations over a half century ago.</p>	<p>The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used these boundaries and added a buffer area around these boundaries to form the Archeology Resource Management Area for the Burro Flats site. There is no requirement under the law for additional boundary delineation as part of identifying historic properties.</p> <p>The Burro Flats site was revisited and resurveyed in June 2007 to reassess the nature and extent of the previously recorded Burro Flats site in NASA's Area II. As a result, of this investigation, California Department of Parks and Recreation Primary Record forms for Burro Flats were updated and submitted to SHPO.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	Cultural Resources, Affected Environment, Section 3.3: The boundaries for the Santa Ynez Band of Chumash Indians' Sacred Site have not yet been determined, and it is unclear how this applies to the Area of Potential Effect. The Traditional Cultural Properties (TCP) and Cultural Landscape Assessment are still underway to determine whether there is a TCP that is eligible for listing on the National Register. Without additional information, it is impossible to know how these potential resources comprise portions of the affected environment.	The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used these boundaries and added a buffer area around these boundaries to form the Archeology Resource Management Area for the Burro Flats site. There is no requirement under the law for additional boundary delineation as part of identifying historic properties.
Patricia	Sanderson Port (DOI)	Cultural Resources, Appendix C-51, Section 6.1.2: Statement that limited Holocene soils are present in most of APE is questionable. North 1/3 of area has several areas of deep soils.	We acknowledge your comment.
Patricia	Sanderson Port (DOI)	Cultural Resources, Appendix C-52: Recommended plan for dealing with "unanticipated discoveries" at VEN-1072 is inadequate for an eligible archeological site that has demonstrated subsurface potential of great significance. The recommended approach would barely suffice for twentieth-century style "salvage archeology."	An Unanticipated Discoveries clause is included in the Programmatic Agreement and/or ROD.
Patricia	Sanderson Port (DOI)	Cultural Resources, Appendix C-52, Section 6.1.4, Affected Environment Section 3.3.3.1, pg. 3-15: Sacred Site is assumed to encompass the entire APE. What is this based on? Santa Ynez has expressed concern about VEN-1072 and the documented Native American occupation which is clearly focused on the south 1/3 of APE.	The Santa Ynez Band of Chumash Indians declared the entirety of the NASA-administered Area of SSFL and the remaining Boeing portion of SSFL an Indian Sacred Site under EO 13007.
Patricia	Sanderson Port (DOI)	Cultural Resources, Appendix C-52, Section 6.1.5, Affected Environment 3.3.3.2, pg. 3-15: TCP study is underway, but no results are provided in draft EIS. It is not clear if there is a TCP at this point. How relevant is the TCP to the DEIS. The survey report and EIS may be premature at this stage of TCP identification.	We acknowledge your comment. Consulting parties including the Santa Ynez Band of Chumash Indians and several State Listed tribes felt the site to be important and thus NASA conducted the study to identify if there is a TCP and cultural landscape. A summary of the results are included in the FEIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	Cultural Resources, Appendix C-36-37: The description of the Burro Flats Painted Cave (CA-VE-1072) is extremely superficial, as is the summary of previous work conducted there. The authors claim to have fully re-documented the site complex to resolve inconsistencies and problems with previous work, when these issues were actually resolved in 1991 by Al Knight and colleagues. Although Knight's work and subsequent publications are not acknowledged, his nomenclature for incorporating multiple previous site designations into a single complex (VEN-1072) is adopted. The 2007 record by CH2MHill is actually very limited and produced little new information except for a new map of the site superimposed on aerial imagery. The south and west site boundaries are undefined, although the report elsewhere includes recommendations that imply that basic site parameters including site boundaries have been determined.	The Burro Flats site was revisited and resurveyed in June 2007 to reassess the nature and extent of the previously recorded Burro Flats site in NASA's Area II. As a result, of this investigation, California Department of Parks and Recreation Primary Record forms for Burro Flats were updated and submitted to SHPO. Please refer to the Programmatic Agreement and/or ROD for additional information regarding Burro Flats Cave.
Patricia	Sanderson Port (DOI)	Cultural Resources, DEIS Section 3.3.3.3, pg. 3-16: Again, the EIS states that numerous multiple sites were re-recorded in 2007 to form one larger site (VEN-1072) and reduce misinterpretations and inconsistencies. In fact, this work was conducted over a decade earlier by Al Knight as independent research that was permitted by NASA, but done for purposes of Section 106 compliance or with any linkage to the current undertaking.	The EIS chapter and the cultural resources technical report in Appendix C will be corrected (Section 3.3 and Appendix C). Al Knight re-recorded the site in 1991. In 2007 his information, together with the field findings from the 2007 resurvey, were recorded on new DPR forms that were changed in 1995.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Cultural Resources, Environmental Consequences, Section 4.3.1.1, pg. 4-17: Demolition of buildings and facilities is said to be a minor impact and no adverse effect because of previous disturbance, including piping and other facilities in and around VEN-1072. However, intact subsurface archeological deposits are routinely found adjacent to areas which have previously been trenched and otherwise impacted for installation of utilities. With no prior subsurface evaluations of depth, character, and integrity, the currently existing data from the site indicate that adverse effects are much more likely to occur. Because of partial loss that has already occurred, the remaining archeological resources at this extremely important site are especially important.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details. No demolition work is anticipated in the vicinity of CA Ven 1072.</p>
Patricia	Sanderson Port (DOI)	<p>Cultural Resources, Environmental Consequences, Section 4.3.2, pg. 4-25: Regarding Measure #3, suggesting a "more in-depth ethnographic study" that would build on the 2013 TCP study is meaningless when all that has been said at this point is that the TCP study is currently underway. There is no reason to believe that additional subsequent research would be productive without knowing anything about what has already been learned from this type of research.</p>	<p>The TCP study is confidential but NASA proposes to produce a public version with additional research as part of the mitigation included in the Programmatic Agreement and/or ROD.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Cultural Resources, Environmental Consequences, Section 4.3.2, pg. 4-25: Regarding Measure #4, “use of local archeologists and anthropologists with knowledge of the area” to determine site boundaries and gain a better scope of the site sounds like work that should have already been done before impacts could effectively be evaluated. It also imposing on the local community to help NASA do work that is normally a very intensive and sometimes expensive professional service done by paid contractors. This sounds like suggesting that a volunteer effort to remedy current deficiencies in site knowledge would somehow help mitigate partial destruction of VEN-1072. These deficiencies are not unanticipated. They have been discussed in previous 106 Consulting Party discussions, and the NPS Cultural Resource Manager at SMMNRA has suggested twice in those conversations that new fieldwork and testing were needed to define site parameters. In one conversation, NASA agreed to arrange site testing at VEN-1072 to remedy the deficiency. That clearly has not taken place.</p>	<p>The Burro Flats site was revisited and resurveyed in June 2007 to reassess the nature and extent of the previously recorded Burro Flats site in NASA’s Area II. As a result, of this investigation, California Department of Parks and Recreation Primary Record forms for Burro Flats were updated and submitted to SHPO.</p> <p>No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details specific to CA VEN 1072.</p>
Patricia	Sanderson Port (DOI)	<p>Cultural Resources, Environmental Consequences, Section 4.3: The Draft EIS suggests that total demolition of the historic architecture might not be necessary if preserving one or more historic structures is selected as mitigation for the removal of other historic resources. What technical constraints are involved? Exactly where preservation-over-demolition might be feasible is not identified in the Draft EIS. If one test stand could be preserved, why not preserve more of these nationally significant structures?</p> <p>Suggested mitigations for impacts to prehistoric archeological resources actually consist of remedial documentation to provide information that typically is used for planning data recovery or other mitigation measures commensurate with an undertaking of this type and scale. As described also in the Affected Environment, the existing data are not adequate for scoping and designing effective mitigation for impacts.</p>	<p>We acknowledge your comments and suggestions. NASA has consulted with multiple consulting parties to identify ways to avoid, minimize and mitigation impacts to historic properties including known and unknown archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details specific to the architectural historic properties.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	Biological Resources, Affected Environment, Wildlife “Migration” Corridors, Section 3.4.2: Figure 3.4-2 illustrates the habitat linkage area, but lacks habitat quality information and does not show park land and open space in the vicinity of the property. Thus, the figure does not adequately illustrate the location of this property in the context of existing parkland and important habitat. Please see attached NPS Figure 1 for a more accurate illustration of the greater park land and open space setting.	NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. We recognize that the federal site plays a role as an important habitat area. The EIS text will be revised to reflect the migration corridor may include SSFL (Sections 3.4.2, 4.4.1.2, and 4.4.1.3).
Patricia	Sanderson Port (DOI)	Biological Resources, Affected Environment, Wildlife “Migration” Corridors, Section 3.4.2: The citation upon which the Draft EIS statement is based incorrectly references U.S. Fish and Wildlife Service (USFWS) as the source for critical habitat corridors in the region. USFWS maps critical habitat for listed species and is not responsible for mapping critical habitat linkages for wildlife movement. The correct reference would be the South Coast Missing Linkages project report (Penrod et al. 2006: Penrod, K., C. Cabañero, P. Beier, C. Luke, W. Spencer, E. Rubin, R. Sauvajot, S. Riley, and D. Kamradt. 2006. South Coast Missing Linkages Project: A Linkage Design for the Santa Monica-Sierra Madre Connection. Produced by South Coast Wildlands, Idyllwild, CA. www.scwildlands.org, in cooperation with National Park Service, Santa Monica Mountains Conservancy, California State Parks, and The Nature Conservancy.). The South Coast Missing Linkages report was the product of a major collaborative effort among a dozen governmental and non-governmental organizations. This landmark report on wildlife habitat linkages is not cited in the Draft EIS.	NASA appreciates the comment and has updated the EIS to include reference to the South Coast Missing Linkages project report. (Sections 4.4.1.2 and 4.4.1.3)

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Affected Environment, Wildlife “Migration” Corridors, Section 3.4.2: The Draft EIS’s statement that “SSFL could play a role for habitat linkage among the Santa Susana Mountains, the Simi Hills, and possibly into the Santa Monica Mountains” (pg. 3-23) (emphasis added) is incorrect. The South Coast Missing Linkages report identified the entire SSFL, including the NASA portion, as an important habitat area containing habitat for 19 of the 20 species considered in the habitat linkage analysis (the 20th species was the southern steelhead trout; the study found no currently existing habitat for this species in the area studied). SSFL presents a continuum of native habitat types; there is nothing distinguishing habitat on the 451-acre NASA property versus the rest of the 2,850-acre site and its service to wildlife living within or moving through SSFL and beyond into parkland within Santa Monica Mountains National Recreation Area. With that observation, the South Coast Missing Linkages report included open space within SSFL in a priority habitat linkage design connecting the Santa Monica Mountains through the Simi Hills and Santa Susana Mountains to the Sierra Madre.</p>	<p>NASA appreciates the comment and has updated linkage areas references in the EIS (Sections 4.4.1.2 and 4.4.1.3).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Affected Environment, Wildlife “Migration” Corridors, Section 3.4.2: The Draft EIS’s statement that the mapped habitat linkage excludes the NASA property is overly conservative and presents a narrow interpretation of the complex set of factors upon which to map a wildlife habitat linkage. The Missing Linkage report’s mapped linkage area was defined through delineation of the top one percent (1%) of habitat as identified by a GIS least-cost model. The modeled linkage does not mean that areas outside the critical linkage map are unimportant to the wildlife corridor. The mapping also does not imply that outside areas are unimportant habitat or unimportant to wildlife movement. The fact that the NASA property is not included in the critical linkage map only means those parcels were not selected as the top 1% of the habitat. The NASA portion of the SSFL is immediately adjacent to the 1% critical habitat linkage area and appears in the South Coast Missing Linkage report’s 3% and 5% habitat linkage areas.</p>	<p>NASA appreciates the comment and has updated linkage areas references in the EIS (Sections 4.4.1.2 and 4.4.1.3).</p>
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Affected Environment, Wildlife “Migration” Corridors, Section 3.4.2: The Draft EIS uses the phrase “wildlife migration corridor” throughout the document, although this phrase presents a limited purpose for protecting habitat for wildlife movement. The appropriate phrase is “wildlife habitat linkage.”</p>	<p>NASA appreciates the comment.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Special Status Wildlife, Appendices D and E: The Fall 2010 (Appendix D) and Spring 2011 (Appendix E) biological surveys did not conduct systematic wildlife surveys (see Appendix E p.E-28 for information). Surveys were for vegetation, and wildlife that was encountered was incidentally noted. Therefore, no USFWS or other rigorous protocols were followed when looking for species that were endangered, threatened, or of special concern.</p> <p>For sensitive, threatened, or endangered birds: Point counts, area searches, and nest searches should have been conducted.</p> <p>For sensitive, threatened, or endangered aquatic amphibians: Stream surveys during the day and night should have been conducted. California red-legged frogs (<i>R. draytonii</i>) – The local population of <i>R. draytonii</i> is about 3.5 miles away from SSFL. Movements of frogs from the local population to sites less than 1 mile away have been documented every year since 2009. It is unknown whether adult frogs would travel the 3.5 miles to SSFL, but USFWS survey protocols should be followed to determine if there are <i>R. draytonii</i> on the NASA property. Suitable breeding and year-round habitat exists on the property.</p> <p>For sensitive, threatened, or endangered terrestrial herpetofauna: cover boards, visual surveys, transect walks, pitfall trapping, or comparable census methods should have been conducted.</p> <p>For sensitive, threatened, or endangered Desert woodrats: Sherman trapping at nests should have been conducted.</p> <p>Incorrect Information in Appendix D Table 2 (p. 4-10 to 4-12): Mountain garter snake (<i>Thamnophis elegans</i>) is not found in this area. Most likely, the surveyors saw a two-striped garter snake (<i>Thamnophis hammondi</i>) and misidentified it because they were not familiar with the local species. Bobcat species name should be <i>Lynx rufus</i>. Mountain lion species name should be <i>Puma concolor</i>. Wild pig (<i>Sus scrofa</i>) has not been detected before in this area. It is highly unlikely that wild pigs are in the area of SSFL because they have not been detected in other park sites like Cheeseboro Canyon or Upper Las Virgenes Canyon. The report does not say what the “sign” of pigs was. NPS staff will follow up on this.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Affected Environment, Special Status Wildlife, Section 3.4: Species that were not detected does not mean they were not there. Survey methods were not appropriate to make the conclusions that are made in this table and in Appendix D and E (see below).</p> <ul style="list-style-type: none"> - Desert woodrat (<i>Neotoma lepida</i>) – not detected during observations but highly unlikely that woodrat species in SSFL is this species of special concern, as the habitat is highly suitable to this species. Without night surveys and trapping, there is no way the surveyors could have determined what species of woodrat was found. - Fairy shrimp species – not detected during observations but no aquatic surveys (i.e. dip net, kick net) were done. - Spadefoot toad (<i>Spea hammondi</i>) – personal communication from a reliable source (local biological consultant) told me (K. Delaney) that ponds at SSFL Area IV were breeding grounds for this species. SSFL has highly suitable habitat for this species, it has been documented in the CNDDDB in this area, and individuals have been captured in the Simi Hills (by NPS) and at Chatsworth Nature Preserve (by Southwestern Herpetological Society) within the last 10 years. It is possible that this species could also be found on the NASA property. - Coastal California gnatcatcher (<i>Polioptila californica californica</i>) – suitable habitat is found nearby. More extensive surveys during the spring breeding season should have been done to confirm non-detection of this species. 	<p>Thank you for taking the time to provide comments on NASA's DEIS. NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other agencies, such as USACE with respect to wetlands.</p> <p>NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Environmental Consequences, Special Status Wildlife, Section 4.4, pp. 4-30, 4-31: - Fairy shrimp: Finding of “no expected impacts” is premature given no surveys were done for these species.</p> <p>- Coast horned lizard:</p> <ol style="list-style-type: none"> 1. Three juvenile lizards were observed during the surveys, the report only states the 1 lizard seen during Fall 2010 surveys. 2. The conclusion that the population of coast horned lizards is small because only 1 individual was observed during surveys is incorrect. A population size cannot be determined from a few incidental observations. 3. The observation of juvenile lizards suggests a healthy breeding population of this sensitive species 4. The impact of the proposed action on this species would be moderate to significant, negative, local, and short term. <p>- Two-striped garter snake: NPS finds the proposed action on this species would also be moderate to significant, negative, local, and short term.</p>	<p>NASA appreciates the comment and will consider amending the analysis in Section 4.4.</p>
Patricia	Sanderson Port (DOI)	<p>Water Resources, Wildlife, Environmental Consequences, Section 4.6: All actions that affect surface water (ponds and streams) would affect native amphibian breeding habitat. Native amphibians known to breed on the property include the Western toad, Pacific tree frog, and spadefoot toad. Effects from the proposed action to surface water would have significant, negative, local and short term impacts to native amphibian breeding.</p>	<p>NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	Biological Resources, Wildlife, Affected Environment, Table 3.4-3: Please correct typo: "gnatcatcher" is misspelled.	Thank you for your careful reading. The bird will be spelled correctly in the EIS (Section 3.4.3.2)
Patricia	Sanderson Port (DOI)	<p>Environmental Consequences, Biological Resources, Section 4.4.1.3, Section 6, Biology BMP-1: Biology BMP-1 is unrealistic. Removal of 500,000 cubic yards of soil would be akin to a quarrying operation, thereby removing all native substrate and rendering no opportunity for soil crust regeneration and associated native recolonization. Studies of native revegetation efforts at mining reclamation sites have found lack of success, and typically the result is conversion to non-native plant populations and loss of native diversity ("Does post-mining rehabilitation restore habitat equivalent to that removed by mining? A case study from the monsoonal tropics of northern Australia." Author S. Gould. Wildlife Research 38(6) 482-490, November 2011). Soil properties (physical, chemical, organics like roots that hold soil together, microbial properties) need to be similar to the native soils. Replacement soils would be unconsolidated and subject to wind and rain erosion, particularly when vegetation is not yet established. What metrics would be used to determine soil integrity and to what extent would the replacement soils be compacted during installation?</p> <p>Biological soil crusts are particularly important in arid and semi-arid places, including many areas of soils in the Santa Monica Mountains and Simi Hills. The following link to a study on soil crusts describes the importance of soil crusts to plant establishment: http://sbsc.wr.usgs.gov/products/pdfs/Belnap_et_al_ch21_Influence_on_soil.pdf.</p> <p>Removal of the top two feet or more of native soils would also eliminate the native seed bank. The proposed seeding alone would not be sufficient. Plantings from local sources of stock would be necessary. Control of invasive plant propagules would be important to avoiding noxious plant spread, assuming the imported replacement soils could be deemed weed-free.</p> <p>Long-term site maintenance is recommended—ten or more years for such a large area of high disturbance, or until the plant cover is a self-sustaining native community. The three-year monitoring period proposed in the Draft EIS is considerably too short for such an extensive area of disturbance.</p>	<p>The DEIS evaluates impact by looking at disturbance, displacement, and mortality of plants and wildlife and destruction of sensitive habitat. The impact to native soils was found to be significant negative. Existing micro-ecosystems might never be restored. It can take years for native species to reestablish, and the species composition would be different from the original even if reseeded with native plant seed. Sources of naive topsoil within SSFL are limited are unlikely to supply enough topsoil to replenish all removed soil. However, these impacts are unavoidable to meet the requirements of the AOC.</p> <p>As part of Biology BMP-2, a SWPPP and an ECP would be updated and implemented. They will identify appropriate restoration measures based onsite location, slope, and remoteness. The initial duration of monitoring will be determined at that time and adjusted as site-specific conditions warrant.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Vegetation, Environmental Consequences, Section 4.4.1.2, pg. 4-31: The statement that impacts to native vegetation communities is short-term is unsupported by data. What evidence indicates ability to successfully restore the native vegetation communities that were present, after soil is removed? Ecological restoration is extremely difficult and simply re-seeding areas where 2 to 20 feet of topsoil has been removed seems unlikely to result in restoration of a functioning native ecosystem. Impacts should be reclassified as long-term and possibly permanent losses.</p>	<p>The text in the EIS has been updated to reflect a long term impact (Section 4.4.1.2).</p>
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Vegetation, Environmental Consequences, Section 4.4.1.2, pg. 4-31: The Draft EIS states “Over time, the demolition would increase the amount of undeveloped, vegetated area and would have a moderate, beneficial, local, and long-term impact.” This statement is unsupported by data. Please provide additional data to support this claim. NPS experience in the Santa Monica Mountains National Recreation Area, as well as other studies in the ecological restoration literature, suggests that if the removal areas do become revegetated over time, the likeliest outcome is that they will be non-native annual grassland or other non-native herbaceous weeds. NPS studies of seeding in the Santa Monica Mountains have found it to be an ineffective treatment for the most part without large amounts of hand-weeding post-seeding.</p>	<p>The EIS reference is being made to the fact that if you remove parking lots and buildings it will provide area for habitat that currently does not exist. Section 4.4 of the EIS notes that "Demolition activities could increase the spread of invasive and noxious weed species by transporting weeds around the site and redistributing them." It further states that NASA will implement a BMP to (Biology BMP-1) use native seed mix for reseeded. As you point out this is not totally effective. NASA agrees it can take many years for native species to reestablish in disturbed areas and the species composition would be different than what was originally there, despite reseeded with the approved native seed mix. The restoration goal would be 50 percent native plant cover, 3 years after disturbance for grass and herbaceous species, though it may take much longer for shrub and tree species. Despite an improvement to the native vegetation communities, the natural communities as they occur currently will likely never return and the, overall impacts after implementation of this BMP would remain significant, negative, local, and short long term (Biology Impact-2a, d, e, g, i, and k).</p> <p>Text will be added to the EIS to emphasize that natural communities as they occur today will likely never return.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Vegetation and Land Cover Types, Affected Environment, Section 3.4.1: The Draft EIS refers only to Appendix D, the 2010 Fall field work report dated February 2011. Appendix D includes vegetation survey reports that are difficult to assess owing to mixing of old and new taxonomy without identifying synonymy, listing by common names (species are not grouped by family and genera), and misspelling of several scientific names. The findings in Appendix D were based on plant survey lists from 2008, 2009, and fall 2010 (pg. D-78, Appendix D). A more comprehensive field effort was carried out in spring, 2011, and resulted in the report dated December 2011, presented in the Draft EIS as Appendix E. Appendix E has a more extensive list of species observed in spring, 2011, and the information is presented accurately and more comprehensively. NPS finds Appendix E should be referenced in the Draft EIS, because Appendix D insufficiently presents vegetation and land cover types.</p>	<p>Appendix E is referenced in Section 3, and Appendix D will remain as is as a referenced document that was prepared prior to the EIS being started.</p>
Patricia	Sanderson Port (DOI)	<p>Biological Resources, Environmental Consequences, Santa Susana Tarplant, Section 4.4.1.1, pg. 4-30: Impacts to Santa Susana Tarplant are not adequately evaluated. Please identify what portion of the population at SSFL would be destroyed by soil removal/remediation activities. Also, please identify that seed production and seedling survival rates in remaining population are high enough to support population viability into the future. Also, please evaluate vulnerability of the population under climate change to show that the individuals lost during soil removal will not be critical to future population survival.</p>	<p>Impacts on the tarplant are included in Section 4.4.1.1 (page 4-30) and maps indicating location of soil removal locations are also included. Please also refer to Section 4.4.2.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	Biological Resources, Environmental Consequences, Braunton's Milkvetch, Section 4.4.1.1, pg. 4-30: Impacts to Braunton's milkvetch are not adequately evaluated. Braunton's milkvetch appears to have a long-lived seedbank and a meta-population type dynamic in natural areas. NPS has had Braunton's milkvetch show up in previously unrecorded areas after a fire or other form of soil disturbance (exposing surface soils to the light) (NPS, unpublished survey data can be provided upon request). These more transitory populations may play an important role in the long-term persistence of these species (a regional population viability analysis is needed to evaluate the role of these transitory populations in the long-term persistence of the species). If appropriate habitat exists in the ROI, negative impacts to this species should be assumed and mitigated appropriately rather than assuming no impacts because no plants above ground were observed. Alternatively, an extensive series of soil samples could be collected and germinated in the greenhouse to test for the presence of Braunton's milkvetch in the seedbank.	Braunton's milkvetch has not been observed on NASA's land. Please refer to Section 4.4.2. for BMPs and mitigations intended to reduce impacts on biological resources.
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation and Land Cover Types, Affected Environment, Section 3.4.1, pg. 3-24: <i>Plantago erectus</i> should be corrected to <i>Plantago erecta</i> . (In 2nd paragraph below Table 3.4-2)	The EIS will be changed to reflect this comment (Section 3.4.3.2).
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation and Land Cover Types, Affected Environment, Section 3.4.1, pg. 3-35: No need to capitalize 'palustrine' in mid-sentence.	The EIS will be changed to reflect this comment (Section 3.4.5.1).
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-15: <i>Eriodictyon crassifolia</i> should be corrected to <i>Eriodictyon crassifolium</i> . (Under 4.1.1.2 Chaparral)	The EIS will be changed to reflect this comment (Appendix D).
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-17: <i>Artemisia</i> is spelled <i>Artemisia</i> (1st paragraph under 4.1.1.3)	The EIS will be changed to reflect this comment (Appendix D).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-17: The document doesn't state which source is followed in plant names (TJM1 or TJM2)—possibly TJM1, so <i>Sambucus mexicana</i> probably okay although besides TJM1 it is commonly recognized now that <i>S. mexicana</i> was a mis-id for California. The species we have is <i>S. nigra</i> subsp. <i>caerulea</i> . Later on pg. D-19, under Venturan CSS, <i>Acmispon glaber</i> is based on TJM2 while <i>Yucca whipplei</i> is based on TJM1. On previous page <i>Eremocarpus setigerus</i> is based on TJM1. Under sensitive species, <i>Deinandra minthornii</i> is based on TJM2. It would probably be good to follow TJM2 in all plant names since that is the new standard.	The document was written prior to the publication of the second edition of the Jepson Manual (TJM2) but made use of name changes that were already reflected at the time on the Jepson Interchange [http://ucjeps.berkeley.edu/interchange.html]. It does not seem appropriate to update the name references in this document to the newer reference (TJM2) when that document was only issued after this document was complete. In addition, this initial survey was followed by a floristic study in 2011, which more definitively addressed the issues related to name changes and taxonomic organization. For this reason, no changes to the original document are proposed.
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-57: Under disturbed chaparral: We shouldn't have <i>Eriodictyon californicum</i> . Likely <i>E. crassifolium</i> (also under Disturbed Sage Scrub on page D-59). Likewise, we shouldn't have <i>Yucca schidigera</i> —our species is <i>Y. whipplei</i> .	The EIS will be changed to reflect this comment (Appendix D).
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-18: Under 4.1.1.6 Mulefat Scrub, 2nd sentence "consists of mostly of..."; 3rd sentence: <i>Baccharis salicifolia</i> shrubland alliance (not <i>salicifolias</i>)	The EIS will be changed to reflect this comment (Appendix D).
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-65: Under dominant vegetation for ruderal: <i>Dieteria</i> (segregated from <i>Machaeranthera</i>) has not been reported from our area. (<i>Symphyotrichum lanceolatum</i> var. <i>hesperium</i> does occur in our floristic region. Images are posted at www.smmflowers.org/bloom/species/Symphyotrichum)	Due to the desiccated state of the plants on the date, the field entry was only listed as a tentative identification as either, <i>Dieteria</i> sp. or <i>Symphyotrichum</i> sp. We accept comment that <i>Dieteria</i> sp. may not apply to this location; however, no change to the field sheet is proposed. We also accept the commenters suggestion that <i>Symphyotrichum lanceolatum</i> var. <i>hesperium</i> is known to occur in the area and note, as well, that <i>Symphyotrichum subulatum</i> var. <i>ligulatum</i> (slim aster) is known to occur in the area based on the Santa Monica Mountains National Recreation Area Vascular Plant Species List (as derived from NPSpecies 18 Dec 2006). It should also be noted that issues of plant identifications and taxonomy were resolved by the floristic surveys completed in 2011, that were conducted immediately after the initial habitat survey in 2010.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-71: Plant species list is generally better organized alphabetically first by family and then by genus/species, listing the scientific name first. Common names are ambiguous and a genus with several species will be distributed in different places on the list, making it difficult to understand the nature of the species complex/community.	NASA appreciates the comment concerning the presentation of the plant name information for this survey. However, no changes to the document are proposed because this initial survey was followed immediately by a floristic survey in 2011, which provided a more definitive assessment of plant conditions at the site. The plant list included in the 2011 survey report addressed the taxonomic concerns of the commenter on the earlier report.
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-74 and onward: Plant list typos and suspicious entries: Yucca whipplei (not whippleri); Salvia columbariae (not columberiae); Ceanothus arboreus is a mis-id, we don't have that—see www.smmflowers.org/bloom/species/Ceanothus for SMMNRA species (C. crassifolius, C. oliganthus, and C. spinosus are known from the site); Ceanothus crassifolius (not crassifolia); Lonicera hispidula is suspect...we have not been able to confirm an old record from Malibu Canyon. You begin to run into L. hispidula along the coast at about Santa Barbara (Lonicera subspicata var. denudata would be more likely); Artemisia douglasiana (not Artemesia); Chlorogalum pomeridianum (not Chloragalum); Eriodictyon crassifolium (not crassifolia);	The EIS will be changed to reflect this comment (Appendix D).
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-82: Caption for Photo 6: Likely the exposed outcrop habitat has not resulted from non-native 'grassland' eroding away. The non-native annual grasses are likely a later introduction from ranching era, encroaching on the crust/moss/Selaginella /native forb patches. This comment applies also to Photo 22.	NASA agrees that presence of dominant grasses may be an artifact of ranching where these grass species were introduced onto patches that were previously dominated on crust/moss/Selaginella /native forb patches. The presence of the patches in conjunction with microtopographical features (cracks, ridges, depressions) on these slopes confirms that erosion continues to be a significant aspect of these habitats.

Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-84:Caption for Photo 14: The dry plant in foreground looks more like <i>Carduus pycnocephalus</i> (based on habit/stature; heads are not clear enough to determine from picture either way...) The difference would be native vs. non-native...	<p>Agree with commenter that the photograph is not clear enough to determine a species. However, we stand on our original identification of this plant since the cocklebur (<i>Xanthium</i> sp.) plant is very distinct and easily identifiable after the fruits have formed. The foreground plant in question is at the downstream side of this basin within the surface water flow pathway. It is not a dominant plant that would dictate the vegetative classification at this location.</p> <p>It should be noted that this location was specifically re-visited on January 4, 2012 as part of the wetland delineation. Two wetland data points (one within the basin and one just outside to north) were completed that provided more floristic details on the basin feature in question. Neither plant, <i>Xanthium</i> sp. or <i>Carduus pycnocephalus</i>, occurred within the data points areas that were intended to characterize the basin</p>
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-86: Photo 21: the non-chalky <i>Dudleya</i> sp. is <i>D. lanceolata</i> . (Also in Photo 23.) During survey in June 2011, only <i>D. lanceolata</i> and <i>D. pulverulenta</i> was found. No suitable habitat for sensitive <i>Dudleya</i> known from this floristic region was found at the site. June 2011 survey was attended by a botanist with extensive knowledge of local common and sensitive <i>Dudleya</i> .	The EIS will be changed to reflect this comment (Appendix D).
Patricia	Sanderson Port (DOI)	Biological Resources, Vegetation, Appendix D-86: Photo 22: <i>Dudleya pulverulenta</i>	Thank you for your careful reading and helping ensure the accuracy of our photographs. The document will be updated to reflect this change (Appendix D).
Patricia	Sanderson Port (DOI)	Soils, Environmental Consequences, Section 4.2: The soils impact analysis does not take into account remedial grading that typically ensues when any large amount of soil is excavated. The 500,000 cubic yard estimated maximum soil removal could be significantly increased based on the need to resolve unforeseen unstable soils.	NASA anticipates that some grading of adjacent soils will be needed to complete the remedial action to accommodate proper drainage and storm water infiltration. The adjacent soils will not have to be removed from SSFL and disposed of in a landfill; therefore, it was not included in the 500,000 cubic yard estimate for soil removal.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	Soils, Environmental Consequences, Soils, Section 4.2, Executive Summary, Look-up Table dated June 11, 2013: There is also the risk of over-excavation owing to difficulty in confirming the field point at which the soils meet the Look-Up Table's background levels and limits on detectability. It is apparent in the Look-Up Table document that the potential for false positives, i.e. remaining contamination, could lead to excessive excavation. The statistical method for reducing false positive readings was an important consideration in setting the testing standard for cleanup to background levels. The Draft EIS did not provide a layman's description of the testing parameters described very technically in the Look-Up Table document. The document is difficult to interpret. Such technical presentation, accessed by reference only in the Draft EIS, makes the ramifications of the proposed cleanup to background difficult to grasp.	NASA appreciates the comment. NASA surveys the sampling locations and will be able to locate them to identify the extent of the excavations where the LUT values are met in the soil. The comment related to the LUT document developed by DTSC has been noted.
Patricia	Sanderson Port (DOI)	Air Quality, Fugitive Dust, Environmental Consequences, Section 4.7.1.2: The Draft EIS needs to consider the potential for Santa Ana wind events to create fugitive dust. The wind roses provided in Figures 4.7-1, 2, and 3 may indicate overall mild wind patterns, but they do not illustrate the potentially severe Santa Ana wind conditions. NPS studies of Santa Ana wind speeds collected from the Cheeseboro Canyon RAWS site between 1997 and 2010 found maximum wind speeds between 34 and 45 miles per hour (mph) during Santa Ana wind events, with 0 to 6.8 events per month. Raphael ("The Santa Ana Winds of California", Earth Interactions, Vol. 7, Paper No. 8, 2003) found a mean number of 20 Santa Ana weather events occur per year, lasting typically 1.5 days per event. The Draft EIS should evaluate the ability to control fugitive dust during high wind/low humidity conditions lasting both day and night.	NASA will have air monitors in place that will be taking measurements very frequently every hour. We will have management practices in place in the event any particulates are noticed such as during high winds or any time dust is raised and triggers our air monitors.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Hazardous Materials and Waste, Executive Summary Section ES-5.0 and 5.3.3, Table ES-4, Environmental Consequences</p> <p>Hazardous Materials and Wastes, Section 4.12: The Draft EIS states conflicting impact levels for the Hazardous Materials and Waste topic. The Executive Summary states an overall finding of a “significant, beneficial, local, and long term” impact for the removal of hazardous wastes. Environmental Consequences Table 4.12-2 summarizes eight individual impacts, with only one finding of a moderate, beneficial impact—for reduction or removal of hazardous material from soils and groundwater. No significant impacts were identified in the Environmental Consequences. Furthermore, the Executive Summary (Section ES-5.3.3) proceeds to justify the significant beneficial impact based only on the large volume of soil removed, without regard for any other quantitative or qualitative factors. NPS finds this inconsistency important, because in return for only a moderate long-term positive impact for hazardous waste removal (and water quality) from the cleanup-to-background action alternative, there are several significant or moderate long-term negative impacts on all other resource areas, including natural and cultural resources of concern to NPS.</p>	The impacts are minor, beneficial. The document will be updated to reflect your comment. NASA re-evaluated and impacts have been moved from the Hazardous Mataterials section to Health and Safety (Section 3.9).
Patricia	Sanderson Port (DOI)	<p>Reduced Maintenance Cost, Purpose & Need, Section 1.2: While NEPA does not require preparation of a cost-benefit analysis, if one has been prepared that would substantiate that the proposed project would reduce site maintenance costs, the cost-benefit analysis needs to be included in the Draft EIS (40 CFR 1502.23).</p>	NASA proposes to demolish all structures to significantly reduce cost associated with maintenance. As noted Cost/benefit analyses are not part of this EIS evaluation.
Patricia	Sanderson Port (DOI)	<p>Topics Dismissed, Land Use, Project Description, Section 2, Table 2.5-1:Dismissal of Land Use: The Draft EIS does not include the basic information of existing land use and zoning classifications assigned by Ventura County to SSFL and the NASA component. The Draft EIS also does not present any surrounding land use classification typically found in a “Setting” description within an EIS.</p>	Setting information is included in Section 3 of the EIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Sanderson Port (DOI)	<p>Topics Dismissed, Land Use, Project Description, Section 2, Table 2.5-1: The dismissal of land use as a topic does not correlate with the Draft EIS’s Need statement to prepare the property to support future disposition. The Draft EIS does not follow the advice provided in CEQ’s list of 40 questions on implementing NEPA. Question 18 addresses uncertainty about indirect impacts and discusses uncertainty related to land use in the event of disposition. The advice notes that an EIS preparer should discuss indirect impacts on an issue like land use when trends are ascertainable or potential purchasers have made themselves known. At least one potential purchaser (recipient) of the property has been officially identified: Santa Ynez Band of Chumash Indians (notification to GSA as an interested party). Boeing has also expressed commitment to native open space as a future land use.</p> <p>While the Boeing property is jurisdictionally separate from the NASA land within the overall SSFL site, there is no ecological distinction between the two ownership areas, and Boeing has offered in the past to convey their property to the state for public parkland. The potential to hold the land as a native habitat and cultural resource protection open space park has been widely discussed among parkland agencies, including at meetings of the interagency Linkage Implementation Alliance (LIA). LIA participants include NPS and several other parkland and resource management agencies with jurisdiction in the Santa Monica Mountains and Simi Hills, as well as CalTrans. The LIA seeks solutions to protect and preserve habitat linkages between Los Padres National Forest and the Santa Monica Mountains. NPS and the other participants have been anticipating disclosure in the Draft EIS of cleanup impacts, particularly impacts on future land use as well as on natural and cultural resources. The disclosure of the project’s indirect impacts on future land use is critical to NPS’s or other agencies’ decision-making tree to pursue acquisition of the NASA property.</p>	<p>While the future use of the site is uncertain at this time, the conservative cleanup prescribed by the 2010 AOC will be protective of human health regardless. The impacts to historic structures, archeological resources, and biological resources (all of which are significant) in effect are potentially the impacts to future use if that use was to be open/park space.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Sandoval	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Sangster	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Sangster	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathryn	Santana	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Walter	Santucci	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Craig	Sap (California Department of Parks and Recreation)	<p>However, CDPR is concerned that the negotiated 2010 Administrative Order on Consent (AOC) failed to account for standard risk-based assessments, uses terminology for cultural resources that are not defined under federal and state statutes, and most importantly, constituted an action subject to review under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA), a review which was not performed prior to NASA's commitment. The AOCs have significantly constrained the environmental review of the project by imposing a potentially unnecessary clean-up to background standards reflected in the State Department of Toxic Substance's (DTSC) Lookup Table. For example, the "Background" level of cleanup will require the removal and treatment of ten times the soil volume as the "Recreational" cleanup standard.</p>	<p>The 2010 AOC did not qualify as a "proposal" under CEQ regulations found at 40 CFR Sec. 1508.23. The document reflects the conditions of an administrative order issue to NASA under DTSC's enforcement authority. While NASA engaged in discussion with DTSC over the contents of the AOC, NASA was not entitled to choose among a list of alternatives offered by DTSC.</p> <p>NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements. NASA plans to enter into a Programmatic Agreement with the California SHPO and the ACHP that identified protection and MMs for historic structures and archaeological resources at the site.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Craig	Sap (California Department of Parks and Recreation)	<p>Additionally, although the DEIS states that demolition to support property disposition is a part of the proposed action, the document does not evaluate the cleanup in regards to potential future land use. The proposed clean-up alternatives would grossly modify the existing habitats, historic structures and aesthetic of the site, and would increase the potential for further degradation via invasive plant and animal incursions. The project site is also located within or directly adjacent to a key wildlife corridor, the Santa Monica Mountains-Sierra Madre Linkage. Because cleanup and-demolition activities (105 acres) will have a direct impact on the resource values which make the SSFL site valuable as o open space or parkland, the significantly degraded value of the site for open space uses is not fully considered.</p> <p>Further, NASA and the General Services Administration (GSA) have stated that a separate NEPA review will be conducted for the disposition of the property following clean up activities. CDPR is concerned that separating these related actions constitutes piecemealing and runs counter to the requirement of full public disclosure of potential impacts under NEPA and CEQA guidelines.</p> <p>DEIS under NEPA and the DTSC future preparation of an Environmental Impact Report (EIR) under CEQA. Typically, joint environmental documents are prepared concurrently as to ensure a consistent review between the two processes, to economize, and to simplify public notice and consultation by the issuance of one document. CDPR is concerned that separating the federal and state environmental reviews by several months or more will create opportunities for inconsistencies and confusion. How will NASA and DTSC rectify differences in analysis between the two documents, for example?</p>	<p>Once the soil was removed, the existing micro-ecosystem might never be restored. It can take years for native species to reestablish in disturbed areas, and the species composition would be different from what was originally there, despite reseeding with approved native plant seeds. Due to the strict AOC requirements, NASA will have to implement its soil cleanup utilizing excavation and offsite disposal for the majority of the areas. The significant impacts to biological resources have limited mitigation possibilities. NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>Although there will be habitat changes following cleanup, the area will provide opportunity for successional events to take place and return of the area to suitable vegetative habitat for other species that are adapted to the ecosystems that develop post cleanup. Any follow-on NEPA actions will likely consider these changes as part of the characterization of the area as appropriate under state and/or federal requirements.</p> <p>Segmentation does not apply in this case because the impacts relevant to the proposed action are separate and not cumulative or interdependent for any proposed disposition of the property. The follow-on disposition activities may be considered similar to a supplemental document where post cleanup characterization of any environmental negative or positive impacts that occurred will represent the new baseline condition and be reflected in any documentation of post cleanup disposition.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Craig	Sap (California Department of Parks and Recreation)	The commitments NASA has made in the 2010 AOC has limited a fully developed range of alternatives in the DEIS that would meet a properly scoped purpose and need. By evaluating only the "Clean Up to Background" and "No Project" alternatives, NASA has given no consideration to ultimate land use decisions or to resource connectivity concerns which may affect adjacent or nearby parklands. A land use analysis must be included in this document and it must be connected to future land use options.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.
Craig	Sap (California Department of Parks and Recreation)	For example, Figure 2.1-1 fails to adequately represent all the open space and parklands in the vicinity of the SSFL site. In particular, the boundaries of Santa Susana Pass State Historic Park are not shown, nor is the park even mentioned in the DEIS, despite the fact that the park lies on the previously mentioned wildlife corridor through the Simi Hills.	NASA will identify the SSPSH in the appropriate figures and discussions.
Craig	Sap (California Department of Parks and Recreation)	On page 2-19, the DEIS identifies the Rindge Dam in Malibu Creek State Park as a possible offsite backfill source for the SSFL cleanup activities. CDPR is currently preparing a joint EIS/EIR with the U.S. Army Corps of Engineers to evaluate the removal of Rindge Dam and other upstream barriers in order to restore Malibu Creek habitat values. We are willing to discuss with NASA the disposal of excess sediments, however, our understanding is that preliminary testing of the impounded sediments behind Rindge Dam showed that soils would not meet the AOC Look-up Table values for Background at SSFL. Have any of the identified potential offsite sources met this threshold, and if not, how will this issue be rectified?	Section 2.2 of the EIS identifies potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California. According to the 2010 AOC backfill soil must meet the LUT values. These sources have not been evaluated to determine if they can meet the 2010 AOC requirement.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Craig	Sap (California Department of Parks and Recreation)	<p>However, CDPR finds that NASA's cultural resource identification efforts within the Area of Potential Effect (APE) are incomplete. A Traditional Cultural Property (TCP) study is currently underway, but this study should have been completed prior to the issuance of the DEIS because it is part of the cultural resources inventory process, which cannot be deferred. Further, given the size and importance of archaeological site CA-VEN-1072, and the general density of prehistoric archaeological sites documented in surrounding areas of the western San Fernando Valley and Simi Hills, it is unlikely that only two additional archaeological sites would have been identified in a 100%-coverage survey of the subject 490 acres. CDPR also finds that NASA's site boundary identification level of effort for CA-VEN-1072 through is inadequate per standard archaeological subsurface testing practices.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Craig	Sap (California Department of Parks and Recreation)	Because NASA's identification and evaluation efforts of historic properties within the APE are incomplete, a thorough assessment of effects from project implementation cannot be made. As such, CDPR finds that measures to avoid or minimize impacts to historic properties have not been considered thoroughly in the alternatives analysis and that the proposed mitigation measures are insufficient to resolve the adverse effects assumed for the identified historic properties.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement and/or ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Craig	Sap (California Department of Parks and Recreation)	Specifically, NASA is proposing to retain one test stand as mitigation for the removal of all buildings within the APE and to perform HASS/HAER documentation on all the other eligible structures prior to demolition. However, subsequent statements made by DTSC suggest that complete demolition is not required under the 2010 AOC. Since the three historic districts, including the test stands and other contributing structures, have high interpretative value for future parkland use, CDPR recommends that the 100% demolition requirement be revisited and that consideration for retention of one or more complete historic districts be evaluated in the alternatives analysis.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

First Name	Last Name	Comment	NASA Response
Craig	Sap (California Department of Parks and Recreation)	<p>Additionally, NASA is proposing the completion of the TCP/ethnographic study as mitigation, presumably for impacts to the identified Indian Sacred Site. As mentioned previously, this study should be part of the identification and evaluation process, and proposing it as mitigation for adverse effects to an important site of tribal heritage is inappropriate and does not provided the needed information to inform how best to implement the project, and avoid, minimize and mitigate potential impacts.</p>	<p>NASA acknowledges your comments.. NASA has conducted a preliminary investigation of the potential for a TCP. The results of this investigation will be included in the FEIS. Additional studies have been proposed as mitigation. The final MMs will be included in the Programmatic Agreement and/or ROD.</p>
Craig	Sap (California Department of Parks and Recreation)	<p>Similarly, NASA is proposing to better delineate the boundaries of archaeological site CA-VEN-1072 as mitigation for adverse effects to the site. Again, this is part of the identification effort that should be used to evaluate ways to avoid or minimize impacts to the historic property. Finally, installation of protective measures for the Burro Flats site during project implementation should be considered best practices, not mitigation, and the DEIS mitigation proposals do not even require that archaeological and Native American monitoring be employed to ensure that these protective measures are enforced.</p> <p>Please refer to additional comments on the identification and evaluation of historic properties, and the resolution of adverse effects by the Office of Historic Preservation (SHPO's September 24, 2013 letter to you).</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Craig	Sap (California Department of Parks and Recreation)	Biological Resources - The extent of impacts on the Santa Susana tarplant are significant, not moderate. It is also unclear if the species could reestablish itself within cleaned up areas given the extent of soil removal and disturbance, and the apparent lack of suitable top-soil. More detailed mitigation is needed for this species, when it cannot be avoided. We expect the impacts on coast horned-lizard to be moderate, not minor, due to the extent of ground disturbance, and demolition activities. Care needs to be taken to avoid or relocate sensitive species such as this, and not just listed species, out of harm's way.	Please refer to section 4.4.2 for BMPs and mitigations intended to help reduce impacts to the Santa Susana Tarplant and other biological resources.
Craig	Sap (California Department of Parks and Recreation)	The site is directly adjacent, if not within, a key wildlife corridor, and the open space resources on the project site are significant for animal movement on a regional level. Project demolition activities are likely to increase the number and extent of invasive weeds and increase truck trips which will likely result in increased animal mortality onsite and along area truck routes. Therefore we disagree with the statement that there is no potential impact on migration corridors (pg. 4-32). Measures should be provided to protect wildlife movement through the area and out of construction zones (e.g. silt fence to deter wildlife moving into work areas, etc.).	NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area. The EIS text will be revised to reflect the migration corridor may include SSFL (Sections 3.4.2, 4.4.1.2, and 4.4.1.3).
Craig	Sap (California Department of Parks and Recreation)	All locally sensitive plants, as well as state listed plants, should be avoided to the maximum extent feasible. Seed collection should occur from onsite or adjacent areas for reseeding or propagation prior to construction to protect the genetic integrity of species onsite and within the watershed. This is strongly preferable to purchasing commercially available mixes which are not likely to represent the same species mix or genetic lines.	Please refer to section 4.4.2 for BMPs and mitigations intended to help reduce impacts to the Santa Susana Tarplant and other biological resources.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Sarabia	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Angelina	Saucedo	<p>Over many decades, NASA’s poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Albert	Saur	<p>One comment and objection to the DEIS is that the preparers have considered only two clean-up options:</p> <ol style="list-style-type: none"> 1. Do nothing. Leave the property as it is. 2. Clean up the property to the condition it was in before it was used as a field laboratory. <p>I recommend that NASA redo the DEIS and include a clean-up standard in keeping with the proposed ultimate use of the land: a park. Using “park” rather than “original condition” as the basis for the cleanup standard would require much less replacement of soil at the site and much less truck traffic along routes that necessarily go past schools, residential areas, recreational areas, and through a street (Topanga Canyon Boulevard) that already has very heavy traffic.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Saur	<p>In addition to the truck traffic required to clean up the NASA site, there will be truck traffic needed to clean up the remainder of the SSFL – the park owned and controlled by the Boeing Corporation. Whatever standard of clean-up that is finally used in cleaning up the NASA portion will probably also be used for the Boeing portion.</p>	<p>The cumulative impact, in the Cumulative Impact section of the EIS, analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available. Cleanup standards are prescribed by DTSC.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Saur	<p>The preparers of the DEIS did not consider the total risk of any clean-up standard. In the case presented in the report, the risk of a polluted or partly polluted site was not weighed against the risk to the general public of the activity required to achieve the “original” condition. Any activity associated with cleaning up the site involves risk to some populations. I think it would be appropriate to compute the total risk of each of several clean-up approaches and choose the one with the smallest total risk. Aside from the personal satisfaction that dedicated environmentalists get from a “perfect” clean-up, I see no reason for insisting that such a stringent standard should be applied.</p>	<p>NASA acknowledges SSFL is contaminated and needs cleanup and appreciates your concern and comments. NASA has compared the risk for cleanup to residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment based on three factors: (1) application of cleanup levels that are 2 to more than 1 million times more conservative than risk-based levels, (2) potentially requiring cleanup of up to 51 chemicals that do not pose risk, and (3) potentially impacting 87 additional acres when compared to a suburban residential risk-based cleanup.</p> <p>Consequently, the benefit to human health and the environment of cleaning up to background is questionable for several reasons. The more aggressive remediation of the site that would occur under the background cleanup (more soil removal, more trucks entering the site, more emissions, more road miles, more soil to dispose of in landfills, etc.) could result in an increase in traffic accidents, spills, and habitat modification and disturbance of wildlife, all of which might result in reduced net benefits when compared to the risk-based cleanup scenario. Because only 10 percent of those analytes detected in soil are identified based on risk estimates as requiring remediation under the background cleanup scenario, the overall net benefit of cleaning up to background for all chemicals as opposed to a risk-based cleanup is low.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Saur	<p>Another comment is that I think it would be a good thing to leave at least one of the rocket engine test stands intact. An intact test stand would be an interesting souvenir of the early part of the space exploration age and an attractive exhibit if the land is to become a park. Leaving a test stand intact would encourage people who decide such things to make the land into a park instead of eventually selling it to developers.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Saur	In my opinion the draft EIS for the clean-up of the NASA property at the SSFL should be redone, with detailed consideration of several clean-up standards and an assessment of the total risk associated with each one. If that is done, the resulting document will be a useful tool in deciding which clean-up standard to use. In its present form, the document is useful only in fueling a controversy over the risks of the one clean-up standard described therein.	Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).

First Name	Last Name	Comment	NASA Response
Ava	Schleder	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Sylvia	Schleimer	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ken	Schmidt	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David	Schwartz	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Madison	Selby	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.
Lida	Shahbazian	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lida	Shahbazian	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lida	Shahbazian	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Shapiro	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Evelyn	Sheridan	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Evelyn	Sheridan	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Steven L.	Shestag	Boeing supports NASA's efforts to proceed with cleanup activities at SSFL.	NASA acknowledges your comment.
Steven L.	Shestag	The DEIS Should Address How NASA's Proposed Project Will Address Compliance with NPDES Effluent limits. As Allowed For In the AOC, NASA Should Consider Alternatives with Different Cleanup Standards Based on Potential Impacts to Cultural Resources or Biological Resources.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Steven L.	Shestag	The DEIS Should Consider Potential Impacts Associated with Longer Durations and Impacts Resulting from the Concurrent Implementation of Soil and Groundwater Treatments.	<p>The EIS does evaluate impacts from concurrent actions including NASA actions of soil cleanup, groundwater cleanup, and demolition. In each resource area, a number of items were considered and evaluated. The highest level of intensity (negligible, minor, moderate, significant) for any of the individual items evaluated in a resource area determines that resource area's overall impact. For example, if the intensity of one impact within a resource area was identified as significant, then that resource area was considered to have an overall significant impact.</p> <p>Cumulative impacts (which include Boeing and DOE) were also evaluated.</p>
Steven L.	Shestag	The DEIS Should Consider Transportation and Related Noise Impacts Utilizing Historic Site Data and Other Constraints.	<p>Additional disposal facilities may be selected to reduce the impact on a few landfills. NASA will discuss changes (if needed) to the current transportation plan during the remediation planning stage. The level of detail included in the transportation impacts is adequate for this remediation project. The 3 dBA increase in truck noise was provided in a NASA funded study in 2011 prepared by Urban Cross Roads. 3 dBA is a barely discernable level change in noise level. The 'short term' is defined in the DEIS as the duration of the cleanup effort.</p>
Steven L.	Shestag	The DEIS May Understate Potential Environmental Impacts From Excavation of 500,000 CY on 105 Acres.	<p>The current biological impacts are included in the EIS as significant, which is the most severe impact identified. Any increase in the amount of soil excavated will similarly result in significant impact.</p>
Steven L.	Shestag	To the Extent NASA's Proposed Project Extends Into SSFL Areas Beyond the Boundaries of the Federal Property Administered by NASA, the DEIS Should Consider Alternative Cleanup Processes and Standards	<p>Thank you for your comment, it is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Steven L.	Shestag	The DEIS should provide more information regarding the analysis of cumulative impacts and potential mitigation measures.	The cumulative analysis reflects the information currently available and provided to NASA.
Steven L.	Shestag	Table ES-2 includes a category of "beneficial impacts." It is not clear why biology is listed in this category given the significant impact to biological resources noted in the same table.	NASA considers that there are some net beneficial impacts to the cleanup by removing contaminants from the soil that could affect wildlife. NASA also recognizes in Section 4.4.1.3 that there will be significant impacts to native vegetation communities. The overall net impact, therefore, is a negative one, and Biological resources are characterized as having significant impacts.
Steven L.	Shestag	The DEIS states: "The potential for even one accident involving a child is significant and unacceptable." Yet, the impacts to the safety of children that would be expected because of an increased exposure to truck traffic are deemed to be "moderate, negative, local and short-term." The potential for one accident is not an adopted threshold typically used in health and safety analysis in environmental documents. This section should be clarified.	Statement will be removed
Steven L.	Shestag	The list of permits, licenses, and approvals that are likely to be required for the Proposed Action does not include DTSC's approval of the Record of Decision (ROD), the California Environmental Quality Act (CEQA) process, or the Streambed Alteration Agreement, issued by the California Department of Fish and Wildlife (CDFW).	These items will be added (Appendix B and Table ES-5).
Steven L.	Shestag	For completeness, the DEIS should include a description of the 2010 Administrative Order on Consent (AOC) between the Department of Energy (DOE) and the California Department of Toxic Substances (DTSC).	The orders are publicly available. DOE's AOC is available on the DOE website and the DTSC website.
Steven L.	Shestag	The DEIS states: "Stormwater from NASA-administered property exits SSFL through one of these outfalls." It should be noted that there are three other outfalls on the NASA-administered property.	Thank you for your comment regarding the storm water outfalls at SSFL. The full description of the outfalls in NASA-administered property at SSFL is presented in Section 3.6.1. of the FEIS.
Steven L.	Shestag	The information regarding "Equipment for Resale" in Table 2.2-2 appears to either misstates the amount at 8,134 tons or misstates the truck trips at 20.	Table will be corrected (Section 2.2)

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Steven L.	Shestag	Figure 2.2-2 This Figure does not include the drainage leading to Silvernale Pond and/or Silvernale Pond (outside of Area II) that may be subject to cleanup by NASA.	Silvernale Pond is on Boeing property and thus will be considered in Boeing's remediation plans as well in DTSC's CEQA review.
Steven L.	Shestag	Kettleman Hills Landfill, located in Kettleman City, California is identified as a landfill for possible offsite disposal of excavated soil. This landfill currently does not accept waste from the Santa Susana Field Laboratory.	We will retain reference to the landfill, recognizing that Kettleman Hills Landfill will not be used for offsite disposal unless the Landfill accepts waste from SSFL.
Steven L.	Shestag	The description of area of impacted groundwater (AIG)-9 in the text of the DEIS is not consistent with what is depicted on Figure 2.2-4.	The description of the AIG-9 area in the text and Figure 2.2-4 in the FEIS will be made consistent.
Steven L.	Shestag	The text of the DEIS and Table 2.2-8 provide that utilization of in situ chemical oxidation or in situ enhanced bioremediation to remediate the groundwater will take "months to years." The SSFL Groundwater Expert Advisory Panel's assessment is that these techniques would likely take decades to complete the remediation.	Until the results of the treatability studies are complete the length of time is unknown. NASA feels that "months to years" is an accurate estimate at this time.
Steven L.	Shestag	Kettleman Hills Landfill located in Kettleman City, California is included in Table 2.4-2 as a location for disposal of hazardous waste from the soil cleanup. This landfill currently does not accept waste from the Santa Susana Field Laboratory.	We will retain reference to the landfill, recognizing that Kettleman Hills Landfill will not be used for offsite disposal unless the Landfill accepts waste from SSFL.
Steven L.	Shestag	Reclaimed Water System Infrastructure: Although eliminated as a resource for further consideration because it is currently inactive, NASA may want to consider keeping it place to support treatment technologies that may utilize reclaimed water.	Thank you for your comment regarding the reclaimed water system. NASA will consider leaving it in place for use while planning the demolition phase of the proposed action.
Steven L.	Shestag	There does not appear to be a discussion in the DEIS of impacts to the utilities and infrastructure identified in this Section.	The utilities identified for consideration of potential impacts are discussed in Section 4.10. Utilities NASA does not believe will be impacted by the proposed action were not included for discussion.
Steven L.	Shestag	The description of the use of the Area III Sewage Treatment Plant (STP) (STP-3) is in error. STP-3 has been demolished.	The demolition will be reflected in the FEIS (Section 3.2.2.3).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Steven L.	Shestag	Boeing appreciates the information included in the DEIS regarding Site No. CA-VEN-1803 (Lithic Scatter), located north of Area II on Boeing property.	We acknowledge your comment.
Steven L.	Shestag	Although no Brauton's milkvetch (a federal endangered species) was found on NASA-administered property, it was found on the adjacent Boeing property. Whether the NASA-administered property presents a suitable habitat for the species is not addressed.	EIS Section 4.4.1.1 Sensitive Species notes that suitable habitat exists. Due to no observation of plants within NASA's ROI, there are no impacts.
Steven L.	Shestag	The DEIS identifies the Propellant Loading Facility (PLF) Drainage and Drainage A-1 as riverine wetlands and SW-2 Pond as a palustrine wetland. In its February 12, 2013 letter to NASA, USACOE provided its determination that the PLF and A-1 drainages were not riverine wetlands and that the SW-2 Pond was an intrastate isolated water not regulated by USACOE.	At the time the DEIS was developed this information was accurate. The EIS will be revised to reflect this determination (Table 3.4-6)
Steven L.	Shestag	The following statement should be deleted: "Boeing and the California Department of Public Health currently are responsible for verifying radiological cleanup procedures and activities." It is unclear what portion(s) of the SSFL this sentence is intended to address, and USEPA and DOE have responsibility for verifying radiological cleanup procedures and activities.	The statement will be deleted from the EIS (Section 3.8.2.1)
Steven L.	Shestag	The DEIS states: "For investigation and reporting purposes, the contaminated sites at SSFL are considered by geographic locale and similar historical use (referred to as RI groups) rather than by ownership. An RI group could have contaminated sites that are owned and operated by NASA or Boeing." For accuracy, the second sentence above should be revised to read: "An RI group could have contaminated sites that may have been owned and/or operated by NASA, Boeing or DOE."	This change will be made (Section 3.8.2.3).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Steven L.	Shestag	<p>The DEIS states:"The combined effect of demolition and remediation activities on the potential to increase surface water and groundwater pollution would be minor, given the regulatory controls in place to protect water quality and the assumption that NASA would adhere to these requirements."</p> <p>It is unclear why the DEIS describes NASA's adherence to water quality regulatory controls as an assumption.</p>	<p>The words "the assumption" will be removed (Section 4.6.2).</p>
Steven L.	Shestag	<p>The DEIS states that 140,000 cubic yards of soil will be excavated by Boeing as part of the remediation of the Boeing property. Boeing is continuing to refine its soil volume excavation estimates.</p>	<p>NASA will update Section 4.13 of the EIS with current information provided by Boeing.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Steven L.	Shestag	<p>The DEIS states: "No new residential developments have been proposed immediately surrounding or within a 1-mile radius of SSFL." It further states: "Consequently, new residential development is not discussed further in this cumulative analysis."</p> <p>There are two proposed residential developments in close proximity to SSFL: the Runkle Canyon residential development and the Dayton Canyon residential development.</p>	<p>The Runkle Canyon project includes 323 SFD and 138 senior attached condos. In August 2012, the City of Simi Valley approved amendment 1 to the Runkle Canyon Development Agreement, which extended the development term to June 2019. In June 2013, the Planning Commission approved a modification to construct 138 senior condos and in August 2013 the City issued a grading permit for the project. Based on the public information available, it is likely that the condos and SFDs will be built concurrently, in phases, with construction occurring after 2015.</p> <p>Given the uncertainty of when the Runkle Canyon project will be constructed, this project has not been included in the cumulative analysis at this time. Furthermore, the project is located west of SSFL, with access proposed from Sequoia Avenue and a potential extension from Talbert Avenue. The Runkle Canyon project is physically separated from SSFL by a canyon. Based on the proposed access, it is unlikely that the project generated trips would overlap with SSFL project trips as the project trips would be distributed on different roadways.</p> <p>Dayton Canyon is the site of a proposed Centex Homes housing development called Sterling Properties (also known as Dayton Canyon Estates). It is located west of the intersection of Roscoe Boulevard and Valley Circle Boulevard. 150 SFDs are planned on 64.2 acres out of the development's 359.4 total acreage. The FEIR for the project was released in 1999. In May 2004, the Centex-Sterling Homes Company bought the site from SunCal Homes. Since its approval in 2001, residents have opposed the Sterling Properties project, and have been working with local and federal agencies to restrict development. In 2008, the DTSC released a Preliminary Endangerment Assessment which concluded that there is no significant risk to public health or the environment at the site, and no further action is required. No new permits or approvals associated with this development have been sought since the DTSC memo was released. Given the uncertainty of when or if this project will be constructed, this project has not been included in the cumulative analysis at this time.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Steven L.	Shestag	Table 4.13-1 Although this Table appears to include the volume of soil generated by NASA on a yearly basis over a 2 year period (247,585 cubic yards), the volume shown for Boeing (140,000 cubic yards) is the total amount estimated in the DEIS to be removed by Boeing during its soil remediation activities. (See DEIS, p. 4-156.)	The EIS will reflect this distinction (Section 4.13).
Steven L.	Shestag	Although the DEIS considers that as much as 500,000 cubic yards of soil may be excavated, there is no discussion of an "upper limit" in acknowledgment of the ongoing characterization work, which may be appropriate.	500,000 cubic yards and 105 acres are a general estimate based on the Look Up tables provided by DTSC. These may differ slightly upon completion of soil characterization, but it is likely that the impacts in the EIS fully represent the "upper limit".
Steven L.	Shestag	The list of permits, licenses, and approvals that are likely to be required for the Proposed Action does not include DTSC's approval of the Record of Decision (ROD), the California Environmental Quality Act (CEQA) process, and the Streambed Alteration Agreement, issued by the California Department of Fish and Wildlife (CDFW).	These items will be added (Appendix B and Table ES-5).
Steven L.	Shestag	The final sentence in the paragraph describing an August 25, 2011 meeting states: "The site visit concluded with Director Raphael describing her understanding of the SSFL cleanup, the two Administrative Orders on Consent (AOCs) with both NASA and Boeing: and her planned approach, foreseen challenges, and ultimate goals." The two AOCs are with NASA and DOE.	This change will be made (Section 5.4.3).

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Gregory	Shiffer	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small igniters that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the igniters. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jeffrey	Shuben	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Winnie	Shy	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Winnie	Shy	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Korby	Siamis	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anne	Siegrist	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Scott	Silverstein	We strongly request the public comment period to be extended from October 1st for an additional 30 days for our committees to address the Draft Environmental Impact Statement (DEIS). We request that NASA develop a new DEIS to show all options as listed in your summary Table 2.4-1. We need NASA to show all options – not just a cleanup to “background levels” or a “No Further Action”.	NASA extended the public review from 45 to 60 days.
Scott	Silverstein	A compromise on the Administrative Order on Consent is necessary due to the impact of the truck traffic and the potential of toxic materials being disbursed into our communities.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Scott	Silverstein	At no previous meetings, that we are aware of, was the route for the trucks from Santa Susana Field Laboratory to go south on Topanga Canyon Boulevard through Woodland Hills along with the adjacent communities of West Hills and Canoga Park.	The EIS is required to present all possible routes Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. The most likely route for all parties would be Woolsey Canyon Road to Valley Circle Boulevard to Roscoe Boulevard to Topanga Canyon Boulevard. At that point multiple options exist depending on the location of the disposal site. Alternate routes do exist, see Figure 4.5-1 in the EIS.
Scott	Silverstein	In the NASA assessment of schools, NASA was negligent in conducting a thorough investigation of all schools potentially impacted by the traffic. NASA’s list of schools on Table 4.8-2 fails to list many Los Angeles Unified School District Schools sites which includes local schools, magnet schools, charter schools, and private schools, as well preschools and day care centers.	Additional schools will be added to the evaluation (Sections 4.5, 4.5.1, and 4.8).
Scott	Silverstein	The NASA DEIS does not tell the Woodland Hills stakeholders the true impact of the cleanup of all of Santa Susana and how many additional trucks may go south on Topanga Canyon Boulevard from The Boeing Company and the Department of Energy sites. A full site Environmental Impact Report is necessary to weigh all of the impacts of the cleanup by all three responsible parties.	The cumulative impact, Section 4.13 in the EIS, includes the known information about DOE and Boeing cleanup activities. DTSC will be developing an EIR that reviews proposed cleanup actions from all three parties (NASA, DOE, and Boeing).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Scott	Silverstein	Furthermore, your DEIS only references repairs to Woolsey Canyon Road. The entire route in every direction should be surveyed for damage and ongoing maintenance should be paid for by the responsible parties.	Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, and reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that go towards road maintenance.
Scott	Silverstein	In conclusion, as the DEIS is currently written, the Woodland Hills Warner Center Neighborhood Council strongly objects to the plan. It requires two or more years of daily and continuous heavy truck traffic, estimated to send over 140,000 truckloads through our communities. In our opinion, an EIR should have been required just for the enormous added volume of truck traffic. We also object to NASA's proposal for twelve operating hours per day. The hours of truck traffic needs to be limited to daytime hours only.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

Dave	Singleton	<p>The NAHC has also reviewed the September 24, 2013 letter from the California State Historic Preservation Officer (SHPO) regarding the same project. The NAHC strongly supports the comments, concerns and recommendations contained in the letter from the SHPO, as referenced.</p>	<p>We will consider your comment as supportive of the SHPO comments.</p>
Dave	Singleton	<p>In the 1985 Appellate Court decision (170 Cal App 3rd 604), the Court held that the NAHC has jurisdiction and special expertise, as a state agency, over affected Native American resources impacted by proposed projects, including archaeological places of religious significance to Native Americans, and to Native American burial sites.</p>	<p>NASA will include NACH as a member of the Native American Advisory Board that we are establishing as mitigation for the Proposed Actions impact on native American sites such as the Traditional Cultural Property.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dave	Singleton	Attached is a list of culturally affiliated American Indian tribes that have concern for this area in southeast Ventura County, California. Of course, the NAHC strongly urges that NASA work closely with the Santa Ynez Band of Chumash Indians, the federally recognized American Indian tribe in the region. But the NAHC also urges that you extend Section 106 consultation opportunities to the non federally recognized tribes in the region, as shown on the attached list, as interested consulting parties. We believe that such action is consistent with the 2004 'guidelines' to the NAHPA Section 106 requirements. Beverly Folkes, on the list is the NAHC designated Most Likely Descendant (MLD).	We appreciate receipt of your list. We contacted not only all parties on your list, but also numerous tribal representatives in Los Angeles County. We also will continue to work closely with the Santa Ynez Band of Chumash Indians.
Randle	Sink	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Derek	Sinutko	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Smith	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Ilan	Sobel	<p>I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ilan	Sobel	<p>NASA activities led to widespread contamination of soil and groundwater with very toxic materials such as perchlorate, dioxins, and TCE. Some of the contaminants have been migrating offsite. As a local resident, I am very concerned about the potential health impacts of these materials and want the site cleaned up properly.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Southwick	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Southwick	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Rick	St. John	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Rick	St. John	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathryn	Steffen	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Kathryn	Steffen	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Kathryn	Steffen	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kathryn	Steffen	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Penni	Steinberg	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Christopher	Stephens (Ventura County Resource Management Agency)	The project proponent should be aware that Santa Susana Pass Road from Katherine Road to Rocky Peak Road has a "No Trucks Over 2 Axles" Truck Restriction adopted by the Ventura County Board of Supervisors (BOS) February 4, 1986.	As described in Section 3.10 of the EIS, Santa Susana Pass Road was evaluated in the EIS as a road that would be used for workers to commute to and from SSFL and not for large truck traffic. Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).
Christopher	Stephens (Ventura County Resource Management Agency)	<p>The project proponent should be aware that Box Canyon Road from Santa Susana Pass Road to the Ventura County and Los Angeles County jurisdictional boundary has a "No Trucks 3 Or More Axles" Truck Restriction adopted by the BOS September 28, 1999.</p> <p>If the project proponent plans to use trucks that are not restricted on Santa Susana Pass Road or Box Canyon Road, then please include these roads in the survey of road conditions as described in Traffic MM-2 on Pages 6-3 of the DEIS.</p> <p>Proper precautions should be taken to protect all County road facilities in the unincorporated areas.</p>	<p>As described in Section 3.10 of the EIS, Santa Susana Pass Road and Box Canyon Road were evaluated in the EIS as roads that would be used for workers to commute to and from SSFL. Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p> <p>As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p>
Christopher	Stephens (Ventura County Resource Management Agency)	<p>If, in the opinion of the Transportation Department, any portion of a County road is damaged by the project's operations, then it should be repaired in accordance with current standard construction details and/or in a manner acceptable to the Transportation Department.</p> <p>An Encroachment Permit is required for any work in the public right-of-way.</p> <p>The Transportation Department will not allow/permit hauling on Black Canyon Road north of the project site.</p>	<p>Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, and reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that go towards road maintenance.</p> <p>NASA will remove Box Canyon Road as an option for large truck traffic. Figures 4.5-1 through 4.5-3 illustrate the proposed truck routes.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>Please notify the Transportation Department when the Final EIS is ready for review and comment.</p> <p>Transportation Department review is limited to the impacts this project may have on the County's Regional Road Network.</p>	NASA will notify the Transportation Department when the FEIS has been prepared.
Christopher	Stephens (Ventura County Resource Management Agency)	<p>Ventura County General Plan</p> <p>The DEIS should be revised to discuss consistency with General Plan policies in identifying impact intensity, type, context, and duration. Mitigations measures should be developed that preserve and protect SSFL biological resources and incorporate recommended wetland protections.</p>	As a federal agency, NASA is not required to comply with local policies or ordinances. NASA will continue to make efforts adhere to these policies when feasible.
Christopher	Stephens (Ventura County Resource Management Agency)	<p>Ventura County Locally Important Species and Communities</p> <p>Section 4.4 and Appendix E Section 2.1 of the DEIS do not include an analysis of Ventura County Locally Important Species, and the DEIS does not consider them as "special status species" under Section 4.4.1.1. Impacts to Ventura County Locally Important Plant Species identified on-site should be evaluated and mapped (e.g., <i>Allophylum divaricatum</i> and <i>Crassula aquatic</i>). For a complete listing of Locally Important Species please see the following link:</p> <p>http://www.ventura.org/rma/planning/conservation/locally-important-species.html</p> <p>Impacts to Locally Important Communities (e.g., Venturan coastal sage scrub, oak woodlands) should be acknowledged in the EIS. The EIS should evaluate direct and indirect (i.e., dust) impacts to Locally Important Communities.</p>	<p>As a federal facility, NASA is not required to comply with the Ventura County ordinances. We do strive to comply with state and local ordinances when feasible.</p> <p>If the cleanup can be done in a manner compliant with the 2010 AOC, the soil would be removed with pick axes, shovels, or a vacuum truck in areas where sensitive resources occur, including CDFW sensitive habitats and large Oak trees. When possible, the least detrimental remediation technologies would be used in sensitive resource areas.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>Evaluation of Presence of the Californian Gnat Catcher (CAGN). The CAGN should be discussed in Section 4.4.1.1, and included where applicable throughout the DEIS biological resource analysis. On-site Venturan coastal sage scrub, and potentially other unidentified vegetation alliances absent the DEIS analysis, provides suitable habitat for the CAGN, a federally listed threatened bird. In recent years, CAGN has been observed in coastal sage scrub habitats in Ventura County that were previously thought to be unoccupied. Many of these occurrences, which are near Thousand Oaks, Camarillo, Simi Valley, and Moorpark, are located in habitats similar to the habitats on the project site. Given that suitable habitat is present, and no protocol presence/absence surveys were conducted, potential exists for the presence of the CAGN. Page E-38 Appendix E describes the potential for CAGN to occur on the project site as "unlikely" based the transition from coastal sage to chaparral and the dense brush cover. This evidence is inadequate for three reasons: (a) the project site was never surveyed for CAGN, (b) suitable habitat exists on the project site, and (c) several new occurrences of CAGN were identified in the region.</p> <p>Given this additional evidence, protocol surveys should be conducted within suitable habitat in the areas proposed to be directly and indirectly impacted by the project to adequately evaluate the potential impacts of the project on CAGN.</p> <p>Wildlife Corridor. Modeled corridor strands should not be taken as absolute limits to the areas of the landscape on SSL that wildlife use for movement, as nearby areas outside the modeled corridor that appears on the South Coast Missing Linkages map are likely still utilized.</p>	<p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS. NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions.</p> <p>If the cleanup can be done in a manner compliant with the 2010 AOC, the soil would be removed with pick axes, shovels, or a vacuum truck in areas where sensitive resources occur, including CDFW sensitive habitats and large Oak trees. When possible, the least detrimental remediation technologies would be used in sensitive resource areas.</p> <p>NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>The project site contains significant habitat connections and movement patterns for both transitory and permanent wildlife populations. Direct impacts from habitat destruction, fencing, and equipment can create physical barriers to wildlife movement while indirect impacts from lighting, noise, and increased human activity may also discourage wildlife use of the area. Impacts to the regional wildlife corridor, including temporary and long term introduction of barriers to gene flow, should be considered in the DEIS. In addition, the "no impact" assessment in Section 4.4.1 .3 should be corrected to reflect the appropriate intensity level, duration, and context. Additionally, Figure 4.4-2 and 3.4-2 should be updated to include on-site specific connectivity features and impediments to connectivity that would result from the project.</p> <p>Vegetation Mapping. Vegetation types and sensitive communities, which are briefly categorized in the Appendices and in Section 3.4, should be mapped to the alliance level consistent with the California Manual of Vegetation (2010) and included in the DEIS. The entire site, and any offsite affected area (e.g ., groundwater basins), should be mapped to the alliance level, which would provide an analysis of sensitive communities and habitats and a baseline for mitigation opportunities such as habitat restoration.</p>	<p>NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area. The EIS text will be revised to reflect the migration corridor may include SSFL (Sections 3.4.2, 4.4.1.2, and 4.4.1.3).</p> <p>The original habitat mapping undertaken in 2010 to update the existing mapping after the 2008 Topanga Canyon Fire. It was also consistent with mapping done by SAIC for the adjacent Boeing-administered property to the north of Area 2. While NASA recognizes that mapping all vegetation to the alliance level within their boundaries would have provided a more detailed information on sensitive communities and habitats, this approach would have required a much greater cost field effort that was not warranted for the level of analysis required for the EIR. The same end result of having an adequate baseline for mitigation opportunities will be achieved, at much lower cost, by conducting this level of mapping on only areas that will directly affected by the proposed remediation activities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	The EIS analysis, including Figure 4.4-1, only describes two types of communities affected by the project. Detail on the amount of vegetation removed and the area of all native vegetation alliances impacted needs to be depicted and discussed in the DEIS and its appendices.	NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.
Christopher	Stephens (Ventura County Resource Management Agency)	Native Soil Import Impacts. Page 4-35 states that 39 acres of native soil would be removed as a result of the Proposed Action, and that an unknown amount of replacement native soil would be imported. The DEIS should specify the off-site locations where imported, replacement native soil would be obtained and provide an analysis of potential impacts associated with the removal of soil from that property.	The EIS recongizes that soil will be brought into the site and Section 2.2.2.3 includes a list of potential sources for backfill soil.
Christopher	Stephens (Ventura County Resource Management Agency)	If the excavation areas for the native soil fill for the proposed project are located within unincorporated Ventura County, it is presumed that a discretionary permit from Ventura County would be required, and the potential project impacts associated with the removal of native soil within the unincorporated County must therefore be evaluated in the DEIR in accordance with the County's thresholds of significance. Those thresholds are found in the Ventura County Initial Study Assessment Guidelines. In addition, the removal of off-site soil must be evaluated for consistency with the County's policies and ordinances.	As a federal agency, NASA is not required to comply with state or local policies, ordinances or statutes. NASA will continue to make efforts to adhere to these policies when feasible.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	Oak Woodlands Preservation. Absent from Appendix B, Applicable Laws and Regulations, is the California State Oak Woodland Conservation Act (OWCA) (PRC §21083.4, Fish and Game Code §1361). The Ventura County Oak Woodland Management Plan was developed in response to the OWCA, and oak woodlands have also been acknowledged as a Locally Important Community by the Ventura County Board of Supervisors. Oak Woodlands were also identified as a sensitive community by the California Department of Fish and Wildlife, and impacts to the two oak woodlands on-site should be included in the DEIS. Figure 4.4-1 only shows two communities in the context of soil clean-up boundaries. The two types of oak woodlands need to be shown on Figure 4.4-1, and the acreage removed should be quantified in the DEIS. The DEIS does not provide adequate detail to know whether direct or indirect impacts would occur to the approximately 22.5 acres of oak woodland habitat identified onsite (Appendix D, Table 10), and the document should be revised to address impacts to oak woodlands and individual oak trees.	As a federal agency, NASA is not required to comply with state or local policies, ordinances or statutes. NASA will continue to make efforts to adhere to these policies when feasible.
Christopher	Stephens (Ventura County Resource Management Agency)	Groundwater Clean-up: The DEIS currently lacks adequate information on potential impacts to biological resources that could result from proposed changes to hydrology. Section 4.4.1.4 (Page 4-41) of the DEIS should include more information regarding impacts both on-site and offsite related to the following changes associated with the Proposed Action: (a) changes to the water table, (b) additional topsoil removal "outside the soil clean-up footprints", (c) on-site wetlands, and (d) effects on regional hydrology. In addition, the DEIS should include impacts to off-site and on-site native vegetation alliances that would be affected by changes to hydrology as shown in Appendix Figure 2.2-4.	The impacts to hydrology are discussed on Page 4-79 of the DEIS. The potential impacts associated with topsoil removal are discussed on page 4-35 and the wetlands are discussed on page 4-39 and in Appendix G.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	Protocol Surveys. Additional protocol surveys are needed for special status species found within the SSFL study area. In the absence of protocol surveys for special status species (e.g., riverside shrimp, redlegged frog), actual impacts to wildlife from the implementation of the project are speculative.	Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.
Christopher	Stephens (Ventura County Resource Management Agency)	The proposed project would result in extensive impacts to biological habitat for numerous special status species. The biological resource mitigation measures within the DEIS are generally inadequate under the requirements of NEPA (40 CFR 1508.20) for addressing significant regional impacts that affect sensitive biological resources. As defined under the Council of Environmental Quality (CEQ) guidance document (dated January 4, 2011), NEPA mitigation measures should include documentation, monitoring, and performance standards. The proposed BMPs and mitigation measures lack details on requirements, timing, monitoring, and success criteria.	NASA is in the process of developing a mitigation monitoring plan for all mitigations identified in the EIS as required by the CEQ.
Christopher	Stephens (Ventura County Resource Management Agency)	Removal of Native Vegetation Communities: The removal of approximately 39 acres of native vegetation (impact biology 2a) would be regionally significant and long-term, especially in the absence of adequate mitigation as discussed below. The proposed best management practices mitigation measures would have minimal effect on mitigating this impact. Additionally, removing developed areas (biology impact 2b) would not have a beneficial effect on native vegetation, unless these previously developed areas were carefully restored. Planting an "approved seed mix" without performance criteria or an effective invasive plant removal program would not constitute restoration.	As explained in Section 4.4.1.2 of the EIS, only previously disturbed, developed areas would be impacted during demolition activities; consequently NASA is comfortable with the minor impact assessment assigned to this activity. Also as described in Section 4.4.1.2 the beneficial impact is a result of increased habitat availability, rainfall infiltration and storm water runoff. NASA is in the process of developing a mitigation monitoring plan for all mitigations detailed in the EIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>Pre-Construction Wildlife Surveys, Monitoring, and Relocation. Appendix E, Section 4.2, recommends preconstruction surveys and the development of a breeding season schedule for listed and protected species. However, the Draft EIS Section 4.4.2 only recommends avoidance if protected species are discovered by workers (BMP-4), and it includes a vague reference to red-legged frog monitoring (MM-5). Preconstruction protocol surveys and relocation should be required for all special status wildlife, including Locally Important Species that may be expected to occur, and as recommended in Appendix E, Section 4.2. Additionally, surveys should include species that are present in the vicinity, but are not identified in the DEIS as having the potential to occur (e.g., ring-tailed cat).</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>
Christopher	Stephens (Ventura County Resource Management Agency)	<p>Typically, a biological monitor, with any appropriate permits needed, should survey the construction area prior to construction and relocate special-status wildlife outside the construction area. In addition, the construction area should be fenced to prevent the return of wildlife to the construction area. The biological monitor should also be present during project implementation.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>Pre-construction Santa Susana Tarplant Surveys and Monitoring. The proposed mitigation (MM-2) and BMPs (BMP-4) are inadequate to address what should be considered a significant regional impact to the State-listed rare Santa Susana Tarplant (Impact Biology 1 a and 1 g). Avoidance and worker awareness (MM-2) is not a recognized mitigation measure. Likewise, BMP-4 is not considered an acceptable strategy for the management of this plant. The mitigation measures should be revised to include preconstruction surveys, biologist monitoring during project implementation, and relocation of impacted species.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>
Christopher	Stephens (Ventura County Resource Management Agency)	<p>On-site Habitat Restoration and Monitoring Plan. The proposed removal of seven (7) acres of the sensitive Ventura Sage scrub, of 0.05 acres southern willow scrub, and of unspecified impacted oak woodlands should be mitigated through on-site restoration. In addition, the on-site restoration should be implemented through mitigation that requires a Habitat Restoration and Monitoring Plan with timing and success criteria. The DEIS should include mitigation measures that require restoration at different ratios for each habitat type, as developed in consultation with the California Department of Fish and Wildlife.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	The proposed BMP to reseed with a "approved mix" (BMP-1) is not adequate, and permanent restoration should be conducted with a compatible plant pallet that is derived from reference sites specific to each impacted alliance. In order to maintain the genetic integrity of the local flora, Native plants and seed stock used during the revegetation process should be locally collected or propagated from locally collected seed or cuttings (from the Simi Valley area or same watershed). An attempt should be made to restore some of the diversity of the existing native plant community by specifically including some of the less common native species currently found on the project site. For temporary revegetation, the DEIS should provide specific information that identifies seed mix, seed application, seeding methods, timing of monitoring, and reporting and performance criteria.	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>
Christopher	Stephens (Ventura County Resource Management Agency)	On-site Habitat Preservation. The loss of habitat for locally important wildlife species should be mitigated through the preservation of existing, intact plant communities and through the restoration and preservation of disturbed plant communities at an appropriate ratio in the project vicinity.	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	Off-site Mitigation Measures. The DEIS should include mitigation measures that require preservation of off-site biological habitats that offset the destruction of native habitat and underlying soils.	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>
Christopher	Stephens (Ventura County Resource Management Agency)	Nesting Bird Mitigation. The mitigation that would protect nesting birds (Biology MM-4) is incomplete. Proposed mitigation measures should include nesting and breeding considerations for any special status birds identified onsite, including the Least Bell's Vireo and the Loggerhead Shrike.	NASA has been in consultation with USFWS. NASA believes that the assessment of impacts, findings and mitigation are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.
Christopher	Stephens (Ventura County Resource Management Agency)	Dust. Indirect impacts to biological resources from dust would vary greatly depending on the amount of excavation required. The DEIS should consider impacts and mitigation measures from dust based on the excavation to 20 feet.	NASA intends to have dust monitoring equipment that should significantly limit dust accumulation and impacts on biological resources.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	Wetlands. The DEIS must disclose all mitigation measures and related impacts in the current document. Currently, the DEIS (Page 4-39) states that the project could affect two (2) acres of wetlands, and it identifies this loss as moderate, regional, and long-term. The DEIS further states that "NASA would work with the USAGE during the permitting process to mitigate the disturbance to waters of the U.S". Impact 6a and b of the DEIS should therefore be updated to reflect that the loss of 2 acres of wetlands is significant, regional, and long-term unless clearly defined mitigation measures would explicitly reduce impacts. Additionally, groundwater impacts (Biology impact 2k) to wetlands would not be "no impact" if changes in groundwater were to affect surface water availability.	Biology BMP-5: NASA would obtain a CWA Section 404 Permit from the USACE and a CWA Section 401 permit from the RWQCB for the discharge or dredge of material into jurisdictional waters of the U.S. The Section 404 and 401 permits would include necessary measures to avoid, minimize, or otherwise mitigate impacts to wetlands and other waters of the U.S.
Christopher	Stephens (Ventura County Resource Management Agency)	Deferred Mitigation. Impacts Biology 1b, 1f, 1i,11, 1o, 1r,, 6a, and 6b were considered (or should be considered, in the case Impacts Biology 6a and 6b) to be "regionally significant". However, the DEIS does not identify appropriate mitigation measures but instead defers the development of mitigation measures to future USFWS review. It is critical that mitigation measures be defined within the DEIS in order to disclose to the public whether (or not) the project under review does (or does not) have potentially significant regional impacts following the application of mitigation measures. Accepted standards for environmental review include the development of mitigation measures within the DEIS, and prior to project approval and implementation. The impact analysis is not clear and clearly defined mitigation is needed within the DEIS.	Final MMs concurred to by USFWS are included in FEIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	While the proposed cleanup at the SSFL is intended to remove the groundwater and soil contamination present at the site, and thus return the site to its "background" condition, the proposed cleanup will occur in a manner that is not consistent with the Open Space goals of the County's General Plan. For example, the project includes significant clearing of native vegetation and soil, which is not consistent with the County's goals of preserving natural resources, using such lands for recreational purposes, or retaining the scenic value of the land. In addition, while the proposed cleanup levels may bring the contaminant levels down to "background," the site would not be returned to "its natural state prior to the introduction of contaminants" (NASA Audit Report No. IG-13-007, pg. 6; NASA SSFL Fact Sheet) given NASA's plan to remove such large amounts of soil and vegetation.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Christopher	Stephens (Ventura County Resource Management Agency)	Although the Proposed Action may not require a change to the County's land use classifications, and would presumably not affect minor land use issues such as easements, that does not lead to a conclusion that "existing and proposed land uses do not conflict with ... state land use plans, policies, regulation, or laws. The State of California requires that local jurisdictions prepare a General Plan, and (as noted previously) the Proposed Action is not consistent with the purpose or goals associated with the property's Open Space land use classification.	As a federal agency, NASA is not required to comply with state or local policies, ordinances or statutes. NASA will continue to make efforts to adhere to these policies when feasible.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>were not developed in a way that reasonably anticipates, or even discusses future land use. In fact, as part of NASA's response to comments, they state that, "(a) decision about future land use is not within NASA's purview, nor part of NASA's EIS" (Appendix K, Pg. K-7). Given the lack of analysis in the EIS, NASA's conclusion that land use can be eliminated as a cleanup consideration appears to be unfounded and premature. Without an examination of land use options (e.g. park use, recreation use, residential use, or other types of land use), it is impossible to state what effect the proposed demolition and cleanup activities will have on future land use of the property. Although not a federal Superfund site, the U.S. Environmental Protection Agency's guidance with respect to remedy selection at Superfund sites is instructive. An EPA 2010 Directive state:</p> <p>"In carrying out Superfund response actions that protect human health and the environment, EPA typically considers the reasonably anticipated future land use of a site in the remedy selection process" (EPA OSWER Directive 9355. 7-19).</p> <p>Without an analysis of "reasonably anticipated future land use", it is difficult to conclude that remediation decisions are, indeed, consistent with existing and/or future land uses.</p>	<p>This is intended as a statement regarding if the action eliminates future land uses. NASA believes the proposed demolition and environmental cleanup activities would not result in a change in land use on the NASA-administered property; implementation of the Proposed Action or action alternatives would not require a change in zoning, and no easements or land encroachments would be necessary. No land use acquisitions or transfers would be required.</p> <p>While the soil, topography, and biological resource impacts may diminish the use as park space, it does not preclude that use.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>Zoning</p> <p>In addition to the General Plan, future land use for the SSFL site will be dependent upon zoning. The SSFL site, which includes properties owned by Boeing, is also subject to a 1947 Special Use Permit issued by Ventura County. It should be noted that the current zoning for the NASA property, which is Rural Agricultural, or RA-5 acre, is not consistent with the General Plan land use designation of Open Space, which has a 10-acre minimum lot size. Consistent zones would be as follows:</p> <ul style="list-style-type: none"> • Open Space (OS), which has a 10-acre minimum • AE (Agricultural Exclusive), which has a 40-acre minimum <p>The Zoning Matrix (pg. 44 of the Non-Coastal Zoning Ordinance) shows minor differences in allowable uses between the current zone and the two consistent zones. However, the minimum lot size would change from 5 acres to either 10 or 40 acres, depending on the selected zone.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>The NCZO requires a discretionary permit and offsets for the removal of more than four (4) oak trees. Based on the information provided in Appendix D of the DEIS, there are over 20 acres of oak woodland on the NASA property (Appendix D, Pg. D-17). Although this resource is mapped on Figure 3.4-1 (Vegetated Cover Types), these oak woodlands do not appear in Figure 4.4-1, which is the map showing the Biological Resources that will be impacted by NASA's proposed actions.</p> <p>The Planning Division recommends that oak woodlands be added to Figure 4.4-1, as it appears that the remediation will remove a portion of the oak woodlands. Moreover, the Planning Division assumes that NASA's remediation plan will remove far more than four oak trees, and hence would have required a discretionary permit and commensurate offsets (such as inlieu fees) as mitigation for the loss of this resource. In addition, Appendix B of the DEIS should be revised to include the Tree Protection Ordinance and appropriate mitigation should be included in the DEIS to account for the loss of oak woodlands that result from cleanup activities.</p>	<p>Thank you for your comment. Since SSFL is federal land, it is not subject to local ordinances but will comply as much as possible.</p>
Christopher	Stephens (Ventura County Resource Management Agency)	<ul style="list-style-type: none"> • Noise Ordinance: Appendix B of the DEIS refers to the County's Noise Ordinance as an applicable regulation (Pg. B-18), and the document states that it provides relevant night-time noise standards. However, the Noise Ordinance only applies in residential neighborhoods between the hours of 9:00 p.m. to 7:00 a.m. of the following day. Given that NASA's remediation activities will not occur in residential neighborhoods and are scheduled between the hours of 7:00 a.m. and 7:00 p.m. (DEIS, Section 4.11, Pg. 4-140), the night-time noise standard would not apply. The Planning Division recommends that the reference to this noise ordinance be removed from Appendix B, as it does not appear to be applicable. 	<p>The reference to the noise ordinance will be removed from the EIS (Appendix B).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>The County recommends that NASA clarify its truck trip calculations so that noise impacts can be properly evaluated. Currently, there's an inconsistency within the report regarding the amount of additional truck traffic that could be generated by the Proposed Action. On page 4-119 of the DEIS, it states that 3,476 trips associated with demolition hauling would take place over the course of approximately one year. However, on page 4-139 of the DEIS, it says that the "analysis assumed that up to 142 trucks per day would use the designated haul routes." Assuming 260 work days in a year, these 142 daily truck trips add up to almost 37,000 annual truck trips, which is considerably more trips than the 3,476 trips estimated elsewhere in the DEIS. In addition, in Section 4.11.1.1 (Demolition) of the DEIS (pg. 4-140), it states that demolition activities would take place between 2014 and 2016. Of course, demolition activities would result in additional truck trips and those trips do not appear to be accounted for in the 37,000 truck trips noted above.</p>	<p>Consistent with the air quality analysis, the traffic analysis assumes that demolition would take 150 days. With these estimates, there will be 3,476 trucks/150 days = 23 one-way truck haul trips per day.</p> <p>There is a difference between haul trips, one-way truck trips, and passenger car equivalent trips:</p> <ul style="list-style-type: none"> • The first step is to start with the 23 one-way truck haul trips per day. • Each truck will have to make a return trip, so there will be a total of 46 one-way truck trips per day (filled in one direction and empty in the other direction). • Truck trips were converted to passenger car equivalents at a rate of 2.5 passenger car equivalents per truck. • With this factor, demolition would result in a total of 120 PCE one-way truck trips per day (46 one-way truck trips + 2 delivery trips x 2.5 passenger car equivalent trips/truck). <p>The estimate of 142 PCE truck trips per day is slightly higher, based on more conservative assumptions. However, with either 120 or 142 passenger car equivalent trip truck trips per day, extrapolating out to a number of truck trips per year is not the correct calculation. The maximum number of passenger car equivalent trip truck trips is for a single day, and reflects the passenger car equivalent trip and other factors described above.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	The CHS staff comments seek to evaluate whether "most or all of the primary structures, sites, and other improvements ... could be considered potentially eligible for listing on both the National Register of Historic Places and the California Register of Historic Places. (Calvit and Barrier 2006: 1)" (NASA, Historic Resources Survey and Assessment of the NASA Facility at Santa Susana Field Laboratory, Ventura County, California (March 2009 ver.) p. i.; see also 36 CFR Part 60) and whether the proposed project significantly affects existing cultural resources, including sacred sites and historic properties in the project's region of influence or area of potential effects.	The DEIS identifies the historic properties within the APE: 3 historic districts, 9 individually eligible structures within the districts (6 test stands and 3 control houses), one NRHP-listed archeological site and 2 potentially eligible archeological sites. The DEIS discloses that the proposed project would have a significant impact under NEPA and adverse effect under Section 106 of the NHPA on cultural resources.
Christopher	Stephens (Ventura County Resource Management Agency)	CHS staff concurs with the NRHP eligibility of the three districts and their contributing elements, as well as the nine individual eligible structures and the NRHP eligible archaeological sites as described in the May 2008 Historic Resources Survey and Assessment of the NASA facility at SSFL.	We acknowledge your comment and concurrence.
Christopher	Stephens (Ventura County Resource Management Agency)	CHB staff believes the APE boundary is inadequate. As shown in Figure 2 of Appendix C, additional soil remediation cleanup areas are located outside of the existing APE. The APE should be adjusted to include these sites. Furthermore, the Traditional Cultural Property and Cultural Landscape Assessment ("TCP Assessment") has not been completed, so it is unknown whether these sites would be within the current APE. Once the Assessment has been completed, the results and recommendations should be incorporated into the DEIS for recirculation to the public and if necessary, the APE adjusted to incorporate these sites.	The APE (ROI) includes those areas outside of NASA's boundary that are likely to be impacted by NASA's cleanup activities. Archeological investigations included all of these areas. The results of TCP and cultural landscape investigation will be summarized in the FEIS. NASA's DEIS included an assessment of impacts to a TCP that equated the entire APE.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>In accordance with the above policy, the TCP Assessment and the Chumash Sacred Site boundary identification should be completed so that the full scope of the project is known. Once the assessment and the boundary identification are completed, the potential impacts to such resources can be disclosed to the general public and considered by the decision makers in their determination to implement the project.</p> <p>The purpose of the DEIS is to "inform decision makers and the general public of the environmental consequences of a proposed federal action." The DEIS doesn't disclose the full magnitude of the property disturbance. Delineation the contaminated areas is still underway so it is premature to circulate a NEPA document when the full scope of the project is unknown.</p>	<p>The Indian Sacred Site, as designated by the Santa Ynez Band of Chumash Indians under EO 13007, incorporates the entirety of the NASA-administered Area. No further boundary identification is required.</p> <p>The TCP and cultural landscape boundaries will be included in the confidential TCP and cultural landscape report on the findings of the investigation. The results of TCP and cultural landscape investigation will be summarized in the FEIS. NASA's DEIS included an assessment of impacts to the Indian Sacred Site and a TCP that equated the entire APE.</p>
Christopher	Stephens (Ventura County Resource Management Agency)	<p>Decisions presented in the DEIS should first consider project avoidance and minimization of effects, rather than mitigation. Mitigation measures should be developed to save all three test stands, and their contributing elements, as well maintaining the individual eligibility of the nine structures within the three historic districts.</p>	<p>NASA will consider these and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p> <p>The consultation process under Section 106 of the NHPA is ongoing. NASA, SHPO, ACHP, Consulting Parties, Tribes, and other agencies continue discussions regarding appropriate MMs to address the adverse effect on cultural resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	In accordance with the policies above, CHB staff recommends that the DEIS incorporate feasible mitigation measures identified by the Santa Ynez Band of Chumash Indians and the Native American Heritage Commission through consultation with NASA for the protection of the nationally significant Burro Flats Painted cave archaeological site, the not-yet defined Chumash Sacred Site, as well as Sites CA-VEN-1800 and CA VEN-1803. As part of the consultation, the location of the archaeological sites shall remain confidential. Additionally, feasible mitigation measures identified by the National Park Service, Advisory Council on Historic Preservation, and the State Office of Historic Preservation staff for the protection of the NRHP eligible historic architectural resources during the Section 106 consultation should be incorporated into the DEIS.	Please refer to the Programmatic Agreement and/or ROD which take into effect the multiple comments from consulting parties in accordance with S106 of NHPA.
Christopher	Stephens (Ventura County Resource Management Agency)	Mitigation Measures (Cultural MM-1, MM2, MM3, MM4 and MMS under Section 4.3 - Cultural Resources) The identified Mitigation Measures "MM-1 Retaining one Test Stand," "MM-2 HABS/HAER documentation" and "MM-3 In-depth ethnographic study" for the impacts on cultural and historic resources from proposed demolition, excavation, soil removal and groundwater cleanup do not reduce the significant adverse effects of the project to a less than significant level.	That is correct. Even after identified MMs, the impact on cultural resources from the Proposed Action would be significant, as disclosed in the DEIS.
Christopher	Stephens (Ventura County Resource Management Agency)	MM-1 Mitigation Measure for retention of one test stand does not meet the Secretary of Interior's Standards and Guidelines for Preservation which requires retention of the greatest amount of historic fabric, along with the building's historic form, features, and detailing as they have evolved over time.	While the proposed undertaking is up to 100% demolition, NASA recognizes that retaining a test stand and other facilities does mitigate the adverse effect to less than a significant impact. NASA has included other MMs as part of the Programmatic Agreement and/or ROD which take into effect the multiple comments from consulting parties in accordance with S106 of NHPA based on consultation with multiple consulting parties.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	MM-2 and MM-3 Mitigation measures of HABS/HAER documentation recording and the completion of ethnographic studies would avoid the loss of historical information, but do not prevent the physical loss of historically significant resources. It should be noted that photographic documentation to HABS standards of a historic building or structure is not sufficient mitigation for its demolition (Architectural Heritage Assn. et al v. County of Monterey, (2004) 122 Cal.App. 4th 1095.)	Please refer to the Programmatic Agreement and/or ROD which concludes the Section 106 consultation process under the National Historic Preservation Act and takes into account adverse effects to historic properties.
Christopher	Stephens (Ventura County Resource Management Agency)	CEQA requires that all feasible mitigation be undertaken even if they do not mitigate the project below a level of significance. Therefore, additional mitigation measures should be developed to save all three test stands, and their contributing elements, as well as the nine structures within the three identified historic districts.	While the proposed undertaking is up to 100% demolition, NASA recognizes that retaining a test stand and other facilities does mitigate the adverse effect to less than a significant impact. NASA has included other MMs as part of the Programmatic Agreement and/or ROD which take into effect the multiple comments from consulting parties in accordance with S106 of NHPA based on consultation with multiple consulting parties.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	<p>CHB staff concurs with using the following Mitigation Measures:</p> <ul style="list-style-type: none"> • Avoidance of excavation within the boundaries of Burro Flats (CA-VEN-1072) and CA-VEN-1803 to diminish or eliminate adverse impacts to known archeological sites and reduce the impacts to negligible. • All three Test Stands and their contributing elements, as well as with the individual eligibility of the nine structures should be retained in-situ or relocated elsewhere on the same project site. • Use Monitored Natural Attenuation (MNA) to monitor soils or groundwater to evaluate the reduction in contamination over a period of time once another treatment technology had been implemented or the naturally occurring attenuation processes had proven effective in reducing contamination in the subsurface. • Use of Institutional Controls including deed restrictions, fencing, signage, and other security measures to eliminate public access to the most significant sites. 	<p>NASA recognizes the historical importance of the test stands and is conducting section 106 consultaiton in accordance with the National Historic Preservation Act to resolve potential adverse effects from the proposed action on historic resources. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA will also work with GSA to place a covenant for the protection of at least one test stand and control house.</p> <p>MNA is part of the options being evaluated for the groundwater cleanup, however MNA and land use controls are not permitted by the 2010 AOC for soil cleanup (see page 2 of the AIP attachment to the 2010 AOC; excerpt below).</p> <p>"Residual concentrations 'not to exceed' local background concentrations i.e., if during site survey efforts or during confirmatory sampling the level of any constituent detected in a soil sample is above local background levels, step-outs will be taken to delineate the contamination and removed;..."</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Stephens (Ventura County Resource Management Agency)	The DEIS alternatives ("No Action" and 100% Demolition) discussion is inadequate. The alternatives analysis is considered the "heart" of the EIS and should discuss a range of alternatives, including all "reasonable alternatives." CHB staff recommends that the DEIS include additional alternatives that are feasible from an economic, technical, and future land use standpoint that provides for the preservation of the most significant historic resources at SSFL. The DEIS should develop mitigation measures in conformance with the Secretary of Interior's Standards for Rehabilitation that would result in the retention of the greatest amount of historic fabric, along with the building's historic form, features, and detailing as they have evolved over time. Other cleanup alternatives consistent with the potential future use of the land should be considered.	While the proposed undertaking is up to 100% demolition, NASA recognizes that retaining a test stand and other facilities does mitigate the adverse effect to less than a significant impact. NASA has included other MMs as part of the Programmatic Agreement and/or ROD which take into effect the multiple comments from consulting parties in accordance with S106 of NHPA based on consultation with multiple consulting parties.
Christopher	Stephens (Ventura County Resource Management Agency)	The information in the DEIS indicates that the handling of solid waste and hazardous materials encountered or created in the cleanup activities appears to be in conformance with applicable regulations regarding these materials.	NASA acknowledges your comment.
Christopher	Stephens (Ventura County Resource Management Agency)	Two known closed solid waste landfills exist within the general area of the SSFL. These are identified as Area 1 Landfill Solid Waste Information System (SWIS) #56-CR-0051, and Area 2 Landfill SWIS #56-CR-0052. The EHD understands that the cleanup activities proposed in the DEIS will not impact these closed solid waste landfills, however, in the event that changing conditions during the cleanup occur which results in disturbance of either of these landfills, the EHD, as Local Enforcement Agency for Solid Waste must be contacted prior to any disturbance. Also, the EHD will continue to monitor the condition of these solid waste landfills, in conformance with State minimum standards.	Area 1 Landfill is on Boeing's portion of SSFL and their responsibility. The Area 2 Landfill is NASA's responsibility and it is part of the proposed soil cleanup action. The exact extent of soil removal has not yet been determined. NASA representatives will contact your office to discuss these plans.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>Overall, we applaud the clarity and organization of the DEIS, which states its assumptions and findings clearly. We appreciate its direct and thorough description of the analysis completed to date. The DEIS provides analysis of a required “no action” alternative, and one alternative proposing demolition and clean up of the 451-acre site to “background levels” as established in a previous agreement made between government agencies—referred to in the documents as “2010 agreement on consent” (AOC) for which no formal, public study of the environmental impacts of the agreement was completed. The first and overarching comment of the RCDSMM therefore is that after completion of this first draft of the EIS, given the single action proposed at only the most stringent standards levels of contaminant removal, the environmental impact documentation and analysis remains incomplete.</p> <p>We request a revision of the DEIS that includes more true alternatives for cleanup including an approach that gives primary consideration to the protection of critical natural and cultural resources while protecting human safety at a level appropriate to the anticipated future land use.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>Please refer to the Programmatic Agreement (PA) and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 were incorporated in the PA and/or ROD.</p>
Clark	Stevens	<p>By providing only a no-action alternative and clean-to-background alternative analysis, the DEIS proposes a type of circumlocution in which an agreement established on the basis of contaminant measurement, without adequate study or public review of the environmental consequences, is cited as the sole reason for not providing an adequate study or public review of a full range of alternatives. The RCDSMM suggests that a place of such critical ecological and exceptional cultural resource value merits consideration of a full suite of reasonable alternatives.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>We recognize that the no action alternative leaves the site unsafe for human use, so to leave the existing contaminants at the site at current levels is unacceptable. However, by providing only one proposed action, no actionable “alternatives” have been provided at all for consideration, but a single action alone. “Alternatives” implies more than one action be provided which it the analysis approach that follows the spirit, intent and purpose of the public environmental review process.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives.</p>
Clark	Stevens	<p>We understand that NASA is working to comply with AOC-established timelines and internal “directives”, and that a number of elements of the analysis lack clear definition which we understand to be in the purview of the DTSC and their own as yet incomplete environmental analysis. Nevertheless the even the impact of the single (and insufficient) proposed action cannot be completely analyzed until such time as the DTSC/NASA provides more specific information.</p>	<p>Thank you for your comment, it is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>We request that a revision of the DEIS not only provide the DTSC components, but also provide:</p> <ul style="list-style-type: none"> - Complete and balanced analysis of various reasonable cleanup scenarios. <p>Please note that RCDSMM fully supports reduction of human health risk as the highest priority consideration, and recognizes that the current condition of SSFL does not provide an appropriate environment for any public or private end-use of the property. Reduction of contaminants to safe levels must be achieved according to measurable standards. However, “background” is a measure that requires a qualitative decision on the point in time and specific location in which such a condition could have existed, and as such the choice of quantitative determination drives significant impacts. Given that this background level will not be found in the majority of the metropolitan region that surrounds this site and in which millions of people now live full time, and that the negative ecological and cultural impacts at the site may increase exponentially with increasing quantitative standards of “safe”, other reasonable alternatives should be provided for analysis- as has been requested by numerous commenting parties during the scoping process.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>- Identification of specific outcomes for cultural resources, archeological as well as structural.</p> <p>We find the description of the end condition of the cultural landscape to be lacking specificity in the DEIS. The likelihood of finding archeological elements within contaminated soils is possible, and the outcome of that situation is not sufficiently defined.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>- Identification of replacement material for soils of sufficient quality to meet the AOC standards.</p> <p>We understand that a number of sources for replacement material have been studied and none have been as yet identified as meeting the standards now required in the single proposed action. The replacement soil values, if not matching the lookup tables, will drive a different cleanup approach and excavation quantities than is described in the DEIS.</p>	<p>The one third backfill estimated was based on historic cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets 2010 AOC requirements.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>The relatively undivided and sparsely developed Simi Hills and Santa Susana Mountains (SHSSM) are of great importance to the people and land managers of the region, as they represent the core areas of a primary habitat linkage that provides the Santa Monica Mountains (SMM) with the source of its sustainable biodiversity. However, the connectivity between core habitat areas in the SMM, Simi Hills (SH), Santa Susana Mountains (SSM) and the Los Padres National Forest (LPNF) has been severely degraded by intrusive “fingers” of development, fenced off freeways and railroads, etc. Mitigation for these environmental impacts that occurred prior to the California Environmental Quality Act has been the primary driver for 20 years of wildlife corridor studies, the most recent being the South Coast Missing Linkages Project (http://www.scwildlands.org/projects/scml.aspx). It is important to note that a habitat linkage is more than a “wildlife migration corridor”, but is rather a contiguous area connecting significant habitat patches (sources or sinks) within which species can feed, breed and adapt over time to changes in the ecosystem, and through which genetic diversity can flow over generations to maintain species health and viability. As such, the definition of “corridors” is only part of the consideration of ecological importance of the NASA property and SSFL. The subject parcel is the heart of the habitat linkage that is most critical to maintaining the ecological health of the entire Santa Monica Mountains ecosystem, as well as the Simi Hills ecosystem it currently anchors.</p>	<p>SSFL is important habitat recognized in linkages by local agencies. The NASA administered areas of SSFL are located adjacent to a potential migration corridor for numerous wildlife species (South Coast Wild lands, 2008). SSFL habitat and species diversity, physical attributes, and geographic location make the area a potentially important route for species migrations. Open space at SSFL could play a role for habitat linkage among the Santa Susana Mountains, the Simi Hills, and possibly, the Santa Monica Mountains (NASA, 2011b). Species observed using the migration corridor through SSFL include mountain lion, badger and mule deer; though potential habitat exists for many other species as well (South Coast Wild lands, 2008). While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area. The EIS text will be revised to reflect the migration corridor may include SSFL (Sections 3.4.2, 4.4.1.2, and 4.4.1.3).</p> <p>NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>As such, the several acknowledged “significant, negative, regional and long-term” impacts of the single action proposed by the DEIS must be understood in this context. To excavate 100 acres of this key watershed, removing all of the soil and replacing less than 20% of that- and even that not with soil, but “backfill”- as currently proposed in the action will leave a significant concavity in the Bell Creek upper catchment. Downstream impacts to the miles of Oak Riparian woodlands downstream have not been adequately studied, but replacement of a positively draining 100-acre surface with a non-draining concavity will certainly devastate the local hydrological cycle. The DEIS cites only the removal of impervious surface and corresponding increase infiltration to establish a claim of beneficial impact. But a critical analysis of the sectional gradient of the resulting hydrology- that is, the loss of positive flow within the riparian corridor resulting from the impoundment created by the unrestored topography- is missing from the DEIS. Clearly, the costs and number of truck trips proposed are contributing factors rationalizing the proposed action, but this extraordinarily unbalanced cut-fill has impacts we ask be fully recognized and evaluated and the claims of beneficial impacts corrected.</p>	<p>On an acreage basis approximately 25% of the NASA area will be impacted. NASA agrees that there will be impacts as a result of the "loss of positive flow within the riparian corridor resulting from the impoundment created by the unrestored topography". This negative impact to the potential change in flow conditions is addressed in Section 4.6.1.2 of the EIS and states that the likely outcome of this significant excavation would be to create new ponded areas. Although surface flows would be decreased, the additional infiltration would increase discharges from existing seeps, thus increasing surface flows downstream of the seeps. A portion of the increased infiltration, however, would be lost to deep percolation, resulting in an overall net decrease in surface flows. The small overall net decrease in surface flows would be considered a minor, negative, local, and long-term impact (Water Impact 2a). NASA believes the level of detail in the EIS is acceptable under NEPA.</p> <p>The one third backfill estimated was based on historic cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets 2010 AOC requirements. NASA believes that replacement of approximately one third of the excavated soil will be sufficient to accommodate the hydrology and eventual re-vegetation of the site. As discussed in the EIS, the soil biology will be destroyed upon excavation/removal. Section 2.2 of the EIS identifies potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California. According to the 2010 AOC backfill soil must meet the LUTvalues. These sources have not been evaluated to determine if they can meet the 2010 AOC requirement.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>The DEIS does not note that the subject property is part of the Rim of The Valley Special Resources Study (ROTV) area for which an Environmental Assessment (EA) is currently being drafted. The ROTV in its completed initial stages has identified and described the natural and cultural resource value and connectivity of the area, noting the critical importance of the region in which the subject property is located. In our letter of comment at the Feasibility stage of the ROTV study the RCDSMM noted that “some important resources that are not yet designated National Historic Landmarks”.</p> <p>The sole action described in the DEIS would forever sever this nationally significant connection between the highest aspirations and technological feats of two historic cultures, and create impacts for which no mitigation may be possible, but certainly for which no adequate mitigation has been proposed in this document.</p>	<p>Thank you for your comment. However, the findings of the ROTV study are not yet publically available, and will not be available until after the expected publication of the FEIS. Consequently, we are unable to perform an adequate cumulative impact analysis on this activity. While, we did add a discussion of the ROTV study under cumulative activities in Section 4.13.1; it is not carried further in the analysis.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>As rare as this convergence of aspirations from widely separated eras and cultures is the opportunity to interpret Native American cultural resources within the largely intact ecological systems that supported their activity and sourced their cosmology. It is a contemporary mistake to compartmentalize the physical characteristics of an historic cultural site from its spiritual and cultural significance. The oak woodlands, the horizontal and sectional geometry of the exposed rock formations and the converging valleys all contributed to the inevitability of this site as the Chumash place of solstice observation, of the human effort to support the cause of Coyote in his yearly contest with Raven to bring the sun back from its journey south and diminishing day-life. The “artifacts” of the human hand ought not be separated from the “artifact” of the ecosystem and space that directed the hands and supported the ceremony. To remove the soil and the ecosystems would be to remove the Sacred Landscape identified by the federally recognized Santa Ynez Band in support of all Chumash people. These are protected resources for which no mitigation is possible.</p>	<p>NASA endeavored to analyze impacts to multiple cultural resources including Indian Sacred Sites and TCPs as well as known and unknown archeological sites and features and plants of interest to Native Americans.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>The co-location of ethno-astronomical technology with modern-era technology created in order to explore the heavens reaching presents an extraordinary inspirational value and interpretive opportunity. Nine eligible historic structures exist at the site. We suggest that demolition of most of these historically significant structures can not be mitigated by retaining only one of them. We will provide section 106 comment under separate cover, but propose that the remaining Coca and Alfa district test stand structures have the greatest potential for interpretive, educational, and inspirational value at the site and at least one test stand at each site should be preserved along with its critical contextual structures, such as the associated blockhouse. We suggest that appropriate mitigation for the historically significant structures that are to be demolished not only be 3-dimensional documentation of their pre-destructed state, but also an endowment for the maintenance and interpretation of all of the “structures” both indigenous and modern and the absolutely unique co-location at Hi’im (mystery valley), also known as SSFL.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p>
Clark	Stevens	<p>In addition to creating negative, significant and long-term impacts to rare riparian and oak woodland areas and their supporting hydrology, removal of nearly a quarter of the surface soils and much of their underlying topography to a depth of up to 20 feet, and replacing that with a small fraction of “backfill”, the removal of up to 100% of the modern era historic structures and protection of only the “artifacts” found within a destroyed context- even that of the Burro Flats Cave site- will limit not only the not only the number, but the type of recipients who will take interest in assuming ownership.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	The GSA disposition process cannot force a preferred steward to take on the property, so it must be left in a state that is suitable for some end-use. Public open space managers with stressed budgets and very clear missions may be hard-pressed to justify obtaining a 451-acre property with 100 acres of un-restored excavation area, a weed, erosion, and surface water management problem, stripped of all cultural resource and interpretive value, with only fragile artifacts remaining without context yet still in need of protection.	Your comment is noted.
Clark	Stevens	The disposition process does not guarantee any public or open-space/recreational end use. Should no such stewards accept the property, others will evaluate the "highest and best use" of a former development site, now free of contaminants, within a fully accessible 100-acre graded area. The potential for losing the site to development is a potential unintended consequence of look-up tables and timelines rather than Purpose and Need driving the choice reasonable alternative approaches to cleanup.	Your comment is noted.
Clark	Stevens	The stated Purpose and Need to remediate the environment and prepare the property for disposition is not met by the single action proposed.	NASA believes that the proposed action can meet the purpose and need. NASA acknowledges that the proposed action is not the environmentally preferred option. While impacts would be reduced by using risk-based alternatives, NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>Discussion of the environmentally superior alternative is absent from the DEIS. Perhaps this is because “no action” is clearly not what the community has been working toward for 30-plus years. Nevertheless, this section should be completed, as it is not a foregone conclusion that the single action studied would be superior to “no action”, or that the action proposed meets the standards required for the significant long term benefit claimed.</p>	<p>A discussion of a Preferred Alternative (under NEPA) is not applicable. NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Clark	Stevens	<p>The RCDSMM notes that the minimum amount of on-site remediation techniques proposed, and the 500,000 cubic yards to be removed to another site do not together represent true cleanup so much as contaminant relocation and concentration.</p> <p>The offsite impacts of concentrating low levels of contamination in a single site such as Kettleman to create an area of significant contamination ought be considered when this required discussion and identification of the environmentally superior alternative is completed- as well as in the environmental justice analysis.</p>	<p>NASA will conduct treatability studies to evaluate the effectiveness of ex situ and in situ technologies to treat the chemicals in the soil to LUTvalues. The soil exhibiting chemical concentrations that cannot be treated onsite effectively, will be removed and placed in an approved landfill. Soil excavation and disposal is the only proven remedial technology that can be implemented and meet the AOC requirements for soil and will be used during cleanup activities. Environmental Justice issues associated with the truck routes to the landfills is provided in Section 4.8 of the EIS. A discussion of the potential impacts of the waste and landfills is provided in Section 4.12 of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>The environmental impact and justice of taking soil of “background” level quality from another location should also be taken into consideration. It stands to reason that such soils, if available, would come from areas minimally impacted by surface or atmospheric deposition of environmental contaminants- that is, primarily natural and relatively pristine sites. What environmental permit process would allow such a taking? And, if material of such quality is physically or legally unobtainable, as may be the case if it can only be found in another community’s treasured open space, then what quality of material would be provided as a substitute? If that quality allows for a higher measure of contaminants within a safe standard, then why remove the existing soil that meets that elevated level of acceptability in the first place? The result would be a new alternative, one that would be possible within the constraints of available material.</p>	<p>Section 2.2 of the EIS identifies potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California. According to the 2010 AOC backfill soil must meet the LUTvalues. These sources have not been evaluated to determine if they can meet the 2010 AOC requirement.</p>
Clark	Stevens	<p>We do not agree with the conclusion that the single action proposed will result in a moderate improvement to the biological resources of the site in the long term. 100 acres of soil is to be removed, and far less returned as backfill, which is not of course soil. The net loss of native soils cannot be considered a benefit under any time frame or standard of objective measurement. With that correction, the reports tables seem to suggest that the no action alternative is the superior alternative. This result of course cannot stand, as there is a recognized need for contaminant removal at the site, and yet we do not have an action yet that has less than significant negative impacts in critical categories.</p>	<p>NASA considers that there are some net beneficial impacts to the cleanup by removing contaminants from the soil that could affect wildlife. NASA also recognizes in section 4.4.1.3. that there will be significant impacts to native vegetation communities. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Clark	Stevens	<p>In conclusion, we request that NASA, with DTSC’s full involvement and assistance, provide a revised DEIS evaluating a full suite of safe alternatives that recognize not only the critical ecological and cultural context that exists on site, but also the environmental “background” reality of the city in which this damaged but storied and sacred landscape is improbably located.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>
Clark	Stevens	<p>We urge the agencies to take the long view, and extend the deadlines and clarify or renegotiate the agreements that appear to be driving this understudied environmental analysis. Section 2.4 of the DEIS is particularly helpful, revealing, and provides a potentially valid framework for analysis of just such a complete suite of alternatives, as presented in earlier public meetings and truly useful for engaged public comment.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jim	Stewart	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jim	Stewart	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. To meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Jim	Stewart	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sarah	Stone	<p>...that neighborhood is very windy and there's lots of dust that already is blowing around. A lot of that dust ends up in my house and on my back porch and all around our neighborhood. And that's just normal. That's just the way it is. We live in an area that's decomposed sandstone, and that sandstone breaks down to small particles of dust. And that dust, every time there's wind, it blows around.</p> <p>And so my concern is that when I hear that there's going to be -- I forgot the numbers -- 80,000 trucks going up and down, and there was some mention earlier when you were talking about the impact that there would be particulate matter in the air. That would be an impact, a significant impact, on the neighborhood.</p> <p>That particulate matter that's going to be flying around as all of this stuff is being dug up that Brian expressed what was in that particulate matter, that's going to be in my living room and my kids are going to breathe it. So that's my -- what are you guys going to do? How are you going to keep that particulate matter from ending up all over the neighborhood with particulates and whatever all is in there? Because for the next few years that's what I'm going to be breathing. And that's my concern.</p>	<p>Fugitive dust emissions would be controlled by measures prescribed by VCAPCD Rule 55. Specifically, NASA would load materials carefully to minimize the potential for spills or dust creation; implement water spraying as needed to suppress potential dust generation during loading operations; take care to apply dust suppression water to the top of the load or source material to avoid wetting the truck tires; and would not perform loading during unfavorable weather conditions (such as high winds or storms). Material spilled during loading would be collected for subsequent loading. After loading, trucks would pass through the decontamination and inspection station before weighing and departure from SSFL. Trucks would be decontaminated by dry brushing before they leave the staging and loading areas to prevent track out. Materials from the truck decontamination would be collected and hauled out with the last load of soil. It is expected that application of water during loading operations could reduce fugitive dust emissions by up to 69 percent, whereas ceasing loading operations during unfavorable weather conditions could reduce fugitive dust emissions by up to 98 percent. When dealing with materials onsite in stockpiles, NASA will enclose material in a three- or four-sided barrier equal to the height of the material; apply water at a sufficient quantity and frequency to prevent wind-driven dust; apply a non-toxic dust suppressant that complies with the applicable air and water quality government standards; or install and anchor tarps, plastic, or other material. It is expected that enclosure of the material could reduce fugitive dust emissions by up to 75 percent, whereas application of water or non-toxic dust suppressants could reduce fugitive dust emissions by up to 90 percent. When hauling materials from the site, NASA will use properly secured tarps that cover the entire surface area of the load or use a container-type enclosure; and will maintain a minimum of 6 inches of freeboard, or water, or otherwise treat the bulk material to minimize loss of material to wind or spillage. It is expected that use of secured tarps and maintaining 6 inches of freeboard could reduce fugitive dust emissions by up to 91 percent, whereas watering bulk materials could reduce fugitive dust emissions by up to 69 percent.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Warren	Stone	Providing only two alternatives, clean up to background or no cleanup is not appropriate, other alternatives need to be presented such as a clean up to suburban residential or recreation standard.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Warren	Stone	The DEIS is flawed since the level of cleanup is not balanced against costs, cultural impacts, and environmental impacts, required by NEPA and CEQA.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Warren	Stone	Protection needs to be established before the cleanup for archaeological sites, such as the Burro Flats site VEN-1072 and any other archaeological sites on the property.	In consultation with SHPO, ACHP and the tribes, NASA is developing appropriate protection measures for the Burro Flats site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Warren	Stone	Protection needs to be established before the cleanup for structures such as Alpha, Bravo, and Coca rocket test stands and their related structures, eligible for protection as historic structures and districts.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Warren	Stone	Moving contaminated soil, and only replacing 1/3 of the removed soil is bad for the community that will receive the water runoff and bear the burdens of 80,000 trips carrying contaminated and new soil over two years, just from the 450 acre NASA site.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Warren	Stone	Alternative clean up methods to clean up soil on site, even if recovery in 10 years occurs, needs to be considered due to reduced environmental impacts in neighboring community.	<p>NASA considered a range soil cleanup technology and the viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Warren	Stone	<p>Pressure to complete the cleanup to meet the 2010 Administrative Orders on Consent (AOC) deadline by 2017 may cause illegal destruction of historic and archaeological resources on the property. Removal of key cultural resources likely will significantly decrease interest in the property from state and federal park agencies, generally identified as the likely optimum long term holder of the property.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Warren	Stone	<p>The long term use of the property needs to be considered in the cleanup approach, and the 2017 AOC deadline may need to be extended to prepare adequate foundation for the cleanup.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures. The 2017 schedule is very aggressive and if it were changed to a date further out it would remove some of the pressures driving the cleanup actions. Maybe it could help mitigate the impacts from large numbers of trucks by spreading out the frequency or allowing time to build a conveyor system. Maybe it could give time to see if a future land owner wants to preserve and maintain some of the historic structures. However, it would not aide in the reduction of impacts to biological resources.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cynthia Hobgood	Strauss	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Penny	Strowger	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Amanda	Suelter	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	<p>I have not yet received a reply nor acknowledgement of my request from the administrators of the msfc-ssfl-eis@mail.nasa.gov mailbox.</p> <p>May I have a copy of the "Evaluation of Archaeological Site CA-VEN-1072." Letter please?</p>	<p>Thank you for your interest in this report; however, confidential reports on sensitive archeological sites are not shared with the public. NASA's summary report in Appendix C is intended to provide the information that the public can see.</p>
Brian	Sujata	<p>The current DEIS is the outcome of two flawed decisions. First, NASA erred by including only one action alternative in the DEIS and not the full range of alternatives twice presented to the public. Granted, NASA has less responsibility for the outcome as Senator Boxer who interceded at various agency levels to reduce five action alternatives to one. The result is a DEIS based on an arbitrary, hastily crafted, single option cleanup plan that is unique to established State and Federal environmental laws. The community can only comment on the options of 'do nothing' or stripping all soil, grass, plants and trees from over one hundred acres of land totaling roughly one quarter the NASA-administered property at SSFL.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Brian	Sujata	<p>NASA also erred by not combining their supporting NEPA analysis with the DOE for their respective cleanups at SSFL even though they are nearly identical projects in terms of cleanup requirements, remediation activities, transportation consequences, completion schedule and long-term impacts to the environment. The current DEIS represents a piecemeal analysis of a larger project that has been segmented for the convenience of two Federal agencies. Thus, the community has been denied the opportunity to consider the totality of the cleanup conducted by the Federal government at SSFL.</p>	<p>Truck operations (and schedules) will be conducted according to information provided in the EIS. Typically trucks will run from 7 am to 7 pm.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	<p>Absent Meaningful Alternatives</p> <p>The absence of meaningful alternatives within the subject DEIS has produced an incomplete analysis that can only be remedied by the inclusion of additional alternatives.</p> <ul style="list-style-type: none"> • NASA must comply with established regulations relevant to the considered alternatives and scope of the DEIS. 	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Brian	Sujata	<p>A full range of alternatives (such as those presented in the Notice of Intent and Scoping Meeting) would include a range of cleanup levels which would attempt to balance the detrimental effects of the cleanup against impacts to human health and the environment. The analysis of a broader range of alternatives would certainly provide new information to the community and those potentially affected regarding the reasonableness of the SSFL cleanup.</p> <p>Removing the full range of alternatives withholds the opportunity for those potentially affected to consider the incumbent tradeoffs of the agency decision. For instance, community members exposed to the additional safety risk and other harm from the expected one hundred thirty five trucks per day are not allowed to consider a lesser cleanup standard requiring fewer trucks and the smaller risk of being engaged in a transportation - related accident.</p> <p>The DEIS must be revised to include a meaningful range of cleanup alternatives as presented in the July, 2011 Notice of Intent and March, 2012 Scoping Meeting.</p>	<p>NASA originally proposed to evaluate a cleanup to background (proposed action) that meets the 2010 AOC requirements, a "no action" alternative, and three other alternatives that are normally analyzed for a typical Superfund cleanup based on common cleanup goals associated with risk-based scenarios to evaluate the full range of options and their associated environmental or cultural impacts. Additionally, we always included evaluation of the different technological approaches to soil and groundwater cleanup. These additional three alternatives included a cleanup to suburban residential, industrial, and recreational cleanup standards. Based on input from multiple parties, NASA streamlined the evaluation to only one alternative which reflects the AOC "background" cleanup levels, while examining impacts of various technologies to meet that goal, that is, how to meet the AOC level. CEQ's letter dated July 19, 2012 states, "However, there is no requirement that NASA consider alternatives that cleanup to other standards that differ from the agreement with the State."</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	<p>Some of the Area II structures and buildings are considered historic, however, NASA removed two alternatives concerning their demolition from the DEIS. The public should have an opportunity to consider the fate of the NASA administered historic structures in Area II.</p> <p>The DEIS must be revised to include the two demolition-related alternatives presented in the July, 2011 Notice of Intent and March, 2012 Scoping Meeting.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	<p>The DTSC-approved SSFL Standardized Risk Assessment Methodologies must be used to implement a cleanup standard consistent with the future land use of administered parcels should be used by NASA.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Brian	Sujata	<p>The SSFL should be preserved in its current state rather than suffer the additional harm to the ecosystem and surrounding inhabitants the preferred alternative poses. The action alternative will also cause the loss of potentially historic buildings without the consideration of meaningful alternatives by the community. The No Action alternative is preferred over the Proposed Action. The DEIS Scope Has Produced An Incomplete and Piecemeal Analysis</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	<p>Upon fair consideration of the above, one can only conclude NASA has artificially divided a major federal action into two smaller segments with the result being an incomplete analysis of the Federal cleanup at SSFL. Because the DEIS scope is seriously flawed, those interested are not able to evaluate the planned government funded cleanup of SSFL in its entirety. The community (this author included) is denied the opportunity to respond to the complete extent of impacts to human health and the environment, including the cumulative impacts of the proposed Federal actions.</p> <ul style="list-style-type: none"> • The DEIS must be revised to include all Federal cleanup activities to be undertaken by both NASA and the DOE at the SSFL. 	<p>NASA has been coordinating with USFWS, USACE, SHPO, DOE, Boeing, consulting parties, Tribes, and National Park Service. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis was amended to reflect new information provided by DOE and Boeing (Section 4.13).</p>
Brian	Sujata	<p>Tangible Risk Communication Needed</p> <p>The NASA portion of the SSFL cleanup forecasts a total of 500,000 cubic yards of soil to be transported through the adjacent neighborhoods and therefore transportation presents a tangible risk of harm. The DEIS presents risk in terms of percent exposure to children traveling to school but does not consider the additional risk to the parent returning home.</p> <p>Accident risk does not end when the truck enters the highway but continues to the disposal facility and back. The DEIS must consider the additional harm arising from of all project-related truck traffic. Tens of thousands of truck trips will be involved in the proposed action. All affected and potentially affected persons should have the opportunity to understand the additional hazards the cleanup poses.</p> <p>The DEIS must consider the harm to the entire exposed public, including those on the highways as well as non-children.</p>	<p>The project will obtain all necessary transportation permits for truck travel on City, County, and State roadways. Federal and state regulations also govern the operation of commercial motor vehicles. These regulations, among others, have been established to help reduce or prevent truck crashes, fatalities, and injuries. As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents. NASA will coordinate traffic control plans with Boeing and DOE.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	The DEIS should be revised to include the transportation risk in terms of additional morbidity/mortality per transportation mile for the evaluated alternative.	See Section 4.5 of the EIS. In the United States in 2010, large trucks accounted for 4 percent of all registered vehicles and 10 percent of the total VMTs). These large trucks accounted for 8 percent of all vehicles involved in fatal crashes and 3 percent of all vehicles involved in injury and property-damage-only crashes. In California, trucks were only involved in 6.5 percent of fatal crashes in 2010 less than the national average (U.S. Department of Transportation, 2012). The overall crash rate in the U.S. for all vehicles was 1.22 fatal crashes per 100 million miles traveled and 20 injury crashes per 100 million miles traveled.
Brian	Sujata	The DEIS Must Consider the Inability to Secure Suitable Backfill, the Excavation Backfill Schedule and Define "Local Background" for Replacement Soils. The AOC requires offsite replacement soils not to exceed "local background" but the DEIS does not contemplate actions to be taken if suitable soil is not located. Under the AOC, backfill soils must not exceed the background levels for contaminants. However, given the stringency of the analytical requirements, an off-site soil may have one or more naturally occurring components thereby causing the soil to exceed the SSFL background and be rejected by the DTSC. NASA should consider and present the appropriate options and contingency responses the agency will undertake. <ul style="list-style-type: none"> The DEIS must be revised to present the course of action to be taken if sufficient quantity of acceptable replacement soil cannot be located. 	The backfill material could be from an onsite or offsite source. The following potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California: <ul style="list-style-type: none"> - P. W. Gillibrand Company, located in Simi Valley, California - Rindge Dam, located in Malibu Canyon, California - Santa Paula Materials, Inc., located in Santa Paula, California - Grimes Rock, Inc., located in Fillmore, California - Tapo Rock and Sand Products, located in Simi Valley, California These suitability of these soils for backfill meeting the 2010 AOC requirements has not been determined at this time. Sampling would occur to confirm suitability prior to any excavations starting.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	<p>The DEIS is silent regarding the schedule for soil replacement once the impacted soils have been removed. To minimize harm to the environment, the excavated areas must be restored using the appropriate replacement soils and re-vegetated as soon as possible. Site restoration must not wait for a source of suitable replacement to be located and committed to the site.</p> <ul style="list-style-type: none"> • Excavation of impacted soils must not occur until an adequate volume of appropriate replacement soil has been located and committed to the project. 	<p>Sampling of possible borrow locations will be conducted in advance of the cleanup actions so that appropriate planning can be developed.</p>
Brian	Sujata	<p>It would not be appropriate to conveniently define “local background” definition in a way that would allow backfill soils meeting “local background’ at their off-site source to be used by NASA. Impacts to the SSFL NASA-administered parcel ecosystem and those affected must be minimized. It does not make sense to remove soil and habitat only to have the replacement soil that does not meet the original cleanliness criteria.</p> <ul style="list-style-type: none"> • Replacement soils must meet the “local background” established for SSFL and not a “local background” established for an off-site location. 	<p>“Local background” is a loosely defined term from the Agreement in Principal (attachment to 2010 AOC). In practice it is chemical LUT provided by DTSC.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	<p>The Planned Soil Removal Volume Appears To Be Low The method and assumptions used to estimate the quantity of soil to be removed is not presented but likely underestimates the actual amount removed by a significant margin.</p> <p>The accurate assessment of the planned soil removal volume is important since it will affect the exposure from the harm associated with trucks carrying the impacted and replacement soils. It is also important to understand the extent of environmental impact the project poses.</p> <p>Established evidence indicates contaminants exist in the areas shown within the DEIS. The difficulty is to accurately estimate the amount of soil which needs to be excavated to remove literally every trace contaminant above background.</p>	<p>The soil areas required to be cleaned up to meet the 2010 AOC are called PRAs. These areas are considered preliminary because DTSC has only recently published the soil cleanup values [in their June 2013 chemical LUT] for the primary contaminants detected in the soil. Consequently, field investigation work has not been completed. The PRAs were developed by comparing the current field data to the screening values agreed to with DTSC. These screening values are reasonably comparable to DTSC's LUT as shown in Table 2.2-3 of the EIS. NASA believes there is a greater chance of the soil volumes increasing rather than decreasing. Applying the 2010 AOC exceptions, the total cleanup volumes may be reduced. DTSC has evaluated NASA soil removal volume estimates and agrees with the numbers</p>
Brian	Sujata	<p>Stormwater is also of grave concern since it has ability to spread contaminants out of the excavation, thus increasing the volume of impacted soil and possibly cause NPDES permit exceedances.</p>	<p>NASA appreciates your concern for mobilizing soil from excavations via stormwater runoff. Removal of large amount of soil can increase erosion and the amount of soil in water runoff. NASA evaluated the potential impacts of stormwater runoff in Section 4.6 of the EIS.</p>
Brian	Sujata	<p>Contaminant maps tend to underestimate the remediation area: Soil samples retrieved to determine the presence/absence of contaminants are not performed to map an areal distribution of the contaminant but to bound the extent of contamination. In other words, the DEIS maps indicating the areas of soil removal are provided only as large scale representations which rely on some amount of educated guesswork. Maps represent only start and not the completion of a remediation project.</p>	<p>Each soil sample location was surveyed within an accuracy of less than a meter so that the remediation areas could be estimated on maps using a computer-based geographic information system. NASA used conventional engineering methods to evaluate the soil remediation areas using the laboratory data from the soil samples collected and the survey information of each sample location. NASA realizes there is engineering judgment applied to estimating the extent of contamination in the soil.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	Spills and cross-contamination will increase soil volumes: The unprecedented cleanup standard of detect for most contaminants dictates the absolute control of impacted soils. Each movement of virtually every soil particle presents the opportunity to spread contamination into previously "clean" areas. Cross-contamination resulting from the unintended mismanagement of impacted soils must be planned for.	NASA appreciates your concern of cross contaminating areas of clean soil with soils that have constituents that do not meet the LUT values. Conventional construction methods implemented while remediating soil do not entail transporting contaminated soil across clean areas of the site. The remediation work in excavations will be conducted such that contaminated soil is transported and stockpiled or loaded in areas that are not designated as having clean soil. In addition, tarps will be used as necessary to collect incidental releases if soil excavation is required near clean areas of the site.
Brian	Sujata	The underlying bedrock is not a level surface: The bedrock underlying the soils is uneven with nearly continuous undulations characterizing the weathered bedrock surface. Planned soil removal estimates tend to be inaccurate since they do not factor in the volume represented by the highly variable subsurface low points.	NASA appreciates the comment regarding soil volume estimates. NASA has collected drilling refusal depth data at the vast majority of soil sampling locations. NASA realizes the bedrock is an undulated surface and did take into account the varying bedrock depths in the soil volume calculations if the parameters detected in the soil exceeded LUT values in the entire soil column up to the depth of the underlying bedrock.
Brian	Sujata	<ul style="list-style-type: none"> • The DEIS must be revised to state the rationale for the planned soil removal volume. • The DEIS must be revised to include a margin of error for the planned soil removal volume and the resultant impacts. 	The soil volume is based on sampling data as compared to DTSC LUT values. The areas of soil needing remediation were defined, and the volumes identified based on sample depth and the undulating bedrock surface. These volumes are approximate, and minimal margin increase has been included.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	<p>Only One-third the Volume of Excavated Soils Is To Be Replaced Restoring the site with only one third the volume of soil removed was not evaluated for long term impacts.</p> <p>The proposed action allows NSAS to restore the site using two thirds less soil than removed. The restored areas will therefore have a substantially reduced soil column which will drive permanent modifications of the existing habitat. Steeper surface gradients will result in greater erosion and in turn increased sediment loading over time, resulting in a negative long-term off site consequences to water quality.</p> <p>The shallower soils will hold less moisture and dry out sooner so the restored locations will favor fewer oak trees and favor weedy and non-native plants thus resulting in dramatic visual and habitat modifications throughout the nearly twenty four percent of Area II where remediation is planned.</p> <ul style="list-style-type: none"> • The DEIS must be revised to consider the impacts of reduced replacement soil volume on the environment. • The DIES must be revised to provide for the complete replacement of removed soils. 	<p>The one third backfill estimated was based on historic cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets 2010 AOC requirements.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brian	Sujata	<p>Replacement Soil Materials May Not Be Similar to Those Removed The replacement soils type should match the excavated soil type as much as possible.</p> <p>Sandy loam soils which are rather light and porous predominate SSFL. A different soil type (such as a clay-type soil) will have contrasting characteristics such as less moisture infiltration rate, greater compaction which would lead to changes to the vegetation, groundwater recharge and other unforeseen habitat changes.</p> <ul style="list-style-type: none"> • The DEIS must be revised to specify that all replacement materials will have a similar soil type to those removed. <p>General Comments Regarding the Practicability of Excavating Impacted Soils to Background</p>	<p>NASA will attempt to match backfill soils with the soil types that will be removed. Whenever possible, topsoil from within SSFL will be used to replace the remediated topsoil; however, the sources of native topsoil within the vicinity of SSFL are limited and are unlikely to supply enough topsoil to replenish the entire area.</p>
Brian	Sujata	<p>Finally, the on-site treatment of impacted soil should be discounted as means to reduce the soil removal/replacement volume. The excavation, movement and processing of impacted soils will be at best insufficient to remove all detectable traces of organic contaminants and at worse provide for the unintended spread of abovebackground contaminants (and/or their by-products) to the surrounding area.</p>	<p>NASA will conduct treatability studies to evaluate the effectiveness of onsite soil treatment technologies in reducing the detected organic contamination. NASA will use the onsite treatment technologies that reduce organic contamination to levels that meet or are below LUT values.</p>
Brian	Sujata	<p>Consideration of Ventura County Oak Tree Protection Law Although not specifically required, the DEIS should be responsive to the Ventura County ordinances requiring protection or mitigation of impacts to oak trees.</p>	<p>As a federal facility, NASA is not required to comply with the Ventura County ordinances. We do strive to comply with state and local ordinances when feasible.</p>

NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Susan	Suntree	I am writing to support a mitigation at the Santa Susan Field Lab that preserves the biological and cultural life of this landscape. It is profoundly valuable as open space, as habitat, and as a cultural repository.	Please refer to the Programmatic Agreement and/or ROD which identifies much of the mitigation associated with cultural resources and Section 4.4.2. for BMPs associated with biological resources
Susan	Suntree	The Lab offers an opportunity to establish open space, wild life corridors, and multiple species protection. Destroying the landscape through radical actions only moves dirt from one site to a landfill --nothing has really changed except the serious cost of moving and keeping covered contaminated dirt.	NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Susan	Suntree	<p>I support allowing light, monitored public access around boundaries. Monitor dust, filter water that leaves the site, and monitor ground water. I,also, support keeping some of the rocket engine testing structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Susan	Suntree	I do not support building additional structures within the boundaries except for a small interpretive center with parking and public transportation access located at the periphery, so that no one enters areas deemed contaminated.	Thank you for commenting on the DEIS. NASA will comply with the AOC and cleanup to background, a level that will accommodate any future use. Future Use is the responsibility of GSA thus outside the scope of this EIS. DTSC will prepare a CEQA document and GSA will develop a NEPA document that will address the future uses of the site.
Susan	Suntree	It is my hope that a responsible partnership with the Chumash will develop so that the sacred sites and anthropological treasures located there will be protected from public access except through guided tours.	In consultation with SHPO and the tribes, NASA is developing appropriate protection measures for the Burro Flats site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Susan	Swan	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Christina	Swindall	<p>As it is well known by NASA, the Chumash and ourselves, this site is of utmost importance to our Tribe. The well known Burro Flats Painted Cave is a treasure that must be preserved. When visiting the area previously for both Winter and Summer Solstice, we were able to physically appreciate the many other sensitive sites of the area.</p>	<p>NASA acknowledges your comment.</p>
Christina	Swindall	<p>In anticipation of construction and disturbance of sacred ground, one of our trained Native American monitors must be present to assess for human remains or artifacts.</p>	<p>A process for monitoring in known archeological sites will be developed in consultation with the SHPO and tribes and will be included in the agreement document.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Swindall	As a Tribe, we would request to have heard our opinion on potential construction and the damage it may cause. We would like to work along side NASA to protect this very important sacred site from outside destruction as well as potential destruction caused by the clean up project.	NASA's EIS identified potential historic resources and the likely impacts of the proposed action on those resources. NASA has been working with over 35 consulting parties including Native Americans under Section 106 of the NHPA to identify and determine effects to historic properties. Potential impacts have been noted by the public during the scoping period and the EIS comment period. The efforts to minimize, avoid or mitigate adverse effects are identified in the Programmatic Agreement and/or ROD. NASA will be setting up a Native American Advisory Board to assist NASA in its stewardship of important Native American sites during the implementation of the proposed actions.

Teena	Takata	<p>The DEIS lacks guidance on situations and actions that depend on vague language in the 2010 Administrative Order on Consent (AOC) that governs the cleanup. DTSC must provide NASA with an authoritative and binding interpretation of the language of the AOC.</p> <p>The DEIS is incomplete because it lacks guidance that still-undelivered DTSC documents, such as the DTSC EIR should include. This future EIR document must include a CEQA analysis that balances cleanup goals under various scenarios, including costs (both financial and environmental). Additionally, the DTSC EIR must provide information on what soils are to be removed in culturally sensitive areas, and what cultural resources will remain after the cleanup, as DTSC has sole authority to make these decisions under the AOC.</p>	<p>The AOC requires NASA to develop a NEPA document. In order to meet the 2017 cleanup completion date, NASA must proceed with the EIS. NASA is coordinating with DOE and Boeing and will update the EIS as information becomes available. The cumulative analysis section of the EIS shows additive impacts from NASA, DOE, and Boeing activities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	The DEIS is incomplete because it does not specify expected outcomes for cultural resources, both archeological and architectural.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic proeprties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	The DEIS is incomplete because it excludes analysis of all possible levels of cleanup except the “cleanup to background” alternative. Many commentators specifically requested inclusion of other reasonable alternatives during the scoping process.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Teena	Takata	The DEIS is incomplete because it does not address how to obtain replacement soil that will meet the requirements in the AOC.	Section 2.2 of the EIS identifies potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California. According to the 2010 AOC backfill soil must meet the LUTvalues. These sources have not been evaluated to determine if they can meet the 2010 AOC requirement.
Teena	Takata	The DEIS is incomplete in its specification of cumulative impacts with other concurrent projects; viz., the DOE and Boeing cleanups.	NASA has been coordinating with DOE, Boeing, The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	The DEIS is incomplete in its survey and mitigation methods for plants.	NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS. NASA is making efforts to cooperate with state and local policies when appropriate.
Teena	Takata	ESSENTIAL POINT OF SSMPPA's COMMENTARY: NASA must acquire from DTSC important missing information, and NASA must issue a corrected, comprehensive DEIS that provides decision makers adequate information to make an informed decision on how the cleanup should proceed.	The AOC requires NASA to develop a NEPA document. In order to meet the 2017 cleanup completion date, NASA must proceed with the EIS. NASA is coordinating with DTSC.
Teena	Takata	We believe the preceding comments taken as a whole make it clear the DEIS as issued is incomplete, inadequate, and does not conform to key environmental laws such as NEPA and CEQA. Lack of input from DTSC, for virtually every decision affecting cultural resources and key soil removal approaches, thwarts the DEIS from fulfilling its purpose as a guide to responsible decision-making. Additionally, it is dangerous to adhere to the 2017 completion date for cleanup that the AOC arbitrarily mandates. A hurried cleanup will likely become an irrevocable mistake, due to significant negative impacts to soil and cultural resources that may occur. The DEIS must be re-issued after DTSC and NASA determine and agree to robust decision-enabling guidelines, and the DEIS must evaluate multiple reasonable alternatives.	NASA recognizes the parallel DTSC processes under CEQA, and the additional level of detailed review that will be conducted in project-specific EIRs that evaluate localized remedial activities. No soil or groundwater cleanup actions will occur prior to DTSC completing its CEQA work. NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	Finally, the target date for completion of the cleanup must be extended. The current target date of 2017 has become unrealistic. A revised target date of 2020 will permit meaningful evaluation, compliant with NEPA and CEQA processes, of multiple, reasonable cleanup alternatives and their impacts. An orderly and logical cleanup can then be executed responsibly, thereby avoiding unwarranted destruction of irreplaceable cultural and natural resources.	The 2017 date is required by the 2010 AOC and can only be changed by mutual agreement with DTSC. NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Teena	Takata	The AOC charged DTSC with oversight authority for the cleanup.1a DTSC must provide NASA with a binding, authoritative interpretation of the language of the AOC. NASA must learn what SSFL-situation-specific rules will govern decisions and actions for the cleanup.	NASA believes that the AOC language is clear and is working to comply with it.
Teena	Takata	DTSC must provide NASA with much information that a DTSC EIR-type document would contain.	NASA is coordinating with DTSC. DTSC will begin their EIS soon.
Teena	Takata	DTSC must provide guidance to NASA on many subject areas before NASA can complete its DEIS. Of major consequence for every decision is the requirement under the AOC that at least 95% of any soil that has ANY amount of contamination over background level must be removed. This ambiguous requirement has pervasive impact on every item discussed below.	NASA believes that the AOC language is clear and is working to comply with it.
Teena	Takata	DTSC does not expect to deliver its EIR until some unspecified time in the future. NASA needs information from such EIR to complete a valid EIS that can be used as a decision making guide. Does this lack of a realistic schedule not call into question the feasibility of the AOC-mandated completion date of 2017? Can the governing AOC therefore any longer be considered 'binding'?	The NEPA evaluation can be completed before the CEQA evaluation. Remediation cannot be started until the CEQA evaluation is completed.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	The NASA Associate Administrator for Mission Support Directorate notes that NASA will be assisting DTSC in a CEQA analysis estimated to be complete by the end of 2015, but also notes that analysis will be restricted to the AOC cleanup level.1e.1 (See Attachment 1.) To the best of our knowledge, both NEPA and CEQA set standards for environmental considerations that must be addressed in environmental documents, and contracts that are inconsistent with that law do not trump NEPA and CEQA provisions. The NEPA and CEQA analysis must consider all options, not the single path set by the AOC1e.2 When will DTSC's actual EIR, including CEQA considerations, be issued as a draft? When will it be issued in final form? It appears these documents are not scheduled before execution of the cleanup to the constraints of the AOC. That is not our understanding of CEQA or environmental policy.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted. For planning purposes, NASA has been provide the 2015 timeframe for the completion of DTSC's CEQA process. Specific details should be requested directly from DTSC.
Teena	Takata	There are many environmental cleanup projects in the U.S. They "all" (as far as anyone knows) MUST operate according to federal and state EPA laws that were passed by legislators concerned with the environment. Operating under EPA processes means any toxic cleanup MUST evaluate multiple reasonable alternatives. The SSFL cleanup was forced to be uniquely different from other projects, because the AOC was signed before any EIS-type document. Why the difference? See Attachment 2. How is the different treatment of this project explained? We can fathom no reasonable explanation. SSMPA advocates a cleanup based on scientific results, testing and standards, not political pressures.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Teena	Takata	NASA should include the AOC document as an Appendix to the DEIS.	The AOC is available both on DTSC's and NASA's website (http://ssfl.msfc.nasa.gov)

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>DTSC must interpret the AOC on the handling of Native American cultural resources. The AOC language is vague in its definition of Archaeology, defining it as "Artifacts." They must be "formally recognized as Cultural Resources".^{2a} What does a "formally recognized cultural resource" mean? Who needs to recognize what to meet that odd definition? Interpretive guidance is critically needed, because much of the Burro Flats Cave area, registered in the National Register of Historic Places, is on the NASA property. The future of Burro Flats and related nearby Native American areas is yet to be decided by DTSC. An artifact is generally understood to represent a movable, historically used, significant object. Given that definition, the Burro Flats Cave itself could be eliminated by the language in the AOC, as well as bedrock mortars that are very significant in the immediate area. An explanation of how the Burro Flats Cave, and nearby related sites, will be treated must be provided by NASA and DTSC in the DEIS.</p>	<p>The exceptions in the 2010 AOC are dependent on DTSC approval. The cultural resources will remain in the EIS has having the potential to be impacted in the absence of this approval. Please refer to the Programmatic Agreement and/or ROD for further details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>The DEIS states that cleanup of approximately 0.65 acres of the Burro Flats site (CAVEN-1072) will be undertaken.2b At the August 28 public comment session on this DEIS, a NASA representative indicated they have been told the Cultural Resource definition in the AOC means the National Register of Historic Places (only). Under that definition, this site is exempt from cleanup. Why would this DEIS indicate any portion of this site is to be cleaned? This discrepancy highlights the problem of who controls the cleanup, an ongoing issue as we reviewed the DEIS. We do note, however, the definition of Artifact still was not clarified so the Burro Flats site may still be subject to cleanup under the AOC; since this site may still be subject to cleanup due to vague language, we object to cleanup of the Burro Flats site, as it is an identified and registered National Register of Historic Places area, and as it is an identified Indian Sacred Site.</p> <p>What are the contamination levels at the archaeological sites, and in particular, the 0.65 acre Burro Flats parcel slated for cleanup?</p>	<p>The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. The potential 0.65 acre impact from cleanup activities would be outside the National Register boundary, but within the Archeology Resource Management Area.</p> <p>NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further details.</p>
Teena	Takata	<p>The DEIS does not provide any information on how the boundaries of the archaeological sites on the property were determined. What survey methods were used? When was that done? What was found on the site? How was it tested? At what depth? What will DTSC do with an artifact NASA found in that survey, or a midden area that would not qualify as an artifact (that surely would be “contaminated”)?</p>	<p>The Burro Flats site was listed in the National Register in 1975. The Burro Flats site was revisited and resurveyed in June 2007 to reassess the nature and extent of the previously recorded Burro Flats site in NASA’s Area II. As a result, of this investigation, California Department of Parks and Recreation Primary Record forms for Burro Flats were updated and submitted to SHPO. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. The potential 0.65 acre impact from cleanup activities would be outside the National Register boundary, but within the Archeology Resource Management Area.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>Only a pedestrian survey of the site boundaries was done. Are additional pedestrian studies, and more detailed studies needed in the area where soil is to be removed? The DEIR lacks sufficient specificity to understand what has been surveyed.2d A more comprehensive survey using soil sampling techniques must be undertaken to determine the true size of the District. The Burro Flats Archaeological District extends outside the borders of Area II into Area III and possibly into Area IV. This site should not be segmented between the 3 RPs, but should be looked at holistically as part of the entirety of the Cultural Resources of SSFL. New, detailed surveys of this site must be accomplished prior to making irrecoverable decisions to “clean up” this exceptional and irreplaceable Indian Sacred Site.</p> <p>An additional boundary dilemma with the Burro Flats site and the National Register of Historic Places (NRHP) is that as of 1972, the NRHP site is 25 acres. Since the DEIS recognizes only 17 acres as the site, where are the boundary differences? Does the NRHP boundary exclude or include the 0.65 acres that is to be cleaned up? What is protected under the NRHP, and what should be protected as part of VEN-1072?</p> <p>The steps in 2b, 2c, and 2d are all necessary to define the Burro Flats site. Again we see the same problem – DTSC must advise what can be excluded from the cleanup. NASA must provide information on what they will exclude, given an updated DTSC interpretation. And here, on the single site that is already NRHP certified, the boundaries must be established, and the site still needs a detailed evaluation by a qualified archaeologist, and careful and limited testing must be done to provide information on contamination of any part of the site. The approach that DTSC and NASA will take to an Indian Sacred Site must be incorporated in the decision. All this information needs to be provided and presented, with proposed resolutions, in a re-issued DEIS.</p>	<p>NASA's EIS includes the appropriate amount of acreage of the Burro Flats Cave Site within the Area of Potential Effect. NASA resurveyed CA Ven1072 in 2007. The 0.65 acres is within NASA's protective buffer management area of the site and a small portion of the site.</p> <p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	What will be done with newly discovered archaeological Artifacts found in the process of the cleanup, that are not “culturally recognized”? How will these items be preserved or protected?	Please refer to the Programmatic Agreement and/or ROD for further details.
Teena	Takata	The Appendix for Cultural Resources lists multiple sites within a mile of the NASA property that have Cultural Resources. We have heard that multiple additional sites have been identified during recent surveys on nearby SSFL properties. It appears the list in the Appendix at Table 4 has not been updated to reflect current information. The segmented nature of the various studies is of concern. Please review and update as needed.	We acknowledge your comment. NASA understands that additional sites have been located on SSFL, outside of NASA property, during recent investigations, but the reports have not been finalized, so the information was not included.
Teena	Takata	DTSC must interpret the AOC on the handling of Architectural Structures that are eligible historic structures (rocket engine testing facilities). Three structures at each of the Alpha, Bravo and Coca test stand areas have been found eligible under NRHP and SHPO (nine total structures). What contamination has been found in the soils under the test stands? Have testing boreholes been drilled under these structures? What has been found? Appendix C, Figure 8 at page C-53, shows significant contamination in the Test Stand Areas, but does not disclose information specific to the key structures. The DEIR is deficient in not disclosing specific information on contamination issues in these areas, and particularly in the foundation areas of the NRHP and SHPO-eligible structures.	Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects. Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.
Teena	Takata	Will DTSC allow some or all of these historic structures to remain?	Please refer to the Programmatic Agreement and/or ROD for resolution of the impacts on historic structures.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>Since test stands are not "artifacts", but are recognized as significant historic structures under Section 106, NRHP and SHPO, what will happen to these structures?</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>The standards established by Section 106 (reproduced below) provide a mandate to seek ways to avoid or mitigate adverse effects on historic properties. Both NASA and DTSC need to indicate their intention for these structures that could be irreparably destroyed and a key part of our country's rocket history forever thereby lost. Because the NASA property holds key remnants of our country's space and rocket development, consideration of the possible end use of the property as a park should be incorporated in the preservation decisions. If the NASA parcel ultimately is joined with the larger Boeing parcel that is expected to become a park, preservation of appropriate NRHP and SHPO-eligible structures to inspire future generations should be given a much higher priority. These decisions should be documented in Alternatives presented in the re-issued DEIS. Appendix C, Section 5.1 is reproduced in part below (emphasis added): "The enabling legislation for Section 106 is contained in 36 CFR 800, "Protection of Historic Properties." The Section 106 process entails three basic steps:</p> <ol style="list-style-type: none"> 1. Identify historic properties potentially affected by the undertaking. 2. Assess adverse effects on historic properties. 3. Seek ways to avoid, minimize, or mitigate adverse effects on historic properties." 	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Teena	Takata	<p>Prepare and present a cost/benefit analysis for preserving and maintaining the historic structures and Districts. Include contamination analysis (soil and building), as well as costs and benefits identified in the study, to make informed decisions about which to preserve, and which can be preserved and be safe for visitors. We encourage special attention to Coca V and Alfa III and their associated blockhouses, as those were targeted early as preferred candidates for preservation, if reservation choices ultimately are necessary.</p>	<p>Cost/benefit analyses are not part of an EIS evaluation. NASA will provide this type information on our website.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>With respect to all cultural resources, please provide information for the groundwater and surface water effects due to soil mitigation. Specifically include consideration of the effect of the 330,000 cubic yard reduction in site soils noted in the soil replacement plan, including collateral re-contamination and other effects from flooding and silt runoff due to soil changes.</p> <p>The impacts anticipated to the archaeological cultural resources from removal of soil from parcels within the designated archaeological site have not been reviewed or disclosed in the DEIS.</p> <p>The impacts anticipated to the archaeological cultural resources from removal of soil from parcels outside of the designated archaeological site, but within the NASA DEIS study area have not been reviewed or disclosed in the DEIS.</p> <p>Nothing is disclosed relative to the Burro Flats cave except that soil is to be removed from 0.65 acres – from where?</p> <p>The impacts anticipated to the historic test stands (Alpha, Bravo, Coca) from removal of soil from parcels within the designated historic area have not been reviewed or disclosed in the DEIS.</p> <p>The impacts anticipated to the historic test stands (Alpha, Bravo, Coca) from removal of soil from parcels outside of the designated historic area, but within the NASA DEIS study area, have not been reviewed or disclosed in the DEIS.</p>	<p>The impacts to cultural resources are provided in Section 4.3. NASA believes this analysis is adequate in the document; however, some clarifying text has been added explaining the impacts from the proposed action.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	Exclusion of any possible cleanup alternatives, except one, is a momentous detriment to the usefulness of the DEIS. The DEIS excludes from consideration reasonable alternatives supported by authorized standards of the State of California including cleanup to Suburban Residential, Commercial/Industrial, and Recreational levels.	NASA recognizes public concern regarding the 2010 AOC. The impacts related to the 2010 AOC alternative have been addressed in the EIS. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA must continue to abide by its obligations under the AOC as drafted.
Teena	Takata	The DEIS should be expanded to include those excluded alternatives, presenting comparison of costs and all related effects on transportation, biological resources, cultural resources, soil, water, and air.	<p>NASA recognizes there is community concern regarding the 2010 AOC (cleanup to background) alternative. The impacts related to the 2010 AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the 2010 AOC as drafted.</p> <p>NASA believes the EIS adequately evaluates effects on transportation, biological resources, cultural resources, soil, water, and air resources. Please refer to the Programmatic Agreement (PA) and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 were incorporated in the PA and/or ROD.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	We include as Attachment 3 charts NASA presented at past public meetings. The charts show estimates for cost and materials that could be expected for Background, Suburban Residential, Industrial, and Recreation level cleanup alternatives. Presented just behind these charts, is a summary of the anticipated costs for each type of cleanup and a chart summarizing the meaning of each cleanup standard. ^{3c} These charts and related commentary on cleanup standards and costs should be included in the re-issued DEIS.	Cost/benefit analyses are not part of the EIS evaluation. NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. However, NASA must continue to abide by its obligations under the AOC as drafted. NASA has provided more information regarding the risk-based alternatives on our website at http://ssfl.msfc.nasa.gov/environmental-cleanup/environmental-impact-statement/default.aspx .
Teena	Takata	A discussion of alternatives should include what NASA will do if the Appeals Court supports the lower court decision, which will have the effect of stating that special, stricter cleanup standards are not required at SSFL under California law. An explanation should be provided to explain why the public should pay for a cleanup that is inconsistent with the law, and why local residents should be subjected to significant environmental contaminants from emissions, disturbed soil and related fugitive dust effects, and surface water runoffs that are greatly increased by unavoidable consequences of a background level cleanup of the site. See, in Attachment 4, the text of the District Court decision filed May 5, 2011, which prohibits DTSC from compelling compliance with SB990. The AOC appears to operate as a substitute for a questionable law, but the justification for its position requiring a "background level cleanup" on this important site is very unclear.	Following lengthy discussions with the Department of Justice and other involved Federal agencies, NASA senior leadership signed the AOC on December 6, 2010. NASA has been advised that the specific language of paragraph 1.5 of the document compels NASA to comply with the terms of the AOC regardless of the legal status of California State Law SB990. That paragraph has been interpreted to require NASA to comply with the special stricter standards of the AOC in order to achieve compliance with California Hazardous Waste laws. NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	The February 2013 Report of the Inspector General of NASA brought up many similar questions. The report requested that the level of cleanup be re-evaluated. The Inspector General also questioned whether NASA would receive funding allocations within its own budget to perform the cleanup to the draconian standards required by the AOC. How will this be resolved? Will NASA be provided sufficient funding for cleanup to this background standard, even if the cleanup to SB990-type levels is again held unlawful by the Appeals Court? See Attachment 5, "NASA Inspector General Overview February 14, 2013".	NASA fully appreciates the Office of Inspector General (OIG) recommendation to reexamine the Agency's current plans for cleanup at SSFL (SSFL). NASA's Office of Strategic Infrastructure (OSI) and SSFL project personnel continue to review and evaluate SSFL cleanup program to find options for cost avoidance and better protection of the cultural and natural resources at the site. These options include working with California DTSC, the State Historic Protection Office (SHPO), the tribes, and local interested community members to find effective and efficient ways to implement the December 2010 AOC. The conditions of the AOC compel NASA to meet cleanup standards set by the DTSC. NASA must continue to abide by its obligations under the AOC as drafted.
Teena	Takata	The DEIS does not fully address how appropriate backfill soil will be sourced. Some possible suppliers are noted, but there is no guidance on how soils that must match the specific background levels for SSFL will be identified. Source sites from which sufficient quantities of such soils may be obtained are not identified.	Section 2.2 of the EIS identifies potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California. According to the 2010 AOC backfill soil must meet the LUT values. These sources have not been evaluated to determine if they can meet the 2010 AOC requirement.
Teena	Takata	The DEIS does not explain why or how three times as much soil will be removed from the site as will be backfilled. Can permanent reduction (by non-backfilled removal) of up to 333,000 cubic yards of soil be deemed appropriate mitigation?	The one third backfill estimated was based on historic cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets 2010 AOC requirements.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>The site, apparently to be reconstituted with up 333,000 cubic yards less soil, will have significant effects on surface water runoff. A major problem on the SSFL site has been surface water runoff and related contamination effects. Although the site has had a better record in the last two years, rainfall levels have been very low. Surface water runoff effects resulting from substantial reduction in surface soils must be reviewed, explained, and disclosed. It is well settled that a reduction in permeable surfaces (typically associated with development) causes significantly increased runoffs. What will be the runoff effects of the decreased soil in a year with average rainfall? What is expected when rainfall is significantly over average levels?</p>	<p>The 1/3 backfill is referring to materials brought from offsite. There will be additional soils from around the excavation are used to finish the soil grading. That said, the final (after cleanup) soil profile will be different than it is now. The resultant grading profile will contain more depressions which will tend to pond water and slow stormwater runoff. Additionally as stated in the EIS, demolition of structures and paved areas can benefit native vegetation through increased habitat availability, rainfall infiltration, and slow stormwater runoff.</p> <p>The potential impacts of soil runoff from storm events with regards to backfilling the excavations with 1/3 of the soil volume are provided in Section 4.6 of the document. Once the site is remediated to background levels over a two year period, the soil runoff will no longer contain contamination above background levels so there will be no impacts; therefore, the amount of rainfall will not be a factor in transporting contaminated soil.</p>
Teena	Takata	<p>The EIS states “onsite” (ex situ and in situ treatment) soil cleanup may be performed where appropriate. The AOC seems to prohibit this promising alternative and states the only allowable method for soil cleanup is removal. DTSC and NASA must both explain how this seeming contradiction is possible based on the AOC language. The “leave in place” remediation alternative should be considered in the NEPA and CEQA analysis, as well as in the DEIS, because such a remediation approach would entail significantly less environmental impact, by reducing soil excavation, hauling, and soil replacement.</p>	<p>NASA appreciates the comment regarding soil treatment technologies. The AOC does permit NASA to use alternative treatment technologies to remediate soils. NASA is currently developing a plan to evaluate the effectiveness of the ex situ and in situ remediation technologies listed in Section 2.2.2.3 of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>The DEIS includes a review of Environmental Justice which generally looks at the impacts to lower income and minority populations that will be affected by the hauling. Nothing is presented to address such demographics in the areas that are proposed to receive, and then permanently live with possible effects from the contaminated material, such as Buttonwillow, Kettleman, and Beatty. The Environmental Justice analysis should be extended in the re-issued DEIS to include these areas.</p>	<p>Landfills are constructed to safely receive and contain contamination. They are permitted and regulated to prevent impacts to the surrounding environment.</p>
Teena	Takata	<p>At the August 28, 2013, public comment session on the DEIS, it was disclosed the haul trucks are merely covered with tarps when traveling with contaminated material. We request much more complete protection for our community from the contaminated material that the AOC's require to be removed. Better alternatives for reduced dust from the trucks need to be developed and implemented.</p>	<p>Fugitive dust emissions would be controlled by measures prescribed by VCAPCD Rule 55. Specifically, NASA would load materials carefully to minimize the potential for spills or dust creation. Implement water spraying as needed to suppress potential dust generation during loading operations. Take care to apply dust suppression water to the top of the load or source material to avoid wetting the truck tires. Do not perform loading during unfavorable weather conditions (such as high winds or storms). Material spilled during loading would be collected for subsequent loading. After loading, trucks would pass through the decontamination and inspection station before weighing and departure from SSFL.</p> <p>As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	The combined impacts of all concurrently operating SSFL projects regarding traffic and transportation-related pollution are non-specific: (e.g., "...likely would be noticeable ...").5a	<p>Per your comment reference the EIS states, "The combination of the Proposed Action and the Boeing and DOE activities would result in increased traffic within the ROI. If the actions occur concurrently, the average daily traffic and peak hour volumes on the affected roadways likely would be noticeable. However, the additional traffic would not exceed the capacity of these roadways or change the LOS (Tables 4.5-3 and 4.5-4)."</p> <p>LOS is a qualitative measure of roadway capacity and operating conditions. LOS is related directly to vehicle delay. LOS is given a letter designation from A to F, with LOS A representing extremely short delays and LOS F representing extremely long delays.</p>
Teena	Takata	What transportation routes will the other related projects (concurrent DOE, Boeing cleanups) use. Will they use the same or different haul routes?	<p>Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. The most likely route for all parties would be Woolsey Canyon Road to Valley Circle Boulevard to Roscoe Boulevard to Topanga Canyon Boulevard. At that point multiple options exist depending on the location of the disposal site. Alternate routes do exist, see Figure 4.5-1 in the EIS.</p>
Teena	Takata	What will the transportation emissions be for all projects combined? What will be the total effect on surrounding communities?	<p>In addition to DTSC, NASA has been coordinating with USFWS, USACE, SHPO, DOE, Boeing, consulting parties, Tribes, and National Park Service. CEQA analysis typically includes private and public property impacts. Currently there are no cleanup efforts on private lands associated with this project. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.</p> <p>A general discussion of combined transportation emissions is discussed in the Cumulative Impact section of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>The number of trucks on all projects, travelling on Woolsey Canyon during daylight hours must be disclosed, as well as twilight and night truck traffic volumes for all projects combined. This disclosure should be presented in a table format, and specify the anticipated number of incoming and outgoing trucks in one hour increments during weekdays and weekends (if applicable), for all projects to present a realistic understanding of the traffic impact. Include a column for worker arrivals and departures from the site. Provide hour of the day in the rows, and in columns show incoming and outgoing traffic for each of NASA, DOE, Boeing. Combine all workers for all projects in the last set of columns for cumulative incoming and outgoing traffic.</p>	<p>The level of detail you are requesting is not available at this time.</p> <p>As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing’s existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p> <p>NASA will coordinate traffic control plans with Boeing and DOE.</p>
Teena	Takata	<p>The DEIS survey and analysis of flora are insufficient. They lack quantification and specifics related to impacts.</p>	<p>Final MMs concurred to by USFWS are included in FEIS.</p>
Teena	Takata	<p>How many plants of each type are involved? How many coast live oak (quercus agrifolia) trees will be removed or otherwise endangered? How many western sycamores? Although counts for Santa Susana tarplants are shown, presentation of plant density and expected soil removals (similar to Appendix C, Figure 8 at page C-53) would greatly improve the understanding of the effect of the project on this Statelisted Rare species.</p>	<p>NASA plans to work with DTSC to try to avoid removal of large trees if cleanup levels can still be achieved with the trees in place. Please also refer to Section 4.4.2. for BMPs associated with biological resources</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>What steps will NASA take, over what period of time, to regenerate sensitive species? For example, we do not believe Santa Susana tarplant is part of the seed mix specified for replanting. How will plantings be monitored to encourage regrowth?</p>	<p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS. NASA is making efforts to cooperate with state and local policies when appropriate.</p>
Teena	Takata	<p>What steps will NASA take to eliminate introduction of invasive species as off-site soil is brought in as part of the soil replacement? How will plants be affected by re-filling the site with only one-third as much soil as was removed? How will the segmented cleanup and backfills affect the overall health of this habitat, which in many areas is uniquely unaffected by the major metropolitan community next door?</p>	<p>NASA acknowledges that when remediation is complete, the existing conditions will have changed. NASA believes that replacement of approximately one third of the excavated soil will be sufficient to accommodate the hydrology and eventual re-vegetation of the site. As discussed in the EIS, the soil biology will be destroyed upon excavation/removal.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>I do not believe the SSFL caused the problem from a statistical, or scientific point of view. And I believe the lesser cleanup standards of open space/recreational use are adequately protective of health in the surrounding community.</p> <p>Unfortunately, the extreme standards of cleanup to background, will have a much greater impact on residents of nearby communities than is needed for a adequate cleanup under the open space/recreational alternative. The DEIS is helpful for analysis in that it shows some of the severe, and in my opinion, totally unacceptable results of this cleanup.</p>	<p>NASA appreciates your comments regarding the risk posed by soil and groundwater at SSFL. NASA has compared the risk for cleanup to residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment. See Section 4.9 for more information.</p> <p>NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.</p>
Teena	Takata	<p>One of the great characteristics of the SSFL is the undisturbed nature of the land that has not been used for buildings or industrial uses. The entire site should be viewed as a special area, and an example of how the Valley may have looked before it became grazing land, farmland, homes, and a suburb of Los Angeles. Removal of huge amounts of soil, and replacement with soil from outside the area, will bring an unknown amount of foreign plants to this area, which presently has few invasive plants.</p>	<p>NASA acknowledges your comment. NASA recognizes public concern regarding the AOC. The impacts related to the AOC alternative have been addressed in the EIS. NASA acknowledges that there could be reduced impacts by using other alternatives. NASA has chosen to analyze only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA will comply with the current AOC or future revisions/modifications of the AOC as agreed to by appropriate parties. NASA has identified multiple BMPs and Mitigations intended to reduce impacts</p>
Teena	Takata	<p>Not addressed in the DEIS is where the replaced soil will come from. What additional plants will be introduced through seeds in those soils?</p>	<p>NASA discusses some possible source locations for backfill in Section 2.2.2.3. Additionally NASA recognized the impacts of introduced soil are identified in Section 4.4.1.3. NASA recognizes the soil used for backfill will most likely not be the same as the soil removed under the requirements of the AOC.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>Not addressed in the DEIS is the effect on the community of diseases that may be introduced in the community by the removal of vegetation and the disturbance of soil, for possible Valley fever outbreaks and other diseases that may occur through air-borne dust.</p>	<p>Valley fever is caused by a fungi, <i>Coccidioides immitis</i> or <i>Coccidioides posadasii</i>, found in arid desert soils. When the soil is disturbed, spores are released into the air and can be carried on the wind. People are exposed when they breathe in the spores. Most people who are exposed do not get sick; however, valley fever can cause flu-like symptoms and, in rare cases, cause meningitis and even death. The soils at SSFL have not been sampled for the fungi that cause valley fever. To meet the AOC cleanup requirements, approximately 500,000 cubic yards of soil will be disturbed. If cleanup alternatives other than soil removal could be used, the amount of soil disturbed would be reduced by approximately 180,000 cubic yards and the dust emissions reduced by approximately 19%. Release of dust during remediation and demolition will be controlled by wetting the soil, limiting the stockpile area to 0.14 acre and height to 8 feet, covering roads with gravel, etc., limiting speed of vehicles, placing tarps over or barriers around stockpiles of soil, ceasing loading during high winds or storms, and removing bulk material from trucks. After remediation, the previously vegetated areas will be planted with a native seed mix.</p> <p>See EIS Section 4.7, Air Quality BMP-1, and Air Quality MM-3.</p>
Teena	Takata	<p>Given our chaparral vegetation community, plants that are removed due to soil bearing a 1 or 5 percent too much of a tested chemical out of hundreds of chemicals tested.....it may take 10 years to regenerate the plant and to regenerate a root system under it to hold soil again.</p> <p>How will dust from the soil be contained while the plant community is regenerated?</p>	<p>The revegetation will be slow, and there is a possibility of natural soil removal during this process. The hydroseed mix is similar to a gel and does not become airborne. NASA may also elect to use a mesh or netting to cover the seed mix to keep it in place.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	I do not believe the benefit to the community for removal of contaminants to background levels, justifies the various pollution effects to our community and to the eventual dump site.	Thank you for your comment it has been noted. NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.
Teena	Takata	Impacts or destruction of cultural resources (Burro Flats site, NRHP eligible structures), BEFORE we have any CEQA analysis from DTSC that controls the decision under the AOC, is simply wrong!	NASA will not begin any cleanup activities until DTSC completes their CEQA evaluations.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Teena	Takata	<p>Include costs compared to benefits. Show multiple alternatives based on usual cleanup standards (such as residential use, recreational use, as well as background, no alternative), for each impact item mentioned below.</p> <ul style="list-style-type: none"> ● Include Multiple Alternatives consistent with general California law. ● Include how DTSC will decide various issues. ● Include a definition of an Artifact. ● Include a definition of a recognized Cultural Resource. ● Include how restoration using 1/3 of the removed soil can be justified. ● Include source of soil. ● Include detailed effects from removal of 2/3 of the soil on the surrounding community. ● Provide information on how dust will be controlled in the revegetation and soil removal period. ● Provide contaminant information on how emission and traffic impacts vary under multiple alternatives. ● Complete the evaluation of the cultural resources including limited contamination testing of soils near NRHP eligible structures. ● Include which structures and related buildings will be retained. ● Reconcile the NRHP definition of the Burro Flats site with the DEIS. ● Explain what part of the Burro Flats site is proposed to be impacted and even better, eliminate that. ● Explain how the Indian Sacred Site will be handled. <p>The list above will not be resolved for some time. Based on a likely three year delay in the CEQA analysis being available by DTSC, it seems extending the clean up date from 2017 to 2020 is an excellent short-term solution to provide NASA with time to gather appropriate input and develop an adequate and comprehensive plan to deal with the items above, which should all be part of the analysis provided on this extremely significant and special property.</p>	<p>You have multiple subject areas here and we have tried to cover most by category below:</p> <p>Cultural - Please refer to the Programmatic Agreement and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 plan to be incorporated in the Programmatic Agreement.</p> <p>Dust - Fugitive dust emissions would be controlled by measures prescribed by VCAPCD Rule 55. Specifically, NASA would load materials carefully to minimize the potential for spills or dust creation. Implement water spraying as needed to suppress potential dust generation during loading operations. Take care to apply dust suppression water to the top of the load or source material to avoid wetting the truck tires. Do not perform loading during unfavorable weather conditions (such as high winds or storms). Material spilled during loading would be collected for subsequent loading. After loading, trucks would pass through the decontamination and inspection station before weighing and departure from SSFL. (see Air Quality BMP-1 in Table 6.1-1 of the EIS)</p> <p>Community affects to movement of soil - Certainly the number of trucks estimated to be required to meet the AOC cleanup will be of concern to the local community. Especially for roads closer to the site. NASA is evaluating onsite soil cleanup options that may reduce the truck traffic.</p>

Takata	Teena	<p>I have a lot of concerns about the limited alternatives presented in the DEIS. The public comment -- and it's referred to in the DEIS -- the public comment was quite supportive of looking at multiple alternatives, and they have magically disappeared. And the Council on Environmental Quality and Barbara Boxer have sided, rather than looking at NEPA and CEQA, which I think are more the governing law in the matter.</p>	<p>NASA recognizes public concern regarding the AOC. The impacts related to the AOC alternative have been addressed in the EIS. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Takata	Teena	<p>I also don't understand why NASA is issuing this document by itself. Virtually every significant decision, particularly relating to cultural resources, DTSC is controlling all the decisions. How can we have a decision-making document with no input from DTSC?</p>	<p>NASA will follow the AOC. By following the NEPA process, NASA complies with its statutory requirements (42 U.S.C. 4321 et seq.) and Section 4.0 of the AOC. NASA continues to work expeditiously with DTSC and the public to complete the actions called for in the AOC. NASA realizes that the EIS describes the negative impact of cleanup to background, as required by NEPA. The 2017 schedule and cost for completion are a function of the AOC. If the AOC is revised, NASA will comply with the appropriate NEPA analysis and documentation.</p> <p>NEPA process does not include a review by regulatory agencies prior to release to the public.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Takata	Teena	<p>We don't know today what a historic structure is that might be preserved because, after all, it's not an artifact. I don't think we can possibly call it an artifact. And we don't know what DTSC will eventually do with any of the Native American cultural resources.</p>	<p>Section 106 of the NHPA requires federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Takata	Teena	<p>I was on a PPG committee that DTSC hosted that met every month or two in 2010. They told us during those meetings, because we asked, that CEQA would be considered as part of the AOCs. We have been looking at a report issued by NASA's Inspector General who says that NASA will not even consult with DTSC on CEQA matters until winter of 2015. By the time a preliminary consultation happens that says DTSC probably won't have an EIR out until 2017. That's when you're supposed to have it all cleaned up. It makes no sense whatsoever.</p>	<p>NASA will follow the AOC. By following the NEPA process, NASA complies with its statutory requirements (42 U.S.C. 4321 et seq.) and Section 4.0 of the AOC. NASA continues to work expeditiously with DTSC and the public to complete the actions called for in the AOC. The 2017 schedule and cost for completion are a function of the AOC. Takata	Teena	And so someone else suggested that the 2017 date didn't make a lot of sense, and I think the evidence in the record is quite supportive of that. It doesn't make sense. The cart is far in front of the horse.	The 2010 AOC between DTSC and NASA says "The schedule shall ensure that the identified activities can be accomplished by 2017 or sooner." This can only be changed by mutual agreement with DTSC. NASA will meet with DTSC to seek clarification of this requirement. NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Takata	Teena	And there were people here that talked about how the AOC should be followed, and yet -- they talk about if the soil is contaminated it must be removed, and yet they were talking about in situ remediation.	Thank you for your comment. NASA notes your opposition to the AOC.
Jessica	Tektas	Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found. Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

Lynn	Tharsing	NASA, the Department of Energy and the Boeing Company each control part of the land. In 2010, NASA and DOE signed agreements with California pledging to clean up all their contamination, returning the site to its condition before they polluted it. So do it!!!!!!	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bob	Thomas	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Catherine	Thomasson	<p>I was gratified to hear that NASA entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). Decades of perchlorate, radioactive toxins and many other toxic chemicals lie there contaminating the groundwater.</p> <p>There is no option to ignore it in good faith or good conscience. These are serious health hazards.</p> <p>As a physician and having studied the impacts of these contaminants especially on our children, it is imperative to clean up the area.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Matthew	Thompson	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Imelda	Tio	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Imelda	Tio	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Margaret	Toews	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Margaret	Toews	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Zoltan	Tokes	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Gail	Topping	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. Mary	Trujillo	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small igniters that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the igniters. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Liza	Tucker	Rather than a NEPA compliant science-based assessment of how to clean up the site, this draft EIS appears to be an unscientific polemic aimed at trying to get out of the promises NASA made.	The EIS is scientifically based on studies and data.
Liza	Tucker	On and on, the EIS tries to scare readers into being worried about trucks while blatantly refusing to do what the EIS was supposed to do, address in detail the environmental impacts of all that pollution and thus the effect the No Action alternative would have.	The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. However, based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).
Liza	Tucker	The AOC expressly exempts from the cleanup to background requirement anything that might damage recognized Native American artifacts. Yet the EIS tries to make it seem that cleanup to the AOC would damage the cave paintings at the Burro Flats area.	NASA will clarify the text. The Burro Flats site includes many rock features and areas of soil too. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the exception clause in the 2010 AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further details.
Liza	Tucker	NASA goes even further overboard and asserts that maybe the entire 2,850 acre SSFL site should somehow be considered "sacred."	We acknowledge your comment. The Santa Ynez Band of Chumash Indians has declared the NASA-administered Area and the Boeing land as an Indian Sacred Site under EO 13007.
Liza	Tucker	Trying to claim the polluted test stands are historical and implying that perhaps you can get out of cleanup that way directly violates the AOC.	Your comment is noted.
Liza	Tucker	Lastly, the real purpose of an EIS is in large part to identify mitigation measures. The Draft EIS fails to do that.	Mitigations are included in Section 4. The 2017 deadline in the AOC also precludes some of the suggested mitigations.
Liza	Tucker	The EIS should look at mitigation for any soil removal in terms of revegetation and restoration. But on this, the EIS is deficient.	Mitigations for biological resources which include reseeded, are in Section 4.4 of the EIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Liza	Tucker	This is not an EIS; this is an overt effort by NASA to try to misuse an EIS to blow up the binding commitments NASA made and instead just walk away from the great majority of the contamination NASA created.	Your comment is noted.
Roy	Tuckman	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Jamie	Tyler	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constant (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jamie	Tyler	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Jamie	Tyler	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jamie	Tyler	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Craig	Tyrka	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Gwendolyn	Tyus	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Arany	Uthayakumar	<p>In 2010 NASA signed an agreement with California to clean up all the contamination to background levels, restoring the site to the condition it was in before it was polluted. NASA is responsible for the contamination, has promised to clean it all up, and should live up to those commitments and promptly and thoroughly clean up the site and carry out all the obligations it assumed when it entered into the cleanup agreement.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Alec	Uzemeck	<p>The DEIS only provides a “no action plan” and one other plan that cleans to background. It is rumored that state and federal pressure drove this selection and no scientific review or analysis of other alternate plans was made.</p> <p>NEPA requires that the Decision Maker be fully informed on all aspects of EIS and further should be informed of all alternate cleanup plans including those that are to be rejected along with an explanation for each rejection. The DEIS discusses the alternate cleanup plans but does include any metrics to allow comparison of the plans or their attributes. Items such as risk, cost, schedule or disposal volumes are not provided. The reasoning for the rejection of alternates is not provided other than to refer to the AOC agreement that was forced on NASA by the politicians. The metrics need to be included and full rejection reasons need to be shown.</p>	<p>NASA originally proposed to evaluate a cleanup to background (proposed action) that meets the 2010 AOC requirements, a no-action alternative, and three other alternatives that are normally analyzed for a typical Superfund cleanup based on common cleanup goals associated with risk-based scenarios to evaluate the full range of options and their associated environmental or cultural impacts. Additionally, we always included evaluation of the different technological approaches to soil and groundwater cleanup. These additional three alternatives included cleanup to suburban residential, industrial, and recreational cleanup standards. Based on input from multiple parties, NASA streamlined the evaluation to only one alternative, which reflects the AOC background cleanup levels, while examining impacts of various technologies to meet that goal; that is, how to meet the AOC level. CEQ’s letter dated July 19, 2012 states, “However, there is no requirement that NASA consider alternatives that cleanup to other standards that differ from the agreement with the State.”</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	<p>Future land use is not factored in so that cleanup requirements under the various alternate plans cannot be compared and only two plans are shown, cleanup to background or the do nothing alternate plan.</p> <p>Future land use is an important aspect of USEPA cleanup evaluations that matche the cleanup against the eventual land use. Thus land that would be used for parks would have less stringent cleanup requirements than land that would be used for homes. The AOC requirement that the NASA property be cleaned to background applies the most stringent cleanup for property that now is proposed for future park use. Park use would have much less demanding cleanup criteria.</p>	<p>NASA originally proposed to evaluate a cleanup to background (proposed action) that meets the 2010 AOC requirements, a no-action alternative, and three other alternatives that are normally analyzed for a typical Superfund cleanup based on common cleanup goals associated with risk-based scenarios to evaluate the full range of options and their associated environmental or cultural impacts. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	<p>Backfill should be fully discussed in the DEIS. The DEIS states that soil to a two-foot depth will be considered permanently contaminated and removed. Additionally, soil beneath that level may be removed and cleaned and then reinstalled however none of the proposed soil remediation methods have been tried and proven to clean to the levels required by the AOC. In the event that the soil remediation fails the backfill will have to be found from another source and significant delays will occur while looking for soil that complies with the stringent AOC standards. This entire process has a high probability of difficulties and the DEIS does not discuss any worst-case scenario or any plans for a corrective action to maintain the process and schedule.</p> <p>The EIS further states that only one third of the soil will be returned to the site and does not provide any explanation why this reduced amount will suffice. Will there be areas without topsoil and biota? Will there be sufficient soil to minimize flooding and silt runoff?</p>	<p>The backfill material could be from an onsite or offsite source. The following potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California:</p> <ul style="list-style-type: none"> - P. W. Gillibrand Company, located in Simi Valley, California - Rindge Dam, located in Malibu Canyon, California - Santa Paula Materials, Inc., located in Santa Paula, California - Grimes Rock, Inc., located in Fillmore, California - Tapo Rock and Sand Products, located in Simi Valley, California <p>The suitability of these soils for backfill that meets the 2010 AOC requirements has not been evaluated at this time. Sampling would occur to confirm suitability prior to any excavations starting.</p>
Alec	Uzemeck	<p>The traffic analysis underestimates the number of truck trips. In the DEIS plan there would be trucks carrying away contaminated soil and those trucks coming back empty But additional trucks would be bringing back remediated soil or backfill and leaving empty. It is possible that some truck trips may be eliminated if the trucks leaving with debris could be used to bring back backfill however that close coordination of events is unlikely as previously discussed under the subject of backfill.</p>	<p>NASA will consider transporting clean soil with the trucks used to transport excavated soil from the site. There are logistical factors that will be considered such as the location of the backfill soil in relationship to the landfills and properly cleaning the trucks used to haul the excavated soil prior to loading the clean soil. These decisions will have to be made during cleanup operations.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	<p>The DEIS did not discuss another factor to the trucking problem and that is that Boeing and DOE will also be conducting excavation and trucking to remove the contaminated soil. The DEIS says that NASA will operate on a schedule beginning at 7:00 AM to 7:00 PM. If all of the RP's excavation occurs simultaneously the roads from the site will be jammed or operating in extended hours thus creating a further hardship on the surrounding communities. This also assumes that sufficient trucks and drivers are available to meet the 2017 completion date. I recommend that NASA and DTSC discuss extending the completion schedule perhaps to 2020 so as to not overload the necessary transportation and roads.</p>	<p>NASA has explored techniques for reducing the amount of material to be moved offsite; however, to meet the current AOC schedule deadline of 2017, removal of soil via trucks is the only alternative. NASA will comply with the current AOC or future revisions/modifications of the AOC as agreed to by appropriate parties. Excavation of soils is the only alternative the will meet the current AOC cleanup levels and schedule.</p> <p>As a BMP for efficient and safe traffic management, a N-CTCP will be developed; similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p> <p>As detailed in the EIS, after trucks leave Woolsey Canyon Road, project-related traffic is negligible as compared to the existing traffic levels. Therefore, typical incident response procedures should sufficiently address transportation-related needs.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	The archeology, architecture and biology are not sufficiently discussed in the DEIS and are not clearly described in the AOC. NASA and DTSC need to develop specific directions in these subjects before the DEIS goes forward. For example the AOC's speaks about protecting artifacts and the question arises is the Burro Flats cave considered an artifact or will it be removed?	Agreed, NASA and DTSC will have to come to an agreement in regard to which areas are covered under the exception clause in the 2010 AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further details. Those discussions will be conducted in coordination with SHPO and the Tribes and needs to wait until the soil cleanup areas are finalized and DTSC is further along in its CEQA process.
Alec	Uzemeck	The DEIS does not present the full information for the NASA site and assumes that the Best Management Practices will mitigate all of the cleanup negatives while many of these BMP's have not been tested or proven. The BMP discussion does not contemplate failure and no failure scenarios or recovery plans have been presented and the effects of the cleanup in an accelerated/ catch up recovery mode have not been discussed.	Cleanup area footprints and soil volumes provided in the EIS are best estimates based on available information at this time. The EIS identifies significant impacts to four areas (potential for soil erosion, cultural resources, damage to biological resources, and impacts to roadways), along with other concerns (such as air quality, water resources, and health and safety). NASA believes that soil erosion can be mitigated through good stormwater management practices. Impacts to roadways can potentially be reduced, but not eliminated, if onsite soil treatment technologies are proven to meet 2010 AOC requirements. Cultural and biological resource impacts can only be reduced by minimizing the required cleanup area. Possibly this could be done through the exception identified in the 2010 AOC.
Alec	Uzemeck	The narrative regarding cultural items is confusing since it appears that more information is required from DTSC and from specialists.	NASA will look at this information in the DEIS and make changes, as might be needed.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	<p>As I read the document, I'll be specific, I think it violates the spirit and intent of NEPA. Violates.</p> <p>As I understand NEPA, it's to inform the decision maker fully. They didn't say partially. They didn't say 25 percent of it. And you folks presented the alternatives in such a way that there's only one decision to be made. The alternatives that you presented, they had no metrics associated with it. You didn't say what the final land use was, what the risk calculation was, or cost or schedules, for starters.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Alec	Uzemeck	<p>The truck traffic. The truck traffic analysis that you put up assumes that everything flows smoothly, but I don't think that you included the truck traffic from DOE and Boeing, who will be doing the same thing at the same time. And we're talking about one road. The EIS says that you'll be operating 12 hours a day. I don't think that you can get that many truckloads off of there.</p>	<p>The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available. See Section 4.13 of the EIS.</p>
Alec	Uzemeck	<p>But in addition to that, your schedule seems odd. In the EIS it says that you're going to do demolition in 17 months -- 17 or 18 months -- and then cleanup will start, based on what you presented today. Well, I don't know how you are going to get cleanup done and also go through the research program of trying to figure out how to remediate that soil that you took out that's below two feet that you want to use for backfill.</p>	<p>Current schedule plans calls for completion of field sampling by 2105, demolition from 2014 through 2015, feasibility study work (treatment technologies evaluations) completed in 2015, cleanup implementation plans completed by early 2016, and cleanup actions starting in 2016. The 2017 schedule is aggressive and if it were changed to a date further out, it would remove some of the pressures driving the cleanup actions. Maybe it could help mitigate the impacts from large numbers of trucks by spreading out the frequency or allowing time to build a conveyor system. Maybe it could give time to see if a future land owner wants to preserve and maintain some of the historic structures. However, it would not aid in the reduction of impacts to biological resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzameck	You're signing up for a research program. You haven't got any schedule. You don't know if it's going to be successful. And you're adding it onto something that takes a great deal of time.	Your comment is noted.
Alec	Uzameck	The archaeological is astounding. And I'm sorry we don't have any Native Americans here today. A sacred site is not an artifact. The AOC refers to archaeological artifacts as if they were a couple of bones that will be picked up and carted away. This is a sacred site, and I don't see anything in your report that says we're going to have a formal archaeological investigation and some mitigation of what you're going to tear out.	NASA and DTSC will have to come to an agreement in regard to which areas are covered under the clause in the AOC referencing Native American artifacts. NASA is in consultation with the Santa Ynez Band of Chumash Indians regarding impacts to the Indian Sacred Site.
Alec	Uzameck	I've talked about backfill, and the biological just says you're going to destroy it and replace it. And the other thing I don't understand is you're removing an amount of soil but you're only replacing 30 percent. Does that mean that you're promoting erosion?	Site activities would take place in accordance with the statewide General Permit for Stormwater Discharges Associated with Construction Activity. As required by this permit, NASA would prepare plans that specify site management activities to protect stormwater runoff and to minimize erosion during construction, operation, and maintenance of the project. These management activities would include construction stormwater BMPs (silt fences, sand bags, straw waddles, and tire washes), dewatering runoff controls, containment for chemical storage areas, and construction equipment decontamination. NASA also would continue monitoring offsite drainages for increased sediment load and contamination. The impacts from the soil removal and replacement are discussed in Section 4.2 of the EIS.
Alec	Uzameck	And finally, I just get the feeling like the document is so insensitive to the community. I mean, this is -- if you wanted to present worst case, you did. You did very well. You were successful. But my God, what does it do to the communities around here? What are you going to have left? Because you never describe what the eventual land use is going to be or whether you're moving toward that goal.	NASA is providing an analysis of impacts that would result from complying with the AOC. We recognize that the community has concerns because the future use of the property must be considered in a subsequent process. Future use is the responsibility of the Government Services Administration (GSA) and outside the scope of this EIS. DTSC will prepare a CEQA document and GSA will develop a NEPA document that will address the futures uses of the site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	The DEIS is deficient because it only presents two unacceptable extreme alternative for the cleanup. The proposed Soil Cleanup to Background would have significant environmental impacts and the No Action alternative would leave contamination in place that most would agree should be removed.	Following lengthy discussions with the Department of Justice and other involved Federal agencies, NASA senior leadership signed the AOC on December 6, 2010. NASA has been advised that the specific language of paragraph 1.5 of the document compels NASA to comply with the terms of the AOC regardless of the legal status of California State Law SB990. That paragraph has been interpreted to require NASA to comply with the special stricter standards of the AOC in order to achieve compliance with California Hazardous Waste laws. NASA must continue to abide by its obligations under the AOC as drafted.
Alec	Uzemeck	The Cleanup to Background will require a major amount of excavation that will overload the one mountain road coming from the SSFL and saturate the community roads leading from that site. Truck accidents are anticipated and the DEIS notes that the danger to nearby school children will be significant. The danger to the school children is unacceptable.	We recognize that there will be impacts from the use of trucks to remove soil. The best way to reduce the number of trucks is to reduce the soil volume required to be transported offsite. NASA is evaluating several treatment technologies that have the potential to reduce the truckloads by 36% (9,500 truckloads). The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	The soil removal will destroy the existing biota and will alter the topography yet the DEIS does not address a grading or drainage plan. The DEIS calls for only a third of the removed soil to be replaced and it is questionable that the plants and habitat will be reproduced.	<p>In section 4.2, Water BMP-1 says, Site activities would take place in accordance with the statewide General Permit for Stormwater Discharges Associated with Construction Activity (Order No. 2009-0009-DWQ [NPDES No. CAS000002]). As required by this permit, NASA would prepare an SWPPP and an ECP that specified site management activities to protect stormwater runoff and to minimize erosion during construction, operation, and maintenance of the project. NASA also would continue monitoring offsite drainages for increased sediment load and contamination. The SWPPP would include the protocol for proper storage and use of hazardous materials, as well as spill response procedures. These management activities would include construction stormwater BMPs (silt fences, sand bags, straw wattles, and tire washes), dewatering runoff controls, containment for chemical storage areas, and construction equipment decontamination. The combined effect of demolition and remediation activities on the potential to increase surface water and groundwater pollution would be minor, given the regulatory controls in place to protect water quality and the assumption that NASA would adhere to these requirements.</p> <p>It can take many years for native species to reestablish in disturbed areas and the species composition would be different then what was originally there, despite reseeding efforts. The natural communities as they occur currently will likely never return and the, overall impacts after implementation of the BMPs would remain significant.</p>
Alec	Uzemeck	The plan proposes that some of the removed soil be remediated and returned as backfill however the techniques for this remediation are unproven. It is questionable that sufficient offsite soil can be found that meets the stringent cleanliness standards of the selected alternate to be used as backfill.	As you note, according to the 2010 AOC backfill soil must meet the LUT values. We recognize that offsite sources have not been evaluated to determine if they can meet the 2010 AOC requirement.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	The widespread soil removal will damage existing native sacred grounds ancient sites and artifacts. The DEIS does not provide for professional assistance to identify and develop protection for these critical areas the impact of the cleanup will generally have significant negative effects and in particular the Burro Flats site will be impacted. Non-excavation methods of remediation should be exhausted before performing excavation that could damage cultural sites.	Please refer to Section 4 of the EIS for NASA's MMs to minimize impacts to cultural resources. NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.
Alec	Uzemeck	Under the proposed action numerous historical buildings are to be removed and the rocket test stands are to be dismantled. These test stands were used for all of the space vehicles and they are a remembrance of our national space program. NASA should make a greater effort to preserve as much of this heritage as reasonably possible.	NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.
Alec	Uzemeck	The core of the many problems with the DEIS is the amount of soil to be excavated and this is dictated by the AOC which calls for the Cleanup to Background. This AOC should be modified to allow a risk-based cleanup that would greatly reduce the amount of the soil to be excavated and thus mitigate many of the problems. The AOC allows for agreement changes if accepted by both parties and with the inclusion of PRG's into the lookup tables would allow this alternate cleaning method to be evaluated and used. A Modification in Principle alternative is being proposed that would maintain the AOC and include this recommendation.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	Finally, the DEIS as written using the Clean to Background method will have a major impact on the SSFL with the irretrievable loss of culture, history, environment, sensitive habitat and critical natural resources. The nearby communities and those along the transport route will also be affected. The DEIS as written needs to be rewritten as suggested including a risk based cleanup.	NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA will make every effort to reduce the impacts from the required cleanup. Some reductions can be accomplished through the proposed mitigation. Should the soil onsite treatment technologies be proven effective at meeting the 2010 AOC cleanup requirements, then additional reductions can be accomplished. While changing the schedule to be later than 2017 makes the implementation of the AOC requirements more manageable, it does little to reduce the significant impacts from taken the cleanup actions. Therefore not all impacts can be eliminated. NASA must continue to abide by its obligations under the AOC as drafted.
Alec	Uzemeck	The SSFLCAG, while not endorsing every comment made individually by its members, supports the overwhelming essence of those comments which state that the DEIS as written is unsatisfactory and the AOC requirements that caused the proposed destructive cleanup must be changed.	We recognize the effort so many local residents made to provide constructive comments regarding their concerns. We are considering every comment. We particularly recognize public concern regarding the 2010 AOC. The impacts related to the 2010 AOC alternative have been addressed in the EIS. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	The threats to child safety are unacceptable. The proposed traffic volume needs to be reduced. NASA should place greater emphasis on on-site treatment to reduce truck traffic.	<p>NASA recognizes the concern about truck traffic and has spent much time considering ways to reduce the number of trucks. The number of trucks required is predominately a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus are not a valid option. Section 4.5 in the EIS discusses transportation routes further (also see Alternate routes do exist, see Figure 4.5-1).</p> <p>The best way to reduce the number of trucks is to reduce the soil volume required to be transported offsite. NASA is evaluating several treatment technologies that have the potential to reduce the truckloads by 36% (9,500 truckloads). The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	The second is that WHNC has serious concerns with the removal of such a large amount of soil fearing that erosion will endanger the creeks in Dayton Canyon, Bell Canyon and Woolsey Canyon. The plan does not discuss grading or drainage methods.	Site activities would take place in accordance with the statewide General Permit for Stormwater Discharges Associated with Construction Activity. As required by this permit, NASA would prepare plans that specify site management activities to protect stormwater runoff and to minimize erosion during construction, operation, and maintenance of the project. These management activities would include construction stormwater BMPs (silt fences, sand bags, straw waddles, and tire washes), dewatering runoff controls, containment for chemical storage areas, and construction equipment decontamination. NASA also would continue monitoring offsite drainages for increased sediment load and contamination.
Alec	Uzemeck	Under the NASA proposal, Native American artifacts and sites including sacred areas and historic locations are to be destroyed. The plan includes the disruption of the wild life corridor, the removal of the natural habitat for many wild animals and the uprooting of plants and trees. Further, the removal of the rocket test stands would destroy historic structures that were part of our national space program.	Your comment is noted.
Alec	Uzemeck	This plan does not recognize the expected eventual use of the NASA land as open area which only requires cleanup to risk based levels. No consideration has been given to intermediate cleanup methods that are risk based and that are approved by the USEP A and used throughout the United States. These methods would greatly reduce the amount of soil to be removed, the traffic and associated hazards, risk of hazardous contamination resulting from the transportation of soil, the time to complete and resulting cost.	NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA will make every effort to reduce the impacts from the required cleanup. Some reductions can be accomplished through the proposed mitigation. Should the soil onsite treatment technologies be proven effective at meeting the 2010 AOC cleanup requirements, then additional reductions can be accomplished. While changing the schedule to be later than 2017 makes the implementation of the AOC requirements more manageable, it does little to reduce the significant impacts from taken the cleanup actions. Therefore not all impacts can be eliminated. NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	The WHNC requests that NASA reconsider its decision to limit the selection of one cleanup method and look at other alternatives and procedures that would mitigate the negative effects of this DEIS.	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	<p>The NASA properties was a heavily utilized area by native Americans. Much focus is relating to rock art sites and other ceremonial features, such as cupules, bedrock mortars, rock alignments, and shadow and light effect, which may have been associated with ceremonies. However, the site the site of the SSFL was probably used seasonally throughout the year for thousands years to gather food and other resources as well as for hunting. Nearly all of the structures and associated road grading, paving activities, and emplacement of utilities during the historic period were conducted without environmental reviews. At the time, there seemed to have been an awareness of the spectacular rock art panel associated with CA-VEN-1072 and its possible significance, and efforts seem to have been made to protect that rock art panel. However, it is likely that many archaeological loci were destroyed, disturbed or buried during grading activities. Those sites, disturbed or not, may be impacted by cleanup activities. It is important to have all grading activities observed by Chumash and archaeological consultant monitors, who are authorized to defer, at least temporarily, grading when such resources are encountered. These monitors should accompany each piece of grading equipment. This requirement may seem onerous, however, the operator of a piece of heavy equipment is not in a position to spot such resources and is not trained to recognize them, and a contractor has little incentive to comply with a requirement to be sensitive to archaeological deposits.</p> <p>The Chumash buried their dead, so it possible, especial during soil removal from CAVEN-1072, that one or more human burials will be encountered.</p> <p>CA-VEN-1072 should be definitively delineated by a team of professional archaeologist and native Americans (including Chumash Indians) prior to any approval of the EIS. It seems to be clear that this step has not yet been taken.</p> <p>Archaeological site CA-VEN-1803, listed as a "lithic scatter," should be subject to Phase II testing in order to determine its significance</p>	<p>NASA has a process for utilizing Native American monitors and employs an archeologist to assist in monitoring. A process for monitoring in known archeological sites will be developed in consultation with the SHPO and tribes and will be included in the agreement document, which will be signed by SHPO.</p> <p>NASA is in consultation with the SYBCI and SHPO regarding any further archeological investigations and/or data recovery. Please refer to the Programmatic Agreement and/or ROD for additional information.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Alec	Uzemeck	<p>Figure 2.4-1: Each of the cited potential conveyor routes, with the possible exception of Rail Site I, to the Union Pacific Railroad (UPRR) would present multiple problems, including land use incompatibilities and inadequate sites for rail car loading. Note that the areal extent shown for Corriganville Regional Park omits portions of the park.</p> <p>Rail Site 4 would go through or immediately adjacent an archaeological site complex, including rock art. It would cross the Brandeis-Bardin Campus, which features summer outdoor programs and some outdoor programs during the rest of the year. These activities cater to children and young adults. The proposed route would constitute an attractive nuisance for camp participants. The conveyor terminus would have to cross the Arroyo Simi Flood Control Channel and Los Angeles Avenue to access the railroad, where there simply isn't room for loading facilities. Both light industrial and residential land uses are nearby. The UPRR is a major interregional transportation corridor, which includes Amtrak and Metrolink services.</p> <p>Rail Site 2A does not include a rail siding and would be across the railroad from the Corriganville Regional Park. The state water project pipeline runs under the area and facilities for loading would be near the west orifice of the railroad tunnel under Santa Susana Pass.</p> <p>Rail Site 2B lacks room for a rail siding without taking parkland and would be located at the west orifice of the railroad tunnel under Santa Susana Pass.</p> <p>The proposed construction of such conveyor and rail loading facility would require appropriate environmental review beyond what is stated in the subject draft EIS.</p>	Your comment is noted.

First Name	Last Name	Comment	NASA Response
Cuxan	Valladares	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Pamela	Vampotic	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Pamela	Vampotic	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Andre	Van der Valk	<p>The DEIS lacks guidance on situations and actions that depend on vague language in the 2010 Administrative Order on Consent (AOC) that governs the cleanup. DTSC must provide NASA with an authoritative and binding interpretation of the language of the AOC.</p> <p>The DEIS is incomplete because it lacks guidance that still-undelivered DTSC documents, such as the DTSC EIR should include. This future EIR document must include a CEQA analysis that balances cleanup goals under various scenarios, including costs (both financial and environmental). Additionally, the DTSC EIR must provide information on what soils are to be removed in culturally sensitive areas, and what cultural resources will remain after the cleanup, as DTSC has sole authority to make these decisions under the AOC.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	The DEIS is incomplete because it does not specify expected outcomes for cultural resources, both archeological and architectural.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	The DEIS is incomplete because it excludes analysis of all possible levels of cleanup except the "cleanup to background" alternative. Many commentators specifically requested inclusion of other reasonable alternatives during the scoping process.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Andre	Van der Valk	The DEIS is incomplete because it does not address how to obtain replacement soil that will meet the requirements in the AOC.	The one third backfill estimated was based on historic cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets 2010 AOC requirements. Section 2.2 of the EIS identifies potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California. According to the 2010 AOC backfill soil must meet the LUT values. These sources have not been evaluated to determine if they can meet the 2010 AOC requirement.
Andre	Van der Valk	The DEIS is incomplete in its specification of cumulative impacts with other concurrent projects; viz., the DOE and Boeing cleanups.	Currently there are no cleanup efforts on private lands associated with this project. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis will be revised to include the new information released by Boeing and DOE (Section 4.13).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	The DEIS is incomplete in its survey and mitigation methods for plants.	NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.
Andre	Van der Valk	ESSENTIAL POINT OF CHATSWORTH NEIGHBORHOOD COUNCIL'S COMMENTARY: NASA must acquire from DTSC important missing information, and NASA must issue a corrected, comprehensive DEIS that provides decision makers adequate information to make an informed decision on how the cleanup should proceed.	NASA's NEPA analysis includes the most up to date information from DTSC. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts and the 5% clause. The cleanup to the AOC will be protective of human health. NASA can amend the EIS if further information becomes available that significant alters the rationale for the ROD.
Andre	Van der Valk	We believe the preceding comments taken as a whole make it clear the DEIS as issued is incomplete, inadequate, and does not conform to key environmental laws such as NEPA and CEQA. Lack of input from DTSC, for virtually every decision affecting cultural resources and key soil removal approaches, thwarts the DEIS from fulfilling its purpose as a guide to responsible decision-making. Additionally, it is dangerous to adhere to the 2017 completion date for cleanup that the AOC arbitrarily mandates. A hurried cleanup will likely become an irrevocable mistake, due to significant negative impacts to soil and cultural resources that may occur. The DEIS must be re-issued after DTSC and NASA determine and agree to robust decision-enabling guidelines, and the DEIS must evaluate multiple reasonable alternatives.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	The AOC charged DTSC with oversight authority for the cleanup.18 DTSC must provide NASA with a binding, authoritative interoretation of the language of the AOC. NASA must learn what SSFL-situation-specific rules will govern decisions and actions for the cleanup.	Your comment is noted.
Andre	Van der Valk	DTSC must provide NASA with much information that a DTSC EIR-type document would contain.	DTSC and NASA have coordinated on the preparation of this EIS. NASA will provide the EIS and any other needed information to DTSC for their use in the EIR.
Andre	Van der Valk	DTSC must provide guidance to NASA on many subject areas before NASA can complete its DEIS. Of major consequence for every decision is the requirement under the AOC that at least 95% of any soil that has ANY amount of contamination over background level must be removed. This ambiguous requirement has pervasive impact on every item discussed below.	The 2010 AOC driver for what soils require treatment is the LUTpublished by DTSC. Once those areas are identified, then NASA and DTSC will have to come to an agreement in regards to which areas are covered under the exception clause in the 2010 AOC referencing Native American artifacts.
Andre	Van der Valk	DTSC does not expect to deliver its EIR until some unspecified time in the future. NASA needs information from such EIR to complete a valid EIS that can be used as a decision making guide. Does this lack of a realistic schedule not call into question the feasibility of the AOC-mandated completion date of 2017? Can the governing AOC therefore any longer be considered 'binding'?	NASA has provided all of the studies utilized in this EIS to DTSC for incorporation into their CEQA review.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	The NASA Associate Administrator for Mission Support Directorate notes that NASA will be assisting DTSC in a CEQA analysis estimated to be complete by the end of 2015, but also notes that analysis will be restricted to the AOC cleanup level. (See Attachment 1.) To the best of our knowledge, both NEPA and CEQA set standards for environmental considerations that must be addressed in environmental documents, and contracts that are inconsistent with that law do not trump NEPA and CEQA provisions. The NEPA and CEQA analysis must consider all options, not the single path set by the AOC. When will DTSC's actual EIR, including CEQA considerations, be issued as a draft? When will it be issued in final form? It appears these documents are not scheduled before execution of the cleanup to the constraints of the AOC. That is not our understanding of CEQA or environmental policy.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Andre	Van der Valk	There are many environmental cleanup projects in the U.S. They "all" (as far as anyone knows) MUST operate according to federal and state EPA laws that were passed by legislators concerned with the environment. Operating under EPA processes means any toxic cleanup MUST evaluate multiple reasonable alternatives. The SSFL cleanup was forced to be uniquely different from other projects, because the AOC was signed before any EIS-type document. Why the difference? If See Attachment 2. How is the different treatment of this project explained? We can fathom no reasonable explanation. The Chatsworth Neighborhood Council advocates a cleanup based on scientific results, testing and standards, not political pressures.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. NASA must continue to abide by its obligations under the AOC as drafted.
Andre	Van der Valk	NASA should include the AOC document as an Appendix to the DEIS.	The AOC is available both on DTSC's and NASA's website (http://ssfl.msfc.nasa.gov)

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>DTSC must interpret the AOC on the handling of Native American cultural resources. The AOC language is vague in its definition of Archaeology, defining it as "Artifacts." They must be "formally recognized as Cultural Resources" What does a "formally recognized cultural resource" mean? Who needs to recognize what to meet that odd definition? Interpretive guidance is critically needed, because much of the Burro Flats Cave area, registered in the National Register of Historic Places, is on the NASA property. The future of Burro Flats and related nearby Native American areas is yet to be decided by DTSC. An artifact is generally understood to represent a movable, historically used, significant object. Given that definition, the Burro Flats Cave itself could be eliminated by the language in the AOC, as well as bedrock mortars that are very significant in the immediate area. An explanation of how the Burro Flats Cave, and nearby related sites, will be treated must be provided by NASA and DTSC in the DEIS.</p>	<p>NASA and DTSC will have to come to an agreement in regards to which areas are covered under the exception clause in the 2010 AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>The DEIS states that cleanup of approximately 0.65 acres of the Burro Flats site (CAVEN-1072) will be undertaken. At the August 28 public comment session on this DEIS, a NASA representative indicated they have been told the Cultural Resource definition in the AOC means the National Register of Historic Places (only). Under that definition, this site is exempt from cleanup. Why would this DEIS indicate any portion of this site is to be cleaned? This discrepancy highlights the problem of who controls the cleanup, an ongoing issue as we reviewed the DEIS. We do note, however, the definition of Artifact still was not clarified so the Burro Flats site may still be subject to cleanup under the AOC; since this site may still be subject to cleanup due to vague language, we object to cleanup of the Burro Flats site, as it is an identified and registered National Register of Historic Places area, and as it is an identified Indian Sacred Site.</p> <p>What are the contamination levels at the archaeological sites, and in particular, the 0.65 acre Burro Flats parcel slated for cleanup?</p>	<p>The Burro Flats site was listed in the National Register in 1975. The Burro Flats site was revisited and resurveyed in June 2007 to reassess the nature and extent of the previously recorded Burro Flats site in NASA's Area II. As a result, of this investigation, California Department of Parks and Recreation Primary Record forms for Burro Flats were updated and submitted to SHPO. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. The potential 0.65 acre impact from cleanup activities would be outside the National Register boundary, but within the Archeology Resource Management Area.</p> <p>NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts. Please refer to the Programmatic Agreement for further details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>The DEIS does not provide any information on how the boundaries of the archaeological sites on the property were determined. What survey methods were used? When was that done? What was found on the site? How was it tested? At what depth? What will DTSC do with an artifact NASA found in that survey, or a midden area that would not qualify as an artifact (that surely would be "contaminated")?</p>	<p>The Burro Flats site was listed in the National Register in 1975. The Burro Flats site was revisited and resurveyed in June 2007 to reassess the nature and extent of the previously recorded Burro Flats site in NASA's Area II. As a result, of this investigation, California Department of Parks and Recreation Primary Record forms for Burro Flats were updated and submitted to SHPO. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>Only a pedestrian survey of the site boundaries was done. Are additional pedestrian studies, and more detailed studies needed in the area where soil is to be removed? The DEIR lacks sufficient specificity to understand what has been surveyed. A more comprehensive survey using soil sampling techniques must be undertaken to determine the true size of the District. The Burro Flats Archaeological District extends outside the borders of Area II into Area III and possibly into Area IV. This site should not be segmented between the 3 RPs, but should be looked at holistically as part of the entirety of the Cultural Resources of SSFL. New, detailed surveys of this site must be accomplished prior to making irrecoverable decisions to "clean up" this exceptional and irreplaceable Indian Sacred Site.</p> <p>An additional boundary dilemma with the Burro Flats site and the National Register of Historic Places (NRHP) is that, as of 1972, the NRHP site is 25 acres. Since the DEIS recognizes only 1.7 acres as the site, where are the boundary differences? Does the NRHP boundary exclude or include the 0.65 acres that is to be cleaned up? What is protected under the NRHP, and what should be protected as part of VEN-1072?</p> <p>The steps in 2b, 2c, and 2d are all necessary to define the Burro Flats site. Again we see the same problem - DTSC must advise what can be excluded from the cleanup. NASA must provide information on what they will exclude, given an updated DTSC interpretation. And here, on the single site that is already NRHP certified, the boundaries must be established, and the site still needs a detailed evaluation by a qualified archaeologist, and careful and limited testing must be done to provide information on contamination of any part of the site. The approach that DTSC and NASA</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	What will be done with newly discovered archaeological Artifacts found in the process of the cleanup, that are not "culturally recognized"? How will these items be preserved or protected?	NASA has not yet determined where artifacts from data recovery would be curated. However, please refer to the Programmatic Agreement and/or ROD for details regarding archeological investigations.
Andre	Van der Valk	The Appendix for Cultural Resources lists multiple sites within a mile of the NASA property that have Cultural Resources. We have heard that multiple additional sites have been identified during recent surveys on nearby SSFL properties. It appears the list in the Appendix at Table 4 has not been updated to reflect current information. The segmented nature of the various studies is of concern. Please review and update as needed.	We acknowledge your comments. The report on those sites is not yet available to NASA.
Andre	Van der Valk	DTSC must interpret the AOC on the handling of Architectural Structures that are eligible historic structures (rocket engine testing facilities). Three structures at each of the Alpha, Bravo and Coca test stand areas have been found eligible under NRHP and SHPO (nine total structures). What contamination has been found in the soils under the test stands? Have testing boreholes been drilled under these structures? What has been found? Appendix C, Figure 8 at page C-53, shows significant contamination in the Test Stand Areas, but does not disclose information specific to the key structures. The DEIR is deficient in not disclosing specific information on contamination issues in these areas, and particularly in the foundation areas of the NRHP and SHPO-eligible structures.	Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects. Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.
Andre	Van der Valk	Will DTSC allow some or all of these historic structures to remain?	Please refer to the Programmatic Agreement and/or ROD for resolution of the impacts on historic structures.

APPENDIX K

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>The standards established by Section 106 (reproduced below) provide a mandate to seek ways to avoid or mitigate adverse effects on historic properties. Both NASA and DTSC need to indicate their intention for these structures that could be irreparably destroyed and a key part of our country's rocket history forever thereby lost. Because the NASA property holds key remnants of our country's space and rocket development, consideration of the possible end use of the property as a park should be incorporated in the preservation decisions. If the NASA parcel ultimately is joined with the larger Boeing parcel that is expected to become a park, preservation of appropriate NRHP and SHPO eligible structures to inspire future generations should be given a much higher priority. These decisions should be documented in Alternatives presented in the re-issued DEIS.</p> <p>Appendix C, Section 5. I is reproduced in part below (emphasis added): "The enabling legislation for Section 106 is contained in 36 CFR 800, "Protection of Historic Properties." The Section 106 process entails three basic steps: 1. Identify historic properties potentially affected by the undertaking. 2. Assess adverse effects on historic properties. 3. Seek ways to avoid, minimize, or mitigate adverse effects on historic properties."</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. Andre	Van der Valk	<p>With respect to all cultural resources, please provide information for the groundwater and surface water effects due to soil mitigation. Specifically include consideration of the effect of the 330,000 cubic yard reduction in site soils noted in the soil replacement plan, including collateral re-contamination and other effects from flooding and silt runoff due to soil changes.</p> <p>The impacts anticipated to the archaeological cultural resources from removal of soil from parcels within the designated archaeological site have not been reviewed or disclosed in the DEIS.</p> <p>The impacts anticipated to the archaeological cultural resources from removal of soil from parcels outside of the designated archaeological site, but within the NASA DEIS study area have not been reviewed or disclosed in the DEIS. Nothing is disclosed relative to the Burro Flats cave except that soil is to be removed from 0.65 acres - from where?</p> <p>The impacts anticipated to the historic test stands (Alpha, Bravo, Coca) from removal of soil from parcels within the designated historic area have not been reviewed or disclosed in the DEIS.</p> <p>The impacts anticipated to the historic test stands (Alpha, Bravo, Coca) from removal of soil from parcels outside of the designated historic area, but within the NASA DEIS study area, have not been reviewed or disclosed in the DEIS.</p>	<p>Please refer to Section 4.3 which reviews the impacts to multiple cultural resources from the proposed actions. Additionally please refer to the Programmatic Agreement and/or ROD regarding historic properties.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	Exclusion of any possible cleanup alternatives, except one, is a momentous detriment to the usefulness of the DEIS. The DEIS excludes from consideration reasonable alternatives supported by authorized standards of the State of California including cleanup to Suburban Residential, Commercial/Industrial, and Recreational levels.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Andre	Van der Valk	The DEIS should be expanded to include those excluded alternatives, presenting comparison of costs and all related effects on transportation, biological resources, cultural resources, soil, water, and air.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>We include as Attachment 3 charts NASA presented at past public meetings. The charts show estimates for cost and materials that could be expected for Background, Suburban Residential, Industrial, and Recreation level cleanup alternatives. Presented just behind these charts, is a summary of the anticipated costs for each type of cleanup and a chart summarizing the meaning of each cleanup standard. These charts and related commentary on cleanup standards and costs should be included in the re-issued DEIS.</p>	<p>Please refer to Table 2.4-1 for costs associated with cleanup standards alternatives considered but not carried forward.</p>
Andre	Van der Valk	<p>A discussion of alternatives should include what NASA will do if the Appeals Court supports the lower court decision, which will have the effect of stating that special, stricter cleanup standards are not required at SSFL under California law. An explanation should be provided to explain why the public should pay for a cleanup that is inconsistent with the law, and why local residents should be subjected to significant environmental contaminants from emissions, disturbed soil and related fugitive dust effects, and surface water runoffs that are greatly increased by unavoidable consequences of a background level cleanup of the site. See, in Attachment 4, the text of the District Court decision filed May 5, 2011, which prohibits DTSC from compelling compliance with SB990. The AOC appears to operate as a substitute for a questionable law, but the justification for its position requiring a "background level cleanup" on this important site is very unclear.</p>	<p>Following lengthy discussions with the Department of Justice and other involved Federal agencies, NASA senior leadership signed the AOC on December 6, 2010. NASA has been advised that the specific language of paragraph 1.5 of the document compels NASA to comply with the terms of the AOC regardless of the legal status of California State Law SB990. That paragraph has been interpreted to require NASA to comply with the special stricter standards of the AOC in order to achieve compliance with California Hazardous Waste laws. NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>The Feb. 2013 Report of the Inspector General of NASA brought up many similar questions. The report requested that the level of cleanup be re-evaluated. The Inspector General also questioned whether NASA would receive funding allocations within its own budget to perform the cleanup to the draconian standards required by the AOC. How will this be resolved? Will NASA be provided sufficient funding for cleanup to this background standard, even if the cleanup to SB990-type levels is again held unlawful by the Appeals Court? See Attachment 5, "NASA Inspector General Overview February 14, 2013".</p>	<p>NASA must continue to abide by its obligations under the AOC as drafted.</p>
Andre	Van der Valk	<p>The DEIS does not fully address how appropriate backfill soil will be sourced. Some possible suppliers are noted, but there is no guidance on how soils that must match the specific background levels for SSFL will be identified. Source sites from which sufficient quantities of such soils may be obtained are not identified.</p>	<p>The reason the sources have not been sampled to determine if they meet the 2010 AOC backfill requirements is because NASA did not have the LUT values from DTSC. The initial set of LUT chemicals were provided by DTSC in June of 2013. Final set(s) are still pending. (see DTSC website - http://www.dtsc-ssfl.com/files/lib_look-uptables/chemical/66073_06112013LUTand_cover.pdf)</p>
Andre	Van der Valk	<p>The DEIS does not explain why or how three times as much soil will be removed from the site as will be backfilled. Can permanent reduction (by non-backfilled removal) of up to 333,000 cubic yards of soil be deemed appropriate mitigation?</p>	<p>NASA acknowledges that when remediation is complete, the existing conditions will have changed. NASA believes that replacement of approximately one third of the excavated soil will be sufficient to accommodate the hydrology and eventual re-vegetation of the site. The one third backfill estimated was based on historic cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets 2010 AOC requirements.</p> <p>DTSC released the initial AOC chemical LUT in June 2013, and additional releases are expected from DTSC. (see DTSC website - http://www.dtsc-ssfl.com/files/lib_look-uptables/chemical/66073_06112013LUTand_cover.pdf)</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>The site, apparently to be reconstituted with up 333,000 cubic yards less soil, will have significant effects on surface water runoff. A major problem on the SSFL site has been surface water runoff and related contamination effects. Although the site has had a better record in the last two years, rainfall levels have been very low. Surface water runoff effects resulting from substantial reduction in surface soils must be reviewed, explained, and disclosed. It is well settled that a reduction in permeable surfaces (typically associated with development) causes significantly increased runoffs. What will be the runoff effects of the decreased soil in a year with average rainfall? What is expected when rainfall is significantly over average levels?</p>	<p>NASA acknowledges that when remediation is complete, the existing conditions will have changed. NASA believes that replacement of approximately one third of the excavated soil will be sufficient to accommodate the hydrology and eventual re-vegetation of the site. As discussed in the EIS, the soil biology will be destroyed upon excavation/removal.</p> <p>The potential impacts to water resources and associated mitigations are included in Section 4.6 of the DEIS.</p>
Andre	Van der Valk	<p>The EIS states "onsite" (ex situ and in situ treatment) soil cleanup may be performed where appropriate. The AOC seems to prohibit this fromising alternative and states the only allowable method for soil cleanup is removal. DTSC and NASA must both explain how this seeming contradiction is possible based on the AOC language. The "leave in place" remediation alternative should be considered in the NEPA and CEQA analysis, as well as in the DEIS, because such a remediation approach would entail significantly less environmental impact, by reducing soil excavation, hauling, and soil replacement.</p>	<p>The AOC does permit NASA to use alternative treatment technologies to remediate soils. NASA is currently developing a plan to evaluate the effectiveness of the ex situ and in situ remediation technologies listed in Section 2.2.2.3 of the EIS.</p> <p>As for the "leave in place" part of your comment, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>The DEIS includes a review of Environmental Justice which generally looks at the impacts to lower income and minority populations that will be affected by the hauling. Nothing is presented to address such demographics in the areas that are proposed to receive, and then permanently live with possible effects from the contaminated material, such as Buttonwillow, Kettleman, and Beatty. The Environmental Justice analysis should be extended in the re-issued DEIS to include these areas.</p>	<p>NASA acknowledges the comment.</p> <p>The landfills are outside the ROI. Impacts at disposal facilities are not included in this EIS.</p>
Andre	Van der Valk	<p>At the August 28, 2013, public comment session on the DEIS, it was disclosed the haul trucks are merely covered with tarps when traveling with contaminated material. We request much more complete protection for our community from the contaminated material that the AOC's require to be removed. Better alternatives for reduced dust from the trucks need to be developed and implemented.</p>	<p>Fugitive dust emissions would be controlled by measures prescribed by VCAPCD Rule 55. Specifically, NASA would load materials carefully to minimize the potential for spills or dust creation. Implement water spraying as needed to suppress potential dust generation during loading operations. Take care to apply dust suppression water to the top of the load or source material to avoid wetting the truck tires. Do not perform loading during unfavorable weather conditions (such as high winds or storms). Material spilled during loading would be collected for subsequent loading. After loading, trucks would pass through the decontamination and inspection station before weighing and departure from SSFL.</p> <p>As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	The combined impacts of all concurrently operating SSFL projects regarding traffic and transportation-related pollution are non-specific: (e.g., " ..likely would be noticeable ... ").	The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis will be revised to include the new information released by Boeing and DOE (Section 4.13).
Andre	Van der Valk	What transportation routes will the other related projects (concurrent DOE, Boeing cleanups) use. Will they use the same or different haul routes?	The cumulative impact analysis, in the Cumulative Impact section of the EIS, identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available. They will likely use the same routes.
Andre	Van der Valk	What will the transportation emissions be for all projects combined? What will be the total effect on surrounding communities?	The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available. A general discussion of combined transportation emissions is discussed in the Cumulative Impact section of the EIS.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>The number of trucks on all projects, travelling on Woolsey Canyon during daylight hours must be disclosed, as well as twilight and night truck traffic volumes for all projects combined. This disclosure should be presented in a table format, and specify the anticipated number of incoming and outgoing trucks in one hour increments during weekdays and weekends (if applicable), for all projects to present a realistic understanding of the traffic impact. Include a column for worker arrivals and departures from the site. Provide hour of the day in the rows, and in columns show incoming and outgoing traffic for each of NASA, DOE, Boeing. Combine all workers for all projects in the last set of columns for cumulative incoming and outgoing traffic.</p>	<p>NASA has explored techniques for reducing the amount of material to be moved offsite. The EIS addressed other impacts and MMs such as air pollution, noise, and traffic related to transportation of materials to the landfills. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	The DEIS survey and analysis of flora are insufficient. They lack quantification and specifics related to impacts.	<p>The habitat mapping was undertaken between September 28 and October 8, 2010 to update SSFL mapping for the NASA-administered portion of SSFL after the 20005 Topanga Canyon Fire. Base maps for field use in updating the habitat mapping were made using aerial photographs and the existing SSFL facility-wide habitat mapping by Technology Associates International Corporation (TAIC) [GIS metadata dated November 2002].</p> <p>The Fall Biological Survey Report for SSFL Area IV and Northern Undeveloped Area (SAIC 2009) was reviewed before initiating the Fall 2010 surveys on the NASA-administered property. That report (page 2, second full paragraph) states that ‘Vegetation categories are consistent with Preliminary Descriptions of Terrestrial Natural Communities of California (Holland 1986), except where no suitable category exists’. No other vegetation classification system was referenced in the SAIC 2009 report. Because the Fall 2010 habitat mapping effort was intended primarily as an update in response to changed conditions since the 2005 Topanga Canyon Fire, it was decided to use the same vegetation classification system that was already in use throughout SSFL facility. It did not seem reasonable to change the vegetation classification system for just a portion of SSFL facility. However, recognizing that the Holland 1986 system was out-of-date by the time of the mapping, the Fall 2010 report presented cross-walk information to relate the mapping units (already in place) to the California Natural Diversity Data Base CNDDB Natural Communities List (1990). Mapping to the alliance level, as documented in the more recent Sawyer et al. 2008, was not done at that time because of the system’s reliance on dominant plant criteria, which would require field sampling of vegetation stands (whose absence was also noted in the CDFW comment). This approach would have been complicated by the fact that mapping was occurring in late September/early October, when only perennial and late-season plants would have been blooming or recognizable. As discussed in the 2010 Fall Habitat Report, the mapping was done from visual field observations and mapping onto detailed aerial photographs. In fact, it was not physically possible to access many locations due to extremely steep and dangerous terrain and/or dense vegetation. Because mapping to alliance level was not how the habitat mapping was originally conducted (by CH2M</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	<p>How many plants of each type are involved? How many coast live oak (<i>quercus agrifolia</i>) trees will be removed or otherwise endangered? How many western sycamores? Although counts for Santa Susana tarplants are shown, presentation of plant density and expected soil removals (similar to Appendix C, Figure 8 at page C-53) would greatly improve the understanding of the effect of the project on this State-listed Rare species.</p>	<p>Please refer to Section 4.4.2 for BMPs and mitigations intended to help reduce impacts to these type of resources.</p>
Andre	Van der Valk	<p>What steps will NASA take, over what period of time, to regenerate sensitive species? For example, we do not believe Santa Susana tarplant is part of the seed mix specified for replanting. How will plantings be monitored to encourage regrowth?</p>	<p>NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andre	Van der Valk	What steps will NASA take to eliminate introduction of invasive species as off-site soil is brought in as part of the soil replacement? How will plants be affected by re-filling the site with only one-third as much soil as was removed? How will the segmented cleanup and backfills affect the overall health of this habitat, which in many areas is uniquely unaffected by the major metropolitan community next door?	Given the range and diverse nature of habitats that might be disturbed, a range of restorations would be needed. In soil remediation areas it is anticipated that about one third of the excavated material would be replaced with clean back fill topsoil. Additionally NASA plans to use BMPs related to invasive species identified in our Biological MMs. See Table 6.1-1 for additional information.
Deborah	Van Der Zaag	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Danielle	Vanasco	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Danielle	Vanasco	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Felipe	Villarreal	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mike	Villegas (Ventura County Air Pollution Control District)	All demolition, construction, and excavation equipment such as compressor engines, generator engines, screens, crushers, conveyors, lighting, drilling rigs, etc. shall be registered with the California Air Resources Board Portable Equipment Registration Program (PERP). In some cases, the equipment may not meet the applicability requirements of the PERP (function, time at facility, etc.) and will be required to obtain a District air permit. Equipment such as backhoes, bulldozers, front-end loaders, and dump trucks do not require a PERP or District permits, but must comply with the California Air Resources Board Diesel Off-Road Online Reporting System (DOORS) Program and Regulation For In-Use Off-Road Diesel Fueled Fleets. If a District air permit is required, the permit application shall comply with the best available control technology (BACT) and emission offset requirements of APCD Rule 26, "New Source Review." The air permit application shall also demonstrate compliance with District Rule 33, "Part 70 Permits", Rule 35, "Elective Emission Limits," or Rule 76, "Federally Enforceable Limits on Potential to Emit," as applicable.	Comment noted. DEIS text will be revised to identify the need to comply with each of these programs, as applicable, prior to the onsite of construction and/or operation activities (Section 4.7.1.2).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mike	Villegas (Ventura County Air Pollution Control District)	<p>The DEIS provides only preliminary details regarding the various soil cleanup technologies that are being considered as alternatives to excavation and offsite disposal. As stated, some of the soil cleanup technologies will require Ventura County APCD permits. To fully determine these permit requirements, a detailed description of each soil cleanup technology will be required. The power source for these soil cleanup technologies must also comply with District air permit requirements. Fuel-fired power sources such as an electricity generating engine may not comply with all air quality rules and grid electricity may be required to power the soil cleanup technologies. If a Ventura County APCD permit is required, the permit application shall comply with BACT and emission offset requirements of APCD Rule 26, "New Source Review." Note that the current Ventura County APCD Permit to Operate for the SSFL has permitted emissions of 2.37 tons per year of reactive organic compounds (ROC) and 5.86 tons per year of nitrogen oxides (NOx). These permitted emissions are considered to be the baselines" when evaluating the APCD Rule 26 emission offset thresholds of 5 tons per year of ROC and 5 tons per year of NOx.</p>	<p>As appropriate, NASA will work with the APCD to identify the need for air permits following determination of which soil cleanup technology will be used for the project.</p>
Mike	Villegas (Ventura County Air Pollution Control District)	<p>The ex situ treatment of contaminated soils using land farming may not comply with District rules and may not be permitted as proposed. Alternative ex situ soil remediation techniques, such as a covered aerated static pile, should be considered. In this technique, the contaminated soil is covered with a tarp or other impermeable cover and the required air is provided via blowers and piping with air emissions vented to an emission control device.</p>	<p>To best address this comment, NASA requests additional details on why land farming may not comply with APCD rules. Additionally, NASA will research remediation via a covered aerated static pile to identify whether it is a viable option for inclusion in the FEIS.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mike	Villegas (Ventura County Air Pollution Control District)	<p>The DEIS also provides only preliminary details for the various groundwater cleanup technologies being studied. As stated, some of the groundwater cleanup technologies will require District air permits where volatile organic compounds (VOCs) or semivolatile compounds are potentially emitted to the atmosphere. To fully determine these permit requirements, a detailed description of each groundwater cleanup technology will be required. The power source for these groundwater cleanup technologies must also comply with District air permit requirements. Fuel-fired power sources such as an electricity generating engine may not comply with all air quality rules and grid electricity may be required to power the groundwater cleanup technologies. If a Ventura County APCD Permit to Operate is required, the permiapplication shall comply with BACT and emission offset requirements of APCD Rule 26, New Source Review.</p>	<p>Comment noted. As appropriate, NASA will work with the APCD to identify the need for air permits following determination of which groundwater cleanup technology will be used for the project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mike	Villegas (Ventura County Air Pollution Control District)	<p>Air Quality Mitigation Measure-3 (MM-3) proposes a "Dust Control Plan" for the project. The Ventura County APCD recommends that MM-3 be expanded to an "Emissions Control and Air Monitoring Plan." During the excavation and temporary storage of contaminated soil, voes and various toxic air contaminants may be released into the atmosphere. The plan should include best management practices to prevent the emissions of VOCs and air toxics in addition to preventing the emissions of fugitive dust. An air monitoring program should also be developed to make sure that the project does not cause a violation of the National and California Ambient Air Quality Standards or Ventura County APCD Rule 51, Nuisance, Rule 62.1, Hazardous Materials, and Rule 74.29, Soil Decontamination Operations. The air monitoring program should include real-time, continuous, and/or periodic monitoring for PM1o, VOCs, and air toxics such as polycyclic aromatic hydrocarbons and lead.</p> <p>The "Emissions Control and Air Monitoring Plan" should incorporate the following requirements of District Rule 74.29, Soil Decontamination Operations: a) a certified organic vapor analyzer should be used to make sure that the aeration of contaminated soil is minimized or prevented, b) contaminated soil piles or soil surfaces should be treated with a vapor suppressant or covered with continuous heavy-duty plastic sheeting or other covering to minimize the emissions of voes and air toxics to the atmosphere; and, c) trucks used to transport contaminated soil shall also be enclosed, tarped or otherwise covered to minimize the emissions of dust, voes, and air toxics.</p>	<p>NASA uses the term "fugitive dust" to discuss impacts associated with loose contaminated soil. NASA agrees that this contaminated soil could contain and release emissions of PM10 and PM2.5 as well as VOCs and toxic air contaminants. Based on this definition of "fugitive dust", NASA expects VOC and toxic air contaminant emissions to be minimized through Air Quality BMP-1, along with PM10 and PM2.5 emissions. In response to this comment:</p> <ul style="list-style-type: none"> -Air Quality BMP-1 will be revised to a) clarify which pollutants may be associated with fugitive dust and b) include the requirements of APCD Rule 74.29, as specified in this comment (Section 4.7.2, Table 6.1-1) . -NASA will discuss the need for an air monitoring program with DTSC prior to release of the final EIR. -The name of the "Dust Control Plan" will be considered for revisions following final discussions with DTSC

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mike	Villegas (Ventura County Air Pollution Control District)	<p>The proposed demolition and remediation activities at the SSFL will involve removal of structural materials and excavation and transport of up to 500,000 cubic yards of contaminated soils over a period of two years. These activities will require significant numbers of diesel equipment and vehicles to remove and deliver the structural debris and contaminated soils to storage and treatment areas within the SSFL boundaries and to off-site disposal facilities. Moreover, up to 167,000 cubic yards of backfill material will be brought in to restore excavated areas. This material will also be delivered and placed with diesel equipment. Diesel particulate matter has been designated a cancer-causing chemical in the State of California. Therefore, a screening health risk assessment (HRA) should be conducted to assess potential health risks of diesel exhaust emissions associated with project activities to nearby populations, especially sensitive receptors, such as residences, schools, daycare centers, and hospitals. This determination can be made by an appropriate health risk assessment. The California Air Pollution Control Officers' Association (CAPCOA) has an HRA guideline document, titled Health Risk Assessments for Proposed Land Use Projects (June 2009), for assessing the health risk impacts of airborne toxic and carcinogenic substances. The guidelines and associated documents are available from CAPCOA's website at http://www.capcoa.org/documents.</p>	<p>NASA will assess the need for performing an HRA following completion of the air dispersion modeling requested in another comment from VCAPCD. If the modeled offsite PM10 and PM2.5 concentrations are considered significant, an HRA will be performed. If, however, the modeled offsite PM10 and PM2.5 concentrations are considered negligible, an HRA should not be necessary.</p> <p>Additionally, given the short duration of the construction activities, NASA would like to discuss the possibility of only evaluating acute risks with the APCD, if an HRA is warranted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mike	Villegas (Ventura County Air Pollution Control District)	Vapor emissions and dust emissions from the excavation, handling, and on-site storage of contaminated soils may result in the emissions of toxic air contaminants such as chlorinated hydrocarbons and metals. Air toxics screening calculations or a HRA should be conducted to assess potential health risks of nearby populated areas as discussed above.	The relevant measures available to reduce both onsite and offsite fugitive dust emissions are summarized in the DEIS on pages 4-109 and 4-110. These measures include such items as: apply water at a sufficient quantity and frequency to prevent wind-driven dust; not perform loading during unfavorable weather conditions (such as high winds or storms); use properly secured tarps that cover the entire surface area of the load for hauling. Information summarizing the health studies previously conducted as well as the risk assessment of potential exposures from current chemical contaminants at the site will be added to the EIS (Sections 3.9.5 and 3.9.6). A study by ATSDR, was published in 1999. According to DTSC's summary, "The preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects."
Mike	Villegas (Ventura County Air Pollution Control District)	The DEIS should assess through dispersion modeling whether project-generated particulate pollutants (PM10 and PM2.5) will exceed either state or federal air quality particulate standards in nearby populated areas.	The relevant measures available to reduce both onsite and offsite fugitive dust emissions are summarized in the DEIS on pages 4-109 and 4-110. These measures include such items as: apply water at a sufficient quantity and frequency to prevent wind-driven dust; not perform loading during unfavorable weather conditions (such as high winds or storms); use properly secured tarps that cover the entire surface area of the load for hauling. Information summarizing the health studies previously conducted as well as the risk assessment of potential exposures from current chemical contaminants at the site will be added to the EIS (Sections 3.9.5 and 3.9.6).

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mike	Villegas (Ventura County Air Pollution Control District)	<p>Project conformity is addressed in Section 4 of the DEIS and Appendix I, AQ General Conformity Analysis. These discussions indicate that the emissions of material from the excavation and offsite disposal for both high and low soil remedial technologies are below the South Central Coast Air Basin's (SCCAB) general conformity thresholds of 50 tons/year for VOC and NOx. Soil remedial emission estimates for 2016 and 2017 are provided in Section 4 of the DEIS and Appendix I, AQ General Conformity Analysis. However, the emission estimates for demolition activities for 2014, although also below the SCCAB thresholds of 50 tons/year for VOC and NOx, are only presented in Section 4 and not found in Appendix I, AQ General Conformity Analysis.</p> <p>This information should be included in Appendix I as well.</p>	<p>As specified in Appendix I, AQ General Conformity Analysis, and per 40 CFR Parts 51 and 93, a General Conformity Analysis is only required if unmitigated emissions are expected to be greater than the General Conformity de minimis thresholds. As calculated in Appendix H, Supplemental AQ and GHG Information and Technical Approach, and presented in Section 4 of the DEIS, the emission estimates for demolition activities for 2014 are below the SCCAB thresholds. Therefore, they were not required to be included in the General Conformity Analysis.</p>
Lance	Vilter	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dean	Wagner	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mare	Wahjosi	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mare	Wahjosi	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Harold	Wakefield	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	DEIS Provides too narrow of a range of alternatives, allowing for only an “all or nothing” approach that is certain to either devastate the environment we are supposed to be protecting, or fails to complete a cleanup of any kind. Neither of these approaches are acceptable to the surrounding affected public or to the surrounding natural environment according to CEQA. Why are these decisions being made now, before CEQA review is done by the State?	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments. NASA is coordinating closely with DTSC for both technical and CEQA work. For example, all EIS technical studies and reports were provided to DTSC for use in the CEQA analysis. DTSC will use the EIS to prepare their CEQA document.
Christina	Walsh	DEIS Provides too narrow of a range of alternatives, allowing for only an “all or nothing” approach that is certain to either devastate the environment we are supposed to be protecting, or fails to complete a cleanup of any kind. Neither of these approaches are acceptable to the surrounding affected public or to the surrounding natural environment according to CEQA. Why are these decisions being made now, before CEQA review is done by the State?	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Christina	Walsh	NASA proposing destruction of an entire habitat and state they will potentially impact the Sacred Cave Paintings site and other existing artifacts, as well as the test stands that represent a significant part of our National Space History.	The Burro Flats Painted Cave would not be physically impacted by the cleanup activities. The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site, which includes the cave. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. The potential impact from soil cleanup would be within the Archeology Resource Management Area, but would not be in the cave itself. Please refer to the Programmatic Agreement and/or ROD for details regarding the resolution of adverse effects to test stands.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>This is unnecessary and goes far beyond the requirement by law to protect human health and the environment. In fact, it further threatens to impact human health and the environment by proposing to move unnecessary volumes of soil that go far beyond EPA health risk requirements. It is also likely to be difficult to find replacement soils that will qualify under the currently written specifications of "local background."</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments.</p>
Christina	Walsh	<p>NASA fails to employ all parts of the AOC by failing to acknowledge the exception clauses designed to protect and address these issues specifically which qualify under the stated exceptions.</p> <p>By choosing to ignore one directive of the AOC while also oversimplifying others, demonstrates a need for limited modification to the AOC agreement so that a workable, implementable cleanup may be achieved that is measurable. People want to be protected from added risk.</p> <p>AOC Severability and Modification clauses provide for a limited modification to allow for a responsible cleanup that maintains human health protection as defined by US EPA Suburban Residential PRGs and existing health-risk data being completed for a health-risk assessment on the same deadline ('07 Consent Order for Corrective Action).</p>	<p>The exceptions in the 2010 AOC are dependent on DTSC approval. The cultural resources will remain in the EIS has having the potential to be impacted in the absence of this approval. Please refer to the Programmatic Agreement and/or ROD for further details.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>We thank NASA for showing what “Background Bright-line Cleanup” really looks like:</p> <p>This is NOT what surrounding affected-residents want as this solution causes unnecessary impacts to the surrounding communities, the ecology and puts the archeological and historic sacred assets at risk without benefit of a measurable improvement to public health. This is not what we can afford to consider when responsible health protective solutions that don’t add these unnecessary impacts are available and should be considered.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments.</p>
Christina	Walsh	<p>An approach that does not consider health-risk, fails to consider the impact of removing/disturbing soils that do not present a health risk.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christina	Walsh	<p>Why fill landfills with soils that do not present a health risk?</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background and placing soil that doesn’t present a health risk in landfills.</p>
Christina	Walsh	<p>What is the impact of that disturbance in the way of trucks, traffic, dust, and unnecessary impacts on these sacred sites?</p>	<p>The impacts of trucks, traffic, and dust on the Sacred Site were not specifically analyzed; however, the impact of different technologies including excavation was analyzed.</p>
Christina	Walsh	<p>Why is mitigation of these potential impacts not being more closely evaluated and presented?</p>	<p>Impacts from the proposed action are discussed in Section 4. The document will be revised to reflect changes since the DEIS was released.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	How can these considerations be made if health-risk is not considered in the process?	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Christina	Walsh	As pointed out by Dr. Ronald Ziman’s comments, “there is nothing in the letter you received from CEQ requires you to exclude other alternatives. It simply states alternatives need not be mandatorily included. I have to believe that [Senator] Barbara Boxer, who has fought both for the environment and at the same time, the “strictest cleanup ever” in the interest of public health, has been misled and is not working at odds with her own core environmental principles.” ¹	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Christina	Walsh	We don’t want to destroy the natural environment and ecology and sacred archeological sites we are trying to save...	Please refer to Section 4 of the EIS for NASA’s MMs to minimize impacts to cultural resources. NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>This “all or nothing” proposal goes far beyond protection of human health and the environment and therefore cannot be considered an adequate analysis of reasonable and implementable alternatives.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christina	Walsh	<p>Adding PRG comparison and risk assessment standards of suburban residential remediation goals used throughout the regulatory world, will adequately protect human and ecological health, and will provide a solution that is consistent with an existing programmatic agreement in place (for the Record of Decision to follow), which is proven.</p> <p>Using AOC without modification insists on a process that is not consistent with any programmatic agreement ever used to address a site of this magnitude and is inconsistent with the way these assessments are done by the experts regulating the process.</p> <p>Adding a comparison matrix to soil environmental condition (undisturbed pristine natural environment would score higher than a debris pile within a former building footprint) so that undisturbed stays as such, wherever feasible based on risk assessment analysis by State Toxicologists to consider those inputs.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	AIP specifically directs the use of alternative in situ treatments to reduce soil movement impacts, yet the DEIS fails to address any alternatives that utilize this directed, proven, and more sustainable method of action.	NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.
Christina	Walsh	DEIS should provide multiple alternatives that describe specific efforts to minimize those impacts instead of this devastate-all approach.	NASA recognizes public concern regarding the AOC. The impacts related to the AOC alternative have been addressed in the EIS. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Now: they are not looking at future use, but deciding on up to 100% demolition of all structures for the purpose of a clean site for future disposition, even though they don't know the purpose OR if it will stay within, or leave federal jurisdiction. Yet, these decisions propose to remove all valuable assets before future-use is determined.</p> <ul style="list-style-type: none"> • They claim that GSA wasn't required to consider future use when declaring the site excess and now they state that those considerations needed to be commented on in the prior process [Excess Declaration] essentially leaving all public consideration without mechanism to be heard or considered. • This NEPA and Section 106 process must slow down for CEQA considerations, otherwise the process fails it's purpose entirely. • This process as proposed, removes the assets before evaluating the potential value of those assets, and then later, when DTSC does their "Soils" EIR, there won't be anything to consider because the test stands will already be gone. NASA and DTSC have stated publicly that their CEQA process will not consider demolition. This is possibly why they are choosing to have the CEQA process follow this process instead of working in tandem as recommended by CEQ [White House Council for Environmental Quality]. • This inappropriate failure to consider future use potential, which is part of the "purpose and need" as defined by the DEIS results in an all or nothing approach that threatens the future use that has been defined by the surrounding public as being most appropriate and beneficial to past, present and future generations. 	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>GSA and NASA defend this decision because it allows for NO ONE to take responsibility. It just happens, and everyone throws up their arms in dismay and points to someone else. This is the ultimate failure in analysis of the actions and solutions proposed. This is unacceptable.</p> <p>The future disposition is in the “Purpose and Need” of the DEIS yet NASA chooses to consider that process separately. WHY? Because then, they never really consider it; It just happens.</p> <ul style="list-style-type: none"> • 100% demolition of the Test Stands Structures is NOT required by the AOC as they are located in un-weathered bedrock and therefore do not require cleanup below the test stands structures. Any decision to remove the Test Stands, is strictly a NASA decision, not an AOC decision. <p>The fact that they separated the process between the NEPA [federal] and CEQA [state] process makes it possible to lose the assets in Demolition phase and then later, having nothing to evaluate because nothing is left by the time the “soils” evaluation comes up for review.</p> <p>We cannot allow this “cart before the horse” process to destroy human space history which are considered valuable on many levels in the way of future education as well as honoring our past.⁴</p>	<p>NASA will defer demolition of the Alfa and Bravo Historic Districts including test stands and control houses and allow time to better assess (in coordination with SYBCI, DTSC, GSA and SHPO) situation.</p>
Christina	Walsh	<p>We need to consider the impact on the existing environment/habitat as well as the current residents who will be exposed to potential impacts of the proposed action. It is crucial that the State’s EIR consider these issues and do so in concurrence with NASA’s investigation so that important considerations are not missed along the way.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>How many trucks of the estimated number described as 142 truck trips per day will carry steel from test stands for recycling? [please provide these details as the numbers provided in Section 106 process are acknowledged to include all demolition and do not specify the costs/revenues associated with the test stands and control houses (of highest historic value)]</p> <p>These truck trips are not based on an AOC requirement, but rather on NASA financial decisions that also unnecessarily burden surrounding communities with the dust, traffic, noise, and hazard impacts that are not for the purpose of health protection or the natural environment. ...Just a Business Decision.</p>	<p>See Tables 2.2-2 and 2.2-5 for the estimated number of trucks that will carry soil or demolition debris. The same number of trucks are needed to remove the test stands whether the material is disposed or recycled.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>The estimate of truck-trips per day will likely triple and will occur simultaneously as all three Responsible Parties are conducting their soil removal at the same time to accommodate the same deadline. The number when tripled and calculated over the course of daylight hours equates to more than one truck per minute for all daylight hours over the course of several years. This is not only unacceptable, but also impossible when considering the loading and staging requirements that will be needed.</p> <p>If the steel is not necessary to remove, why add that burden to these already impossible traffic and operational challenges as currently proposed in the Action? This agreement must be revisited to consider these short-comings that make implementation so difficult.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Please consider modifying the AOC agreement to allow that in situ remedies be considered, and allow the deadline to be described as “completion of construction” as was the case, in all prior versions of the agreement so that the time required to achieve cleanup goals allows for treatment time.</p> <ul style="list-style-type: none"> • By using health-risk to guide in determining remediation requirement, the alternative in situ treatment methods become achievable and protective of human health. This will reduce truck trips, traffic, and dust impacts significantly as “removal” won’t be necessary. It further eases the pressure on landfills that need to focus on soil that DOES present a health risk and therefore requires removal because alternative treatment methods are not possible or achievable. • A “treat first” approach will significantly minimize the impacts that require mitigation, and that cause damage to the current environment. 	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>It was the State and Responsible parties who decided to take health risk out of the equation, and by this long and endless block of each action, the equation of time is part of that process and these communities have waited long enough.</p> <p>time v concentration of COC v pathway to receptor</p> <p>Without considering these scientific facts, the State and Responsible Parties fail to protect human health and the environment as promised by these agreements.</p> <p>We must not make the solution worse than the problem it proposes to address. Let's allow risk assessment parameters being prepared under the same deadline, to inform this process so that we don't remove soil that does not present a risk to human health or the environment. Let's be the stewards of the site we always wanted and make these decisions now, before it's too late.</p> <p>We can make more informed and responsible decisions by evaluating risk so that soil that does not present a risk, is not unnecessarily removed, excavated, and burdening another community.</p> <p>The State has Toxicologists on staff studying this site, who can assist in making informed risk-based recommendations on how to best protect human health and the environment within this cleanup objective if it can be modified to consider traditional risk-based decision-making.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	How will we be protected from unnecessary impacts of trucks, traffic, fugitive dust pulmonary impacts to surrounding residents where the body burden is already very high.	<p>The number of trucks required is predominately a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus not being a valid option. Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p> <p>The best way to reduce the number of trucks is to reduce the soil volume required to be transported offsite. NASA is evaluating several treatment technologies that have the potential to reduce the truckloads by 36% (9,500 truckloads). The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p> <p>Fugitive dust emissions would be controlled by measures prescribed by VCAPCD Rule 55. Specifically, NASA would load materials carefully to minimize the potential for spills or dust creation. Implement water spraying as needed to suppress potential dust generation during loading operations. Take care to apply dust suppression water to the top of the load or source material to avoid wetting the truck tires. Do not perform loading during unfavorable weather conditions (such as high winds or storms). Material spilled during loading would be collected for subsequent loading. After loading, trucks would pass through the decontamination and inspection station before weighing and departure from SSFL.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	How will we be protected from unnecessary impacts to this unique ecological habitat when such drastic soil excavation (the top two feet of everything is essentially all living things) when these actions are not required to protect human health based on risk assessments currently understood?	Thank you for your comment it has been noted. NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.
Christina	Walsh	How will irreversible impacts and possible destruction of our nation’s Space History as well as irreplaceable ancient sacred Native archeological sites that can never be replaced be addressed? How will NASA explain this decision after fifty years of keeping these treasures behind locked fences?	Through the NHPA Section 106 consultation process, NASA is developing a Programmatic Agreement to stipulate the MMs and other commitments that will serve to address the disclosed adverse effect on historic properties from the undertaking.
Christina	Walsh	<p>We ask NASA and DTSC to please reconsider these decisions and contemplate this minor modification to provide toxicological parameters for the purpose of informed decision-making and best protecting human health and the environment.</p> <p>How is it possible that NASA is not more proud of these beginnings as we are? This is truly a travesty failing to seriously consider implementable solutions that are health protective and protective of the environment we are trying to save and protect.</p>	Thank you for your comment it has been noted. NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Current measures to pump down groundwater levels to prevent seeps from emerging are not analyzed or recognized for these impacts despite continued requirement to manage these emergences due to existing VOC contamination. This is an action that is being required by DTSC, and is resulting in a long-term loss of ecological water resources, and has already been described to have dried a perennial stream that feeds Bell Creek⁷ according to many residents, a mesic-riparian habitat, and is a primary water resource for the wildlife corridor, migratory species and has been severely impacted as a result for two years now. Why are these current impacts not being analyzed when they have been observed to already be happening by hundreds of residents?</p> <p>Why does this environmental analysis only occur to benefit the polluter?</p> <p>Why is the responsible party not accountable for these current impacts that have been communicated for more than a year by residents?</p>	<p>The regulators are working with the SSFL parties to examine the Bell Creek drainage issues.</p>
Christina	Walsh	<p>where is consideration of saving the test stands part of the evaluation?"</p>	<p>NASA recognizes the historical importance of the test stands and is conducting section 106 consultaiton in accordance with the National Historic Preservation Act to resolve potential adverse effects from the proposed action on historic resources. NASA has made a commitment to defer the demolition of the Alfa and Bravo historic structures and to work with GSA to place a covenant for the protection of at least one test stand and control house.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>The issue of excess is long past and they did a NEPA analysis for that action and now they are doing this action.</p> <ul style="list-style-type: none"> • So NO ONE considers what to do with the property for this decision to be an informed decision, and this means that • NASA says that it's in the purpose and need, so how can it be a separate action? • This is truly piece-mealing and artificially segmenting the process to essentially avoid any proper analysis or "decision" being made by anybody. 	Your comment is noted.
Christina	Walsh	Native cultural considerations of the Coca area as being appropriate for demolition and any historic preservation of test stands or portions thereof for museum preservation, should be focused on assets from Alfa and Bravo districts.	NASA will take this into consideration.
Christina	Walsh	<p>NASA stated that they could go around the test stands, and this certainly emphasizes the need to modify the look-up table section of the AOC to accommodate for risk considerations which seem to be what everyone wants: protective of human health and the environment.</p> <p>NASA also stated the AOC as reasoning when we have shown that the AOCs are not the reasoning (blame assigned to deflect from NASA as a decision). Now they are stating cost, but in the costs they present, are the costs of remediating the drainages as well – which is NOT what we are trying to prevent or save. Encapsulation should be necessary in either action of they are claiming it to be a mandate for the purpose of liability issues. Those issues exist whether you choose either alternative since the Test Stands are not required to be demolished in order to comply with the agreement. Those issues need to be clearly understood and presented by the responsible parties and regulatory reports presented to the public.</p>	NASA will defer demolition of the Alfa and Bravo Historic Districts including test stands and control houses and allow time to better assess (in coordination with SYBCI, DTSC, GSA and SHPO) situation.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>While comments included an effort to politically limit the range of alternatives, the letter from US Senator Barbara Boxer that NASA uses to justify this decision, provides only one alternative (... or nothing) and does not provide for a reasonable cleanup, or a rational basis to destroy such a large eco-system that includes removing soils that do not present a risk to human health or to the environment according to US EPA Public Remediation Goals.</p>	<p>NASA originally proposed to evaluate a cleanup to background (proposed action) that meets the 2010 AOC requirements, a no action alternative, and three other alternatives that are normally analyzed for a typical Superfund cleanup based on common cleanup goals associated with risk-based scenarios to evaluate the full range of options and their associated environmental or cultural impacts. Additionally, we always included evaluation of the different technological approaches to soil and groundwater cleanup. These additional three alternatives included a cleanup to suburban residential, industrial, and recreational cleanup standards. Based on input from multiple parties, NASA streamlined the evaluation to only one alternative which reflects the AOC background cleanup levels, while examining impacts of various technologies to meet that goal, that is, how to meet the AOC level. CEQ's letter dated July 19, 2012 states, "However, there is no requirement that NASA consider alternatives that cleanup to other standards that differ from the agreement with the State."</p> <p>Additional information regarding the eliminated alternatives is provided in Section 2.4.1 of the EIS and at http://ssfl.msfc.nasa.gov/environmental-cleanup/environmental-impact-statement/default.aspx.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>During the course of the two years of meetings, multiple options were presented as a mechanism for defining “how to achieve project objectives” meaning to provide for meaningful alternative in situ methods to reduce soil volumes and in fact, goes so far as to direct the process to use alternative in situ methods “to the maximum extent possible”⁹ within the AOC agreement, yet the DEIS flatly dismisses this entirely and provides ZERO effort to comply with this directive while simultaneously claiming to comply “to the letter of the AOC.”</p> <ul style="list-style-type: none"> • The surrounding affected public attended dozens of meetings to discuss alternative options, to educate themselves on these technologies and weigh in, because of the importance to protect the environment, and NASA has dismissed all of these methods leading the public to wonder if the entire process is really sincere. • The 756 comments referenced in this section ask to preserve the valuable natural, historical, and cultural resources at the SSFL yet the DEIS says plainly that all of these valuable resources will be impacted and potentially destroyed. 	<p>NASA is bound by the AOC to cleanup levels that require removal of large volumes of soil that result in significant impacts to soils, biological, cultural, and transportation resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>CEQ comments as presented “ CEQ encourages agencies to carry out robust alternatives analysis that consider all reasonable alternatives including those that are not within the agencies authorities. The real focus, however, must always be on a meaningful consideration of alternatives. In this particular situation, where NASA has signed the Agreement and committed to a cleanup standard to “background,” nothing under NEPA or CEQ regulations constrains NASA from looking beyond cleanup to background, even though some may consider the analysis unnecessary and inconsistent with the agreement NASA signed with the State...”</p> <p>o Yet the DEIS presented for comment directly ignores CEQs directive and the comments by the public, and only considers two scenarios: all or nothing (no action alternative) providing no potential for a responsible cleanup.</p> <p>o All effort to minimize soil movement through alternative in situ treatment are ignored despite this directive being contained within the AOC signed by NASA and the State.</p> <ul style="list-style-type: none"> • Based on CEQ analysis of these letters submitted, it states that NASA is not compelled to consider less comprehensive cleanup measures... • But nothing prevents NASA from doing so. NASA is choosing not to. • Follow the AOC to the letter, but ignore page 11? How is this reconciled or justified? 	<p>CEQ's letter dated July 19, 2012 states, "However, there is no requirement that NASA consider alternatives that cleanup to other standards that differ from the agreement with the State."</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	Statements made by NASA that "DTSC will only review soils impacts" during their review which will occur a year after the decisions of demolition may remove any/all structures prior to an evaluation to save them. This makes the entire process invalid and indeed illegal as it fails the purpose and intent of the California Environmental Quality Act as well as the National Environmental Policy Act.	Your comment seems to be addressing the scope of DTSC's CEQA evaluations, however the context is more about demolition decisions. With respect to DTSC's CEQA evaluation, it is NASA's understanding that they will be looking at all cleanup actions (soil and groundwater) for NASA, DOE, and Boeing. With respect to demolition, it is NASA opinion that DTSC will make the final determination whether NASA's soil cleanup remedy has met the 2010 AOC requirements. If there is a case where DTSC determines that the cleanup goals have not been met, then NASA may have to demolish a structure to accomplish the soil cleanup goals.
Christina	Walsh	Following the AOC so stringently, while dismissing specific segments of the signed agreement that provide for this protection fails to follow a Programmatic Agreement [PA] without justification and instead chooses to follow a process that is NOT consistent with existing programs such as RCRA and Superfund and this bright-line AOC approach is unproven and not consistent with any existing programmatic agreement for a site of this size and complexity according to US EPA staff involved in this process throughout Radiological Survey that was recently completed.	Your comment is noted.
Christina	Walsh	The National Historic Preservation Act requires that Section 106 consultation process [under NHPA regulations 36 CFR 800] be followed, but in this process, the same limitations by presenting too narrow a range of alternatives, prevents the process from being followed effectively for the purpose of historic preservation.	NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements. NASA plans to enter into a Programmatic Agreement with the California SHPO and the ACHP that identified protection and MMs for historic structures and archaeological resources at the site.
Christina	Walsh	Separating the NEPA and CEQA processes instead of proceeding in tandem, provides for deadlines to be missed and unnecessarily dismisses primary directive of "how" to achieve the objective from the process.	The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	It is inappropriate to assign a single ROD Record of Decision to apply to the entire site without additional considerations such as the range of exceptions designed to protect sacred and historical sites, and without providing a graded range of "soil environmental condition" so that undisturbed areas that have had no operational impacts are preserved instead of destroyed.	Please refer to the Programmatic Agreement (PA) and/or ROD for final stipulations identifying MMs for historic properties. The PA and/or ROD will be developed to identify MMs. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 will be incorporated in the PA and/or ROD.
Christina	Walsh	All mechanisms and tools available to reduce soil excavation and disposal quantities should be employed so that all impacts to the aforementioned categories (traffic, noise, fugitive dust impacts on pulmonary receptors, greenhouse gas emissions, and most importantly, the complete destruction of 105 acre habitat), as well as, burden on existing landfills.	NASA considered a range of remedial action technologies in the EIS. Some of the technologies considered include excavation (not applicable to groundwater or bedrock), enhanced biological treatment, in-situ treatment, and ex-situ treatment. See Section 2.2.2.3 Soil Cleanup Technologies of the EIS for further information. These technologies continue to be studied through ongoing field-scale and lab-scale tests planned for 2014.
Christina	Walsh	we are seeing complete dismissal of all mechanisms to reduce impacts as promised over the course of years of meetings and presentations to the public.	NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA will make every effort to reduce the impacts from the required cleanup. Some reductions can be accomplished through the proposed mitigation. Should the soil onsite treatment technologies be proven effective at meeting the 2010 AOC cleanup requirements, then additional reductions can be accomplished. While changing the schedule to be later than 2017 makes the implementation of the AOC requirements more manageable, it does little to reduce the significant impacts from taken the cleanup actions. Therefore not all impacts can be eliminated. NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	alternative mechanisms (including soil sorting for impacted excavation areas to reduce removal and disposal volumes on a significant basis) are dismissed by blaming the very document that directs these actions to be considered “to the maximum extent possible”.	Soil washing is one of the soil treatment technologies considered and being evaluated further. See Section 2.2.2.3 of the EIS.
Christina	Walsh	<p>The public has asked for specific costs associated with saving only test stands and control buildings and should therefore exclude the cost requirements associated with soil cleanup, and demolition of structures, piping, utility poles, water tanks and drainage ways (the most impacted should not be included in test stand cost)</p> <ul style="list-style-type: none"> • With NASA’s long history of being the protective stewards of the Native Chumash sacred sites, it is truly unconscionable to fail to protect them now. • We request specific cost recovery mechanisms to be detailed publicly including the cost/benefit of the potential steel recycling revenues that may counter the other costs. These are important for the public to understand clearly. • Given the legal memorandum submitted by Santa Ynez Band of Chumash Indians, a stewardship solution that provides sustainability mechanisms through museum preservation, open air tours and education of cultural resources and national space history monuments could easily provide the required revenues to fund maintenance and should be considered here, prior to a short sighted decision to gut our history. 	<p>Below are the current cost estimates to remove asbestos, hydraulic fluids, and other regulated materials along with encapsulating the lead paint. Annually it is expected to cost around \$20-25K per test stand to maintain. If full abatement (instead of encapsulation) is required the estimates are expected to increase significantly.</p> <p>Alfa 1 Test Stand - \$800K Alfa 3 Test Stand - \$800K Bravo 1 Test Stand - \$700K Bravo 2 Test Stand - \$2.0M Coca 1 Test Stand - \$1.5M Coca 4 Test Stand - \$2.5M</p> <p>Please refer to the Programmatic Agreement and/or ROD for archeological and sacred site protective measures.</p> <p>Salvage value is included in the NASA budget estimates for demolition.</p>
Christina	Walsh	Alternatives evaluated as presented in DEIS states that “up to all structures will be demolished including test stands” even though the test stands are located in weathered and un-weathered bedrock and therefore are not part of the AOC requirement. It must be made perfectly clear that the decision to demolish history is a NASA decision that may be based on financial and liability decisions, but should not be stated as having an AOC basis.	The EIS will include additional analysis of retaining 6 of the individually NRHP-eligible structures: two test stands each in the Alfa and Bravo Test Area Historic Districts and each of the control houses in the Alfa and Bravo Test Area Historic Districts.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	We have outlined here, a method to inject reason and health protection providing the basis for a green, sustainable, long lasting and health protective solution that honors the past and recognizes the existing wildlife habitat and provides for a sound future and minimize negative impacts of the actions proposed. Please consider.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Christina	Walsh	All non-treatable soils should use “soil sorting” for the purpose of identifying the particle sizes associated with the COCs driving the soil excavation so that a portion sent for disposal and burden on other communities can be reduced. Native Cultural Monitor for all such process should be required.	A process for monitoring will be developed in consultation with the SHPO and tribes and will be included in the Programmatic Agreement and/or ROD.
Christina	Walsh	Limited modification to AOC to utilize risk-based limits so that alternative methods are achievable (Suburban residential health risk standard as prescribed by USEPA) making the action protective of human and ecological health, and also provides for many alternative in situ programs to be employed to drastically reduce the impact to the current environment.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>The designation of “treatable” also fails to be employed on the basis of a change to the deadline from all prior agreements upon which the 2017 deadline is based. All versions of this agreement including the 07 Consent Order for Corrective Action, and all versions of the AOC through 1.9 include the requirement of all in situ treatment to be “constructed by 2017” not completed, as it is understood that these methods that require time for degradation processes to occur, cannot be completed by 2017. This modification of the AOC is necessary to make for a workable sustainable solution that the AOC itself directs.</p> <p>The AIP which the AOC is written from specifically states that the “2017 deadline shall remain the same” which demonstrates the fact that this deadline is driven from the prior agreements and therefore cannot be made shorter, while also making the requirement (background) larger.</p> <p>This AOC path forward [unchanged] is designed to fail and therefore must be modified.</p>	<p>The 2010 AOC does require remediation to be completed by the end of 2017. NASA will conduct treatability studies to assess the ability of the remedial technologies described in Section 2 to enhance the natural degradation processes.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>The alternative soil treatment technologies as outlined in ES-3.1.2.2 are all dismissed based on an internally defined conjured deadline and therefore fails to follow the AOC it of which it claims to be based.</p> <p>In the definition of “treatable” it states that excavation is the only “proven” method despite a decade of proven technology data available. These are not new and emerging technologies, but rather existing and already proven effective at residential standards and therefore should not be flatly dismissed here.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christina	Walsh	<p>ES-3.2 No Action Alternative Unacceptable</p> <p>This analysis fails to protect human health or the natural environment. This analysis proposes that no demolition of test-stands would occur and does not require an encapsulation as described by NASA when pushed to answer the questions about the test stands.</p> <p>Why are liability requirements used to justify demolition not required under the no action alternative?</p> <p>This appears to show that this is a false claim with no real basis according to the AOC, but rather a decision by NASA.</p>	<p>40 CFR 1502.14(d) requires federal agencies to include a no action alternative in their NEPA evaluations.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Why doesn't 'leave in place' solution under the "no action alternative" also impose maintenance costs for encapsulation and annual maintenance and paint fees when these requirements are being imposed to respond to an effort to save the test stands. Further, why are the costs provided and presented to the community also including the encapsulation of the "entire district" which includes contaminant impacted drainages. We aren't trying to save the contamination, but the history.</p> <p>This can be done as it is acknowledged that the problem is in the drainage, not in the rock below the test stands. Please provide these numbers separately by district structure for Alfa, Bravo and Coca and provide costs by structure, so that test stands can be differentiated from the cost of remediating the soils, concrete, and support structures that do not represent historic value.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures. Please refer to the Programmatic Agreement and/or ROD.</p>
Christina	Walsh	<p>This describes erosion impacts to be short term despite the proposed action only includes a 30% replacement of excavated soils. Considering the existing steep topography, it is unclear how this impact will be temporary since these topographic changes will be long term by definition. The soil won't grow back.</p> <p>Most importantly, the living biota, flora and fauna will all be destroyed to which there is no legitimate or adequate mitigation presented.</p>	<p>NASA believes that replacement of approximately one third of the excavated soil will be sufficient to accommodate the hydrology and eventual re-vegetation of the site. As discussed in the EIS, the soil biology will be destroyed upon excavation/removal.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>The proposed action calls unnecessarily for the demolition of historic structures on NASA administered land at SSFL having significant negative local and long-term impacts, yet the AOC does not require this. Why is NASA not making any effort whatsoever to save the national history that it is capable of saving through the more accurate and protective interpretation of the AOC. These historic structures are not located in soils but in rock and therefore do not require removal.</p> <p>NASA staff has acknowledged that these can be worked around, so why is there no acknowledgement provided with in the ROD process that is intended to protect the site by evaluating the solution to be sure it isn't worse than the problem. The AOC MUST be modified on a limited basis to account for these very real details that can provide for a responsible cleanup that honors both the past and the future.</p>	<p>As stated in the DEIS and FEIS, the proposed action includes demolition of structures to support the excess of the property. Please refer to the Programmatic Agreement and/or ROD for clauses related to retention of historic structures</p>
Christina	Walsh	<p>As described by the Chumash letter, deferral of mitigation until Record of Decision [ROD] is problematic as it prevents meaningful comment, and fails to consider impacts of demolition that are within the "purpose and need" as described in the DEIS. How can this be artificially segmented?</p>	<p>Please refer to the Programmatic Agreement and/or ROD which identifies stipulations to resolve adverse effects.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>ES-5.1.2 Cultural Resources</p> <p>This section fails to acknowledge the specific exceptions written in the AOC. These exceptions are designed and written for the purpose of protecting the Burro Flats Cave Sacred Site as well as other smaller sites. NASA fails to acknowledge that the word “artifact” includes sacred cave paintings, which are considered among the most well-preserved in North America and estimated to be 1,000 years old. This failure demonstrates an unwillingness to use the portions of the AOC intended to protect the past, to do so. This is of great disappointment and is indeed inexcusable.</p> <p>NASA must acknowledge the purpose and intent behind each and every point within the Agreement In Principle [AiP] which the AOC was based upon, to include the specific sections written by and agreed to for the specific purpose of protecting these important sites.</p> <p>Proper mitigation for the cultural impacts proposed by the action:</p> <ol style="list-style-type: none"> 1. NEW MITIGATION: Cultural Interpretive Center.10 2. NEW MITIGATION: Native American monitoring during any ground disturbing activities. 3. NEW MITIGATION: First Native Chumash National Park11 	<p>NASA and DTSC will have to come to an agreement in regards to which areas are covered under the exception clause in the AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	This section describes the burro flats site as being 0.65 acres and certainly any proposed soil removals would be under the "5% exception clause" since 5% of the proposed soil removal of 500,000 cubic yards is 25000 yards and it is clearly known that the soil in this area (even if you were to remove all of the top two feet of soil in the 0.65 acres would not exceed this limit, so it is confusing to see NASA threaten this impact when it can clearly be handled within the agreement as currently written. This points to an underlying political pressure being exerted and really driving these decisions making promised transparency somewhat of a charade.14	The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. The potential 0.65 acre impact from cleanup activities would be outside the National Register boundary, but within the Archeology Resource Management Area. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the 5% clause in the AOC.
Christina	Walsh	SSFL has been formally identified by the Santa Ynez Band of Chumash Indians as an Indian Sacred Site under Executive Order 13007 and the proposed action seems to dismiss this Executive Order and the importance of this consideration by the limited range of alternatives that are artificially imposed on the surrounding affected public.	NASA evaluated the impact of the Proposed Actions on the Indian Sacred Site in Section 4.3.
Christina	Walsh	Demolishing the test stands is acknowledged to be a long-term negative impact, and is not required by the AOC and therefore should be mitigated by acknowledging their historic preservation value and eliminating this impact. A large majority of the 3000+ truck trips for demolition, can be eliminated by saving these historic sites as is being requested by nearly the entire surrounding affected communities.	The EIS will include additional analysis of retaining 6 of the individually NRHP-eligible structures: two test stands each in the Alfa and Bravo Test Area Historic Districts and each of the control houses in the Alfa and Bravo Test Area Historic Districts.
Christina	Walsh	It is strongly recommended that the summary of cumulative impacts be addressed to consider the obvious mitigations so that a reasonable solution can be attained. This emphasizes the need to revisit the negotiating process to modify the AOC in a limited manner so a workable and reasonable, and health protective solution can be achieved.	Mitigations are considered in the cumulative impact section of the EIS. NASA acknowledges your comments regarding modification of the AOC.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	DEIS fails to consider cumulative impacts of other remedial activities ongoing at the site by the other responsible parties all working based on the same deadline and will be engaging in these activities concurrently.	Cumulative impacts considers past, present and foreseeable actions on the site. Past and ongoing remedial actions were considered, along with the actions of Boeing and DOE. See Section 4.13 of the EIS for the cumulative impacts evaluation.
Christina	Walsh	Section 4.2 Soils, landslide potential, topography, and paleontological resources: Significant, negative, long-term for action, and negligible, negative, local, and short term are how no action alternative is described. This incorrectly assumes that a total lack of cleanup of contaminated soils that represent health risks potentially for centuries moving forward will carry a negligible impact? This fails to analyze and evaluate the no action alternative as a viable possibility when it is indeed the only alternative provided, other than total destruction of the site.	The contamination in the soil is addressed in Section 4.9 The health risk is classified as moderate under no action.
Christina	Walsh	Section 4.3 Cultural Resources This table summary describes the impacts as significant despite the fact that no sampling data proposes that these soils require removal. Pending Consultation, significant mitigation will be required to address this unnecessary destruction of native history and culture. What sort of mitigation could possibly come even close to comparison to the damage to irreplaceable sites this action proposes to destroy	As disclosed in the DEIS, the impacts to cultural resources would be significant. The NHPA Section 106 consultation process regarding impacts on cultural resources is ongoing. The consultation will culminate in an agreement document that will stipulate commitments NASA has made to address the significant impact on cultural resources from the Proposed Action. Please refer to the Programmatic Agreement and/or ROD.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Section 4.4 Biological Resources</p> <p>Moderate regional long-term impacts from failing to address the contamination impacts that present a health risk to either the environment or human health of the surrounding communities which will never be resolved if no actions to protect human health are taken. The purpose of CEQA is to protect the site from a solution that is worse than the problem itself. NEPA is also supposed to evaluate alternatives to avoid such impacts for the same reason. In this case, the processes are separated so that cumulative impacts are not evaluated and therefore missed. The damage to the environment will be devastating and for no measurable increase in protection of public health. Then for what purpose are these extreme and unnecessary actions really being considered?</p> <p>Political??</p>	<p>Please refer to Section 2.4 for the rationale for the changes in alternatives considered. Additionally, please refer to Section 4.13 for cumulative impacts. NASA recognizes public concern regarding the alternatives in the EIS. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA will comply with the current AOC or future revisions/modifications of the AOC as agreed to by appropriate parties. NASA will not commence cleanup activities until the CEQA process is complete.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Section 4.5 Traffic and Transportation</p> <p>Significant impacts as described are also likely to be impossible considering the proposal that puts hundreds of trucks in the same place at the same time. During daylight hours this would likely equate to mean one truck leaving every single minute for years at a time. This proposal is with out merit in the real world.</p>	<p>NASA realizes a large number of trucks will be required to cleanup the soil to meet the LUTvalues published by DTSC in order to comply with the AOC. As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing’s existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would be used during the implementation of the demolition and environmental cleanup activities and will address the volume of trucks that will be used each day.</p> <p>The best way to reduce the number of trucks is to reduce the soil volume required to be transported offsite. NASA is evaluating several treatment technologies that have the potential to reduce the truckloads by 36% (9,500 truckloads). The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>
Christina	Walsh	<p>Section 4.6 Water Resources</p> <p>No action on the impacts to water resources will continue to present a health risk to the surrounding environment and public health as well as degradation to the California resource, which requires protection according to California’s non degradation policy for groundwater resources.</p>	<p>As described in Sections 2.2.3 and 2.2.3.1, NASA will evaluate the potential health risks from groundwater as described in the SRAM.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Section 4.7 Air quality and Greenhouse Gas Emissions</p> <p>Mitigation to these impacts can be partially achieved by using in situ alternative treatment methods to the maximum extent possible to avoid and reduce required truck trips and traffic emissions.</p>	<p>Thank you for your MM suggestions and potential stewardship solutions. NASA will consider these and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p>
Christina	Walsh	<p>Section 4.9 Health and Safety</p> <p>Impacts to a no action have significant long term impacts on the local environment and therefore emphasizes the requirement for health risk to human health and ecological health risk be considered.</p>	<p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>
Christina	Walsh	<p>Section 4.10 Site Infrastructure and Utilities</p> <p>It is advised to maintain water storage resources to maximize opportunities for sustainable solutions to address soil treatment and needed groundwater treatment plans that protect local habitats during treatment cycles. Why build it if it already exists?</p>	<p>NASA will consider this approach and make a decision prior to demolition activities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Section 4.12 Hazardous and nonhazardous Materials and Waste</p> <p>In addition to this moderate negative long-term impact by failing to act and protect the surrounding public, the answers and uncertainties will never be addressed making any potential for a real future for the site to be negligible at best.</p>	NASA acknowledges your comment.
Christina	Walsh	<p>Section 2.10 of the AOC as described in the MIP should be modified to reflect current waste disposal classifications and directives to prevent problems with disposal needs required by the implementation of the proposed action. Enhance this section by specifying that alternative methods of in situ treatment to reduce and minimize burden on landfills, truck trips, etc. will be employed “to the maximum extent possible” as prescribed in the AOC16</p>	NASA acknowledges your comments regarding modification of the AOC. We are committed to meeting the AOC to which we have agreed.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Table ES-5 Summary of Cumulative Impacts without Mitigation or Best Management Practices</p> <p>ES-5 presents the cumulative impact on cultural resources as significant and negative and specifically references the “cave site” as being impacted long-term when there is no specific sampling data that supports this claim. Further given the size of the specific “cave site” referenced, the exceptions defined, would appropriately be able to protect this area to the maximum extent possible. The summary is in fact inaccurate, and unfairly presents a picture of certain destruction and “nothing” as the only possibilities.</p> <p>This is inappropriate and irresponsible to put these areas at risk in this way when it is not necessary to meet health-risk requirements by law, and there is no existing programmatic agreement used to guide such cleanups that DOES NOT consider risk as the primary means to measure needed remedial actions and mitigation.</p>	<p>NASA will consider making updates to the Executive Summary to address this comment.</p> <p>The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. The potential 0.65-acre impact from cleanup activities would be outside the National Register boundary, but within the Archeology Resource Management Area. NASA and DTSC will have to come to an agreement in regard to which areas are covered under the exception clause in the AOC referencing Native American artifacts.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>No adequate mitigations are proposed in this action where complete destruction or no-action are the only alternatives.</p> <p>Most of the analysis of impacts presented in the aforementioned table [Table ES-5 Summary], do not consider more reasonable and health protective as well as legally compliant methods of considering risk inputs [as prescribed in examples shown in Attachment-A (MiP)] which would prevent these areas from being put at such risk. In this proposal of action, 62 acres of open-space is proposed to be devastated, "...requiring complete removal of all existing vegetation such as shrubs, plants, and trees. Additionally, removing large volume of soil would change soil profiles creating soil instability, decreased vegetative biodiversity and increased spread of invasive weeds"¹⁷</p> <p>Reasonable alternatives that are protective of human health and the environment need to be presented, and for that to be measurable, risk comparisons need to be made. Please consider a modification to the AOC that allows for this risk information at Suburban Residential, using state toxicology expertise to weigh with current lookup tables and provide alternative methods to be used to achieve these similar objectives (based on health-risk).</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christina	Walsh	<p>Proposed mitigation should include ceremonial areas for use by local Tribes to encourage outreach and education about their traditions for the future. According to [40CFR 1508.20], replacing or providing substitute resources or environments" by "compensating for an impact" is where the first alternative proposed should be to prevent impact to these resources, and because these resources have not been available for scholarly secular research or religious or ceremonial purposes to allow for that education within the local community to exist, every effort should be made here to provide ceremonial areas in addition to and nearby cultural resources so that presentation of these cultural traditions can be made for the future.</p>	<p>Thank you for your MM suggestions. NASA will consider these and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	NASA has demonstrated that the actions proposed are unacceptable as are the alternatives presented and therefore, the environmental impact analysis should be updated upon modification of the Look up Table [LUT] requirements so that a feasible, implementable, and effective alternative can be presented for analysis with multiple technologies acknowledged to be feasible, presented as alternative methods to achieve the objective to a health protective and environmentally sound cleanup goal.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Christina	Walsh	New sites have been discovered throughout SSFL site including in Area IV through the RAD survey, as well as in other areas in the undeveloped areas. This indicates that there is much that is not known and great care must be taken when considering disturbance of these soils. A proposal to devastate the top two feet of everything living on 105 acres cannot be justified and must be reconsidered.	NASA acknowledges your comments and concerns regarding impacts to archeological resources. Please refer to the Programmatic Agreement and/or ROD which addresses impacts to historic properties.
Christina	Walsh	Completion of CEQA evaluation prior to Record of Decision is necessary BEFORE any demolition decisions are made on historic or sacred areas. It is inappropriate to move forward without CEQA full evaluation, which should be happening in tandem so that NEPA and CEQA processes can best inform one another to ensure that protection of the existing environment is maintained.	The AOC requires NASA to develop a NEPA document. In order to meet the 2017 cleanup completion date, NASA must proceed with the EIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	We ask that NASA consult with DTSC decision-makers and to consult using mediator if useful, to attempt to see if these limited modifications (or similar ideas of limited modification) to utilize the existing work and provide a better, more traditionally measured, risk-based solution path forward, that allows for an environmentally sound cleanup plan that meets health-risk standards and is compliant of the law. Using health-risk standards as a measurable tool to determine level of safety provided to the surrounding communities, and is in keeping with the regulatory decision processes utilized by the regulatory agencies to be most effective at achieving water and soil quality standards.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Christina	Walsh	Please also consult with US Senator Barbara Boxer's office to see if these efforts to protect the existing environment, the sacred sites and our nation's history can be attained by considering risk so that measurable, and better-informed remedy decisions can be made.	Your comment is noted.
Christina	Walsh	Please consult with the Santa Ynez Band of Chumash Indians to see if they would be willing to steward this process to see if a future use consideration can include an open space open air cultural and historical museum park. Many experts have spoken about these valuable assets being protected and we ask that those discussions be given real consideration.	NASA is in consultations with the Santa Ynez Band of Chumash Indians and they will be made aware of this suggestion.
Christina	Walsh	Please consult with other local tribe cultural representatives [both federally recognized as well as non-recognized native cultural groups] as several tribes are expected to have history with the site.	Thank you for your suggestion.
Christina	Walsh	Please consult with Department of Wildlife and consider their long-term concerns and we ask that their staff be given a full presentation and review of the impacts as proposed.	NASA received comments from CDFW and will consider their concerns as noted elsewhere.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	Please consult with Ventura County to consider the Oak Tree ordinance and how it will be navigated considering the proposed action seeks the removal of all trees and vegetation in a 105 acre area that includes steep drainages where erosion considerations and streambed modification must be considered.	As a federal agency, NASA is not required to comply with state or local policies, ordinances or statutes. NASA will continue to make efforts adhere to these policies when feasible.
Christina	Walsh	Please consult with Los Angeles Regional Water Quality Control Board about their interim measures, long term effects of the actions proposed as well as the impact on the discharge permit [NPDES]18 held by the responsible parties.	NASA will continue to coordinate closely with the RWQCB.
Christina	Walsh	"Implementing the proposed action to meet 2010 AOC would result in the excavation of non-treatable soils to the depth of 2ft (and in some places 20ft) from approximately 105 acres" yet they are claiming this mandates impacts of the native burro flats site, (where no samples have been taken to support this claim) and the 5% exception clause could easily accommodate this and all other sites (0.65 acres) but NASA chooses to put them in harms way despite the fact that the AOC DOES NOT REQUIRE IT	The exceptions in the 2010 AOC are dependent on DTSC approval. The cultural resources will remain in the EIS has having the potential to be impacted in the absence of this approval. Please refer to the Programmatic Agreement and/or ROD for further details.
Christina	Walsh	<ul style="list-style-type: none"> • This is a NASA decision and it is dishonest to blame the AOC for this very irresponsible decision that in fact betrays the long involved communities. • This is truly the worst idea ever. There is no legitimate reason to consider this level of destruction that does not protect human health any more, and destroys an entire eco system and creates serious adverse impacts to the surrounding communities. This must be re-thought to consider passive treatment systems, sustainable treatment systems that consider long range solutions and not just the short term compliance of a law that has already fallen. 	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<ul style="list-style-type: none"> A proposal to devastate the top two feet of everything living on 105 acres cannot be justified and must be reconsidered. 	<p>NASA must continue to abide by its obligations under the AOC as drafted. In order to reduce environmental impacts and implement an efficient cleanup, NASA is considering a range soil cleanup technologies. While these technologies may help reduce the amount of soil required to be transported offsite, and those associated impacts, its is not possible for it to treat the surface soils and reduce the 105-acre footprint.</p>
Christina	Walsh	<p>ES-12.0 Relationship between Local Short-term Use of the Environment and Long-term Productivity.</p> <ul style="list-style-type: none"> If NEPA requires this analysis, why has NASA failed to present this analysis within the DEIS material and why is NASA not providing for a range of alternatives to provide opportunity to save these historic structures and sense of place sacred areas in Burro Flats and other designated areas. 	<p>The analysis is performed in Section 4.14.1 of the EIS. NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. NASA plans to enter into a Programmatic Agreement with the California SHPO and the ACHP that identified protection and MMs for historic structures and archaeological resources at the site.</p>
Christina	Walsh	<ul style="list-style-type: none"> It is inappropriate for NASA to claim that cleanup of soils to LUT values reduces risk when risk is not considered. In order to make such a claim, RISK must be considered on a prominent basis. 	<p>When contaminated soil is removed, then risk is also reduced. The amount of the reduction is not yet known, since the risk alternatives have not been fully evaluated in the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	Based on the statements made in the Section 106 consultation, it seems that no effort to protect these resources is being made because the process is being split where demolition is not examined and future use is not considered. This is a complete betrayal of the process we have all committed to follow.	NASA recognizes the historical importance of the test stands and is conducting section 106 consultaiton in accordance with the National Historic Preservation Act to resolve potential adverse effects from the proposed action on historic resources. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.
Christina	Walsh	We request that this information be made available and clearly define the costs that relate to disposal of materials, versus recycling revenues associated with steel from the test stands and concrete from the drainages, roads, and building footprints. The goal is to save what is most feasible, most presentable and is able to help tell the story of our Nations Race to Space.	An EIS is designed to present the impacts to the environment, not the costs. Decisions about costs will be made by NASA during the implementation planning stage.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Since future use is described as being part of the defined “purpose and need”, why does the DEIS fail to analyze for these potential decisions within the process. By artificially segmenting this decision-making process, the DEIS fails to inform it’s primary purpose: to protect the site solution from being worse than the problem it proposes to address.</p>	<p>The purpose of the Proposed Action is to remediate the environment to a level that meets NASA’s environmental cleanup responsibilities and to undertake the demolition actions necessary to support both remediation and property disposition of the NASA-administered portion of SSFL.</p> <p>NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA will make every effort to reduce the impacts from the required cleanup. Some reductions can be accomplished through the proposed mitigation. Should the soil onsite treatment technologies be proven effective at meeting the 2010 AOC cleanup requirements, then additional reductions can be accomplished. While changing the schedule to be later than 2017 makes the implementation of the AOC requirements more manageable, it does little to reduce the significant impacts from taken the cleanup actions. Therefore not all impacts can be eliminated. NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Record of Decision should be examined for each of the regions of influence (ROI) and should evaluate multiple methods of reaching a health protective legally compliant cleanup that protects the current natural, cultural and historical features and assets currently present within the site boundaries as well as within the bordering areas of the Santa Susana Field Laboratory. These decisions need to be responsible for addressing the complexities that arise by the differences in land ownership and requirement for action.</p>	<p>NASA originally proposed to evaluate a cleanup to background (proposed action) that meets the 2010 AOC requirements, a no action alternative, and three other alternatives that are normally analyzed for a typical Superfund cleanup based on common cleanup goals associated with risk-based scenarios to evaluate the full range of options and their associated environmental or cultural impacts. Additionally, we always included evaluation of the different technological approaches to soil and groundwater cleanup. These additional three alternatives included a cleanup to suburban residential, industrial, and recreational cleanup standards. Based on input from multiple parties, NASA streamlined the evaluation to only one alternative which reflects the AOC background cleanup levels, while examining impacts of various technologies to meet that goals.</p> <p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christina	Walsh	<p>ROD needs to be done in detail, by area using alternative non-excavations methods first (within the Decision-tree process).</p> <p>Non treatable areas should employ soil sorting for the purpose of reducing soil movement and disposal (burden on landfills) and long term phyto sequestration solutions for the groundwater challenges that will span many generations.</p>	<p>NASA is currently planning treatability studies that will evaluate the ability of the technologies described in Section 2 to treat contamination and soil and groundwater. One of these technologies is soil washing (soil sorting). Phytoremediation was not carried forward as a technology to be tested as described in Section 2.4.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	All treatable soils should be considered for alternative in situ methods so that truck traffic, burden to landfills, greenhouse gas emissions and fugitive dust impacts can be minimized to the maximum extent possible. Limited modification of AOC to allow for completion of construction so that these technologies may be prominently considered based on human and ecological health-risk levels.	<p>NASA considered a range of remedial action technologies in the EIS. Some of the technologies considered include excavation (not applicable to groundwater or bedrock), enhanced biological treatment, in-situ treatment, and ex-situ treatment. See Section 2.2.2.3 Soil Cleanup Technologies of the EIS for further information.</p> <p>These technologies continue to be studied through ongoing field-scale and lab-scale tests planned for 2014.</p>
Christina	Walsh	Test Stands are not in soils and therefore should not be part of the "requirement" but rather, to be discussed and debated so that reasonable and rational and sustainable decisions can be made to protect our national history.	NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.
Christina	Walsh	Sacred Cultural Areas should not be part of this decision, as nothing based on science (sampling or otherwise) requires this potential harm to take place. It is clear that these areas should be declared protected from impact by this record of decision and all related decisions in this complex process moving forward.	NASA acknowledges your comments. Please refer to the Programmatic Agreement and/or ROD which addresses impacts to historic properties.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	2.2.1 Groundwater GETS system must be modified to discharge treated water in a balanced manner so that the drainages that have historically been riparian, remain so. Current impacts as a result of this effort by NASA and Boeing has resulted in adverse impacts to 1.4 miles of Bell Creek from the water diversion to outfall 19. Please consider moving this discharge to outfall 2, and to balance with pumping that may occur to the north where similar mitigative measures will be necessary to protect those watersheds and habitat.	This is being considered and discussed with DTSC and the RWQCB. Boeing owns this system and holds the permit.
Christina	Walsh	Deeply concerned that demolition seems to include these long term treatment systems that are acknowledged to be needed for decades and possibly centuries. How can we be pulling them offline now? Especially given that the biggest challenge to be addressed is the groundwater impacts and how that will affect surface water impacts in the future.	As discussed in Section 4.6 of the EIS, the long term treatment system (GETS) will remain in place.
Christina	Walsh	The groundwater responsibility by the parties, MUST be acknowledged by NASA and Boeing as we will not accept any more "wait and see." As previous promises have not been kept. Comprehensive groundwater solutions are primary to achieving the objectives presented in the cleanup agreements and they must be modified to be workable and implementable. A site-wide seep and stream study to best understand all potential migration pathways of existing contaminants must be more clearly understood and presented to the surrounding affected public.	Groundwater investigations and studies comply with the 2007 Order. Groundwater monitoring will be on-going during remediation to evaluate the effects of the remedial technologies selected for cleanup.
Christina	Walsh	2.2.1.2 Pre-demolition Activities Standard Operating Procedures must include a sample per bin (not multiple bins) policy to ensure that adequate health protection is achieved. This is especially important given the impacts in many of these areas are of multiple COCs that co-exist within the same soil profile requiring action.	The specific process that will be followed regarding sampling soil stockpiles or waste bins will be included in the Soils Remedial Action Implementation Plan that is required by the AOC.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Hundreds of truck trips can be avoided by considering creative re-use onsite programs to avoid unnecessary damage to the environment and unnecessary impacts to the surrounding communities due to the traffic, noise, dust associated with these activities. Treat first approach should be used to the maximum extent possible as prescribed by the Agreement in Principle and AOC (page 11)</p> <p>Demolition truck schedule should include hiatus between 7 and 8am and 3-4pm to avoid school hours.</p>	<p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p> <p>NASA will coordinate traffic control plans with Boeing and DOE.</p>
Christina	Walsh	<p>2.2.2.1 Cleanup of Soil to Background</p> <p>Modification in Principle to modify this requirement to consider risk based objectives as outlined in MiP19 to ensure that surrounding residential human and ecological health is protected, and unnecessarily removing soils that do not present a health risk can therefore be avoided.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>2.2.2.2 Preliminary Remediation Areas</p> <p>In addition to Table 2.2-3 screening values, Suburban Residential PRG and risk based recommendations from Staff Toxicologists as well as soil zone grading system to avoid disturbing undisturbed areas and protecting what needs protecting including natural habitat, sacred sites, sensitive species, migratory species pathways, and water resources for surrounding ecology.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christina	Walsh	<p>2.2.2.3 Soil Cleanup Technologies</p> <p>All technologies that were dismissed based on deadline issues related to achieving objectives by 2017 should be revisited. This can be accommodated by adding back in the requirement that alternative methods construction must be completed, and that the final objective of cleanup goal would have additional time to become effective as presented in all previous versions of this agreement including the signed '07 Order agreed to by all parties.</p>	<p>The 2010 AOC between DTSC and NASA says "The schedule shall ensure that the identified activities can be accomplished by 2017 or sooner." This can only be changed by mutual agreement with DTSC. NASA will meet with DTSC to seek clarification of this requirement.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	Ex situ Treatment Technologies using Land Farming have proven successful on the site in the past (including Happy Valley treatment of Perchlorate onsite) and should be considered here as a viable potential alternative that is very effective.	NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.
Christina	Walsh	Sustainability presentations stewarded by local Universities including Grant projects should be considered as alternative opportunities that provide a consistent message that supports the sites place in technological history advances.	Thank you for your suggestion.
Christina	Walsh	In Situ Anaerobic or Aerobic Biological Treatment methods should also be seriously considered	NASA will consider this methodology in its evaluations of possible soil treatment technologies. Further information can be found now in Section 2 of the NASA EIS and in the future look for soil treatability study reports.
Christina	Walsh	Pump and Treat is most effective for specific targeted areas, and needs to have more attention to long-term negative impacts so that effective treatment can be attained without the negative impacts as observed at Bell Creek. We therefore recommend that groundwater that is treated be redistributed to the location closest feasible to where it was extracted from the site.	NASA will consider this approach in coordination with DTSC, RWQCB, and Boeing.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	In situ Chemical Oxidation is currently being tested and it is hopeful that it will prove very effective at the site and certainly should be considered here.	NASA will consider this methodology in its evaluations of possible soil and groundwater treatment technologies. Further information can be found now in Section 2 of the NASA EIS and in the future look for soil and groundwater treatability/feasibility study reports.
Christina	Walsh	Pump and treat should also be considered from mid-plume so that unintended drawing toward communities does not occur further.	NASA will consider this methodology in its evaluations of possible groundwater treatment technologies. Further information can be found now in Section 2 of the NASA EIS and in the future look for groundwater feasibility study reports.
Christina	Walsh	Enhanced Bioremediation and vapor extraction to prevent additional impacts to groundwater resources should be seriously considered and implemented wherever feasible throughout the site, especially at high-VOC impacted areas.	NASA will consider this methodology in its evaluations of possible groundwater treatment technologies. Further information can be found now in Section 2 of the NASA EIS and in the future look for groundwater feasibility study reports.
Christina	Walsh	Monitored Natural Attenuation occurs today, but is not adequate as a solution and must only be considered in tandem with other working solutions to protect future generations and seep impacts that potentially bring those impacts to ecological receptors as well as surrounding communities.	NASA will consider this methodology in its evaluations of possible groundwater treatment technologies.
Christina	Walsh	2.4.1.1 Alternative 1-Demolition, Soil Cleanup to Suburban Residential Cleanup Goals and Groundwater Cleanup as described by limited modification is supported by an overwhelming portion of the surrounded affected communities and should be considered here as proposed throughout this and accompanying documents [MiP]	NASA recognizes public concern regarding the alternatives in the EIS. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA analyzed only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Table 2.4-2 Alternative Comparison of Offsite Waste Type</p> <p>This comparison illustrates clearly the need for limited modification so that continued efforts of injunction by the very people insisting on the impossible cleanup will cease. We need a workable solution that uses current regulatory standards for waste classification in a protective and responsible way. Limited modification of AOC in Section 2.10 related to waste classification is necessary as proposed in MiP.</p>	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Christina	Walsh	<p>2.4.2 Remedial Technologies Eliminated</p> <p>Phyto Remediation can achieve long-term health protective objectives in a less damaging matter and can also provide longevity to the solution (especially when considering the challenges related to the groundwater impacts at depth and those migration pathways) With limited modification these solutions can prove very effective in the drainages.</p>	Phytoremediation will require an extensive time period that will not meet the requirements of the AOC for soil cleanup.
Christina	Walsh	<p>Table 3-2-1 Summary of Existing Utilities and Infrastructure at SSFL by area:</p> <p>Concrete removal where infrastructure roads are concerned should be minimized to keep access feasible and prevent unnecessary hauling of concrete.</p> <p>Water conveyance and storage infrastructure should be maintained and enhanced to suit the water needs related to alternative treatment methods.</p>	These kinds of factors will be considered when NASA develops its Remedial Action Implementation Plan. [AM I RIGHT ABOUT THAT?]

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	Record of Decision must consider all reasonable alternatives. 21 Deferral of mitigation DOES NOT comply with NEPA.22 At the very minimum, all effort to use the exceptions provided to absolutely protect the areas we know about, and every effort must also be made to proceed with extreme caution so that currently unknown sites that may be located within the egiom must be considered as likely and therefore cultural monitoring of this process should be mandatory every step of the way, with an immediate “stop work” for any potential finding and assessment of said finding by local cultural monitors and stewards of the site.	A process for monitoring in known archeological sites will be developed in consultation with the SHPO and tribes and will be included in the agreement document, which will be signed by SHPO.
Christina	Walsh	The tribe has already designated all of the NASA administered property as a sacred site under E.O. 13007. Echoing the concerns detailed in the comments from the tribe, we believe that NASA must complete the eligibility process for protection in the National Register.	The Santa Ynez Band of Chumash Indians has declared the NASA-administered Area an Indian Sacred Site under EO 13007. Please refer to the Programmatic Agreement and/or ROD for further details regarding National Register nominations.
Christina	Walsh	UN Declaration on the Rights of Indigenous Peoples must now be followed after December 2010.	NASA, in accordance with US policy, supports the UN Declaration on the Rights of Indigenous Peoples. NASA will be setting up a Native American Advisory Board to assist NASA in its stewardship of important Native American sites during the implementation of the proposed actions.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	Deferral of boundary research as to VEN-1072 and VEN-1803 is inappropriate and not allowed. Additional boundary research is needed to conclude that any avoidance of excavation within the boundaries of burro flats (CA-VEN-1072) and CA-VEN-1803 to diminish or eliminate adverse effects to known archaeological sites	No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.
Christina	Walsh	3.3.3 Cultural Resources identified While several studies have occurred over recent years, the entire site has not been adequately studied due to limited access for such scholarly and field research opportunities. Additional sites have been identified in nearby locations and indicate the potential for additional sites being present and yet to be discovered is extremely high.	No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.
Christina	Walsh	3.3.3.1 Sacred Sites Executive Order (EO) 13007 (1996) states that, for land designated as sacred sites, agencies managing federal lands shall: "Accommodate access to and ceremonial use of Indian Sacred Sites by Indian religious practitioners and avoid adversely affecting the physical integrity of such sacred sites. Where appropriate, agencies shall maintain the confidentiality of sacred sites." This certainly should be interpreted to mean that the proposed action of removal of the top two feet of soil and all living species should be strictly avoided.	We acknowledge your comment on Indian Sacred Sites and federal agency responsibilities. NASA has identified the potential impacts from the proposed action to the Indian Sacred Site and is working closely with the Tribe in accordance with EO 13007.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>3.3.3.4 Architectural Resources</p> <p>The DEIS fails to provide adequate proposal for mitigation of architectural resources. Assembly pieces from Alfa, Bravo and Coca should be considered for preservation under the stewardship of Smithsonian Institute NASM and/or other scholarly institutions for the preservation of American history.</p>	Thank you for your MM suggestions. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.
Christina	Walsh	<p>Table 3.4-2 Sensitive Plant Species potentially located within SSFL</p> <p>According to the DEIS, page 3-24 it states that the California red-legged frog (<i>Rana draytonii</i>) is federally listed as threatened and known to occur in the vicinity of SSFL, and that no evidence of California red-legged frog occurrence was found during the 2010 or 2011 surveys (NASA, 2011b; 2011d). and that limited potential suitable frog habitat for this species primarily around R-2 Ponds and the Coca Skim Pond. It should be noted that this species was found in and around Bell Canyon Creek, but due to impacts from previous groundwater pumping, those area (as with the R-2 and Coca skim ponds) are completely dry now, and therefore no longer suitable habitat due to these actions being take to "control discharge." These actions were taken without CEQA or NEPA review and makes clear the need for such a review so that these sensitive species are protected before decisions make it too late (as we are seeing here, if limited modification to the decisions moving forward are not considered).</p>	NASA notes the concern regarding previous activities related to groundwater treatment systems. NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	With such a severe proposal of soil replacement, it is likely that different vegetative species will grow from different soil, thereby further impacting the wildlife currently supported by the habitat.	Once the soil was removed, the existing micro-ecosystem might never be restored. It can take years for native species to reestablish in disturbed areas, and the species composition would be different from what was originally there, despite reseeding with approved native plant seeds. Whenever possible, topsoil would be imported, along with backfill, to replace the remediated topsoil; however, the sources of native topsoil within the vicinity of SSFL are limited and are unlikely to supply enough topsoil to replenish the entire 39-acre area. If non-native soil were to be used, it would be unlikely to support the current plant distributions on SSFL.
Christina	Walsh	Pumping occurring at WS9a in the recent two years has exacerbated the current drought conditions and has limited the potential habitat significantly as 1.4 miles of riparian habitat now has no water source.	The regulators are working with SSFL parties to examine the Bell Creek drainage issues. Potential pump and treat impacts are addressed on page 4-79.
Christina	Walsh	All of the plant species listed on Table 3.4.2 should be considered further threatened with recharge water source conditions continue to be changed as a result of unmitigated water diversion that has occurred since 2010 for this purpose.	NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Figure 3.4-2 Wildlife Migration Corridor depicted on page 3-25 is inaccurate in that it does not adequately acknowledge the use by wildlife to transverse the property following water resources. Cattle, horses, mule deer, and even mountain lions ave been spotted in Area IV during our site visits guided by Responsible Parties so it is truly ridiculous to ignore those occurrences here, when we’ve viewed these species migrating and feeding across the entirety of the site, including the southern bufferzone, northern bufferzone, and areas 1, 2 and 3 (including the NASA owned LOX area where horses have been photographed drinking from the pond and feeding on the grasses there. The currently existing use of this corridor (which clearly includes Area 2 and other NASA owned portions) must be considered as an impact, especially given that the play presented states that the top two feet of all living vegetation will be removed.</p> <p>The very idea that such extreme actions (to devastate all living things in an open space area of more 50 acres) is being considered while presenting a map on Figure 3.4-2 that doesn’t even include the NASA owned portions as being part of that corridor is UNACCEPTABLE. This must be corrected as you will be advised of such by every expert writing in as well.</p>	<p>The migration corridors shown in the figure was obtained from Ventura County. These corridors are also shown in the studies performed by South Coast Missing Linkages Project.</p>
Christina	Walsh	<p>What will be the mitigation for all the oak trees removed? The report says “up to 100% of all vegetation” and includes trees in that category.</p> <ol style="list-style-type: none"> 1. How many oak trees will be replanted to mitigate this? 2. And how will the Ventura County Oak Tree Ordinance be considered in such a plan that needlessly devastates the environment, or fails it entirely? 3. What will be done to mitigate the damage done to the habitat that supports several hundred diverse species? 	<p>As a federal agency, NASA is not required to comply with state or local policies, ordinances or statutes. NASA will continue to make efforts adhere to these policies when feasible.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	Figure 3.4-4 Sensitive Wildlife Species Why is the mountain lion not included here since they are all tagged and have such a large roaming need? The corridor presented can only mean that the "safest crossing" allows only for a narrow corridor, making that even more important to protect.	The figure includes the species observed during the August 2011 survey.
Christina	Walsh	Listed is the Two-striped garter snake which I have personally photographed in the endangered area of Bell Creek where the habitat is being damaged, and reduced as a result of actions related to the groundwater proposed action and should be considered here.	Your comment is noted.
Christina	Walsh	The ring-tailed cag (<i>Bassariscus astutus</i>) as also been cited by comment author in the riparian drainage immediately to the south of NASAs Area II (Figure 3.4-4).	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date.</p> <p>NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>Table 3.4-4 Biological Species of Native American Concern Included in this list, are both milkweed species (<i>Asclepias eriocarpa</i>, and <i>asclepias fascicularis</i>), Wild Cucumber which have been further identified and photographed throughout the riparian drainage receiving the potential impacts of this action (Bell Canyon Creek).²⁸ As well as the <i>salvia columbariae</i>. This area is also contains several culturally recognized significant sites.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.</p>
Christina	Walsh	<p>Section 4 Environmental Consequences The most disturbing part of this proposed action is the limited alternatives of only providing for total biological destruction of the site, or no action at all. We ask that the DEIS be modified to include reasonable alternatives that are protective of human health and the environment and that the necessary changes to the AOC signed, as agreed mutually by the parties, so that traditional health risk assessment can properly inform this process to avoid the unnecessary removal of so much soil, habitat destruction and destruction of cultural and historic assets.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>We can now see the startling consequences of an action using the AOC proposed “background” as the objective when no such [PA] exists that does not consider health risk. We ask that NASA and DTSC revisit this decision and work with their toxicological resources within the department to establish sound health-risk based parameters to bring this back to a reasonable solution.</p>	<p>Thank you for your comment it has been noted. NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.</p>
Christina	Walsh	<p>I do not agree with the idea that we “must abide by the AOC” while ignoring the primary directive stated on page 11 of the AOC that says alternative in situ methods should be used. I think that a strict adherence of the agreement needs to include all 46 pages, and not exclude such a primary tool to reduction efforts made and intended to minimize all the consequences outlined throughout this document.</p>	<p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	The response from both NASA and DTSC is that the final signed version does not include the language that “construction shall be completed” for alternative in situ methods as it was always understood that such methods would require more time for completion. The removal of that line in the final document can only mean a purposeful intent to make strict adherence of this portions of the AOC impossible and therefore requires modification.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Christina	Walsh	Was the AOC intended to not be possible? Because as proposed action that does not follow any existing programmatic agreement as requirement for the federal government to follow, it therefore creates it’s own programmatic agreement that we can see here cannot be fulfilled by the very limitations it also provides. This is additional basis that makes clear the necessity of modification of the AOC agreement in order to make it feasible, possible, and something beyond the paper it is written. If protection of the surrounding communities is the intent, then TIME must be part of that consideration and creating fictional programs that do not have a reasonable basis to be implemented cannot be used as an excuse to fail those communities now.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Christina	Walsh	Section 5 Agencies, Organization and Individuals Consulted This section proposes that the meetings used to present alternative in situ methods to reduce soil volumes were legitimate. I would argue that there was never any intent (based on this DEIS where any such consideration fails at the first deadline), and instead, these meetings were used to fill in this portion of the report though no real or sincere consideration of any alternatives was ever made.	NASA acknowledges your comment.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>During Section 106 call that occurred last week, it was stated that exceedingly false data has been provided in the media on a substantial political level in an effort to sell the idea that nothing short of full destruction of the site would be protective.</p> <p>This was acknowledged to be untrue, yet no effort to counter those very real messages in the media, has been made. We ask that added media coverage that includes the realities of these issues be done.</p>	<p>NASA recognizes that some misconceptions exist regarding the history and current status of the site. We try to present the facts clearly and consistently. Outreach to media is not an action of the EIS, however.</p>
Christina	Walsh	<p>5.4.1 Consultation Process for National Historic Preservation Act (Section 106 Consultation) indicated that the review of demolition activities would not be done by CEQA in that those processes will not occur until after demolition has already occurred. This fails the purpose of the “historic preservation” objective, and therefore ask that this proposed action/evaluation be halted until full CEQA review of all activities including those that potentially impact historic structures, districts, and sacred sites receive complete review and consideration. Artificial segmenting of the process (Piecemeal) should not be allowed.</p>	<p>NASA does not have a role in identifying the scope of the DTSC's CEQA analysis. NASA appreciates your consideration and comment on the DEIS. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. A Programmatic Agreement and/or the ROD will identify MMs selected to address the effects.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	We recommend that limited modification occur to make a workable feasible and effective cleanup solution that is health protective and measurable and ask that DTSC and NASA re-visit these issues and attempt to find solutions that can make this possible.	Thank you for your comment it has been noted. NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.
Christina	Walsh	Draft EIS submitted by NASA fails to provide legitimate solutions by framing alternatives be either: devastating to the natural ecosystem and sensitive habitats, the sacred Native American sites, as well as failing to conserve American History by suggesting demolishing historic rocket test stands and indicating that the mandating mechanism for these actions is aforementioned AOC.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Christina	Walsh	The AOC driving the project goes beyond EPA recommended requirements for human health and safety.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	SB990 (Kuehl2007) was later struck down by Federal District Court decision, of which the AOC was originally based. A health protective cleanup is what the communities have always wanted.	<p>The 2010 AOC did not qualify as a "proposal" under CEQ regulations found at 40 CFR Sec. 1508.23. The document reflects the conditions of an administrative order issue to NASA under DTSC's enforcement authority. While NASA engaged in discussion with DTSC over the contents of the AOC, NASA was not entitled to choose among a list of alternatives offered by DTSC.</p> <p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Christina	Walsh	Section 5.26 Severability of AOC Order [2010] provides that "...should a court determine that any federal or State law or regulation incorporated into, referenced in, or authorizing this order is invalid or unenforceable in whole or in part, NASA shall comply with each and every remaining part." ¹	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. NASA must continue to abide by its obligations under the AOC as drafted.
Christina	Walsh	6.0 Modification This Order may be modified by the mutual agreement of the parties. Any agreed modifications shall be in writing, shall be signed by both parties, shall have as their effective date the date on which they are signed by DTSC, and shall be deemed incorporated into this Order.	NASA recognizes that this language is in the AOC and acknowledges that modifications may result by mutual agreement of the parties.
Christina	Walsh	1.6 Agreement in Principle (attached) which AOC is based, indicates that "scheduled completion of soils cleanup remains as 2017" yet original specifies that alternative method in situ treatments shall only require completion of construction (not of remedial soil completion) by 2017 and by omitting "construction" language, the responsible parties do not have adequate time to comply with Order as written, despite directive to use said alternative methods "to the maximum extent possible".	Thank you for your comment it has been noted. NASA will continue to work with DTSC, the tribes, and local community to effectively implement the 2010 AOC requirements.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christina	Walsh	<p>7. 2.8 Soils Remedial Action Implementation Plan does follow follow clear directive to use alternative in situ methods “to the maximum extent possible” as the DEIS proposes zero alternative solutions on the basis that adequate time to achieve objective is not provided.</p> <p>a. The purpose of this directive is to minimize the potential impact on sensitive habitat, eco systems, flora and fauna, migratory species protection that use this sensitive corridor, protect historic structures and sacred Native American cultural sites, yet the DEIS describes a solution that in its declaration states all of the above will be potentially impacted by the large magnitudes soil removal being mandated.</p>	<p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>
Christina	Walsh	<p>1.6 Agreement in Principle is defined the guiding document that shall govern the AOC process and lists specific exceptions that include the Native American cultural resources, yet the DEIS continues to ignore this primary promise as it is found in the secondary document. NASA has to follow the Agreement in Principle, which clearly stipulates a 5% volume exception, which could assist in prioritizing and the protection of sacred areas currently known. Due to the likelihood of additional sites being discovered, it is recommended that these boundaries be drawn wide and use of native monitors throughout excavation and alternative method efforts be present.</p>	<p>The exceptions in the 2010 AOC are dependent on DTSC approval. The cultural resources will remain in the EIS has having the potential to be impacted in the absence of this approval. Please refer to the Programmatic Agreement and/or ROD for further details.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Joanne	Watchie	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Monica	Weisberg	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Sarah	Weismer	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	<p>The document and the process that created it are flawed by the political interference that caused the removal from consideration of alternatives intermediate between two unacceptable extremes. The Proposed Soil Cleanup to Background/Detect would have significant negative environmental impacts and the No Action would leave contamination in place that most would agree should be removed. Surprisingly, the No Action appears to have far fewer negative environmental impacts than the proposed action.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Abraham	Weitzberg	<p>The DEIS itself is overly optimistic and minimizes the amount of soil to be removed by neglecting the likely impacts of the very low soil remediation trigger levels coupled with the extensive confirmation sampling that would be required. Note that DTSC has stated that when the chemical LUT values were applied to the background locations false positives in the range of 20-25 percent were observed. The minimization of soil removal is further compounded by the assumption that all Best Management Practices and Mitigation Measures would be 100% effective in eliminating the negative environmental impacts. As will be discussed in later comments this is highly unlikely.</p>	<p>Cleanup area footprints and soil volumes provided in the EIS are best estimates based on available information at this time. The EIS identifies significant impacts to four areas (potential for soil erosion, cultural resources, damage to biological resources, and impacts to roadways), along with other concerns (such as air quality, water resources, and health and safety). NASA believes that soil erosion can be mitigated through good stormwater management practices. Impacts to roadways can potentially be reduced, but not eliminated, if onsite soil treatment technologies are proven to meet 2010 AOC requirements. Cultural and biological resource impacts can only be reduced by minimizing the required cleanup area.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	The removal of two feet of soil with all its life forms, together with deeper excavations down to bedrock, plus replacement of only one-third of the removed volume would significantly reconfigure the landscape and could be characterized as moonscaping. The likely unavailability of replacement soil meeting the SSFL cleanup requirements is also ignored in the DEIS as the soils listed in the document have not been tested and found to be acceptable.	The one third backfill estimated was based on historic cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets the 2010 AOC requirements.
Abraham	Weitzberg	The DEIS does not address the cost or schedule implications of this approach with constraints imposed by realistic budget expectations.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Abraham	Weitzberg	The cumulative impacts of the remediation performed by DOE and Boeing, when added to the NASA actions, significantly exceed the estimates included in the DEIS. This is further complicated by the fact that the much larger Boeing areas will be remediated to suburban residential soil standards with levels higher than the very low AOC look-up table values.	NASA is working with Boeing and DOE to obtain an update about their cleanup activities so that Section 4.13 of the document can be updated accordingly. It is possible that soil on Boeing areas may migrate to NASA areas.
Abraham	Weitzberg	After the passing of time, soils from the Boeing areas will migrate to the other areas...	The fact that Boeing's cleanup standard is different from NASA's is one of the many difficulties in implementing the 2010 AOC. NASA recognizes that there could be migration or cross-contamination of contaminants from Boeing areas at SSFL. NASA is working with DTSC (and with Boeing and DOE) to develop methodology to better implement this aspect of the AOC.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Because of the high levels of naturally occurring dioxin, arsenic, and radionuclides in all Santa Susana soil, the removal of contaminants above background and detect levels only in about one-fourth of the NASA project site area will not significantly change the overall risk. The claims of long-term, moderate, or significant benefits are unjustified.	There have been chemical releases due to past operations at SSFL to the soil and by removing these areas of soil contamination associated with chemical releases, there would be a moderate, beneficial impact. This aspect will be explained in more detail in the EIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	<p>It is not sufficient to simply state that removal of nontreatable soils or unquantified possible reduction in groundwater contaminant concentrations would have a longterm benefit by reducing the potential for contaminant exposure or bioaccumulation without first showing that there is a present risk and that it will be significantly reduced by the proposed action.</p>	<p>NASA appreciates your comments regarding the risk posed by soil and groundwater at SSFL. NASA has compared the risk for cleanup to residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment based on three factors: 1) application of cleanup levels that are 2 to more than 1 million times more conservative than risk-based levels; 2) potentially requiring cleanup of up to 51 chemicals that do not pose risk; and 3) potentially affecting 87 additional acres when compared to a suburban residential risk-based cleanup.</p> <p>Consequently, the benefit to human health and the environment of cleaning up to background is questionable for several reasons. The more aggressive remediation of the site that would occur under the background cleanup (more soil removal, more trucks entering the site, more emissions, more road miles, more soil to dispose of in landfills, etc.) could result in an increase in traffic accidents, spills, and habitat modification and disturbance of wildlife, all of which might result in reduced net benefits when compared to the risk-based cleanup scenario. Because only 10 percent of those analytes detected in soil are identified based on risk estimates as requiring remediation under the background cleanup scenario, the overall net benefit of cleaning up to background for all chemicals as opposed to a risk-based cleanup is low.</p> <p>Additionally, the current risk posed by soil and groundwater have been evaluated and are described in various RI or RFI reports available on DTSC's website.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	<p>We know from the background studies that the total agricultural cancer risk from the radionuclides and chemicals is about 0.05, five percent and that the remediation only addresses soil with contaminants above background or detect. Most of these local contaminants have risk in the tenth to the minus three or tenth to the minus six range, which are 50 to 50,000 times less than the background risk. Removing these contaminants from the small fraction of soil leaves the total site risk essentially unchanged and does nothing to lessen the potential for contaminant exposure or bioaccumulation in humans or wildlife.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments and thank you for providing this information.</p>
Abraham	Weitzberg	<p>The DEIS correctly states that all groundwater cleanup activities would alter existing water quality conditions appreciably and negatively; however, the claims of moderate beneficial regional and long-term impacts are unreasonable considering the very large amounts of contamination present in the fractured bedrock and the longtime horizon for their removal, up to 50,000 years. One could more accurately say that no meaningful changes would occur in the foreseeable future. This assumes that pumping is continued to ensure that contamination plumes do not move away from the site.</p>	<p>NASA appreciates the comment regarding groundwater cleanup activities. NASA, Boeing, and DOE are conducting treatability studies to assess the effectiveness of various remedial technologies in treating groundwater; these are listed in Section 2.2.3 of the EIS. Some of the technologies do not include pump and treat technologies. In addition to pump and treat, NASA will continue its sitewide groundwater monitoring program.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	If, as the DEIS clearly states, the proposed action has unacceptable short-term environmental impact and the no action alternative leaves Santa Susana with too much contamination, the DEIS does not present viable alternatives to either the public or the decision makers. It should therefore be revised to include at a minimum those alternatives that were removed, which would then be prudently applied, consistent with the ultimate planned use of the site.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Abraham	Weitzberg	Page ES-2: The AOC cleanup is infeasible and the No-Action, although undesirable, may be preferable.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Abraham	Weitzberg	Page ES-4, Section ES-3.1.2: The capability of any treatment technology to meet the very low AOC requirements in any reasonable time period is not credible.	NASA considered a range soil cleanup technologies, and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information is available in Section 2.2.2.3, Soil Cleanup Technologies, of the EIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Page ES-5, Table ES-2: Best Management Practices or Mitigation Measures which are assumed to be 100% successful. Such an assumption is unreasonable and unwarranted.	NASA intends to implement mitigations as successfully as possible and has used reasonableness in selecting the measures.
Abraham	Weitzberg	Page ES-5, Table ES-2: The next two feet of soil will have almost the same or perhaps greater risk than the soil that is removed.	The deeper soils are also included in the EIS evaluation. See the DEIS Section 2.2.2.3, Soil Cleanup Technologies, for further discussions about the soil technologies.
Abraham	Weitzberg	Page ES-9, Ssection ES-5.2.4: Moderate beneficial impacts are gratuitously inserted into the paragraph without any examples or substantiation. Such an apparent assumption is not warranted.	There have been chemical releases due to past operations at SSFL to the soil and by removing the areas of soil contamination associated with chemical releases, there would be a moderate, beneficial impact. This aspect will be explained in more detail in the EIS.
Abraham	Weitzberg	Page ES-10, Section 5.3.3: In fact, the AOCs have been interpreted to preclude any risk assessment without language so stating. Without risk assessment, how can NASA claim that risks will be reduced?	By definition, background and "lowest reasonable detection limits" (AOC cleanup standards) are concentration levels below most suburban residential risk-based ranges. Thus, if soil that exceeds the AOC cleanup standards is removed from SSFL, then the risk posed by the contaminants is reduced.
Abraham	Weitzberg	Page ES-11, Table ES-4: Without substantiation, most negative impacts are reduced as a result of Best Management Practices and Mitigation Measures based on an assumption, and all of the beneficial impacts are restated without justification.	The justification and substantiation of the impact severity are provided in Section 4.
Abraham	Weitzberg	Page ES-15, Table ES-5: For Biological Resources it seems strange to claim moderate, beneficial cumulative impact from removing contamination, when you have killed/removed all of the biological resources.	NASA considers that there are some net beneficial impacts to the cleanup by removing contaminants from the soil that could affect wildlife. NASA also recognizes in Section 4.4.1.3. that there will be significant impacts to native vegetation communities. Please also refer to Section 3.9 for an assessment of health risks associated with current contaminants.
Abraham	Weitzberg	Page ES-15, Table ES-5: For Water Resources, it seems very questionable that possible small improvements in water quality in an area that is not anticipated to have residents that would subsist on the ground water could have significant beneficial impacts.	NASA, Boeing, and DOE are addressing groundwater cleanup as per the 2007 AOC.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Page ES-15, Table ES-5: For Hazardous and Nonhazardous Materials and Waste, how is a significant, beneficial impact justified, when the waste may not now pose a significant risk.	There are areas at SSFL in which the contamination does pose a risk to human health or ecological receptors. These areas do require remediation, as shown by the risk assessments conducted for the sites at SSFL. For human health, most of the risks were due to agricultural consumption. For ecological receptors, it was exposure to chemicals that bioaccumulate in tissues (PBCs and dioxins) and exposure of burrowing animals to soil vapor containing TCE. Therefore, remediating the areas of SSFL that do pose a risk will result in a significant, beneficial impact.
Abraham	Weitzberg	Page ES-16, Section ES-8.0: NASA states: "The analysis assumes that the technologies considered are feasible, implementable, and effective " If it is likely that, for the very low AOC cleanup levels, the technologies are infeasible, non-implementable, and ineffective, why is this not reflected in the DEIS?	NASA considered a range soil cleanup technologies, and viable ones were evaluated to assess which remedial technologies could best suit the different types of contaminants present at SSFL. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC.
Abraham	Weitzberg	Page ES-1 7, Section ES-12.0: NASA states: "... cleanup of soils to Look-Up Table values, would provide a beneficial long-term impact for the overall reduction of contaminants across the site and reducing exposing risk to wildlife and humans." There has been no case made that these contaminants now pose a risk to wildlife and humans, particularly in light of the high natural background of some of these contaminants.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments and thank you for providing this information.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Page 2-19, Section 2.2.2.3: Document does not declare that the referenced replacement soils have been tested and found to meet the AOC requirements. Based on the failure of other candidate soils to meet the requirements, it must be assumed that these may not be found to be suitable.	The one-third backfill estimated was based on historical cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets 2010 AOC requirements. NASA believes that replacement of approximately one third of the excavated soil will be sufficient to accommodate the hydrology and eventual revegetation of the site. As discussed in the EIS, the soil biology will be destroyed upon excavation/removal. Section 2.2 of the EIS identifies potential offsite sources (others might be identified at the time of remediation) that have been identified in the project vicinity in southern California. According to the 2010 AOC, backfill soil must meet the LUTvalues. These sources have not been evaluated to assess if they can meet the 2010 AOC requirement.
Abraham	Weitzberg	Table 2.2-5: Why is the replacement of only one-third of the removed soil acceptable?	The one-third backfill estimated was based on historical cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets the 2010 AOC requirements.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Page 2-33, Section 2.4: Why did NASA eliminate the broad range of alternatives, as viable alternatives?	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Abraham	Weitzberg	Page 2-36, Section 2.4.1.4: When translating soil volumes into trucks, the analysis does not appear to take into account the fact that since there are far fewer trucks bringing replacement soil than are needed to remove excavated soil, the number of trucks to be considered in traffic studies must include the empty trucks that also will drive to and up Woolsey Canyon Road.	The return of empty truck traffic will be added to tables in Section 2.
Abraham	Weitzberg	Page 4-27, Table 4.3-1: The impact on Cultural Resources is significant and negative. Mitigation measures would not eliminate negative impacts and one must assume that consultation will not alter the situation, unless there is political interference.	Even after identified MMs, the impact on cultural resources from the Proposed Action would be significant, as described in the DEIS.
Abraham	Weitzberg	Page 4-36 and Page 4-49, Table 4.4-1: The assessment of impact on Wildlife from the removal of non-treatable soils as moderate, beneficial, regional, and long-term by reducing the potential for contaminant exposure or bioaccumulation is a gratuitous fabrication, unless there is some evidence that such effects are or have been observed.	Although there are many studies on this subject, a quick reference by EPA notes that contaminants in soil can adversely affect the health of "animals when they ingest, inhale, or touch contaminated soil, or when the eat plants or animals that have themselves been affected by soil contamination. Animals ingest and come into contact with contaminants when they burrow in contaminated soil" (http://www.epa.gov/superfund/students/wastsite/soilspil.htm).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Page 4-36 and Page 4-49, Table 4.4-1: Since the vast majority of the impacts listed are negative, how can the whole be listed a beneficial?	There are two "wholes" - one negative and one beneficial. The beneficial impact is due to contamination being removed so that resources are no longer exposed to it.
Abraham	Weitzberg	Page 4-54: Project Trip Generation - Construction workers carpooling is a non-conservative estimate.	NASA appreciates the comment, but believes the analysis is adequate.
Abraham	Weitzberg	Page 4-54: Project Trip Generation - Woolsey Canyon should not be considered rolling terrain. It is a steep winding grade.	Agreed, part of the truck route is on a steep, windy road with some blind curves, which could affect the potential for crashes. The LOS assumes a straight, level road with few curves. Woolsey Canyon Road is steep and winding; however, if you look at the truck routes in totality, they meet the assumption of a "normal" road.
Abraham	Weitzberg	Page 4-54: Project Trip Generation - There seems to be no realistic account of the need for empty trucks to drive up to the site to receive their loads.	The demolition table and soil table in Section 2 will be updated to show round trips. The tables in Section 4 that show the truck numbers do account for round trips. The return of empty truck traffic is included in the DEIS and reflected in Table 2.2-5.
Abraham	Weitzberg	Page 4-54: Project Trip Generation - Trucks would not necessarily come from the dumps to which they would eventually deliver their loads and drivers would have to drive there to pick up their trucks if they did.	On the basis of past experience in implementing remediation projects and for the purposes of the EIS, it was assumed drivers would be assigned to the project and make round trips from SSFL to the landfills each day. Therefore, for the overwhelming majority of the round trips made by the truck, their origin will be traveling empty from the landfills to SSFL to pick up the next load. The return empty truck traffic is included in the DEIS and reflected in Table 2.2-5.
Abraham	Weitzberg	Page 4-63: Truck speeds and stopping distances are interesting, but do not seem relevant to the critical route up and down Woolsey Canyon Road.	Thank you for your comment.
Abraham	Weitzberg	Page 4-64, Table 4.5-1: Are the numbers of workers based on the assumption of two shifts with double traffic loads at shift change during the summer and single shifts with overtime during the winter?	The number of workers and vehicles will vary by time of year and phase of cleanup. NASA believes that the analysis is adequate.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	<p>Page 4-65, Table 4.5-3 and Page 4-69, Table 4.5-5: Analysis of traffic on Arterial Roadways and Safety of Truck Trips appears to be limited to numbers of trips, concluding that Levels of Service are not raised above LOS threshold and the safety is not significantly affected. This does not account for the fact that the trucks on Woolsey Canyon Road and Valley Circle will travel at greatly reduced speeds compared with passenger vehicles and the abilities of passenger vehicles to safely enter these roads from side streets will be significantly impacted and the risks of accidents increased. There is no runaway truck escape ramp on Woolsey Canyon Road and the steep grade poses an added risk from trucks.</p>	<p>NASA appreciates the comment, but believes the analysis related to LOS application is adequate.</p> <p>In anticipation of the roadway damage identified (Traffic Impact-4), NASA would survey Woolsey Canyon Boulevard Road conditions prior to the commencement of work and would repair damage caused by its demolition and cleanup activities. NASA would seek to enter into an agreement with Boeing and the DOE to share this work.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Page 4-68, last sentence: It is difficult to understand how the addition of a significant number of trucks to the existing traffic load would not add to the number of truck accidents, even if the rate expressed as number of accidents per mile traveled per truck does not change.	<p>Industry standards for assessing transportation impacts are based on the LOS. Specifically, the impacts are based on increases in the hourly ratio of volume of traffic compared to roadway capacity. For the roadways proposed, the increases in volume from NASA operations do not increase that ratio to a significant level. Because accidents are rare events, it is not standard practice to predict the actual number of accidents in an environmental document. The percentage increase in total traffic will be negligible, and therefore, there is no basis for assuming that there will be a significant increase in the number of accidents.</p> <p>The project will obtain the necessary transportation permits for truck travel on city, county, and state roadways. Federal and state regulations also govern the operation of commercial motor vehicles. These regulations, among others, have been established to help reduce or prevent truck crashes, fatalities, and injuries. As a BMP for efficient and safe traffic management, a N-CTCP will be developed; similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the numbers and impacts of incidents.</p> <p>NASA will coordinate the traffic control plans with Boeing and the DOE.</p>
Abraham	Weitzberg	Page 4-74, Table 4.5-6: Another example of a significant negative impact arbitrarily changed to minor negative impact, with no real changes made in the actual traffic load as part of the mitigation. The only real way to significantly mitigate the impacts of traffic is to decrease the number of trucks.	It is agreed that reducing the number of trucks would reduce the impacts to transportation, health and safety, and air resources identified in this EIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Page 4-79, Page 4-80: Groundwater Quality - Claims that in the long term groundwater and soil cleanup to LUT values would likely reduce groundwater contamination sources are overstated. The residual natural background arsenic and radionuclides over the entire site throughout its depth far outweigh the relatively small amounts of contamination that may be removed. Moreover, in the long term there is high probability that these contaminants will migrate from the Boeing areas which are being cleaned to Suburban Residential levels.	NASA is complying with the AOC (as written) for soils and with the 2007 Consent Order for groundwater.
Abraham	Weitzberg	Page 4-79, Page 4-80: Groundwater Quality - The sentence beginning the third paragraph seems to state that groundwater is being cleaned up to LUT values. The LUTs apply only to soil.	NASA will update the text in Section 4.6 to reflect that groundwater will be cleaned up to levels obtained by applying the risk methodology in the SRAM.
Abraham	Weitzberg	Page 4-81 , Section 4.6.3: The risk of harmful exposure is not estimated. Therefore lengthening it may or may not be consequential.	The risk posed by the groundwater in its current state is provided in the 2009 Draft Groundwater RFI Report. Additional investigations are ongoing and an updated risk assessment will be provided in the final groundwater report (expected in 2015).
Abraham	Weitzberg	Page 4-84, Table 4.6-1: While pumping should continue for the foreseeable future to ensure that contaminant plumes do not move away from the site, no credit should be taken for hypothetical future improvements in water quality.	Groundwater pump and treat systems do allow for a degree of hydraulic containment due to the induced groundwater gradients. In addition to the groundwater containment benefit, the pump and treat activities do remove some contamination, thus resulting in improvements to groundwater quality.
Abraham	Weitzberg	Page 4-129, Table 4.9-1: How can any short-term benefits affecting worker health and safety have any long term benefits to the workers who are no longer working at the site?	NASA appreciates the comment regarding the health and safety of workers. Table 4.9-1 addresses worker safety during implementation of the proposed action or no action alternatives. Previous workers at SSFL are not included in the analysis results listed in Table 4.9-1.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Page 4-152, Table 4.12-2: All impacts shown are negative, yet the overall impact is claimed to be significant, beneficial, local and long term. Where are the benefits described and justified, or are they just assumed? How can all of the negatives be combined into a beneficial?	NASA appreciates the comment regarding the potential impacts of the waste evaluation. The overall impacts in Table 4.12-2 have both negative and beneficial impacts, as listed in the last two rows, respectively.
Abraham	Weitzberg	Page 4-167, Table 4.13-2: All impacts shown are negligible or minor, mostly negative, yet the overall impact is claimed to be significant, beneficial, and long term. How can this mixture of impacts be summarized as significant, beneficial?	Table 4.13-2 lists the potential cumulative impacts by resource area and does not list an overall impact for the project.
Abraham	Weitzberg	Page 4-169, Section 4.14.3: It is unrealistic and not conservative to assume that the technologies are feasible and effective. The assumption can be made, but it is wrong to claim conservatism.	DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm). According to the DTSC summaries there were two UCLA studies, one in 1997 that dealt with radiation exposures and a second in 1999 that dealt predominately with hydrazine exposures. Both were funded by the DOE. Another study performed by the ATSDR was published in 1999. According to DTSC's summary, " <i>The preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects.</i> "
Abraham	Weitzberg	Page 4-154, Table 4.12-2: Where are the benefits described, or are they just assumed? How can all of the negatives be combined into a beneficial?	NASA has two overall impacts for this category: one is negative and one is beneficial. The individual negative and beneficial impacts are listed and described in the table.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	Additionally, because the reevaluation of significant negative impacts on cultural resources and biological resources are dependent only on the results of future consultation, there is significant uncertainty in the ultimate evaluation of the impact.	NASA is consulting with the Section 106 consulting parties for cultural mitigations and with USFWS for biological mitigations. The information in the FEIS will include any final decisions made during the final stages of the consulting process.
Abraham	Weitzberg	The possibility of additional behind closed doors political influence and coercion affecting these consultations is real. So far we can thank at the federal level Senator Boxer and the state level Senator Pavley for interfering with the process and giving us this flawed DEIS.	Your concerns are noted.
Abraham	Weitzberg	The potential long-term benefits of the proposed soil remediation can be quantitatively shown to be truly negligible by noting that the 105 acres assumed to be remediated by NASA represents only about four percent of the total Santa Susana site area. Since the elevation of the hill varies between 700 and 1500 feet above the valley floor, we can assume a 1000 foot average and conservatively overestimate that NASA removes the top ten feet of soil, which leaves another factor of one percent. Thus, .9996 of the background levels of radionuclides and chemicals will remain in place after remediation.	Thank you for your comment; it has been noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	The DEIS and the process that created it are flawed by the political interference that caused the removal from consideration of alternatives intermediate between the two unacceptable extremes.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Abraham	Weitzberg	The proposed soil cleanup to background or detect would have significant environmental impact, and the no action would leave contamination in place that most would agree should be removed. Surprisingly, the no action appears to have far fewer negative environmental impacts than the proposed action.	NASA must continue to abide by its obligations under the AOC as drafted.
Abraham	Weitzberg	Additionally, because the reevaluation of significant negative impacts on cultural resources and biological resources are dependent only on the results of future consultation, there is significant uncertainty in the ultimate evaluation of the impact.	The information in the FEIS will include any final decisions made during the final stages of the consulting process. NASA is consulting with the Section 106 consulting parties for cultural mitigations and with the USFWS for biological mitigations. Consultation with the USFWS is complete, and NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.
Abraham	Weitzberg	The possibility of additional behind closed doors political influence and coercion affecting these consultations is real. So far we can thank at the federal level Senator Boxer and the state level Senator Pavley for interfering with the process and giving us this flawed DEIS.	The information in the FEIS will include any final decisions made during the final stages of the consulting process. NASA is consulting with the Section 106 consulting parties for cultural mitigations and with the USFWS for biological mitigations. Consultation with the USFWS is complete, and NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	<p>The DEIS itself is overly optimistic and minimizes the amount of soil to be removed. Note that DTSC has stated that when the chemical LUT values were applied to the background location, false positives in the range of 20 to 25 percent were observed. The minimization of soil removal is further compounded by the assumption that all best management practices and mitigation measures would be 100 percent effective in eliminating the negative environmental impact. This is highly unlikely.</p>	<p>Cleanup area footprints and soil volumes provided in the EIS are best estimates based on available information at this time. The EIS identifies significant impacts to four areas (potential for soil erosion, cultural resources, damage to biological resources, and impacts to roadways), along with other concerns (such as air quality, water resources, and health and safety). NASA believes that soil erosion can be mitigated through good stormwater management practices. Impacts to roadways can potentially be reduced, but not eliminated, if onsite soil treatment technologies are proven to meet 2010 AOC requirements. Cultural and biological resource impacts can only be reduced by minimizing the required cleanup area. Possibly this could be done through the exception identified in the 2010 AOC.</p>
Abraham	Weitzberg	<p>The removal of two feet of soil with all its life forms, together with deeper excavations down to bedrock, plus replacement of only one-third of the removed volume would significantly reconfigure the landscape and could be characterized as moonscaping. The likely unavailability of replacement soil meeting the SSFL cleanup requirements is also ignored in the DEIS as the soils listed in the document have not been tested and found to be acceptable.</p>	<p>Once the soil was removed, the existing micro-ecosystem might never be restored. It can take years for native species to reestablish in disturbed areas, and the species' composition would be different from what was originally there, despite reseeding with approved native plant seeds. Whenever possible, topsoil would be imported, along with backfill, to replace the remediated topsoil; however, the sources of native topsoil within the vicinity of SSFL are limited and are unlikely to supply enough topsoil to replenish the entire 39-acre area. If non-native soil were to be used, it would be unlikely to support the current plant distributions on SSFL.</p> <p>The one-third backfill estimated was based on historical cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets the 2010 AOC requirements.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	<p>The DEIS does not address the cost or schedule implications of this approach with constraints imposed by realistic budget expectations. This would likely extend the short-term negative impacts of the remediation until they become long-term.</p>	<p>Cost evaluations are not generally a part of an EIS evaluation. NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Abraham	Weitzberg	<p>The cumulative impacts of the remediation performed by DOE and Boeing, when added to the NASA actions, significantly exceed the estimates included in the DEIS. This is further complicated by the fact that the much larger Boeing areas will be remediated to suburban residential soil standards with levels higher than the very low AOC look-up table values.</p> <p>After the passing of time, soils from Boeing will migrate to the other areas by wind and water mechanisms, negating any positive effects of the AOC soil mitigation. Optimism in all resource areas unrealistically overestimates the long-term benefit of the best management practices and mitigation measures and attributes unquantified and unjustified cumulative future benefits of remediation actions in biological resources, health and safety, water, hazardous and nonhazardous materials, and waste resource areas.</p>	<p>NASA is working with Boeing and DOE to obtain an update on their cleanup activities so that Section 4.13 of the document can be updated accordingly.</p> <p>NASA is currently working with DTSC and Boeing to address the migration of soils after cleanup activities are completed.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	<p>Because of the high levels of naturally occurring dioxin, arsenic, and radionuclides in all Santa Susana soil, the removal of contaminants above background and detect levels only in about one-fourth of the NASA project site area will not significantly change the overall risk. The claims of long-term, moderate, or significant benefits are unjustified.</p>	<p>NASA appreciates your comments regarding the risk posed by soil and groundwater at SSFL. NASA has compared the risk for cleanup to residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment based on three factors: 1) application of cleanup levels that are 2 to more than 1 million times more conservative than risk-based levels; 2) potentially requiring cleanup of up to 51 chemicals that do not pose risk; and 3) potentially affecting 87 additional acres when compared to a suburban residential risk-based cleanup.</p> <p>Consequently, the benefit to human health and the environment of cleaning up to background is questionable for several reasons. The more aggressive remediation of the site that would occur under the background cleanup (more soil removal, more trucks entering the site, more emissions, more road miles, more soil to dispose of in landfills, etc.) could result in an increase in traffic accidents, spills, and habitat modification and disturbance of wildlife, all of which might result in reduced net benefits when compared to the risk-based cleanup scenario. Because only 10 percent of those analytes detected in soil are identified based on risk estimates as requiring remediation under the background cleanup scenario, the overall net benefit of cleaning up to background for all chemicals as opposed to a risk-based cleanup is low.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	<p>It is not sufficient to simply state that removal of nontreatable soils or unquantified possible reduction in groundwater contaminant concentrations would have a longterm benefit by reducing the potential for contaminant exposure or bioaccumulation without first showing that there is a present risk and that it will be significantly reduced by the proposed action.</p>	<p>NASA appreciates your comments regarding the risk posed by soil and groundwater at SSFL. NASA has compared the risk for cleanup to residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment based on three factors: 1) application of cleanup levels that are 2 to more than 1 million times more conservative than risk-based levels; 2) potentially requiring cleanup of up to 51 chemicals that do not pose risks; and 3) potentially affecting 87 additional acres when compared to a suburban residential risk-based cleanup.</p> <p>Consequently, the benefit to human health and the environment of cleaning up to background is questionable for several reasons. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	The potential long-term benefits of the proposed soil remediation can be quantitatively shown to be truly negligible by noting that the 105 acres assumed to be remediated by NASA represents only about four percent of the total Santa Susana site area. Since the elevation of the hill varies between 700 and 1500 feet above the valley floor, we can assume a 1000 foot average and conservatively overestimate that NASA removes the top ten feet of soil, which leaves another factor of one percent. Thus, .9996 of the background levels of radionuclides and chemicals will remain in place after remediation.	The conditions of the December 2010 AOC compel NASA to meet cleanup standards set by DTSC. The EIS describes the environmental impacts connected with NASA meeting its obligation to comply with the state's order. The NEPA alternatives of the EIS are limited to a no-action alternative and the alternative of complying with the conditions set out in the AOC.
Abraham	Weitzberg	We know from the background studies that the total agricultural cancer risk from the radionuclides and chemicals is about 0.05, five percent and that the remediation only addresses soil with contaminants above background or detect. Most of these local contaminants have risk in the tenth to the minus three or tenth to the minus six range, which are 50 to 50,000 times less than the background risk. Removing these contaminants from the small fraction of soil leaves the total site risk essentially unchanged and does nothing to lessen the potential for contaminant exposure or bioaccumulation in humans or wildlife.	NASA appreciates your comments regarding the risk posed by soil and groundwater at SSFL. NASA has compared the risk for cleanup to suburban residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment based on three factors: 1) application of cleanup levels that are 2 to more than 1 million times more conservative than risk-based levels; 2) potentially requiring cleanup of up to 51 chemicals that do not pose risks; and 3) potentially affecting 87 additional acres when compared to a suburban residential risk-based cleanup.
Abraham	Weitzberg	The DEIS correctly states that all groundwater cleanup activities would alter existing water quality conditions appreciably and negatively; however, the claims of moderate beneficial regional and long-term impacts are unreasonable considering the very large amounts of contamination present in the fractured bedrock and the longtime horizon for their removal, up to 50,000 years. One could more accurately say that no meaningful changes would occur in the foreseeable future. This assumes that pumping is continued to ensure that contamination plumes do not move away from the site.	NASA is addressing groundwater cleanup in accordance with the 2007 Consent Order. The groundwater hydrogeology does present challenges for cleanup. NASA, Boeing, and DOE are conducting treatability studies to assess the effectiveness of various remedial technologies in treating groundwater, as listed in Section 2.2.3 of the EIS. Some of the technologies do not include pump and treat technologies.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Abraham	Weitzberg	If, as the DEIS clearly states, the proposed action has unacceptable short-term environmental impact and the no action alternative leaves Santa Susana with too much contamination, the DEIS does not present viable alternatives to either the public or the decision makers. It should therefore be revised to include at a minimum those alternatives that were removed, which would then be prudently applied, consistent with the ultimate planned use of the site.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Abraham	Weitzberg	I was thinking about your schedule with the record of decision coming in December. That's well before Department of Energy comes up with their Environmental Impact Statement.	NASA recognizes the timelines of the various parties' environmental reviews and will work with these parties.
Abraham	Weitzberg	Are you concerned about segmentation of two actions, both of which they affect the same environment, same truck traffic, same site, and yet you have a separate record of decision from Department of Energy. I think that's not addressed in the EIS, and I think somebody needs to look at it.	In addition to DTSC, NASA has been coordinating with USFWS, USACE, SHPO, DOE, Boeing, consulting parties, Tribes, and National Park Service. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Stephen	Welch	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mary	Wiesbrock	<p>ES-2.2 Selection of Alternatives to Evaluate</p> <p>We request that the AOC be modified to include a risk based PRG table of suburban residential risk levels. It is not necessary to remove to background soil which does not present a risk to human health. This EIS is grossly inadequate and legally deficient in that it only evaluates two extreme alternatives: the clean-up to background and/or no-action alternative.</p> <p>Only considering a cleanup alternative to background, results in unacceptable significant environmental impacts which include: demolishing 100% of the structures (historical test stands etc.) and significantly adversely impacting 105 NASA acres from 2 feet to 20 feet down.</p> <p>Significant environmental impacts (ES-11.0) can be avoided when the suburban residential risk based level is added to the alternative's analysis.</p>	<p>NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Mary	Wiesbrock	<p>1.3 Scope of the Analysis</p> <p>In order to be acceptable and comprehensive, there should be a joint EIS/EIR document as required per CFR 1506.2. DTSC's EIR document should not follow the completion of this NASA EIS. DTSC's EIR should jointly be a part of this document</p> <p>The NEPA regulations similarly encourage federal agencies to cooperate with local agencies "to the fullest extent possible to reduce duplication between NEPA and comparable State and local requirements, including the preparation of a joint document".</p>	<p>The AOC requires NASA to develop a NEPA document. In order to meet the 2017 cleanup completion date, NASA must proceed with the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mary	Wiesbrock	<p>(ES-5.2.1, ES-3.1.3) There has been already (GETS Pump and Treat) been a significant impact on water resources without any federal and/or state environmental review in violation of environmental law. We requested Boeing that they stop this destructive process which removed contaminated water from one area above Bell Canyon, cleaned it and then returned to an entirely different area. Our request was ignored. The results have been significant destruction of that wetland ecosystem which includes significant impacts on flora and fauna there from the water loss and the Bell Canyon waterfall drying up. The hydrology will be and has been (GETS impacting Bell Canyons) significantly (not moderately) impacted if the Pump and Treat draws water from one area and dumps it in another area.</p>	<p>Groundwater investigations and studies comply with the 2007 Consent Order. The pump and treat system was part of an interim measure directed by DTSC. Groundwater monitoring will be on-going during remediation to evaluate the effects of the remedial technologies selected for cleanup. Final remedy selection of cleanup technologies will take into account, among other things, the impacts of dewatering.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mary	Wiesbrock	<p>The source ground water wells used for drinking water in areas of Simi Valley need independent analysis for all the NASA chemicals of concern listed in this document. These groundwater wells, Sycamore and Niles, are below and within 4 miles of the SSFL Mountain. After some five decades of industrial activities, NASA needs to independently demonstrate that their COC's have not finally reached and impacted these wells used for drinking water for thousands of Simi Valley residents. Source water testing for the Sycamore well showed Perchlorate = 5.2 micrograms per Liter in 1/05/10. The source water from Niles well had 1,600 MG/l Total Dissolved Solids with the MCL for TDS being 1,500 MG/l. (10/16/12). Independent 2013-14 testing should include testing of all of NASA's metal COC's without using a filtering methodology. I have been told that the water from these wells is not filtered at all just blended. Independent testing of these two drinking water wells for all NASA COC's should be done this upcoming rainy season 2013-14 to insure that NASA's COCs have not impacted these drinking water wells after NASA's five decades of activities up on the SSFL mountain above these wells located in Simi's valley floor</p>	<p>NASA is developing characterization plans to further address the groundwater beneath SSFL and, in cooperation with the overseeing regulatory bodies, will continue to evaluate the nature and extent of COCs that are detected.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mary	Wiesbrock	<p>There needs to be a separate analysis on the impacts to the earth. If the backfill material comes from an offsite area, it will not be of the same geological composition as the existing NASA property's Chatsworth Formation's alluvial sediments and the Cretaceous Chatsworth Formation of imbedded sandstone and shale. The cleanup alternative limited only to background will change a significant amount of native soil: 105 acres of earth from 2 to 20 feet down. This significant environmental impact needs its own separate analysis. The amount of imported soil of a different composition will significantly alter the existing flora of the area and this in turn impacts the fauna. The non-native backfill soil needs properly analyze as to amount, locations, and the impacts on biota adequately determined.</p>	<p>The EIS analysis shows that removal of large amounts of soil causes a significant impact to biological resources; however, NASA is required to cleanup to standards that require the removal of large amounts of soil. NASA will evaluate the potential sources of backfill soil to evaluate if the requirements of the LUT values per the AOC can be met. The quantity and quality of the available soil will be evaluated now that DTSC has provided LUT.</p>
Mary	Wiesbrock	<p>A spring survey is needed. The biological analysis is grossly inadequate. The surveys were done in the fall. "Many of the plants, especially flowering plants and grasses were senescent, and migratory breeding birds were not present in the study are. "Bird species raising their young, including the raptors, will be best observe in the spring time when the surveys should have been done. A spring study is even recommended to "provide a more comprehensive inventory of wildlife within the study are". (D-23) A least Bell's vireo, a federal and state endangered species, was found in the fall survey, but a nesting pair could have been missed because no spring survey was done.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mary	Wiesbrock	<p>4.4.1.1 This EIS should not limit its discussion to just the sensitive species. All wildlife species should be listed not just the sensitive federal species. One should not have to look at Appendix E for the animal species which were found and include: 11 butterfly species, 12 reptile and amphibian species, 60 bird species, and at least 15 mammal species including the top predator, the mountain lion. Even this list is not complete because doing only fall surveys were done.</p>	<p>NASA does include and analysis of impacts on wildlife in general in Section 4.4.</p>
Mary	Wiesbrock	<p>The wildlife corridor map (Figure 3.4-2) is incorrect as it has the vast majority of the wildlife corridor outside of the NASA property. This grossly inaccurate map should be eliminated from the document. Ever since the NASA activities have been halted, the entire 400 plus NASA acreage has become part of the major wildlife habitat and corridor which serves our national park, the Santa Monica Mountains National Recreation Area (SMMNRA). "Wildlife moves between the SSFL and SMMNRA without regard for jurisdictional boundaries." (SMMNRA letter, April 19, 2013 to Mr. Armenta of the Santa Ynez Band of Chumash Indians)</p>	<p>NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mary	Wiesbrock	<p>The document is inadequate in that it does not analyze the cleanup alternative impacts to the various habitats. Sensitive and protective habitat was wrongly eliminated from further consideration (Table 2.5-1). Federal agencies are required to avoid destruction or adverse modification of designated critical habitat under Endangered Species Act. By the fact that only fall surveys were done, this document can't make the statement that there is no designated critical habitat within this NASA property. (Page 2-42) This inadequate analysis of sensitive habitats proves that a joint EIS/EIR is needed at this time. Then state agencies can weigh in on this project to properly protect the habitats, flora and fauna considered sensitive by the state.</p> <p>There needs to be an overlay map of the PRAs (map figure 2.2-3) with the vegetation cover type map. (Figure 3.4-1.) Are there impacts to the coast live oak riparian forest (NASA total 9.16 acres) and coast live oak woodland (NASA 13.22 acres)? How are chaparral and coastal sage scrub habitats impacted? How are the grasslands and other sensitive habitats within the NASA study area which provide "important foraging and nesting sites" (D-23) impacted? Another alternative, cleanup to suburban residential, should be analyzed since it will reduce these significant (not moderate) impacts to all sensitive habitats and the biota.</p>	<p>Thank you for taking the time to provide comments on NASA's DEIS. NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. The surveys are scientifically defensible and representative of existing conditions. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands.</p> <p>NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the US Fish and Wildlife Service, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ruth	Wilburn	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ruth	Wilburn	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Willer-Vescio	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Eric	Wilson	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

First Name	Last Name	Comment	NASA Response
Mary	Wilson	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mary	Wilson	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mary	Wilson	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Mary	Wilson	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Rev. Jennifer	Witten	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Rev. Jennifer	Witten	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Rev. Jennifer	Witten	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Richard	Wittman	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Hollace	Wood	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Jacqueline	Young	<p>It has become apparent that NASA wants trucks loaded with hazardous (radioactive and poisonous) and non-hazardous soil sent out without notification and/or compensation to the City of Los Angeles and the West Hills Community.</p>	<p>Notification to local residents or governments is not part of an EIS evaluation.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	I believe Topanga Canyon Blvd. Valley Circle and Roscoe are not rated for the weight of dump trucks. Were these problems investigated? Were the streets restored?	The project would require a permit from the City of Los Angeles Bureau of Street Services for any overweight, overwidth, and/or overheight vehicles. As part of the permit requirements, the vehicles may be required to provide signs and pilot cars, to follow restricted hours, and be subject to inspections. Permits for vehicles weighing 75 tons or more require approval from the Bureau of Engineering/Bridge Structural. The truck route is also subject to approval by the Bureau of Street Services. An approximately 0.5-mile length of Roscoe Boulevard, from Fallbrook Avenue to Woodlake Avenue, is restricted by the city from overload hauling. There are no restrictions on Valley Circle Boulevard or Topanga Canyon Boulevard. During the permit approval process, the City will evaluate whether the overload movements could be made safely, without damage to the pavement or undue interference with traffic, and may issue a waiver to haul on Roscoe Boulevard. If a waiver is not issued, then an alternate route would be selected.
Jacqueline	Young	How many truckloads total have been sent down Valley Circle to Roscoe, and through the West Hills area? What risk will the sending of new trucks cause our West Hills stakeholders/constituents?	For NASA's estimate calculations, the capacity of soil to be transported in each truck is 19 cubic yards. Thus, for 500,000 cubic yards of soil, that is more than 26,000 truckloads. Additional trucks will be needed for backfill and for hauling demolition materials. Round trip trucks are estimated to be between 75,000 and 80,000. The impacts of truck traffic are discussed in Section 4.5 of the DIS.
Jacqueline	Young	When is West Hills to be notified that waste is being driven through its streets? Hopefully before, not after. We want a schedule to be negotiated with stakeholders.	NASA will make every effort to post transportation schedules and routes prior to the work being performed. These schedules will only be estimates, because work conditions dictate the timing. No AOC-related cleanups are planned to occur prior to 2016.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	Cost evaluation?-Both due to constant wear on city streets and in case of necessary clean up. We want repair of street damage.	Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that go toward road maintenance.
Jacqueline	Young	Establishment of a fund for cleanup if necessary and for resurfacing streets. When a spill or accident happens on L.A. City streets. Who pays?	<p>Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that go toward road maintenance.</p> <p>NASA is responsible for hazardous wastes it generates. If a spill occurred during transportation of those wastes, NASA would be responsible for the cleanup.</p>
Jacqueline	Young	Health/Safety to the West Hills Community--both vapor and spill possibilities may occur. What plans exist for treatment?	The EIS addresses impacts from truck transportation in Section 4.5 and MMs such as air pollution, noise, and traffic related to transportation of materials. Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, reporting, and record keeping.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	Establishment of Risk to my community. Vapors, accidents, possible spills? The waste material that was accumulated on the Santa Susana Hill was not collected in L.A. It was created in Ventura County and they should bear the constant wear on streets plus the possibility of accidental exposure to their community.	NASA has explored techniques for reducing the amount of material to be moved offsite. The EIS addressed other impacts and MMs such as air pollution, noise, and traffic related to transportation of materials to the landfills. NASA recognizes that there will be damage to roadways as a result of the project. Road repairs are identified in Section 4.
Jacqueline	Young	Why are trucks being taken through West Hills at all? Can NASA be directed to stop all trucks being driven through West Hills?	Section 4.5 of the EIS discusses possible routes to transport materials to disposal facilities. These routes are limited.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	If no other way can be taken, could a directive be made that NASA reimburse the community for wear on the roads? I know that potholes on Roscoe have been recently filled at cost to the City of LA Department of Transportation. Can an insurance fund be created to pay damages or then transferred to street costs?	Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that help fund road maintenance. Jurisdictions manage potential impacts and their resources for making repairs and improvements by requiring permits for major projects. The project will obtain all necessary transportation permits for truck travel on city, county, and state roadways. As part of Traffic MM-2, NASA would survey Woolsey Canyon Road conditions prior to the commencement of work and would repair damage caused by its demolition and cleanup activities. NASA would seek to enter into an agreement with Boeing and the DOE to share this repair work.
Jacqueline	Young	Local schools, senior facilities, and hospitals should be notified of the time that these trucks will impact our traffic, so they may adapt to the NASA schedule. I would like a specific and current schedule linked by NASA to the West Hills NC website. Better yet, could NASA create its schedule based on those of the local schools, senior facilities, and hospitals?	Notification to local residents or governments is not part of an EIS evaluation.
Jacqueline	Young	If the City does license this transfer, I would like a fund created that allows for possible cleanup in case of accident and for street improvement if it becomes necessary	NASA is responsible for hazardous wastes it generates. If a spill occurred during transportation of those wastes, NASA would be responsible for the cleanup.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	I would like an investigation of the possible risk to public health created by the transportation of radioactive and/or contaminated soil by NASA. What gases/hazardous vapors are possibly being released in West Hills? What is the risk in terms of traffic created?	<p>As a BMP for efficient and safe traffic management, a N-CTCP will be developed; similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p> <p>Measures to avoid health risks from hauling of contaminated soils will be employed such as mitigation of truck dust by covering the truck loads, trucks will be rinsed off prior to travel off SSFL, and NASA will follow current procedures for hauling materials.</p>
Jacqueline	Young	What traffic studies have been created?	No studies were generated as part of this evaluation. Traffic studies and data collected by others were included in Sections 3.10 and 4.5 of the DEIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	I would like the City of LA or the WHNC to investigate the emergency plan NASA has used to instruct drivers. Is it adequate? How are drivers to address a spill or an accident? Who has liability? How does that impact LA or West Hills? Let's decide now. Do the facilities have the funds for clean-up exist?	NASA will comply with the CTCP during the implementation of the demolition and environmental cleanup activities. The safety measures identified in the CTCP should be sufficient to cover traffic-related incidents. As detailed in the EIS, after trucks leave Woolsey Canyon Road, project-related traffic is negligible as compared to the existing traffic levels. Therefore, typical incident response procedures should sufficiently address transportation-related needs.
Jacqueline	Young	Has West Hills Hospital been informed of the possibility of this problem? It could create a massive treatment problem for them.	The DEIS notes that the impact of the additional truck traffic on safety is minor. This aspect should not affect local hospitals.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	<p>My major concern is that, as far as I'm concerned, there are no alternatives given except to come down and go through communities that did not create this mess and they're stuck with it. And I don't think that's fair. I don't know what the fair solution is, but I thought when we were studying alternatives we were really studying alternatives. And now, the only alternative seems to be trucks. And I don't find that an acceptable alternative. I don't find it acceptable because I think it wasn't -- contamination wasn't created in Los Angeles County. It was created in Ventura County, and therefore it should be not in Los Angeles County where you're taking your trucks. I think your trucks should replace any wear and tear on roads caused by the trucks. And I think the trucks are going to be a quagmire.</p>	<p>Section 2.4 in the EIS discusses alternate transportation considerations (1) overland conveyor and rail transport of soil; (2) build a new haul road (3) truck from site to rail and transport by rail to disposal facility.</p> <p>(1) NASA considered alternative rail or conveyor system for hauling materials from SSFL. The analysis showed that a conveyor system would require building the system over private land and constructing a railroad facility to keep trucks off the local roads. NASA concluded that the system could not be built in the AOC timeframe requirement, there could be opposition to acquiring rights-of-way over private lands.</p> <p>(2) NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements.</p> <p>(3) NASA considered a truck-rail combination for soil disposal. Using existing local roads to rail would not alleviate traffic on local community roads.</p> <p>Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p>
Jacqueline	Young	<p>I know that West Hills Hospital has not been concerned -- or not been contacted about what happens if there's a big spill or what happens if there's a big accident.</p>	<p>Part of the route of the truck route is on a steep, windy road with some blind curves, which would require special care to avoid accidents. Section 4.5 provides detailed information about truck traffic and safety.</p> <p>As expressed in the EIS, after trucks leave Woolsey Canyon Road, project related traffic is negligible as compared to the existing traffic levels. Therefore, typical incident response procedures should sufficiently address transportation-related needs.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	<p>And I don't think there's even been a safety plan constructed. There has been one for on site, but how about off site? Don't we deserve a safety plan? And while we're talking about safety, how about risk to those people in the community that you're driving these trucks through? How about the Woolsey Canyon people and every place along Roscoe where people are going to be -- have possible risk? And if none of this dirt is contaminated, why are we taking it all out?</p>	<p>As a BMP for efficient and safe traffic management, a N-CTCP; similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p> <p>In the United States in 2010, large trucks accounted for 4 percent of all registered vehicles and 10 percent of the VMTs. These large trucks accounted for 8 percent of all vehicles involved in fatal crashes and 3 percent of all vehicles involved in injury and property-damage-only crashes. In California, trucks were only involved in 6.5 percent of fatal crashes in 2010—less than the national average (U.S. Department of Transportation, 2012). The overall crash rate in the U.S. for all vehicles was 1.22 fatal crashes per 100 million miles traveled and 20 injury crashes per 100 million miles traveled.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	<p>I don't think there are reasonable alternatives and it's a -- and one of the alternatives should not be trucks down the mountainside. I think we need to look at the other alternatives that were suggested and look at them closely, and the EIS should have come up with that too.</p>	<p>Section 2.4 in the EIS discusses alternate transportation considerations (1) overland conveyor and rail transport of soil; (2) build a new haul road (3) truck from site to rail and transport by rail to disposal facility.</p> <p>(1) NASA considered alternative rail or conveyor system for hauling materials from SSFL. The analysis showed that a conveyor system would require building the system over private land and constructing a railroad facility to keep trucks off the local roads. NASA concluded that the system could not be built in the AOC timeframe requirement, there could be opposition to acquiring rights-of-way over private lands.</p> <p>(2) NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements.</p> <p>(3) NASA considered a truck-rail combination for soil disposal. Using existing local roads to rail would not alleviate traffic on local community roads.</p> <p>Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p>
Jacqueline	Young	<p>I think it's very arbitrary to say 2017 when we've been dealing with this problem forever. And all of a sudden, oh, it's got to be done by X. I don't think it's got to be done by X. I don't think that's one of the alternatives that should have been chosen.</p>	<p>The 2010 AOC between DTSC and NASA says "The schedule shall ensure that the identified activities can be accomplished by 2017 or sooner." This can only be changed by mutual agreement with DTSC. NASA will meet with DTSC to seek clarification of this requirement.</p> <p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jacqueline	Young	And I also think that we have a situation where we need money to back up if there's any kind of a problem with these trucks. We need money to -- some kind of a fund to be created, whether it's through insurance or through the City of Los Angeles or what. There needs to be a fund created to help people if they should have a problem.	NASA is responsible for hazardous wastes it generates. If a spill occurred during transportation of those wastes, NASA would be responsible for the cleanup. Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, and reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that go towards road maintenance.
Jackie	Young	1. There are more than two options; saying there are only two negates our planning evaluation of options. 3. There is no apparent realization that a combination of options might be best, even though we can may need to extend the timeline to allow for in-situ options.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Jackie	Young	2. 2017 was chosen for us rather than chosen with an opportunity for input to the timeline chosen.	The timeline is driven by DTSC's requirements as embodied in the AOC.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jackie	Young	<p>4. Trucks should come with a timeline giving days and times trucks will be in the neighborhood, how many etc. to be given by NCs to leaders of schools, hospitals, or senior homes to be distributed on a "need to know " basis so facilities may change start times if necessary.</p> <p>5. Trucks should include a safety plan stating the responsible party and including the financing for insurance if trucks have an accident or spill.</p> <p>6. Deep investigation of alternative styles of transportation and their routs.</p>	<p>Truck operations (and schedules) will be conducted according to information provided in the EIS. Typically trucks will run from 7 am to 7 pm.</p> <p>As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. Jackie	Young	7. We must have emphasis on human risk, and that must be part of the calculations and part of future investigations and AOCs.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Terry	Young	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Terry	Young	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Robert	Younkin	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Rich	Yurman	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Laurence	Zakson	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ralph	Zelman	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ralph	Zelman	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anthony	Zepeda	<p>In essence, this commitment is to return the site to its natural condition before NASA polluted it. This agreement was widely supported in the community - 3700 comments in favor of the agreement came in, compared to opposition from a handful of people. ... But it is critical to remember that the AOCs went through two public comment periods, and by a ratio of more than a hundred to one the AOCs were strongly supported.</p>	<p>Your comment is noted.</p>
Anthony	Zepeda	<p>Nonetheless, there have been some concerns that NASA signed the AOC with its fingers crossed behind its back and would try to break out of the legally binding agreement it executed. NASA, however, has repeatedly stated formally that it is committed to its full obligations under the AOC. This community will hold NASA to those promises.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anthony	Zepeda	<p>The Draft EIS is being performed under the National Environmental Policy Act, or NEPA. There are a number of aspects of the Draft EIS which do not appear to be in conformance with NEPA, and which raise questions as to whether some at NASA are working at cross purposes to the agency's commitment to its AOC obligations.</p> <p>The most puzzling aspect of the Draft EIS is its virtual complete silence about the very core of what it is to examine - the toxic contamination of the site which needs to be cleaned up. It acts as though the only issues to examine are what are in fact the ancillary impacts, impacts that would exist if there were nothing toxic at all about the pollutants NASA's irresponsible actions over the decades spilled and released. It almost looks as though some at NASA are trying to scare some in the community into giving NASA cover to break its agreement. This would be a violation of NEPA, which requires a dispassionate review of environmental impacts. But by talking endlessly about trucks and being completely silent about toxic contamination with dioxins, PCBs, VOCs heavy metals, perchlorate, etc., a straw man is being set up. If NEPA bars anything, it is the misuse of an EIS as a straw man.</p> <p>...NASA was a bad environmental steward. It has now promised that it has "got religion" and will responsibly cleanup the contamination it created. The Draft EIS in its current form does not demonstrate that this is the case.</p> <p>The EIS needs to be rewritten to disclose the full toxic contamination of the site, in as much detail as has been used for the ancillary issues it focuses instead on.</p> <p>Diversionary and misleading discussions should be avoided. For example, all the endless discussion of trucks while one is silent about dioxin and perchlorate and PCBs is a sign of an agency failing to follow NEPA appropriately.</p> <p>The EIS says something like 53 trucks trips per day would occur to haul off contaminated soil if there is no on-site treatment and 34 trucks if there is</p>	<p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place, and also will include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anthony	Zepeda	And yes, one should focus on successful on-site treatment where possible.	NASA considered a range of soil cleanup technologies, and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3, Soil Cleanup Technologies, of the EIS.
Anthony	Zepeda	The EIS admits that the contaminated areas are largely areas where the natural vegetation was long ago removed and buildings constructed on graded land. Thus cleaning the contamination would have limited effect on vegetation and animals, which should be revegetated in any case after remediation. Leaving flora and fauna to be contaminated with dioxins, PCBs, heavy metals, etc. of course makes no sense; cleanup will help nature as well.	NASA acknowledges your comment.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anthony	Zepeda	<p>The EIS asserts that a fraction of an acre of soil may need to be cleaned up near the Burro Flats cave paintings. It is hard to conceive that NASA contaminated soil inside a cave, and surely that isn't what you are claiming. But in any case, NASA knows full well that under the AOC, NASA does not have to clean up to background anything that could result in damaging a recognized Native American artifact. The EIS should make crystal clear that there will be no impact on the cave, as the AOC expressly exempts cleanup that could impact such an artifact.</p>	<p>The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. The potential 0.65-acre impact from cleanup activities would be outside the National Register boundary, but within the Archeology Resource Management Area. NASA and DTSC will have to come to an agreement in regard to which areas are covered under the exception clause in the AOC and the clause referencing Native American artifacts.</p>
Anthony	Zepeda	<p>NASA in the draft EIS raises the question of not demolishing numerous contaminated NASA structures at the site such as the test stands. This makes no sense. They are the center of contamination. The soil underneath them is contaminated. One cannot clean up the soil, as required under the AOC, without removing the test stands and other structures. If NASA really wishes to consider not demolishing these structures, it needs in the EIS to identify how it will clean up the contaminated soil beneath them. (Furthermore, it just isn't realistic to leave them in place. The health and safety risks and insurance liability problems of rusty, falling-down iron hulks being left for people to hurt themselves on just makes this a non-starter.)</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anthony	Zepeda	The pollution puts at risk the people living nearby. Contamination has already migrated offsite-perchlorate found in Simi wells, TCE plume leaving the property, constant violations of the NPDES pollution discharge permit with hazardous material going offsite hundreds of times at unsafe levels.	<p>NASA respects public concerns regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as to include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>
Anthony	Zepeda	NASA promised to clean it all up. It must live up to its promise. Fully comply with the AOC. Revise the draft EIS to do an honest job of reviewing the contamination you created and your obligation to remediate it. Live up to the commitments you made to these communities to remove the toxic dagger aimed at their hearts.	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site. In December 2010, NASA entered into the AOC with DTSC. To meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Ronald	Ziman	<p>Preserving SSFL’s cultural and historic resources creates the opportunity for SSFL to become an open “space” park, allowing the wildlife corridor, the Chumash archeological sites, sacred sites and TCPs and our monuments to missile development and space exploration to be seen and admired. The preserved Chumash sacred sites serendipitously prophesize NASA’s later use of the same land. Such an open “space” park gives further opportunity to showcase a living demonstration laboratory for innovative, experimental and proven decontamination strategies and techniques under the administration of the National Park Service. Academic institutions could become involved under a competitive system to apply their ingenuity to further the decontamination effort. Properly structured, financial resources could be identified and admission fees instituted to help sustain it. This plan illustrates responsible government leadership to protect both the environment and the people. This would be applauded as the Federal Government exhibiting demonstrable vision in its stewardship of this special land and preservation of its unique cultural, historical and environmental resources.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>I am deeply disturbed by its rationale, structure and conclusions. This document is severely limited and flawed. I recommend that it be rewritten and then resubmitted to the public for further comment. Among other things,</p> <p>your DEIS is in conflict with NEPA and CEQA. Further there are no alternatives besides “all or none,” neither of which addresses the area appropriately and are definitely unsatisfactory to my community. How an EIS can actually recommend either placing the public and environment at serious health risk or have “no action” as the only other alternative when a clean up is indicated and has been promised for years is beyond me. This appears to be bureaucracy at its worst.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>
Ronald	Ziman	<p>The OIG report of 2/14/13 clearly stated that funding a \$200,000,000 clean up for SSFL may “not be feasible” and yet that is the very cleanup you are proposing. A less strict and perfectly acceptable EPA risk based cleanup standard is estimated by the OIG in their same report to cost \$80,000, a sum much more likely to be funded. Based on that, I can only conclude that NASA is not serious about doing any cleanup given that “no action” is the only other possible alternative presented if your “all” proposal is not funded.</p>	<p>NASA has signed multiple agreements regarding the cleanup of the SSFL site and remains committed to meeting the obligations of those agreements.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>Nothing in the letter you received from the CEQ requires you to exclude other alternatives. It simply states alternatives need not be mandatorily included. I have to believe that Barbara Boxer, who has fought both for the environment and at the same time the “strictest cleanup ever” in the interest of public health, has been misled and is now working at odds with her own core environmental principles. Laying waste to 105 acres of earth is catastrophic and when of that magnitude will take decades, if not centuries, to heal. There will be multiple negative consequences, many likely unforeseen, to the public and the environment. These 2 incongruities, advocating for an overly strict and rigid clean up which will be harmful to all and at the same time representing oneself as a defender of public health and the environment is irreconcilable. I will be contacting her about this very issue shortly.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Ronald	Ziman	<p>Senator Boxer’s letter doesn’t even mention the 2017 date or give a timeline by which the cleanup is completed. The Consent Order of 2010 indicates that the cleanup methods should be in place by 2017, but to expect cleanup to be complete by then is not realistic and yet appears to be driving the process. The apparent rationale to remove rather than treat soil directly relates to the “self imposed” 2017 deadline for clean up. There is no reason the cleanup must be completed by 2017 other than an agreement between NASA and DTSC (the AOC) that includes a mechanism for modification and is severable. Mutual agreement of the parties is the only requirement. Mutual agreement is conveniently ignored despite it being part of the CEQ letter to Senator Boxer.</p> <p>Similarly the emphasis of coordination between NASA and the State to optimize the CEQA and NEPA processes also included in the letter and quoted above are “forgotten.”</p>	<p>While schedule is certainly a driver, most technologies were eliminated simply because they cannot treat the contaminants to a point. According to soil sampling data, the vast majority of contaminated areas on NASA-administered land at SSFL consist of approximately the top 2 feet of soil containing non-treatable chemicals. Although some of the deeper soil contains non-treatable contaminants, much of it has the potential for treatment. This determination of non-treatable verses treatable soils does not need to take into account the risk to human health or the environment. It is simply a question of the ability of the technology to breakdown or remove the contaminant from the environment. The judgment of its effectiveness normally is based on residual exposure risk, but for this case, it is judged on its ability to meet the 2010 AOC cleanup requirements (LUTs). Ongoing studies will help evaluate if any of these technologies will prove effective.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>While the land is destroyed, including its archeological resources, and the test stands are dismantled, erasing the space history that is so rich and comprehensive at the SSFL (from the Redstone and Atlas rockets to landing men on the moon and the space shuttle), the very laws and their associated report mechanisms designed to protect haven't even been drafted or considered before destruction occurs. By the time there is a document addressing what to preserve, all will have been removed. What logic is there in that? Is that taking your charge and responsibility as stewards of space and its history seriously and responsibly? It appears that the very processes that are intended to be coordinated have purposely been disconnected. There is no other explanation for your blatantly ignoring the law and the advice given in the CEQ's letter quoted above.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Ronald	Ziman	<p>How can one know what to preserve if the end use of the land has not yet been determined. NASA has made no attempt to balance the financial costs, cultural costs and costs to the environment, all mandated by NEPA and CEQA. Though it may be expedient to tear everything out, including the ground itself, creating a Tabla Rasa, it would seem, given the rich resources that exist there, rather than a Tabla Rasa, NASA, California, and future generations would be better served to preserve the physical monuments to this history. How does anyone know what to preserve if there is no discussion about ultimate long term land use?</p>	<p>To provide time for future use determinations to develop, NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as NASA determines whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>The Alpha, Bravo and Coca test stands should all be preserved. They each represent a unique part of the history of the cold war and later the space age where all are inextricably linked. Some of the test stands are considered to qualify for registration in the National Registry of Historic Sites, yet this is ignored. The Burro Flats Cave and its acknowledged remarkably rich and exquisitely preserved paintings, currently registered, is placed in jeopardy by the clean up. Other caves and known sites are similarly put in harms way for no reason.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA will include an additional demolition alternative in the FEIS which would avoid the demolition of a test stand and associated control house. The identified archaeological resources will be avoided where possible, and NASA will develop an inadvertent discoveries plan.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>This wanton “scorched earth policy” is beyond any rationale. To me and my neighbors, it appears to be almost cruel and vindictive. Who are you hurting other than the environment, the people and future generations of Americans and foreign visitors who should be educated, see, learn and understand this amazing and diverse history? All these resources: the test stand and significant associated structures, Indian sacred sites, TCPs and archeological areas could and should be preserved within the AOCs. I am shocked at the apparent disrespect and irreverence of NASA and the US Government, ignoring all safeguards to protect tangible treasures of prior millennia. The ancient Chumash people gazed at the stars, recorded their observations and dreamed of visiting. Ironically, within steps of their past, what would have appeared to them to be fire-spitting “gods” were conceived that actually transport man to the heavens.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>The cleanup of soil is astronomical (pun intended) with unfortunate and irreparable astronomical consequences. 80,000 truck trips to transport soil removed from 105 acres with the demolition debris of multiple structures added. Removal of this soil unavoidably removes all the plants and biota. Seeding with native plant species sounds all well and good, but no one knows if the natives will grow in soil with different biota and chemical characteristics that comes from another area. How inviting will this barren soil be for non-natives? Where is the soil coming from? That is not known at this time. Is there even enough soil to obtain that would replace 30% of what was removed? The 30% is a maximal amount. It could turn out to be less. What are the consequences to this? Where are they addressed in the DEIS?</p>	<p>The following potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California:</p> <ul style="list-style-type: none"> • P. W. Gillibrand Company, located in Simi Valley, California • Rindge Dam, located in Malibu Canyon, California • Santa Paula Materials, Inc., located in Santa Paula, California • Grimes Rock, Inc., located in Fillmore, California • Tapo Rock and Sand Products, located in Simi Valley, California <p>These soils will need further evaluation to determine if they meet the 2010 AOC requirements. Evaluations as to the impacts of replacing with non-SSFL native soils are discussed in Section 4.4.1.3 of the EIS which says - "Once the soil was removed, the existing micro-ecosystem might never be restored. It can take years for native species to reestablish in disturbed areas, and the species composition would be different from what was originally there, despite reseeding with approved native plant seeds. Whenever possible, topsoil would be imported, along with backfill, to replace the remediated topsoil; however, the sources of native topsoil within the vicinity of SSFL are limited and are unlikely to supply enough topsoil to replenish the entire 39-acre area. If non-native soil were to be used, it would be unlikely to support the current plant distributions on SSFL. The impacts to native vegetation communities on SSFL from excavation of non-treatable soils to meet the LUT requirements would result in significant, negative, local, and long-term impacts (Biology Impact-2d)."</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>Erosion from wind and rain will be substantial and unavoidable. Dust, not only from the trucks but from the prevailing north to south winds will carry infectious Valley Fever organisms (Coccidioidomycosis) and other pathogens into neighboring inhabited areas.</p> <p>Outbreaks of Valley Fever increase even after an earthquake. Removing plants and soil, and then replacing only part of the soil while hoping that native rather than non invasive species will grow and take hold in time to avoid disease is wishful thinking at best. As a physician I have had the unfortunate experience of caring for those with Valley Fever.</p> <p>Once acquired it is present for life and can kill despite the most aggressive treatment.</p> <p>For those who develop involvement of the central nervous system it is not only incurable, but results in the need for continuous treatments with toxic medications that are painful to administer directly into the spinal fluid. This is no minor matter. I have not seen this discussed anywhere in the NASA DEIS despite the fact that coccidioidomycosis is endemic in the San Fernando Valley and I am sure in the SSFL soils as well. Has it even been looked for there?</p>	<p>Valley fever is caused by a fungi, <i>Coccidioides immitis</i> or <i>Coccidioides posadasii</i>, found in arid desert soils. When the soil is disturbed, spores are released into the air and can be carried on the wind. People are exposed when they breathe in the spores. Most people who are exposed do not get sick; however, valley fever can cause flu-like symptoms and, in rare cases, cause meningitis and even death. The soils at SSFL have not been sampled for the fungi that cause valley fever. To meet the AOC cleanup requirements, approximately 500,000 cubic yards of soil will be disturbed. If cleanup alternatives other than soil removal could be used, the amount of soil disturbed would be reduced by approximately 180,000 cubic yards and the dust emissions reduced by approximately 19%. Release of dust during remediation and demolition will be controlled by wetting the soil, limiting the stockpile area to 0.14 acre and height to 8 feet, covering roads with gravel, etc., limiting speed of vehicles, placing tarps over or barriers around stockpiles of soil, ceasing loading during high winds or storms, and removing bulk material from trucks. After remediation, the previously vegetated areas will be planted with a native seed mix.</p>
Ronald	Ziman	<p>There are other organisms of concern that are also not discussed. Stagnant pools related to improper drainage from the extensive soil excavation enhance breeding for mosquito transmitted viral diseases such as Avian Flu and West Nile Virus. This impact is similarly ignored. The risk of other illnesses, such as equine encephalitis, will likely rise, not only for horses, but also people. Flies breeding in the stagnant pools carry parasites and other diseases. None of this was addressed in the DEIS. Changes in topography and water related soil erosion will choke the streams and creeks that come off the SSFL mountain into neighboring areas. Multiple deleterious and unforeseen consequences related to alteration of the stream beds have not been considered.</p>	<p>The analysis shows that excavation of large amounts of soils will have significant impact of biological and soil resources. Even though, the original topography may never be restored, NASA plans to restore the topography as much as possible. The availability of soils that meet the cleanup standards and the indigenous biological system may be limited preventing full restoration. NASA plans to prevent erosion during cleanup by wetting the soil, using covers</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>The topography will be completely altered and with it the surface water flow and percolation needed to recharge ground water. The aquifers have not been adequately characterized and we are already seeing the “law of unintended consequences” related to the GWIM and pumping at the WS-09A well on NASA’s property. The aquifer’s water is being purposefully removed to lower the water table to dry the seeps and springs.</p> <p>Now Bell Creek, an historically perennial creek, is dry. Its well developed canopy with rich understory is not just in jeopardy, but dying. What will be its fate and state after erosion chokes the creek and the groundwater recharge is altered in unknown ways?</p> <p>How will these changes impact the character of the creek? Will it be better or will it destroy this fragile and beautiful habitat? What consequences will occur to the animals that use the creek and its water as part of their habitual migration? Has this really been investigated and adequately addressed in the DEIS? I not only think not, I know not, it has not.</p>	<p>The regulators are working with the SSFL parties to examine the Bell Creek drainage issues.</p>
Ronald	Ziman	<p>The SSFL is a critical point within the migration pathways connecting the coastal range to the inland forests and other wilderness areas. How will the animals fare when the land has been denuded, the plants eliminated, the soil biota completely changed and surface water and groundwater hydrology altered in ways that are not predictable? Open moon-space does not sustain the animals. It is not habitable for them any more than it would have been for the Chumash ancestors. No good will come of this cleanup as far as the animals and plants are concerned -- so much for the environmental concerns that are central to the title and purpose of this report.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>The impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area. The EIS text will be revised to reflect the migration corridor may include SSFL (Sections 3.4.2, 4.4.1.2, and 4.4.1.3).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>How can mitigation of impacts be addressed when alternatives are not even included for consideration? Titling this document an “Environmental Impact Report (EIS)” has never been truer, but all the impacts are negative without considering any alternative mitigation that is normally included to protect the people and the environment. A supposed goal of government is to protect and preserve the environment for posterity. The proposed actions are going to do just the opposite.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Ronald	Ziman	<p>What of the damage to our roads, the predicted fatalities along the routes, the potential for contamination from trucks, the diesel pollution from the trucks themselves and the multiple deleterious impacts they will have on the neighborhoods and its inhabitants as they go through? All negative health and property impacts directly related to the way the cleanup is proposed, the dimension of which is multiplied further because of the arbitrary 2017 goal of soil cleanup. Actually the soil is really not being cleaned. It is being moved to another location, contaminating and polluting along its travel route, exposing ever more people to hazardous materials and then ultimately contaminating another area.</p> <p>Where is the justice to the community or the environment from this action? Add to this the cumulative burdens from Boeing’s and DOE’s cleanup efforts. How do you spell disaster? Answer: NASA DEIS.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>The “decontaminated,” scarred and damaged land left behind would clearly be subject to “recontamination” as a result of the less strict clean up standards being applied to the adjacent Boeing owned property. Contamination will obviously be transported by air and water to properties neighboring Boeing including the NASA owned area at the SSFL as well as neighborhoods surrounding the SSFL, Bell Canyon among them.</p>	<p>The fact that Boeing's cleanup standard is different from NASA's is one of the many difficulties in implementing the 2010 AOC. NASA recognizes that there could be migration or cross-contamination of contaminants from Boeing areas at SSFL. NASA is working with DTSC (and with Boeing and DOE) to develop methodology to better implement this aspect of the AOC.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>To be applying 2 different cleanup standards within the same overall property makes no sense. This AOC defined NASA cleanup is to an impractical standard that has never been done anywhere else in the world – and probably never will be again. It is an arbitrary and impractical standard relative to public health and the environment. This cleanup standard is without justification. Simply put, it is irrational. In the name of clean up that has no rational basis you are destroying that which you are charged to protect and preserve. You are proposing to remove everything, destroying the environment and its unique history and irreplaceable archeology and, at the same time putting public health at risk. How can those who authored this document or those who have presented it maintain a straight face? What is needed is a rational, scientifically sound, risk based clean up.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	<p>If I were to grade my property I would need to file a grading plan and water drainage plan with Ventura County. Yet we are presented with a plan involving an area hundreds of times larger than my lot, to be “graded” in an indefinite way. There really is no grading plan or drainage plan. It is not known if soil meeting the impossibly strict cleanup standards can be located to replace a mere fraction of what is to be removed.</p> <p>Considering the severity of the consequences, how can this all simply be allowed to happen? Alternative methods must be considered to effect a practical level of clean up that is risk based, not based on an arbitrary and overly strict standard that is beyond any clean up done anywhere in the world.</p>	<p>The EIS identifies significant impacts to four areas (potential for soil erosion, cultural resources, damage to biological resources, and impacts to roadways) along with other concerns (such as air quality, water resources, and health and safety). NASA believes that soil erosion can be mitigated through good stormwater management practices. Impacts to roadways can potentially be reduced, but not eliminated, if onsite soil treatment technologies are proven to meet 2010 AOC requirements. Cultural and biological resource impacts can only be reduced by minimizing the required cleanup area. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald	Ziman	SB990 was struck down in part because of its arbitrary and unreasonably strict standards that are without peer. The AOCs are partly based on SB990. Applying the same reasoning as was applied to SB990, the AOCs themselves are at risk to be invalidated on the same grounds. Rather than undoing all the years of work that have ultimately brought us to where we are, I propose that the AOCs be preserved -- unlike what the DEIS is proposing for the NASA portion of SSFL. I propose that they be modified to incorporate risk based cleanup standards. The arbitrary 2017 completion date should be renegotiated as indicated by the CEQ, or at the least affirmed the 2010 Consent Order which requires that methods be in place by then. It is unrealistic to expect the completion of soil cleanup by 2017 and NASA should not be held to that. A realistic, achievable deadline should be renegotiated. Clean up can proceed over however many years with alternative sometimes serial in situ and ex situ techniques applied to the soil that would be far less destructive to the environmental, cultural and historical resources.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Ronald	Ziman	Inherent in NEPA and CEQA is the end use. That should define the risk based cleanup standard. Ultimate use is being completely ignored in this DEIS. Given the fact that NEPA and CEQA have not even been started, let alone completed, there is no way to consider those documents' recommendations in this plan. As I said in the beginning, the process has been perverted by disconnecting NEPA and CEQA from the DEIS and the elimination of all but the 2 most extreme options.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Pamela	Zuppo	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lois	Zweben	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lois	Zweben	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
		<p>Through decades of gross violations of environmental rules, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been transported off the property to neighboring areas. Studies have shown elevated cancer rates, both for people exposed on the site and for members of the public living nearby. After years of dragging its feet on cleanup, in 2010 NASA executed a binding cleanup agreement with the State of California, promising to cleanup all the contamination to background.</p> <p>NASA has now published a Draft Environmental Impact Statement on the cleanup. The EIS has created considerable consternation among the affected community, creating, frankly, the impression that, that some NASA personnel are working to sabotage the agreement NASA signed and is pledged to carry out.</p> <p>We want to be absolutely clear that NASA must live up to the AOC, every provision of it, with no effort at evasion or avoidance of obligations.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>The AOC requires all contamination to be removed, but the EIS considers leaving in place old rocket test stands, trying to call them historical. The problem is that that is where much of the contamination is located, in the soil beneath the stands. It is not possible to clean up the soil without getting those rusty structures out of the way. There is no discussion of how NASA could possibly clean up the contamination beneath the rocket test stands without getting them out of the way. Any such consideration should be removed from the EIS.</p>	<p>The test stands sit on top of bedrock which will not be removed during the cleanup. NASA is conducting sampling around the test stands to determine the location of contamination that needs to be cleaned up to meet the 2010 AOC and 2007 Consent Order. NASA is also evaluating in situ technologies that may be capable of removing contaminants without demolishing the structures.</p> <p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p> <p>The test stands have been evaluated and identified as eligible for listing on the National Register of Historic Properties. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. Comments such as yours are considered during that process. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects. Please refer to the PA and/or ROD for further information.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>Similarly, the AOC already provides protections for recognized Native American artifacts. For example, if the Burro Flats cave paintings could be impacted at all by the cleanup, which seems hard to believe, the AOC provides an exception to the cleanup to background requirement. But the EIS goes way beyond the AOC provisions and seems to raise the possibility of just declaring all of the contaminated soil throughout the 2850 acres of the site sacred and implies that then NASA might not comply with the AOC cleanup requirements all. This is unacceptable and would completely violate the agreement, which has an exception solely for artifacts, not some loose claim about the entire property where there are no such artifacts.</p>	<p>The Burro Flats site includes rock features and many soil features. An Indian Sacred Site was declared for the entire NASA portion of SSFL and extends beyond NASA's boundary. In accordance with NEPA and EO 13007 NASA must consider the impacts to the Sacred Site. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts.</p>
		<p>Additionally, the AOC already has provisions that would be triggered if the Fish and Wildlife Service were to issue a biological opinion requiring certain actions to protect endangered species. But the EIS seems to go far beyond what the AOC allows and appears to imply it would like to hide behind vague, generalized consideration of plants and other biological resources and not clean up contamination at the site even though there is no Fish and Wildlife requirement that would allow that under the AOC. This also would violate the agreement.</p>	<p>NASA analyzed the potential effects of cleanup to background on biological resources and recognizes that the impacts could be significant. Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA has been in consultation with USFWS and has coordinated with other natural resource agencies, such as USACE with respect to wetlands. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>NASA concedes that the Council on Environmental Quality, the agency responsible for assuring other agencies comply with the National Environmental Policy Act, directed that the EIS should not include "alternatives" that would involve breaching the AOC. Yet NASA, in the Draft EIS, goes ahead and includes several alternatives that would in fact breach the AOC, and in the guise of "alternatives not analyzed" goes ahead and analyzes them, throwing in inflammatory and inaccurate claims about how much they would reduce truck trips, etc. If NASA cannot keep its word to the White House Council on Environmental Quality, and Senator Boxer, how can the community have faith it will keep its word about the cleanup it committed to in the AOC? All of those non-compliant alternatives and their misleading truck estimates should be removed from the text.</p>	<p>The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL.</p> <p>These alternatives were included for full disclosure to the public to answer questions about the relative impacts of other cleanups allowed at other sites.</p>
		<p>The most egregious part of the draft EIS is its complete imbalance. The site is contaminated with all sorts of toxic materials, in soil, groundwater, and surface water, and the structures remaining at the site. There is almost no discussion of the contamination in the EIS, no real discussion of the environmental impacts of leaving, for example, vast quantities of TCE and other contaminants in the groundwater, a beneficial resource, or of leaving PCBs, dioxins, perchlorate, etc. in the soil. There is no discussion of the scores of violations of pollution limits cited by the Water Board when rain carries NASA's pollution offsite. The "No Action" alternative is almost silent about the real environmental issue here--the huge amounts of contamination NASA has created and which it has an environmental, moral, and legal obligation to clean up.</p>	<p>The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. Based on these and other comments, NASA will amend the Health and Safety section to reflect the impacts of contaminants if left in place (Section 3.9.5).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>There needs to be vast expansion of the discussion of the contamination itself, for example, the health effects of each of the pollutants that has been found at the site. Is it a carcinogen? Does it cause genetic damage? Does it lead to birth defects? Neurological damage? Immune system dysfunction? The great bulk of the EIS should be about the environmental impacts of the pollution damage NASA has done and the need to clean it up and how the No Action alternative would leave all that contamination continuing to damage the environment.</p>	<p>Details about past releases and the nature and extent of the contamination can be found in the RI reports that are referenced in the EIS and available on DTSC's website.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>Each contaminant should be identified; its effects, environmental persistence, transport pathways, etc. fully described. How much of each is where? At what levels? There is no discussion of the UCLA School of Public Health studies finding that the contamination at the site resulted in excess cancers among the workers. There is no discussion of the study by the federal Agency for Toxic Substances and Disease Registry (ATSDR) finding elevated rates of cancers of the bladder, thyroid, aerodigestive tract, and blood and lymph systems in people living offsite and associated with proximity to the site. There is no discussion of the extensive other study for ATSDR by Professor Yoram Cohen and his UCLA team showing that pollution from the site migrated offsite and at levels in excess of EPA acceptable limits.</p>	<p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p> <p>DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm). According to the DTSC summaries there were two UCLA studies, one in 1997 dealt with radiation exposures and a second in 1999 which dealt predominately with hydrazine exposures. Both were funded by DOE. Another study performed by the ATSDR, was published in 1999. According to DTSC's summary, "The preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects."</p> <p>Additionally, DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>To be clear, we are not advocating "risk assessment"; just the opposite. The whole purpose of the AOCs was to make the cleanup simple. The contaminants would be surveyed, assessed, and whatever was over background would be cleaned up. This draft EIS was supposed to be about how to do that, not whether to do it. Under NEPA, pollution of land or water is a major environmental impact, even if one declares the site uninhabitable or the water too polluted to utilize. And the end- use of SSFL is irrelevant; even if one could guarantee what it would be for the centuries the contamination would be there if not cleaned up. People live near the site, and no one talks of forcing them from their homes, declaring their communities uninhabitable and restricted to open space use. The people nearby have been impacted by the pollution , as evidenced by the increased cancer rates and studies showing offsite migration. They need to be protected. They need full cleanup. The EIS must thoroughly spell out the environmental damage NASA has done by all its pollution, and the significant negative impacts to the environment if NASA were to take "No Action" and breach its AOC commitments by not cleaning up the toxic mess it made.</p> <p>All this needs to be rectified. An honest EIS would focus in detail on the environmental impacts of the contamination to be cleaned up. This EIS doesn't do that, but seems intent on burying the real reason for the action--the extraordinary environmental damage done by NASA in contaminating its site and the need to repair that damage.</p>	<p>The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>Instead, NASA exaggerates the truck traffic that would be needed supposedly to remove the contamination for disposal at toxic waste disposal facilities. If one looks carefully at the numbers, it is really pretty insignificant--a few trucks per hour. The EIS is silent about how many trucks have been going in and out of the site for decades. How much truck traffic was there when the facility was fully operating? How many car trips for workers?</p> <p>A careful review of the EIS shows a lot of exaggeration and double-counting about the trucks. For example, it counts both trucks taking contaminated soil or building debris, and adds to that trucks that might haul in clean fill. But there is no evidence NASA will need to bring in any fill, rather than simply regrade and use soil from the site, and NASA should commit to taking all possible steps to avoid needing any offsite soil. But if NASA needs any from offsite, the trucks going up to the site to haul away contaminated soil can haul up clean fill.</p>	<p>NASA has revised the DEIS estimates of the number of trucks based on additional information on demolition materials (Sections 2.2.1, 2.4.1, 4.5, 4.5.1, 4.7.1, 4.8.1, 4.11.1) . NASA may also have to modify the number of trucks based on success of pilot tests of in-situ and ex-situ treatment. However, based on current information, NASA has provided the best analysis based on information available.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>The purpose of an EIS in large measure is to identify mitigation measures. So, the EIS should focus on regrading and using on-site soil; but it doesn't. NASA should require the use of natural-gas or electric vehicles rather than diesel trucks to reduce air emissions and global warming. But it doesn't. The draft EIS should consider the use of rail, but it doesn't. There is no consideration of improving a fire road leaving the site and then taking by truck some of the shipments a different route, or taking the material that way to a rail spur. Again, the draft EIS doesn't do that. The EIS could identify additional routes once you get down Woolsey, but it didn't. And even for the three routes that were identified, NASA could require the trucks to be dispersed over those routes, so none gets more than a few trucks an hour. Again, the agency refuses to do that. NASA simply refuses to consider any mitigations to the trucks at all, saying it might add time or money. But that is not a reason to refuse to consider appropriate mitigations.</p>	<p>The number of trucks required is predominately a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus not being a valid option. Section 4.5 in the EIS discusses transportation routes further (also see Alternate routes do exist, see Figure 4.5-1).</p> <p>The best way to reduce the number of trucks is to reduce the soil volume required to be transported offsite. NASA is evaluating several treatment technologies that have the potential to reduce the truckloads by 36% (9,500 truckloads). The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>Similarly, the draft EIS fails to adequately consider mitigations for the soil cleanup. These are not pristine areas in the first place. The contamination occurred in the areas of heavy NASA activity, where the soil had already been scraped away, structures like test stands constructed, and huge amounts of pollutants just dumped in the soil. But once it is cleaned, it needs to be restored. There is virtually no discussion about restoration, replanting with native vegetation, etc., so that the land NASA has damaged so badly is returned to its native state, how it was before it was injured so badly. Again, the EIS should detail those mitigation options and plans, and doesn't.</p>	<p>Please refer to Section 4.4 for numerous references to impacts of the cleanup on biological resources including both negative and beneficial impacts. Additionally Section 4.4.2 includes mitigation and BMPs intended to help reduce significant impacts.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
		<p>Instead of following NEPA and identifying the environmental impacts of the contamination and thus the need for the action and what the No Action alternative would result in if all that pollution is left unremediated, the EIS comes across as a piece of propaganda by some within NASA trying to blow up the agreement the agency signed. We note that on September 20 of this year, just a few days ago, NASA testified before the Science and Technology Committee of the U.S. House of Representatives. NASA Associate Administrator Richard Keegan stated, "The draft EIS is open for public comment until October 1 and we expect the final EIS in November and NASA is committed to fulfilling our obligations under the AOC. There is sufficient funding in our FY14 request to accomplish all the activities that are planned for FY14 leading to fulfilling our commitments under the AOC." (emphasis added) Congresswoman Julia Brownley then followed up, confirming, "So, regardless then of what the IG may be recommending, your commitment is still to the agreement with the AOC." (emphasis added) To which Associate Administrator Keegan reiterated, "We are committed to the agreement under the AOC."</p>	<p>Your comment is noted.</p>
		<p>If the draft EIS is any indication, however, there seem to be some at work at lower levels of NASA trying to sabotage or undermine what the agency has committed to, to the Congress, to the State of California, and to our communities. This cannot be tolerated.</p> <p>NAA is responsible for a huge amount of pollution at its property at SSFL. It solemnly signed a legally binding agreement to clean up all the contamination to background. It has reiterated its promises as recently as a few days ago to the U.S. Congress. We expect and demand and insist that NASA live up to its obligations under the AOC, completely and without any efforts to break those commitments.</p>	<p>Your comment is noted.</p>

Subject: Draft Environmental Impact Statement for Proposed Demolition and Environmental Cleanup Activities at the Santa Susana Field Laboratory, Ventura and Los Angeles Counties, California. (CEQ# 20130227)

Dear Mr. Elliott:

The U.S. Environmental Protection Agency has reviewed the Draft Environmental Impact Statement for Proposed Demolition and Environmental Cleanup Activities at the Santa Susana Field Laboratory in Ventura and Los Angeles Counties, California. Our comments are provided pursuant to the National Environmental Policy Act, Council on Environmental Quality regulations (40 CFR Parts 1500-1508), our NEPA review authority under Section 309 of the Clean Air Act, and the provisions of the Federal Guidelines promulgated at 40 CFR 230 under Section 404(b)(1) of the Clean Water Act.

We acknowledge the complexity of the cleanup of NASA administered federal land at the Santa Susana Field Lab. The proposed action has three major components: demolition of buildings and structures; soil removal, including multiple treatment options; and groundwater cleanup, which also includes treatment options. The DEIS explains that NASA must satisfy the requirements of the Agreement on Consent it signed in 2010 with the California Department of Toxic Substances Control, which includes a requirement to remove contaminated soil that exceeds soil concentration limits based on factors such as background values and detection limits. The Proposed Alternative represents that action, and we understand that the Council on Environmental Quality has advised that NASA is not obligated, under NEPA, to consider other alternatives, given NASA's commitment in the AOC to cleanup chemical and/or radiological contaminants to local background levels.

0244-01

We agree that cleanup of radioactively contaminated soil to background is imperative. EPA and DTSC have cooperatively overseen the cleanup of radioactive contamination to background at, for example, Hunter's Point Naval Shipyard and McClellan Air Force Base. For chemical contamination sites, EPA, as well as DTSC, typically performs soil cleanups to health-based levels, unless background concentrations exceed those health-based levels.

We are concerned about the impacts associated with NASA's proposed removal, transport, and disposal of the large volume of soil that is chemically contaminated at levels below risk-based thresholds. At other cleanup sites, including adjacent non-federal portions of the Santa Susana site, nearly two-thirds of the soil with comparable levels of chemical contamination would be left in place. The increase in traffic and associated air emissions that would result from this action

0244-02

would create an unnecessary added burden to communities with environmental justice concerns near the potential receiving facilities, such as Kettleman City and Buttonwillow, as well as to the local community at the cleanup site. Based on the information provided in the Draft EIS, NASA proposed soil removal would require 52,000 (one-way) truck trips, compared to the 19,000 truck trips that would be required for cleanup to residential standards. As the Draft EIS also notes, this would be in addition to the 40,000 truck trips that Boeing and the Department of Energy will need to haul waste to disposal facilities from their portions of the Santa Susana site. Additionally, the total volume of soil would consume a notable portion of the hazardous waste landfill capacity in the State of California. DTSC has announced a commitment to reduce by half the amount of hazardous waste disposed in the State by the year 2025, and EPA supports that effort.

0244-03

Based on the above concerns, we have rated the DEIS as Environmental Concerns – Insufficient Information (EC-2). We recommend that the Final Environmental Impact Statement offer a specific preferred treatment option for soil removal and groundwater cleanup. The enclosed Detailed Comments elaborate on our concerns and include additional recommendations regarding contaminated soil, water resources, air quality, traffic, cumulative impacts, cost, preservation of historic resources, and greener cleanups.

0244-04

As you know, NASA has trust responsibilities to the Santa Ynez Band of Chumash Mission Indians. We encourage NASA to continue to consult with the tribe and address their concerns about the archaeological investigation performed to date. If NASA determines that any part of the federal land is a Sacred Site or Traditional Cultural Property, we also encourage you work proactively with the California Department of Toxic Substances Control and tribal representatives to mitigate the project's impacts.

0244-05

EPA appreciates the opportunity to comment on the DEIS. When the FEIS is released, please send one electronic and one hard copy to the address above (mail code: CED-2). If you have any questions, please contact me at (415) 972-3311, or have your staff contact Tom Kelly, the lead reviewer for this project. Tom can be reached at (415) 972-3856 or kelly.thomas@epa.gov.

Sincerely,

Kathleen Martyn Goforth, Manager
Environmental Review Office

EPA DETAILED COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR PROPOSED DEMOLITION AND ENVIRONMENTAL CLEANUP ACTIVITIES AT THE SANTA SUSANA FIELD LABORATORY VENTURA AND LOS ANGELES COUNTIES, CALIFORNIA (CEQ 20130227), September 30, 2013

Contaminated Soil

Landfills

The proposed alternative would remove or treat contaminated soil above the Look Up Table values (p. 2-14), which are based on factors such as background concentrations and detection limits. In its notice of intent to prepare an EIS, NASA proposed several alternatives based on various health-based cleanup levels (e.g. residential, industrial and recreational scenarios), in addition to the proposed alternative (p. 2-34 to 36). These alternatives would have affected the soil removal action, but not the demolition or groundwater cleanup actions. Based on comments received, NASA decided to limit its evaluation of alternatives to the proposed alternative and the no action alternative, since only the proposed alternative would fulfill NASA's obligations under its 2010 Agreement on Consent (AOC) with the California Department of Toxic Substance Control to clean up the site to background (p.1-7).

While there are merits to remediating contaminated soil to background, such an approach inevitably involves trade-offs. For example, Table 2-4-2 in the DEIS indicates that a health-based alternative, sufficient to allow residential reuse of NASA administered federal property, would require removal of just over a third as much of the contaminated soil volume as would the proposed alternative. Correspondingly, such an alternative would only need just over one third of the 52,000 (one-way) truck trips, greatly reducing traffic and air quality impacts to the surrounding community and those along the disposal transportation routes. It is reasonable to expect that it might also reduce the significant impacts, acknowledged in the DEIS, to native vegetation communities and high-priority conservation habitats.

In the proposed alternative, the amount of soil to be removed from the NASA property (320,000 to 500,000 cubic yards per Table 2.2-5 and 2.2-6) is not only a large quantity for one site to generate, but large relative to the total volume of hazardous waste generated in California. Annually, about 300,000 cubic yards of contaminated soil and 600,000 cubic yards of waste are placed in California landfills.¹ While Table 2.2-4 indicates that 80% of the contaminated soil will be placed in hazardous waste landfills, another 10% of the total may not be hazardous waste, but could still be transported to a hazardous waste landfill. In addition, demolition will generate 43,152 tons of hazardous concrete for transport to a hazardous waste landfill.

The California Department of Toxic Substances Control recently committed to reducing disposal by 50% at both of the state's hazardous waste landfills -- Clean Harbors

0244-06

¹ Department of Toxic Substances News Release, July 2, 2013, <http://www.dtsc.ca.gov/PressRoom/upload/News_Release_T-12-13.pdf>

Buttonwillow and Chemical Waste Management Kettleman Hills Facility -- by 2025.² NASA's soil removal could consume as much as 4% of the permitted capacity at CH Buttonwillow or 8% of the volume at CWM Kettleman Hills pending expansion of that facility.³ NASA's contaminated soil could increase total annual disposal at these facilities collectively by more than 60% for two years. These estimates do not include contaminated non-hazardous soil, nor concrete contaminated with hazardous waste, from demolition.

The DEIS does not discuss coordination with these facilities or with U.S. Ecology in Beatty Nevada, the other hazardous waste landfill identified in the DEIS. While all three facilities have large permitted capacities, NASA should verify that they have current landfill space available to accept such large quantities of waste. If CH Buttonwillow is selected for both hazardous and nonhazardous waste, NASA would consume nearly 50% of the facility's current 950,000 cubic yard capacity. For U.S. Ecology, which has approximately 1.1 million cubic yards of capacity, NASA waste would consume nearly 36% of the facility's landfill volume.⁴ To accept waste on the schedule proposed in the DEIS, the facility may need to speed the construction of additional landfill space.

Please note that the discussion above does not consider waste generation by the Department of Energy (DOE) or Boeing at the other portions of the Santa Susana Field Laboratory site. Boeing and DOE are expected to increase the quantity of contaminated soil to be removed by more than 65% (387,585 cubic yards per Table 4-13.1). The DEIS does not identify the disposal location for that waste.

Recommendation:

The FEIS should summarize NASA's discussions with receiving facilities regarding their ability to handle the potential volumes of contaminated soil from the proposed alternative. NASA should consider shipment to multiple facilities as a means to reduce impacts at the receiving facilities. To the extent possible, NASA should coordinate with Boeing and the Department of Energy on their remediation projects (e.g. schedules, disposal facilities and changes in soil volumes), so that its FEIS may contain as comprehensive a discussion of cumulative impacts as possible.

Treatment Options

The soil removal action, a component of the proposed alternative, includes many treatment options (Section 2.2.2.3). While we understand the urgency to complete soil removal by 2017 to comply with NASA's Agreement on Consent with DTSC (p. 1-7), the options of the DEIS create substantial uncertainty regarding the impacts of the proposed action, which should be avoided in the FEIS.

0244-07

² Department of Toxic Substances News Release, July 2, 2013, <http://www.dtsc.ca.gov/PressRoom/upload/News_Release_T-12-13.pdf>

³ According to DTSC July 2 News Release, the CWM Kettleman expansion is 5 million cubic yards, according to Clean Harbor's Fact Sheet (http://clark.cleanharbors.com/ttServerRoot/Download/12381_FINAL_Buttonwillow_CA_Facility_FS_030108.pdf), the Buttonwillow facility has a 10 million cubic yard permitted capacity. See Table 2.4-5 for the volume that could be sent to these facilities as part of the proposed alternative.

⁴ Per the estimate of EPA's permitting staff familiar with U.S. Ecology

Recommendation:

The FEIS should identify one preferred treatment option for contaminated soil.

Environmental Justice

While the DEIS considers environmental justice impacts near the Santa Susana Field Lab, it specifically eliminated consideration of the effects around designated landfills and disposal facilities (Table 2.5-1). The DEIS states that “siting and licensing of these facilities includes consideration of the potential effects of bringing designated and permitted waste to the sites.” In view of the burden imposed on the communities near receiving facilities, particularly in light of the cleanup to background, a more detailed evaluation of environmental justice impacts would be valuable for those communities. Additionally, a facility permit could be many years old, offering NASA an opportunity to implement more recently developed mitigation measures. DTSC’s proposed permit for CWM Kettleman Hills, for example, would require trucks hauling waste to the facility to meet 2007 emissions standards immediately, and meet 2010 emissions standards by 2018.⁵

0244-08

Recommendation:

The FEIS should consider impacts to communities with environmental justice concerns near facilities receiving substantial quantities of waste from demolition and soil removal. The FEIS should also commit to using on-road heavy duty diesel trucks that meet or exceed EPA’s emissions standard for 2010.

Radioactive Waste

The DEIS estimates that the proposed action will generate 50,000 cubic yards of mixed waste, both low level radioactive and hazardous waste (Table 2.4-2), but does not indicate the source of radioactive contamination. While the DEIS mentions the potential for mixed waste from contaminated industrial or research waste, it also mentions that NASA operations did not use or generate radioactive waste (p. 2-12). Demolition wastes appear to contain minor amounts of radioactive waste, such as smoke detectors, batteries in emergency lighting, exit signs, electric control panels, and building surfaces, equipment and or debris (radiological materials) (p. 3-48). The list of demolition wastes (Table 2.2-2), however, does not include large quantities of radioactive waste and the amount of demolition waste is shown as a separate quantity from that of contaminated soil estimated in Table 2.4-2.

0244-09

Recommendation:

The FEIS should clarify the composition of the material that NASA expects to comprise the 50,000 cubic yards of mixed waste (Class A low-level radioactive waste and hazardous waste).

⁵ Community Notice regarding the Kettleman Hills Facility, DTSC, July 2013 <
http://dtsc.ca.gov/HazardousWaste/Projects/upload/Kettleman_FS_ExpansionDecision_0713.pdf>

Waste Management

NASA's Santa Susana Field Lab website discusses a past waste shipment from the site that was halted due to concerns that the receiving facility was not appropriate for the waste.⁶ Based on our historic involvement with the site, we are aware that this was not an isolated incident. We recommend as much transparency in the matter of waste composition and management as possible. NASA would be better served to hear concerns regarding receiving facilities following publication of the FEIS or the public release of BMPs, than much later in the soil removal process, when delays may hinder NASA's ability to meet its commitment under the 2010 AOC.

0244-10

Recommendations:

The FEIS should include, or commit NASA to develop and publicly release, best management practices that include the following:

- a description of debris and soil screening or testing procedures for radiation and chemical contamination
- a decision matrix that identifies specific facilities or types of facilities (e.g. solid waste landfill, hazardous waste landfill) for debris and soil based on the screening or testing protocol. Particular focus should be given to debris and waste that may be contaminated, but not regulated by EPA or the Nuclear Regulatory Commission (e.g. hazardous waste exceeding background levels of radionuclides, soil exceeding the Look-up Table values that is not considered hazardous waste etc.).

Water Resources

Groundwater Cleanup

The DEIS does not describe groundwater cleanup in the same level of detail as it does demolition and soil removal. The description of the no action alternative for groundwater cleanup, described as a "groundwater interim measure and interim source removal," (p. 2-33) does not show the location of the current extraction well, the lateral or vertical volume the well is intended to capture, the volume of water removed from the aquifer, or the weight of trichloroethylene (TCE) removed from groundwater over time; nor does it describe the treatment method for extracted groundwater or identify its discharge location.

0244-11

The DEIS includes one figure showing the two-dimensional extent of trichloroethylene (TCE) in groundwater (Figure 2.2-4). Even though other contaminants are mentioned, such as TCE degradation products and n-nitrosodimethylamine (p. 2-27), none are mapped. The DEIS does not discuss the thickness of groundwater contaminant plumes. It mentions treatment of metals as an advantage of pump and treat technology but does not indicate elsewhere that groundwater is contaminated by metals. From the reports cited by the DEIS, such as RCRA Facility Investigation reports (p. 3-42), we presume that a considerable

⁶ See email from James Elliott, NASA to Cassandra Owens, Los Angeles Regional Water Quality Control Board at http://ssfl.msfc.nasa.gov/documents/comm/Elliott_to_Owens.pdf

amount of additional information that would be useful for disclosure and decision making could have been summarized in the DEIS.

The DEIS does not discuss criteria for selecting a groundwater cleanup remedy. What factors will NASA or DTSC consider in deciding between the technologies described in the DEIS (e.g. short and long term effectiveness; reduction in contaminant mobility, toxicity or volume; implementability; community acceptance)? The timeframe for treatment technologies is discussed (e.g. pump and treat technology would take “decades to centuries” achieve groundwater cleanup levels, p. 2-28), but further refinement of the estimates would increase the value of this information. While the DEIS discusses the advantages of each technology, it does not consider disadvantages. At some VOC sites, depending on the geochemistry, In-Situ Chemical Oxidation and Enhanced Bioremediation can break down TCE to form vinyl chloride, which is more toxic (i.e. has a lower Maximum Contaminant Level) than TCE.

The DEIS does not include actual or preliminary groundwater cleanup levels. It does clarify that the values will be based on a standardized risk assessment methodology (p. 2-27), but provides little additional information. For example, it is not clear whether the methodology only considers groundwater as a potential source of drinking water, or also considers vapor intrusion into buildings where contaminated groundwater contains volatile organic compounds at shallow elevations.

The DEIS does not discuss contamination of the vadose zone (soil and bedrock above the saturated zone or water table) below the depth of soil removal. Contaminated vadose zone soil may pose a continuing source of groundwater contamination. We note that some of the technologies considered, such as soil vapor extraction, may be capable of effectively removing vadose zone contamination, depending on the local geology.

Energy use can be a major cost and environmental impact of the operation and maintenance of a groundwater remedy. The document appears to recognize this, as the description of remedy options includes alternative energy, such as solar arrays (p. 2-28); however, the DEIS does not provide the energy use of the existing groundwater treatment system or an estimate for the proposed alternatives. The DEIS does state, “groundwater response actions should occur in 2016 and 2017, with long-term groundwater O&M [Operation and Maintenance] following” (p. 2-44), but it does not estimate the associated priority pollutants or greenhouse gas emissions. As noted in our air quality comments, below, NASA’s conformity determination should consider the groundwater cleanup emissions in 2016 and 2017.

Recommendations:

The Final Environmental Impact Statement (FEIS) should include:

- a thorough discussion of the no action alternative that includes the current groundwater extraction and treatment system, its energy use and a discussion of its effectiveness;
- an expanded discussion of the site’s geology;
- an explanation of three-dimensional groundwater flow and contaminant migration at the site;

- a more thorough description of source areas (e.g., test stands, evaporation ponds, landfills, leach fields, etc.) and vadose zone contamination;
- a description of the interaction of groundwater and surface water, including the location of surface seeps;
- an estimate of air emissions (priority pollutants and GHGs) associated with each treatment technology;
- a map of conceptual well networks necessary to implement potential groundwater cleanup technologies;
- the groundwater cleanup levels, based on a standardized risk assessment methodology. NASA should ensure that the methodology includes consideration of vapor intrusion into buildings where contaminated groundwater contains volatile organic compounds at shallow elevations;
- the goals or criteria that will be used in evaluating the vadose zone and groundwater cleanup technologies,
- a brief summary comparison of the advantages and disadvantages of each technology; and
- identification of NASA's preferred groundwater cleanup technology.

For purposes of presenting groundwater information in the DEIS more effectively, we suggest that NASA consider, as an example, a presentation that is posted on the Department of Energy (DOE) website, at: http://etec.energy.gov/Library/Main/GWU--May_5_Beth_Parker_Final_Handout--Full_Page.pdf. EPA cannot speak to the accuracy of the presentation; we note only that it provides a detailed discussion of the site's groundwater contamination in an easy to understand format. While the presentation does not include any information about options for groundwater cleanup, we encourage NASA to consider its format and level of detail as guides for providing more detailed groundwater concepts.

Surface Water

As the DEIS discusses, the entire site, not just the NASA property, is covered by the Los Angeles Regional Water Quality Control Board's permit for the facility.⁷ The DEIS notes permit violations occurring from 2006 to 2009 at NASA outfalls due to contaminants in soil and sediment, such as dioxins (p. 3-42). It mentions an Interim Source Removal Action, conducted at the direction of the Regional Board for Outfalls 8 and 9, as a cumulative impact (p. 4-155 to 156). Interim Source Removal Action reports indicate that NASA and Boeing are using an expert panel to prioritize the need for Best Management Practices (BMPs) in areas draining to these outfalls, to assist in development of BMPs, and to evaluate the success of BMP implementation.⁸

NASA has excavated 4,800 cubic yards of contaminated soil, and expected to remove another 7,580 cubic yards by the end of this year at the Expendable Launch Vehicle area,

0244-12

⁷ Waste Discharge Requirements for the Boeing Company, Santa Susana Field Lab, Order No. R4-2010-0090, NPDES No. CA0001309, California Regional Waste Quality Control Board, Los Angeles, Region, April 6, 2010, Revised May 20, 2010 and June 3, 2010.

⁸ See http://www.boeing.com/boeing/aboutus/environment/santa_susana/isra.page.

the Sewage Treatment Plant, the former Liquid Oxygen Plant and an area identified as A2LF (p. 4-156). The DEIS notes that the cleanup levels are consistent with DTSC's values, except for dioxins which are elevated in the area due to past wildfires. It does not provide a map of these areas nor indicate whether additional soil removal is required for NASA property in the Northern Drainage, which leads to Outfall 9.

Some of NASA's property in the Southwestern Drainage drains through Boeing-owned property back onto NASA property where it flows to Outfall 18 (Figure 3.6-1). (See NASA-Boeing Cross Contamination below.) The Regional Board's Stormwater Permit describes a sophisticated temporary treatment system at the Silvernale Pond, upstream of Outfall 18, which includes filtration, metals precipitation, and activated carbon treatment prior to discharge. The DEIS does not include a description of this system.

Based on discussions with the Regional Board, our review of their permit, and our limited review of the Interim Source Removal Action reports, surface water appears to be a subject of substantial focus for the entire Santa Susana Field Lab. This focus is not apparent from the DEIS. While the DEIS includes a mitigation measure (Water BMP-1, p. 4-80) to develop a Stormwater Pollution Prevention Plan and Erosion Control Plan (i.e. collections of BMPs), it provides no specific information on current or past BMPs.

Recommendations:

The FEIS should include

- a more comprehensive description of the interim source removal action, including BMPs developed through that process;
- a discussion of coordination between the interim source removal, demolition, and soil removal actions, including a map showing remaining demolition and soil removal actions in the Northern Drainage;
- a summary of BMPs currently in place, outside the Northern Drainage, to control the movement of contaminated sediment as well as any planned BMPs that will be used during demolition and soil removal; and
- a more recent description of compliance with the Regional Board's permit. NASA should consider engaging the expert panel on additional BMPs (if necessary) to control its stormwater discharges from active demolition and soil removal for the Northern and Southwest Drainages. EPA has an interest in the facility's BMPs and the description of these measures in the FEIS. Please contact Cindy Lin, at 213-244-1803 lin.cindy@epa.gov, if you would like our assistance.

NASA-Boeing Cross Property Contamination

Boeing and NASA appear to be using different standards for soil remediation. As risk-based standards may allow more contamination to remain at the site than the Look-Up Table values, post-cleanup concentrations of soil contamination will differ between Boeing-owned property and NASA-administered federal property. Figure 3.6-1 appears to show that federal property drainages extend into Boeing property, and Boeing drainages extend into federal property.

0244-13

The DEIS does not describe the timing of cleanup for the two properties. If Boeing completes soil removal prior to NASA, contamination from the NASA property might migrate to Boeing property. While the same is true for Boeing contamination to migrate onto federal land, we are particularly concerned that, following the remediation of both properties, Boeing's property may still pose a risk of contamination to federal property.

Recommendation:

The FEIS should discuss the timing of the cleanup for the Boeing and NASA properties, as well as measures to prevent cross-contamination (pre-and post remediation) to Boeing and federal property.

Wetlands and Waters of the U.S.

The extent of jurisdictional waters of the U.S. (waters) is unclear in the DEIS. Figure 4.10-1 shows the potential impacts of the project to streams and ponds from the estimated soil cleanup activities. Several of these features are not identified in the Appendix G Wetlands Delineation Report or Figure 3.4-5 (Wetlands). In addition, Figure 3.4-5 identifies many of the features as man-made, which, according to the discussion in Section 3.4.5, are not considered as part of the impacts analysis. Also, the discussion of wetlands in section 3.4.5.1 appears to only consider aquatic features, such as palustrine and riverine wetlands that meet the three parameter wetlands test. Based on the information provided, it is difficult to determine the extent of jurisdictional features at the project site and whether the features are wetlands or non-wetland waters.

0244-14

Additionally, the DEIS does not sufficiently describe the condition and functions of the wetland and non-wetland waters on the project site. An approved assessment method, such as the California Rapid Assessment Method (CRAM), should be used to measure baseline conditions as this type of information will be needed as part of the 404 permit application to the Corps.

We also note that the DEIS does not include potential mitigation measures to offset unavoidable impacts to jurisdictional waters of the U.S. Mitigation measures in the DEIS are limited to Table 6.1-1, which includes best management practices such as erosion control, revegetation, and permits from the Corps and the Regional Water Quality Control Board. The DEIS does not address how lost functions of jurisdictional waters could be offset through on-site restoration or through the purchase of credits at an approved mitigation bank or in-lieu fee program. As part of the 404 permit application, and to comply with the Corps/EPA 2008 Compensatory Mitigation Rule, NASA will be required to submit a detailed draft compensatory mitigation plan for approval by the Corps.

Recommendations:

The FEIS should:

- clarify the extent of features, by wetland and non-wetland waters, including any that are manmade, and include a figure that identifies areas of permanent and temporary impacts; (If possible, this information should be based on an

approved jurisdictional determination from the U.S. Army Corps of Engineers.)

- describe the condition and function of jurisdictional waters and other waters at the site;
- include an assessment of the conditions and functions of the waters using an approved assessment method;
- identify potential compensatory mitigation measures that NASA may propose in the CWA 404 permit application to offset unavoidable impacts.

Air Quality

General Conformity is intended to ensure that actions taken by federal agencies in nonattainment and maintenance areas do not interfere with the state's plans to meet the national standards for air quality. The DEIS concludes that the proposed alternative may exceed General Conformity de minimis thresholds in several counties (p. 4-110), so a general conformity analysis is required for the proposed alternative. The DEIS continues on to state, "the quantity of NO_x offsets purchased by NASA would equal the quantity by which the General Conformity de minimis threshold values were exceeded." Please note that a project using offsets to demonstrate conformity must fully offset its emissions (i.e. to 0), not offset the emissions to the de minimis thresholds.^{9,10}

0244-15

The DEIS also states that "Groundwater response actions should occur in 2016 and 2017, with long-term O&M [Operation and Maintenance] following." (p. 2-44). If peak emissions occur in 2016 and 2017, per Tables 4.7-3 and 4, then the General Conformity analysis should consider the emissions from groundwater cleanup response actions along with soil removal. The DEIS states, "the impacts to air quality and climate change from the groundwater remedial technologies are described qualitatively in the following text..." (p. 4-107). Additionally, the General Conformity Table of Appendix H includes demolition, excavation, and offsite disposal, but not groundwater response actions (p. H-17).

The DEIS discusses but does not commit to a mitigation measure to use newer model year trucks to reduce local criteria pollutants and GHGs (Air Quality Mitigation Measure – 2, p. 4-111). The DEIS also discusses the use of offsets to comply with General Conformity. NASA is likely to find cleaner trucks a cost effective project element to reduce the amount of offsets required by Air Districts.

Recommendation:

If NASA plans to use offsets to demonstrate compliance with General Conformity: the FEIS should commit to fully offset emissions (i.e. to zero) of any pollutants for which the projected emissions would exceed the de minimis thresholds. NASA should begin discussions with the appropriate air quality management districts on the emission offsets as soon as practical. The FEIS should include emissions from groundwater response actions in 2016 and 2017 in the General Conformity analysis.

⁹ 40 CFR 93.158

¹⁰ See Question 27, General Conformity Guidance: Questions and Answers, U.S. EPA, July 13, 1994

in addition to emissions from demolition and soil removal actions. The FEIS should also commit to using on-road heavy duty diesel trucks that meet or exceed EPA's emissions standard for 2010 and raise awareness of California's anti-idling rule among drivers (<http://www.arb.ca.gov/msprog/truck-idling/factsheet.pdf>).

Traffic

Reasonably Expected Route

The DEIS shows a truck route leaving the facility. Trucks would travel primarily on Woolsey Canyon, Valley Circle Boulevard, and Roscoe Boulevard and either split between routes that travel north and south on Topanga Canyon Boulevard (Figures 4.5-1 and 3) or favor a southern route (on Topanga Canyon Boulevard) by a 4 to 3 ratio for the maximum soil removal (Figure 4.5-2). We are concerned that the truck routes described for soil removal may not represent a reasonably expected route.

0244-16

The majority of the waste generated during soil removal would be hazardous waste (80% per Table 2.4-2). Two of the three hazardous waste facilities that could accept hazardous waste are northeast of the site. To reach these sites, a route traveling south on Topanga Canyon Boulevard to I-101 and I-405 would appear to take trucks several miles further on highways likely to be as crowded or more so than I-118. Even for waste traveling to U.S. Ecology in Beatty, Nevada, or Energy Solutions Landfill in Clive, Utah, the route suggested by Google Maps would travel north on Topanga Canyon to I-118.¹¹ The DEIS does not explain whether there are overriding considerations that would warrant selection of a less direct route. For hazardous waste, only trucks destined for DeMenno Kerdoon would likely travel south on Topanga Canyon Boulevard, per the Google Maps suggested route, and that facility accepts only petroleum contaminated soil, which may not even be hazardous waste.

Closer to the Santa Susana Field Lab, the DEIS identifies several possible routes as Region of Influence Roadways. Although Box Canyon Road and Plummer Street appear to offer a slightly shorter route to I-118, the DEIS does not clarify the reason for assuming that all trucks will use Roscoe.

Recommendations:

The FEIS should:

- designate truck routes, particularly for the largest (Class VIII) trucks;
- explain the reason(s) more trucks would not travel North on Topanga Canyon Boulevard;
- evaluate the possible effects of landfill selection (or other receiving facility) on the truck route to ensure that all reasonably foreseeable traffic analyses are considered;

¹¹ The Initial recommendation for a route to Beatty Nevada would travel through Death Valley National Park. The recommended southern route, through Barstow, would be on I-118 rather than I-405.

- to the extent possible, based on coordination with Boeing and the Department of Energy, NASA should update its traffic analysis to consider the cumulative impacts; and
- offer rideshare or carpool program for construction workers to further reduce traffic impacts.

Effects and Potential Safety of School Children

We commend NASA for its consideration of the impact of truck traffic on school children. As the analysis is novel, we offer some recommendations for improvement. We noted that the DEIS did not include childcare centers, preschools, parks nor recreation centers in its evaluation of truck traffic and children. While fewer children may walk to these facilities than to schools, their safety is relevant for consideration. Additionally, the DEIS does not consider the role of crossing guards at intersections near schools, nor educational outreach to schools, childcare centers and residents.

0244-17

Recommendation:

The FEIS should:

- consider childcare centers, preschools, parks and recreation centers as well as schools in the evaluation of truck traffic and potential exposure to children;
- provide additional funding for crossing guards, if busy intersections near schools are not currently staffed;
- target outreach material about the construction schedule and truck routes to schools and childcare centers and residents.

Cumulative Impacts

As the Cumulative Impacts Section (4.13) mentions, DOE and Boeing are also actively cleaning up soil and groundwater at their portions of the Santa Susana Field Lab. While the DEIS provides additional waste volumes and trucks for the Boeing and DOE cleanup, it does not model the cumulative impacts to children, traffic, and air quality. A cumulative model of these impacts is likely to be of much more interest and value to the public than the individual analysis of impacts from NASA, Boeing, or DOE.

0244-18

Recommendation:

To the extent possible, in coordination with Boeing and the DOE, NASA should update its analysis to consider the cumulative impacts (including Boeing and DOE soil removal) on traffic, children and air quality.

Cost

Many factors should be considered in making a remedy selection for soil removal. For example, EPA uses nine criteria to evaluate cleanup alternatives under the Comprehensive

0244-19

Environmental Response, Compensation, and Liability Act, commonly known as Superfund.¹² For the most part, the DEIS and the public comment period address these factors, except cost. The cost of a cleanup should play an important role in screening and selection of alternatives.¹³ The DEIS contains no information on the cost or cost-effectiveness of the treatment technologies for soil removal.

Recommendation:

The FEIS should include an estimate of the cost for each element of the cleanup (i.e. demolition, soil remedial activities and groundwater remedial activities), as well as the options within each element (e.g. soil excavation and off-site disposal, soil excavation and ex-situ treatment, soil vapor extraction etc.

Preservation of Cultural Resources

The proposed alternative would include retention of one test stand (Cultural Mitigation Measure-1, p. 4-25). The DEIS describes potential hazardous material that may be encountered during demolition of structures, such as lead painted surfaces, asbestos insulation and ceiling material, and polychlorinated biphenyl (PCBs) contained in caulk and paint (Table 3.8-1). The DEIS does not appear discuss the removal, encapsulation or other methods to minimize hazards associated with retained historic resources.

0244-20

Recommendation:

To enable broader access to the retained historic resources, Cultural Mitigation Measure-1 should include a commitment to remove, encapsulate or otherwise prevent visitor exposure to, potential hazards, such as lead paint, asbestos and PCBs.

Greener Cleanups

Greener Cleanups refers to an approach at remediation sites in which EPA seeks to understand the environmental footprint resulting from site activities and identify opportunities to reduce that footprint. EPA has developed Principles for Greener Cleanups,¹⁴ Best Management Practices (BMPs) for greener cleanups,¹⁵ and a Methodology for quantifying the environmental footprint of a cleanup.¹⁶ Each of these resources may be

¹² See A Guide to Preparing Superfund Proposed Plans, Records of Decisions, and Other Remedy Selection Decision Documents, U.S. EPA July 1999.

¹³ The Role of Cost in the Superfund Remedy Selection Process, U.S. EPA, September 1996
<http://www.epa.gov/superfund/policy/cost_dir/cost_dir.pdf>.

¹⁴ see http://www.epa.gov/oswer/greenercleanups/pdfs/oswer_greencleanup_principles.pdf

¹⁵ BMPs are listed at <http://www.clu-in.org/greenremediation/>.

¹⁶ Methodology for Understanding and Reducing a Project's Environmental Footprint, U.S. EPA, February 2012 (EPA-542-R-12-002

<http://www.clu-in.org/greenremediation/methodology/docs/GC_Footprint_Methodology_Feb2012.pdf> and Overview of EPA's Methodology to Address the Environmental Footprint of Site Cleanup, U.S. EPA, March 2012, EPA-542-F-12-023,

<http://www.clu-in.org/greenremediation/methodology/docs/GR_Overview_of_Footprint_Methodology_FS_3-29-12.pdf>

of use for the activities at the Santa Susana Field Laboratory. Broadly speaking, the resources address the following aspects of a cleanup:

- Total Energy Use and Renewable Energy Use
- Air Pollutants and Greenhouse Gas Emissions
- Water Use and Impacts to Water Resources
- Materials Management and Waste Reduction
- Land Management and Ecosystems Protection

The DEIS already addresses many aspects of Greener Cleanups. These include estimated greenhouse gas emissions (for demolition and soil removal), and estimated waste generation volumes, as well as measures to be taken for fugitive dust control, stormwater management, and reuse of demolition debris.

We offer the Principles, BMPs, and Methodology for use at remediation sites on a voluntary basis, but we also note that these resources may help to identify additional topics that should have been included in the DEIS, and should be included in the FEIS, depending on the potential significance of the impact [40 CFR 1502.2(b)]. For example, the DEIS does not consider: quantifying certain aspects of the remedy such as the amount of water and materials used; extending the scope to off-site support activities, such as laboratory analysis and waste management; and identifying opportunities for reduction for these aspects of the remedy. Karen Scheuermann is available to assist NASA in understanding and applying the Greener Cleanups approach at the Santa Susana Field Laboratory. Ms. Scheuermann can be contacted at (415) 972-3356 or scheuermann.karen@epa.gov. We also note that DTSC's *Advisory for Green Remediation*¹⁷ is compatible with EPA's Principles for Greener Cleanups.

0244-21

Recommendation:

NASA should consider EPA and DTSC resources for Greener Cleanups and take advantage of any aspects of these resources that may be beneficial in the cleanup of the Santa Susana Field Lab.

¹⁷ Interim Advisory for Green Remediation, California Department of Toxic Substances Control, December 2009 < http://www.dtsc.ca.gov/OMF/upload/GRT_Draft_Advisory_-20091217_acl.pdf >

SUMMARY OF EPA RATING DEFINITIONS*

This rating system was developed as a means to summarize the U.S. Environmental Protection Agency's (EPA) level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the Environmental Impact Statement (EIS).

ENVIRONMENTAL IMPACT OF THE ACTION

"LO" (Lack of Objections)

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

"EC" (Environmental Concerns)

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

"EO" (Environmental Objections)

The EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

"EU" (Environmentally Unsatisfactory)

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

ADEQUACY OF THE IMPACT STATEMENT

"Category 1" (Adequate)

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

"Category 2" (Insufficient Information)

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

"Category 3" (Inadequate)

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

Filed Electronically

27 September 2013

Allen Elliot
Santa Susana Field Laboratory Project Director
National Aeronautics and Space Administration
NASA MSFC AS01, Building 4494
Huntsville, Alabama 35812

Subject: Draft Environmental Impact Statement (DEIS), National Aeronautics and Space Administration (NASA), Proposed Demolition and Environmental Cleanup Activities for the NASA administered portion of the Santa Susana Field Laboratory (SSFL), Ventura County, California.

Dear Mr. Elliot:

The Department of the Interior has received and reviewed the Draft EIS prepared by National Aeronautics and Space Administration (NASA) for the proposed demolition and environmental cleanup activities for the Santa Susana Field Laboratory (SSFL) in Ventura County, California. The Draft EIS identifies and analyzes a no-action alternative and one action alternative for cleanup to background.

In National Park Service's (NPS) scoping letter dated September 22, 2011, NASA was asked to consider three topics relevant to conservation planning at the site:

0225-01

1. NPS manages the National Register of Historic Places. SSFL was a center of scientific research during the Cold War and during early to recent space exploration; several structures from this era remain on the site. The 2008 NASA Historic Resources Survey and Assessment (revised 2009) concluded that nine structures and three historic districts are eligible for the register. In addition, SSFL contains a prehistoric site complex that was listed on the National Register in 1976.
2. SSFL is adjacent to the Santa Monica Mountains National Recreation Area. As such, it provides a wildlife linkage between lands within the NPS boundary and the adjacent Simi Hills and Santa Susana Mountains. SSFL also contains archeological sites related to archeological sites found within the NPS boundary.
3. SSFL is part of the Rim of the Valley Special Resource Study (RIVA SRS), authorized by Congress in the Consolidated Natural Resources Act of 2008 (P.L. 110-229-May-2008).

The NPS is concerned that the Draft EIS inadequately addresses these three topics. Furthermore, NPS finds that expressed purpose and need will not be fulfilled by the action alternative, as currently proposed. Our concerns and suggested modifications are summarized below; in addition we have enclosed a table with more detail on specific issues and text corrections.

0225-02

SSFL's and the NASA component's location within the greater public park land and open space setting is not adequately disclosed (Affected Environment).

0225-03

There is no regional vicinity map to illustrate the contextual setting of SSFL and the NASA portion among protected parkland, open space, and surrounding communities. The attached Figure 1 clearly illustrates the nexus of the proposed Project site and the surrounding regional parkland and open space setting. Maps in the Affected Environment and Appendices D and E either have no parkland identification or are missing several areas of public park land and protected open space. None of the maps includes the NPS-SMMNRA boundary. The SMMNRA boundary is shared with the southwestern boundary of SSFL. As noted previously, SSFL is ecologically continuous with the NPS-administered SMMNRA. The prehistoric archaeological sites are also connected to the greater prehistory and Native American cultural heritage of the Simi Hills and Santa Monica Mountains. It is critical to illustrate the parkland setting to more accurately disclose the project's potential for impacts to natural and cultural resources beyond the boundaries of SSFL and the NASA portion and to more fully disclose the site's current and potential future role in the region's ecology and recreation.

The Draft EIS has an incomplete description of important cultural resources in the Affected Environment (Section 3.3) and defers essential treatment to the subsequent planning (Section 4.3).

0225-04

The action alternative, as currently proposed, would remove National Register-eligible historic cultural resources and potentially encroach upon and/or destroy prehistoric cultural resources. The effects on cultural landscapes, traditional cultural properties, and the Native American sacred site are uncertain because of the limited information provided in the Draft EIS.

The impacts to cultural resources clearly are adverse and significant for both historic architectural features and archeological resources. Section 106 consultation is still underway. The Draft EIS only suggests mitigation measures that might be considered, with nothing certain and final impacts stated as "Pending consultation" in Table ES-4. Thus, both the impact analysis of cultural resources and consideration of mitigation measures are difficult to evaluate. Because of the preliminary nature of information on archeological resources, clean-up impacts, and mitigation measures, the EIS does not allow for meaningful public input on cultural resource impacts. Instead, the only option for input is through participation in the limited group composed of community consulting parties that advise NASA on Section 106.

0225-05

The Draft EIS does not have complete information on any aspect of the cultural resource setting. The impacts on archeological resources are uncertain because very limited information is available on the significant site complex associated with the Burro Flats Painted Cave, much of the data being extremely outdated. In addition, the analysis of impacts to cultural resources is also likely inadequate because of the limited soil testing for contaminants in areas rich in archeology, such as the Burro Flats area. Should testing at the outer limits of the cleanup footprint indicate additional soil removal to reach the Look-Up Table values, additional impacts to archeological resources would follow. These uncertainties increase the need to presently

0225-06

identify feasible mitigation measures for the extensive archeological resources in this site complex. The ongoing Traditional Cultural Property and cultural landscape studies and the ongoing consultation on the Native American Sacred Site make impacts and appropriate assignment of mitigation measures even more difficult to consider.

The inventory of architectural resources representing the rocket test stands and related facilities is not well described in the Draft EIS, although an in-depth study was conducted by NASA contractors. Lack of comprehensive descriptions of the nationally significant historic districts and lack of images of the test stands make it difficult for readers of the EIS who have not visited the site to understand the full potential of these historic resources and the possible impacts of their removal.

0225-07

The Draft EIS presents the possibility that some historic structures could be preserved, however it does not define how preservation of any structures would be reconciled with project goals and objectives. The Purpose and Need statement requires cleanup to background levels and the project description calls for complete demolition and hauling away of virtually all structures.

0225-08

The Draft EIS has substantial shortcomings in describing biological resources and characterizing the severity of the proposed action's impacts. The Draft EIS also does not disclose adequate, feasible mitigation measures for either cultural resources or biological resources.

0225-09

The Draft EIS indicates implementation of the action alternative would have mostly significant negative impacts and some moderate negative impacts on almost all resource categories that offer benefits to resources on neighboring NPS lands. Executive Summary Table ES-4 lists significant, negative, regional, long-term impacts on biological resources from project implementation. Environmental Consequences Section 4.4.1.3 (pg. 4-35) supports the finding. However, Table ES-4 also lists a moderate, beneficial, regional, long-term impact attributed to increasing the area of undeveloped habitat and from removing contamination. After mitigation, the Draft EIS finds impacts from the action alternative on the majority of topics are mostly at the level of impact of the no action alternative (Table ES-4).

0225-10

We find this conclusion to be potentially incorrect due to the insufficiency of biological resource surveys and the potentially incorrect assumption that remediated areas will recover their biological diversity and ecological function. Extensive research in remediation of abandoned mine sites indicates that restoration of functional soil and vegetation communities after remediation is extremely difficult to achieve. However, the post-mitigation final impact level on both cultural and biological resources is still pending agency consultations. NPS finds the action alternative, as currently proposed, has the potential to have great irreversible negative impacts on native habitat and associated flora and fauna and wildlife movement.

The Draft EIS undervalues the NASA property's open space and habitat contribution to wildlife movement through the greater SSFL and surrounding open space setting (Section 3.4.2).

0225-11

NPS cannot overemphasize that SSFL, including the NASA property, contributes to habitat connectivity owing to juxtaposition with contiguous open space and park land and because of the diversity and overall quality of the on-site native habitat.

The Draft EIS states:

“SSFL habitat and species diversity, physical attributes, and geographic location make the area a potentially important route for species migrations. Open space at SSFL could play a role for habitat linkage among the Santa Susana Mountains, the Simi Hills, and possibly, the Santa Monica Mountains (NASA, 2011b). However, the NASA-administered portions of SSFL are outside of the critical habitat corridors in the region identified by the U.S. Fish and Wildlife Service (USFWS) (Figure 3.4-2) (Ventura County, 2005)” (pg. 3-23).

There are several errors in this statement. The citation is incorrect and fails to reference the key report on the habitat linkage between the Sierra Madre and the Santa Monica Mountains (South Coast Missing Linkages Report, Penrod, et al. 2006). The presentation that SSFL could only “possibly” play a role connecting habitat into the Santa Monica Mountains illustrates a lack of familiarity with research on habitat connectivity in this region. The exclusion of NASA property from the habitat linkage is overly conservative and presents a narrow interpretation of the complex set of factors used to model and map a wildlife habitat linkage.

The Environmental Consequences assessment of wildlife impacts (Section 4.4.1.3, pg. 4-36) perpetuates the Affected Environment’s inaccurate presentation that the NASA portion of SSFL is not part of any wildlife movement corridor. By asserting that the NASA property is not part of a wildlife movement corridor, the Draft EIS inappropriately lacks analysis of effects on wildlife movement through the cleanup areas.

The Draft EIS minimizes the extent of impacts on several sensitive species owing to non-systematic wildlife surveys.

0225-12

The Draft EIS bases impacts on listed species on wildlife surveys that were opportunistically conducted during the special-status plant surveys (Appendix E, Section 2.2, pg. E-28). Therefore, no USFWS or other rigorous protocols were followed when looking for species that were endangered, threatened, or of special concern. Appropriate survey protocols may have led to discovery of several more sensitive species than observed in the fall 2010 and spring 2011 biological surveys, with associated negative impacts to those species.

The Environmental Consequences’ contaminant impacts on wildlife are not substantiated (Section 4.4.1.3) and impacts from loss of native habitat are not considered.

0225-13

The Draft EIS states that contaminants on-site, such as mercury and polychlorinated biphenyls (PCBs), could result in wildlife mortality owing to ingestion that becomes concentrated in animals higher in the food chain. This may be occurring at the site, although the Draft EIS offers no studies to substantiate contaminant levels in wildlife either residing within or moving through the site. It is possible that a more significant impact could result from the removal of native habitat and soils and following habitat type conversion than the negative impact of ingestion of contaminated vegetation or soils.

The subsequent EIS should provide an analysis of the impacts of contaminant ingestion on wildlife based on contaminant levels in vegetation and typical ingestion rates and possible accumulation rates in the food chain versus impacts on wildlife from the complete loss of native habitat for the foreseeable future.

The Draft EIS references an inadequate vegetation survey and obscures the importance of rocky outcrop habitat by including it within other vegetation types.

0225-14

The Draft EIS refers only to Appendix D, the 2010 fall field work report dated February 2011. However, Appendix E does provide a more extensive list of species observed in spring, 2011, and the information is presented accurately and more comprehensively. Relevant information in Appendix E should be incorporated in the analysis prepared for the subsequent EIS.

Rocky outcrop habitat should be included as a habitat type in Table 3.4-1. The incorporation of rocky outcrops into other types, as presented in Appendix D, limits the disclosure of rocky outcrop habitat as a critical substrate for the state-listed Santa Susana tarplant. Appendix E has a much more comprehensive description of the rocky outcrop habitat on-site and its value as substrate for the Santa Susana tarplant. The Draft EIS project description and impact analysis notes that excavation of rocky outcrops would be avoided, yet rocky outcrops are part of other habitat types that will be destroyed during soil removal. The rare plant surveys conducted also incorrectly conclude that no *Astragalus brauntonii* (Braunton's milkvetch) is present on site.

This species has an extensive and long-lived seedbank and NPS and others' research indicates that it can appear in sites where it was not previously seen after a vegetation clearing event such as a fire. The fact that appropriate habitat is present should be taken as an indication that the species may be present and impacts to the species from clean up may occur.

Inadequacy of Mitigation measure Biology BMP-1 (Section 4.4.2).

0225-15

Mitigation measure Biology BMP-1 should not be considered either a best management practice (BMP) or a mitigation measure for the irreversible effects of habitat and native soil removal. Biology BMP-1 recommends reseeding with a commercially available native seed mix that is of the same composition of plants that currently exist at SSFL. A three-year implementation program is recommended, with a goal of 50% native cover at the end of the timeframe. The Draft EIS offers no long-term management plan for restoration. Lack of long-term monitoring is a primary reason for revegetation failure. In addition, obtaining native seed can be difficult and ensuring genetic appropriateness of seed is also difficult.

Numerous invasive species are also present on site and are likely to colonize disturbed soils and outcompete native plants seeded on disturbed soils. NPS finds that it is likely that Biology BMP-1 would result in habitat type conversion and loss of biodiversity.

Biology BMP-1 should also not be considered an effective mitigation measure for long-term wind and water erosion. Without the long-term monitoring and ongoing treatment, erosion of soils would become a long-term negative impact if restoration of plant cover is not successful.

The action alternative project description does not identify any confirmed replacement soil source.

0225-16

The proposed action would replace removed soils at a backfill volume of one-third of the removed volume. The Draft EIS lists potential sources of backfill topsoil (Section 2, pg. 2-19), but fails to analyze whether the suggested sources would be the same soil type(s) as removed soils and whether or not the soils would be guaranteed uncontaminated and free of invasive weed

seeds. Given that soil treatment is the key element in the cleanup action alternative, a clear identification of the replacement soil source and its suitability is a critical factor in defining a viable cleanup program which needs to be included in the subsequent EIS.

The soils impact analysis does not take into account indirect impacts of remedial grading (Section 4.2).

0225-17

The 500,000-cubic-yard estimated maximum soil removal could be significantly increased based on the need to resolve unforeseen unstable soils. There is also an inherent risk of determining the point at which the soils meet the Look-Up Table's background levels and limits on detectability. Unanticipated expansion of the grading footprint has the potential to exacerbate potential impacts on archaeological resources or sensitive species and native habitat.

Supplemental or the final EIS should consider Santa Ana wind events to fully assess fugitive dust impacts (Section 4.7).

0225-18

The Draft EIS asserts that fugitive dust is likely to be deposited within or near the project site (pg. 4-104). The Draft EIS fails to consider Santa Ana high-speed wind conditions that occur throughout the year, and mostly during the fall through early winter months. Santa Ana winds come from the northeast and would carry contaminated fugitive dust onto state and federal park land within SMMNRA in the Simi Hills southwest of SSFL. The subsequent EIS should fully consider how to contain contaminated fugitive dust during Santa Ana high-speed winds and low humidity conditions when 105 acres of ground surface may be exposed.

Supplemental or the final EIS should address land use as an impact topic (Section 2).

0225-19

Land use as an impact analysis topic was dismissed (Table 2.5-1). The Draft EIS states: "Existing and proposed land uses do not conflict with federal or state land use plans, policies, regulations, or laws. Therefore, no impacts to land use would occur". NPS has several concerns about dismissing land use from impact analysis.

The NPS Rim of the Valley Corridor Special Resource Study is not referenced.

0225-20

As set forth by Congress, the purpose of the special resource study is to determine whether any portion of the Rim of the Valley Corridor study area is eligible to be designated as a unit of the National Park System or can be added to an existing NPS unit through a boundary adjustment to Santa Monica Mountains National Recreation Area. The NPS anticipates providing the public with a draft study report early in 2014, and the final report will be transmitted to Congress at the end of 2014. NPS staff is currently completing environmental analysis of a range of alternatives and developing recommendations for the study area. All of the preliminary alternatives include SSFL and the NASA property, and consider the cultural resources at SSFL nationally significant.

The study also recognizes the natural landscape at SSFL that contributes to the critical habitat linkage between Los Padres National Forest and the Santa Monica Mountains. The NPS urges that the forthcoming study be referenced in the subsequent EIS under a land use topic that informs the public of this and other studies or plans which may be affected by the action alternative.

NPS finds the resulting landscape from cleanup to background needs to consider impacts to the management goals and objectives of surrounding park agencies.

0225-21

The greater land use setting around SSFL is largely public native open space parkland—the vast majority of which is managed by agencies with missions to preserve and protect natural and cultural resources and to provide resource-dependent public recreation. SSFL open space is continuous with both the ecological and cultural resource setting associated with NPS-administered Santa Monica Mountains National Recreation Area. In its current state, SSFL provides ecological benefits for NPS and other park lands. These benefits include wildlife corridors and population “reservoirs” of rare plants. The subsequent or final EIS needs to consider the project’s consequences for the surrounding parkland land use and other agencies mandates for managing these parklands.

The possible action by Congress affecting the future of the SSFL area should also be considered.

In conclusion, the NPS finds the Draft EIS does not adequately address the stated Purpose and Need for the project.

The stated need for the proposed action is “to protect human health and the environment, to meet the requirements of the 2010 AOC by the completion date of 2017, to reduce ongoing maintenance costs, and to prepare the property for disposition” (Section 1.2).

The action alternative, as currently proposed, does not fully meet the stated need to protect the environment.

0225-22

Based on our previous comments on the inadequacy of biological surveys, the inadequacy of evaluation of impacts, and the inadequacy of mitigation measures, we are concerned that the action alternative, as currently described, is not capable of meeting the goal of protecting the environment. Although the action alternative would remove contaminants – a benefit – as currently proposed it also would adversely impact soils, habitats, corridors and vegetation – long term unacceptable consequences.

The action alternative seeks to achieve “background levels” for contaminants at the site. Based on the need to remove or treat 500,000 cubic yards of native soil, the resulting disturbance will render the landscape into an unnatural assemblage of vegetation, soils, topography, and wildlife diversity, and the overall aesthetic and ecological condition will be artificially disjointed from the surrounding natural parklands. In this sense, the post-cleanup environment would be very unlike the reference sites on NPS lands within the SMMNRA used for the chemical and radiological background level studies. Indeed, the proposed cleanup may exacerbate negative site conditions, such as non-native invasive plant proliferation, habitat type conversion, and reduced wildlife diversity.

The Draft EIS does not demonstrate the project would reduce maintenance costs.

0225-23

NPS did not find in the Draft EIS adequate discussion of the costs to be incurred in order to adequately implement the action alternative. Therefore, it is unclear whether the action alternative, as currently described, is capable of achieving the stated need to reduce maintenance costs, particularly compared to the no action alternative.

The NPS appreciates the opportunity to provide comments about information needed in order to prepare the subsequent EIS. For clarification, if needed, regarding our comments, or for further assistance in addressing these concerns and recommendations, please contact David Szymanski, Superintendent, Santa Monica Mountains National Recreation Area, (805) 370-2344.

Sincerely,

A handwritten signature in black ink that reads "Patricia Sanderson Port". The signature is written in a cursive style with a large, prominent initial "P".

NASA Draft EIS for Demolition and Cleanup of Facilities on NASA-owned portion of
Santa Susana Field Laboratory

NPS Table 1. Detailed Comments

Date: September 19, 2013 Page 1 of 10

No.	Page Number, Section, or Reference	Comment/Proposed Revision	
1.	Regional Park Land Setting Affected Environment Section 3 and Appendices D & E	Maps in Section 3 and Appendices D and E either have no parkland identification (Figures 3.4-2, Wildlife Migration Corridor and 3.10-1, Transportation Network), or are missing several areas of public parkland and protected open space (Figure 3.12-3). Several maps in the Draft EIS appendices are also absent any parkland identification (Appendix D, E). None of the maps include the NPS-administered Santa Monica Mountains National Recreation Area boundary. The SMMNRA boundary is shared with the southwestern boundary of SSFL.	0225-03
1.	Cultural Resources Executive Summary pg. ES-7 Table ES-4, pg. ES-12	The Executive Summary states “Demolition would have a significant, negative, local, and long-term impact to all of the historic architectural resources.” The historic structures have been deemed eligible for the National Register. Thus, the impact would be beyond local since the Determination of Eligibility deemed the test stand resources were of national significance. Impact would be national.	0225-24
2.	Cultural Resources Affected Environment Section 3.3	<p>The archaeological resources in Area II have been identified through surface surveys in a heavily vegetated and rugged, sometimes inaccessible landscape that precludes reliable identification of archeological resources in much of the project area. The Draft EIS assumes that subsurface archeological resources throughout the developed areas are likely to be disturbed. At the one clearly significant archeological site complex (Burro Flats Painted Cave), site boundaries were left undetermined. Either a thorough review of the existing documentation or intensive surface survey/mapping would have resolved this, but neither appears to have been conducted. The 1975 National Register nomination form, based on a 1973 archeological survey report, describes a huge midden area within the extensive site complex (CA-VEN-1072) that should have been mapped in order to define the affected environment at this location. As described in the Draft EIS and the associated cultural resource study (Appendix C), the site would appear to be focused on the main pictograph panel, but the midden area could be an equally significant site component, one that might contain buried house structures and human burials. At present, all knowledge about this area is based on unpublished and largely unanalyzed data collected by avocational and field school excavations over a half century ago.</p> <p>The boundaries for the Santa Ynez Band of Chumash Indians’ Sacred Site have not yet been determined, and it is unclear how this applies to the Area of Potential Effect. The Traditional Cultural Properties (TCP) and Cultural Landscape Assessment are still underway to determine whether there is a TCP that is eligible for listing on the National Register. Without additional information, it is impossible to know how these potential resources comprise portions of the affected environment.</p>	0225-25 0225-26
3.	Cultural Resources Appendix C-51 Section 6.1.2	Statement that limited Holocene soils are present in most of APE is questionable. North 1/3 of area has several areas of deep soils.	0225-27
4.	Cultural Resources Appendix C-52	Recommended plan for dealing with “unanticipated discoveries” at VEN-1072 is inadequate for an eligible archeological site that has demonstrated subsurface potential of great significance. The recommended approach would barely suffice for twentieth-century style “salvage archeology.”	0225-28

NASA Draft EIS for Demolition and Cleanup of Facilities on NASA-owned portion of
Santa Susana Field Laboratory

NPS Table 1. Detailed Comments

Date: September 19, 2013 Page 2 of 10

5.	Cultural Resources Appendix C-52 Section 6.1.4 Affected Environment Section 3.3.3.1, pg. 3-15	Sacred Site is assumed to encompass the entire APE. What is this based on? Santa Ynez has expressed concern about VEN-1072 and the documented Native American occupation which is clearly focused on the south 1/3 of APE.	0225-29
6.	Cultural Resources Appendix C-52 Section 6.1.5 Affected Environment 3.3.3.2, pg. 3-15	TCP study is underway, but no results are provided in draft EIS. It is not clear if there is a TCP at this point. How relevant is the TCP to the DEIS. The survey report and EIS may be premature at this stage of TCP identification.	0225-30
7.	Cultural Resources Appendix C-36-37	The description of the Burro Flats Painted Cave (CA-VE-1072) is extremely superficial, as is the summary of previous work conducted there. The authors claim to have fully re-documented the site complex to resolve inconsistencies and problems with previous work, when these issues were actually resolved in 1991 by Al Knight and colleagues. Although Knight's work and subsequent publications are not acknowledged, his nomenclature for incorporating multiple previous site designations into a single complex (VEN-1072) is adopted. The 2007 record by CH2MHill is actually very limited and produced little new information except for a new map of the site superimposed on aerial imagery. The south and west site boundaries are undefined, although the report elsewhere includes recommendations that imply that basic site parameters including site boundaries have been determined.	0225-31
8.	Cultural Resources DEIS Section 3.3.3.3 pg. 3-16	Again, the EIS states that numerous multiple sites were re-recorded in 2007 to form one larger site (VEN-1072) and reduce misinterpretations and inconsistencies. In fact, this work was conducted over a decade earlier by Al Knight as independent research that was permitted by NASA, but done for purposes of Section 106 compliance or with any linkage to the current undertaking.	0225-32
9.	Cultural Resources Environmental Consequences Section 4.3.1.1 pg. 4-17	Demolition of buildings and facilities is said to be a minor impact and no adverse effect because of previous disturbance, including piping and other facilities in and around VEN-1072. However, intact subsurface archeological deposits are routinely found adjacent to areas which have previously been trenched and otherwise impacted for installation of utilities. With no prior subsurface evaluations of depth, character, and integrity, the currently existing data from the site indicate that adverse effects are much more likely to occur. Because of partial loss that has already occurred, the remaining archeological resources at this extremely important site are especially important.	0225-33
10.	Cultural Resources Environmental Consequences Section 4.3.2 pg. 4-25	Regarding Measure #3, suggesting a "more in-depth ethnographic study" that would build on the 2013 TCP study is meaningless when all that has been said at this point is that the TCP study is currently underway. There is no reason to believe that additional subsequent research would be productive without knowing anything about what has already been learned from this type of research.	0225-34

NASA Draft EIS for Demolition and Cleanup of Facilities on NASA-owned portion of
Santa Susana Field Laboratory

NPS Table 1. Detailed Comments

Date: September 19, 2013 Page 3 of 10

11.	Cultural Resources Environmental Consequences Section 4.3.2 pg. 4-25	Regarding Measure #4, “use of local archeologists and anthropologists with knowledge of the area” to determine site boundaries and gain a better scope of the site sounds like work that should have already been done before impacts could effectively be evaluated. It also imposing on the local community to help NASA do work that is normally a very intensive and sometimes expensive professional service done by paid contractors. This sounds like suggesting that a volunteer effort to remedy current deficiencies in site knowledge would somehow help mitigate partial destruction of VEN-1072. These deficiencies are not unanticipated. They have been discussed in previous 106 Consulting Party discussions, and the NPS Cultural Resource Manager at SMMNRA has suggested twice in those conversations that new fieldwork and testing were needed to define site parameters. In one conversation, NASA agreed to arrange site testing at VEN-1072 to remedy the deficiency. That clearly has not taken place.	0225-35
12.	Cultural Resources Environmental Consequences Section 4.3	The Draft EIS suggests that total demolition of the historic architecture might not be necessary if preserving one or more historic structures is selected as mitigation for the removal of other historic resources. What technical constraints are involved? Exactly where preservation-over-demolition might be feasible is not identified in the Draft EIS. If one test stand could be preserved, why not preserve more of these nationally significant structures? Suggested mitigations for impacts to prehistoric archeological resources actually consist of remedial documentation to provide information that typically is used for planning data recovery or other mitigation measures commensurate with an undertaking of this type and scale. As described also in the Affected Environment, the existing data are not adequate for scoping and designing effective mitigation for impacts.	0225-36
13.	Biological Resources Affected Environment Wildlife “Migration” Corridors Section 3.4.2	Figure 3.4-2 illustrates the habitat linkage area, but lacks habitat quality information and does not show park land and open space in the vicinity of the property. Thus, the figure does not adequately illustrate the location of this property in the context of existing parkland and important habitat. Please see attached NPS Figure 1 for a more accurate illustration of the greater park land and open space setting.	0225-37
14.	Biological Resources Affected Environment Wildlife “Migration” Corridors Section 3.4.2	The citation upon which the Draft EIS statement is based incorrectly references U.S. Fish and Wildlife Service (USFWS) as the source for critical habitat corridors in the region. USFWS maps critical habitat for listed species and is not responsible for mapping critical habitat linkages for wildlife movement. The correct reference would be the South Coast Missing Linkages project report (Penrod et al. 2006: Penrod, K., C. Cabañero, P. Beier, C. Luke, W. Spencer, E. Rubin, R. Sauvajot, S. Riley, and D. Kamradt. 2006. South Coast Missing Linkages Project: A Linkage Design for the Santa Monica-Sierra Madre Connection. Produced by South Coast Wildlands, Idyllwild, CA. www.scwildlands.org, in cooperation with National Park Service, Santa Monica Mountains Conservancy, California State Parks, and The Nature Conservancy.). The South Coast Missing Linkages report was the product of a major collaborative effort among a dozen governmental and non-governmental organizations. This landmark report on wildlife habitat linkages is not cited in the Draft EIS.	0225-38
15.	Biological Resources Affected Environment Wildlife “Migration” Corridors Section 3.4.2	The Draft EIS’s statement that “SSFL <i>could</i> play a role for habitat linkage among the Santa Susana Mountains, the Simi Hills, and <i>possibly</i> into the Santa Monica Mountains” (pg. 3-23) (emphasis added) is incorrect. The South Coast Missing Linkages report identified the entire SSFL, including the NASA portion, as an important habitat area containing habitat for 19 of the 20 species considered in the habitat linkage analysis (the 20th species was the southern steelhead trout; the study found no currently existing habitat for this species in the area studied). SSFL presents a continuum of native habitat types; there is nothing distinguishing habitat on the 451-acre NASA property versus the rest of the 2,850-acre site and its service to wildlife living within or moving through SSFL and beyond into parkland within Santa Monica Mountains National Recreation Area. With that observation, the South Coast Missing Linkages report included open space within SSFL in a priority habitat linkage design connecting the <i>Santa Monica Mountains</i> through the Simi Hills and Santa Susana Mountains to the Sierra Madre.	0225-39

NASA Draft EIS for Demolition and Cleanup of Facilities on NASA-owned portion of
Santa Susana Field Laboratory

NPS Table 1. Detailed Comments

Date: September 19, 2013 Page 4 of 10

16.	Biological Resources Affected Environment Wildlife "Migration" Corridors Section 3.4.2	The Draft EIS's statement that the mapped habitat linkage excludes the NASA property is overly conservative and presents a narrow interpretation of the complex set of factors upon which to map a wildlife habitat linkage. The Missing Linkage report's mapped linkage area was defined through delineation of the top one percent (1%) of habitat as identified by a GIS least-cost model. The modeled linkage does not mean that areas outside the critical linkage map are unimportant to the wildlife corridor. The mapping also does not imply that outside areas are unimportant habitat or unimportant to wildlife movement. The fact that the NASA property is not included in the critical linkage map only means those parcels were not selected as the top 1% of the habitat. The NASA portion of the SSFL is immediately adjacent to the 1% critical habitat linkage area and appears in the South Coast Missing Linkage report's 3% and 5% habitat linkage areas.	0229-40
17.	Biological Resources Affected Environment Wildlife "Migration" Corridors Section 3.4.2	The Draft EIS uses the phrase "wildlife migration corridor" throughout the document, although this phrase presents a limited purpose for protecting habitat for wildlife movement. The appropriate phrase is "wildlife habitat linkage."	0229-41
18.	Biological Resources Special Status Wildlife Appendices D and E	<p>The Fall 2010 (Appendix D) and Spring 2011 (Appendix E) biological surveys did not conduct systematic wildlife surveys (see Appendix E p. E-28 for information). Surveys were for vegetation, and wildlife that was encountered was incidentally noted. Therefore, no USFWS or other rigorous protocols were followed when looking for species that were endangered, threatened, or of special concern.</p> <p>For sensitive, threatened, or endangered birds: Point counts, area searches, and nest searches should have been conducted.</p> <p>For sensitive, threatened, or endangered aquatic amphibians: Stream surveys during the day and night should have been conducted.</p> <ul style="list-style-type: none"> • California red-legged frogs (<i>R. draytonii</i>) - The local population of <i>R. draytonii</i> is about 3.5 miles away from SSFL. Movements of frogs from the local population to sites less than 1 mile away have been documented every year since 2009. It is unknown whether adult frogs would travel the 3.5 miles to SSFL, but USFWS survey protocols should be followed to determine if there are <i>R. draytonii</i> on the NASA property. Suitable breeding and year-round habitat exists on the property. <p>For sensitive, threatened, or endangered terrestrial herpetofauna: cover boards, visual surveys, transect walks, pitfall trapping, or comparable census methods should have been conducted.</p> <p>For sensitive, threatened, or endangered Desert woodrats: Sherman trapping at nests should have been conducted.</p> <p>Incorrect Information in Appendix D Table 2 (p. 4-10 to 4-12):</p> <ul style="list-style-type: none"> • Mountain garter snake (<i>Thamnophis elegans</i>) is not found in this area. Most likely, the surveyors saw a two-striped garter snake (<i>Thamnophis hammondi</i>) and misidentified it because they were not familiar with the local species. • Bobcat species name should be <i>Lynx rufus</i>. • Mountain lion species name should be <i>Puma concolor</i>. • Wild pig (<i>Sus scrofa</i>) has not been detected before in this area. It is highly unlikely that wild pigs are in the area of SSFL because they have not been detected in other park sites like Cheeseboro Canyon or Upper Las Virgenes Canyon. The report does not say what the "sign" of pigs was. NPS staff will follow up on this. 	0229-42

NASA Draft EIS for Demolition and Cleanup of Facilities on NASA-owned portion of
Santa Susana Field Laboratory

NPS Table 1. Detailed Comments

Date: September 19, 2013 Page 5 of 10

19.	Biological Resources Affected Environment Special Status Wildlife Section 3.4	<p>Species that were not detected does not mean they were not there. Survey methods were not appropriate to make the conclusions that are made in this table and in Appendix D and E (see below).</p> <ul style="list-style-type: none"> - Desert woodrat (<i>Neotoma lepida</i>) - not detected during observations but highly unlikely that woodrat species in SSFL is this species of special concern, as the habitat is highly suitable to this species. Without night surveys and trapping, there is no way the surveyors could have determined what species of woodrat was found. - Fairy shrimp species - not detected during observations but no aquatic surveys (i.e. dip net, kick net) were done. - Spadefoot toad (<i>Spea hammondi</i>) - personal communication from a reliable source (local biological consultant) told me (K. Delaney) that ponds at SSFL Area IV were breeding grounds for this species. SSFL has highly suitable habitat for this species, it has been documented in the CNDDB in this area, and individuals have been captured in the Simi Hills (by NPS) and at Chatsworth Nature Preserve (by Southwestern Herpetological Society) within the last 10 years. It is possible that this species could also be found on the NASA property. - Coastal California gnatcatcher (<i>Poliophtila californica californica</i>) - suitable habitat is found nearby. More extensive surveys during the spring breeding season should have been done to confirm non-detection of this species. 	0229-43
20.	Biological Resources Environmental Consequences Special Status Wildlife Section 4.4 pp. 4-30, 4-31	<ul style="list-style-type: none"> - Fairy shrimp: Finding of “no expected impacts” is premature given no surveys were done for these species. - Coast horned lizard: <ol style="list-style-type: none"> 1. Three juvenile lizards were observed during the surveys, the report only states the 1 lizard seen during Fall 2010 surveys. 2. The conclusion that the population of coast horned lizards is small because only 1 individual was observed during surveys is incorrect. A population size cannot be determined from a few incidental observations. 3. The observation of juvenile lizards suggests a healthy breeding population of this sensitive species 4. The impact of the proposed action on this species would be <u>moderate to significant</u>, <i>negative</i>, <i>local</i>, and <i>short term</i>. - Two-striped garter snake: NPS finds the proposed action on this species would also be <u>moderate to significant</u>, <i>negative</i>, <i>local</i>, and <i>short term</i>. 	0225-44
21.	Water Resources Wildlife Environmental Consequences Section 4.6	All actions that affect surface water (ponds and streams) would affect native amphibian breeding habitat. Native amphibians known to breed on the property include the Western toad, Pacific tree frog, and spadefoot toad. Effects from the proposed action to surface water would have <i>significant</i> , <i>negative</i> , <i>local</i> and <i>short term</i> impacts to native amphibian breeding.	0225-45
22.	Biological Resources Wildlife Affected Environment Table 3.4-3	Please correct typo: “gnatcatcher” is misspelled.	0225-46

23.	Environmental Consequences Biological Resources Section 4.4.1.3 Section 6 Biology BMP-1	<p>Biology BMP-1 is unrealistic. Removal of 500,000 cubic yards of soil would be akin to a quarrying operation, thereby removing all native substrate and rendering no opportunity for soil crust regeneration and associated native recolonization. Studies of native revegetation efforts at mining reclamation sites have found lack of success, and typically the result is conversion to non-native plant populations and loss of native diversity (“<i>Does post-mining rehabilitation restore habitat equivalent to that removed by mining? A case study from the monsoonal tropics of northern Australia.</i>” Author S. Gould. Wildlife Research 38(6) 482-490, November 2011). Soil properties (physical, chemical, organics like roots that hold soil together, microbial properties) need to be similar to the native soils. Replacement soils would be unconsolidated and subject to wind and rain erosion, particularly when vegetation is not yet established. What metrics would be used to determine soil integrity and to what extent would the replacement soils be compacted during installation?</p> <p>Biological soil crusts are particularly important in arid and semi-arid places, including many areas of soils in the Santa Monica Mountains and Simi Hills. The following link to a study on soil crusts describes the importance of soil crusts to plant establishment: http://sbcs.wr.usgs.gov/products/pdfs/Belnap_et_al_ch21_Influence_on_soil.pdf.</p> <p>Removal of the top two feet or more of native soils would also eliminate the native seed bank. The proposed seeding alone would not be sufficient. Plantings from local sources of stock would be necessary. Control of invasive plant propagules would be important to avoiding noxious plant spread, assuming the imported replacement soils could be deemed weed-free.</p> <p>Long-term site maintenance is recommended—ten or more years for such a large area of high disturbance, or until the plant cover is a self-sustaining native community. The three-year monitoring period proposed in the Draft EIS is considerably too short for such an extensive area of disturbance.</p>	0225-47
24.	Biological Resources Vegetation Environmental Consequences Section 4.4.1.2 pg. 4-31	The statement that impacts to native vegetation communities is short-term is unsupported by data. What evidence indicates ability to successfully restore the native vegetation communities that were present, after soil is removed? Ecological restoration is extremely difficult and simply re-seeding areas where 2 to 20 feet of topsoil has been removed seems unlikely to result in restoration of a functioning native ecosystem. Impacts should be reclassified as long-term and possibly permanent losses.	0225-48
25.	Biological Resources Vegetation Environmental Consequences Section 4.4.1.2 pg. 4-31	The Draft EIS states “Over time, the demolition would increase the amount of undeveloped, vegetated area and would have a moderate, beneficial, local, and long-term impact.” This statement is unsupported by data. Please provide additional data to support this claim. NPS experience in the Santa Monica Mountains National Recreation Area, as well as other studies in the ecological restoration literature, suggests that if the removal areas do become revegetated over time, the likeliest outcome is that they will be non-native annual grassland or other non-native herbaceous weeds. NPS studies of seeding in the Santa Monica Mountains have found it to be an ineffective treatment for the most part without large amounts of hand-weeding post-seeding.	0225-49
26.	Biological Resources Vegetation and Land Cover Types Affected Environment Section 3.4.1	The Draft EIS refers only to Appendix D, the 2010 Fall field work report dated February 2011. Appendix D includes vegetation survey reports that are difficult to assess owing to mixing of old and new taxonomy without identifying synonymy, listing by common names (species are not grouped by family and genera), and misspelling of several scientific names. The findings in Appendix D were based on plant survey lists from 2008, 2009, and fall 2010 (pg. D-78, Appendix D). A more comprehensive field effort was carried out in spring, 2011, and resulted in the report dated December 2011, presented in the Draft EIS as Appendix E. Appendix E has a more extensive list of species observed in spring, 2011, and the information is presented accurately and more comprehensively. NPS finds Appendix E should be referenced in the Draft EIS, because Appendix D insufficiently presents vegetation and land cover types.	0225-50

NASA Draft EIS for Demolition and Cleanup of Facilities on NASA-owned portion of
Santa Susana Field Laboratory

NPS Table 1. Detailed Comments

Date: September 19, 2013 Page 7 of 10

27.	Biological Resources Environmental Consequences Santa Susana Tarplant Section 4.4.1.1 pg. 4-30	Impacts to Santa Susana Tarplant are not adequately evaluated. Please identify what portion of the population at SSFL would be destroyed by soil removal/remediation activities. Also, please identify that seed production and seedling survival rates in remaining population are high enough to support population viability into the future. Also, please evaluate vulnerability of the population under climate change to show that the individuals lost during soil removal will not be critical to future population survival.	0225-51
28.	Biological Resources Environmental Consequences Braunton's Milkvetch Section 4.4.1.1 pg. 4-30	Impacts to Braunton's milkvetch are not adequately evaluated. Braunton's milkvetch appears to have a long-lived seedbank and a meta-0225-52 population type dynamic in natural areas. NPS has had Braunton's milkvetch show up in previously unrecorded areas after a fire or other form of soil disturbance (exposing surface soils to the light) (NPS, unpublished survey data can be provided upon request). These more transitory populations may play an important role in the long-term persistence of these species (a regional population viability analysis is needed to evaluate the role of these transitory populations in the long-term persistence of the species). If appropriate habitat exists in the ROI, negative impacts to this species should be assumed and mitigated appropriately rather than assuming no impacts because no plants above ground were observed. Alternatively, an extensive series of soil samples could be collected and germinated in the greenhouse to test for the presence of Braunton's milkvetch in the seedbank.	0225-52
29.	Biological Resources Vegetation and Land Cover Types Affected Environment Section 3.4.1, pg. 3-24	<i>Plantago erectus</i> should be corrected to <i>Plantago erecta</i> . (In 2 nd paragraph below Table 3.4-2)	0225-53
30.	Biological Resources Vegetation and Land Cover Types Affected Environment Section 3.4.1, pg. 3-35	No need to capitalize 'palustrine' in mid-sentence.	0225-54
31.	Biological Resources Vegetation Appendix D-15	<i>Eriodictyon crassifolia</i> should be corrected to <i>Eriodictyon crassifolium</i> . (Under 4.1.1.2 Chaparral)	0225-55
32.	Biological Resources Vegetation Appendix D-17	<i>Artemesia</i> is spelled <i>Artemisia</i> (1 st paragraph under 4.1.1.3)	0225-56
33.	Biological Resources Vegetation Appendix D-17	The document doesn't state which source is followed in plant names (TJM1 or TJM2)--possibly TJM1, so <i>Sambucus mexicana</i> probably okay although besides TJM1 it is commonly recognized now that <i>S. mexicana</i> was a mis-id for California. The species we have is <i>S. nigra</i> subsp. <i>caerulea</i> . Later on pg. D-19, under Venturan CSS, <i>Acmispon glaber</i> is based on TJM2 while <i>Yucca whipplei</i> is based on TJM1. On previous page <i>Eremocarpus setigerus</i> is based on TJM1. Under sensitive species, <i>Deinandra minthornii</i> is based on TJM2. It would probably be good to follow TJM2 in all plant names since that is the new standard.	0225-57

34.	Biological Resources Vegetation Appendix D-18	Under 4.1.1.6 Mulefat Scrub, 2 nd sentence “consists of mostly of...”; 3 rd sentence: <i>Baccharis salicifolia</i> shrubland alliance (not <i>salicifolias</i>)	0225-58
35.	Biological Resources Vegetation Appendix D-57	Under disturbed chaparral: We shouldn't have <i>Eriodictyon californicum</i> . Likely <i>E. crassifolium</i> (also under Disturbed Sage Scrub on page D-59). Likewise, we shouldn't have <i>Yucca schidigera</i> —our species is <i>Y. whipplei</i> .	0225-59
36.	Biological Resources Vegetation Appendix D-65	Under dominant vegetation for ruderal: <i>Dieteria</i> (segregated from <i>Machaeranthera</i>) has not been reported from our area. (<i>Symphotrichum lanceolatum</i> var. <i>hesperium</i> does occur in our floristic region. Images are posted at www.smmflowers.org/bloom/species/Symphotrichum)	0225-60
37.	Biological Resources Vegetation Appendix D-71	Plant species list is generally better organized alphabetically first by family and then by genus/species, listing the scientific name first. Common names are ambiguous and a genus with several species will be distributed in different places on the list, making it difficult to understand the nature of the species complex/community.	0225-61
38.	Biological Resources Vegetation Appendix D-74 and onward	Plant list typos and suspicious entries: <i>Yucca whipplei</i> (not <i>whipleri</i>); <i>Salvia columbariae</i> (not <i>columberiae</i>); <i>Ceanothus arboreus</i> is a mis-id, we don't have that—see www.smmflowers.org/bloom/species/Ceanothus for SMMNRA species (<i>C. crassifolius</i> , <i>C. oliganthus</i> , and <i>C. spinosus</i> are known from the site); <i>Ceanothus crassifolius</i> (not <i>crassifolia</i>); <i>Lonicera hispidula</i> is suspect...we have not been able to confirm an old record from Malibu Canyon. You begin to run into <i>L. hispidula</i> along the coast at about Santa Barbara (<i>Lonicera subspicata</i> var. <i>denudata</i> would be more likely); <i>Artemisia douglasiana</i> (not <i>Artemesia</i>); <i>Chlorogalum pomeridianum</i> (not <i>Chloragalum</i>); <i>Eriodictyon crassifolium</i> (not <i>crassifolia</i>);	0225-62
39.	Biological Resources Vegetation Appendix D-82	Caption for Photo 6: Likely the exposed outcrop habitat has not resulted from non-native 'grassland' eroding away. The non-native annual grasses are likely a later introduction from ranching era, encroaching on the crust/moss/ <i>Selaginella</i> /native forb patches. This comment applies also to Photo 22.	0225-63
40.	Biological Resources Vegetation Appendix D-84	Caption for Photo 14: The dry plant in foreground looks more like <i>Carduus pycnocephalus</i> (based on habit/stature; heads are not clear enough to determine from picture either way...) The difference would be native vs. non-native...	0225-64
41.	Biological Resources Vegetation Appendix D-86	Photo 21: the non-chalky <i>Dudleya</i> sp. is <i>D. lanceolata</i> . (Also in Photo 23.) During survey in June 2011, only <i>D. lanceolata</i> and <i>D. pulverulenta</i> was found. No suitable habitat for sensitive <i>Dudleya</i> known from this floristic region was found at the site. June 2011 survey was attended by a botanist with extensive knowledge of local common and sensitive <i>Dudleya</i> .	0225-65
42.	Biological Resources Vegetation Appendix D-86	Photo 22: <i>Dudleya pulverulenta</i>	0225-66

NASA Draft EIS for Demolition and Cleanup of Facilities on NASA-owned portion of
Santa Susana Field Laboratory

NPS Table 1. Detailed Comments

Date: September 19, 2013 Page 9 of 10

43.	Soils Environmental Consequences Section 4.2	The soils impact analysis does not take into account remedial grading that typically ensues when any large amount of soil is excavated. The 500,000 cubic yard estimated maximum soil removal could be significantly increased based on the need to resolve unforeseen unstable soils.	0225-67
44.	Soils Environmental Consequences Soils Section 4.2 Executive Summary, Look-up Table dated June 11, 2013	There is also the risk of over-excavation owing to difficulty in confirming the field point at which the soils meet the Look-Up Table's background levels and limits on detectability. It is apparent in the Look-Up Table document that the potential for false positives, i.e. remaining contamination, could lead to excessive excavation. The statistical method for reducing false positive readings was an important consideration in setting the testing standard for cleanup to background levels. The Draft EIS did not provide a layman's description of the testing parameters described very technically in the Look-Up Table document. The document is difficult to interpret. Such technical presentation, accessed by reference only in the Draft EIS, makes the ramifications of the proposed cleanup to background difficult to grasp.	0225-68
45.	Air Quality, Fugitive Dust Environmental Consequences Section 4.7.1.2	The Draft EIS needs to consider the potential for Santa Ana wind events to create fugitive dust. The wind roses provided in Figures 4.7-1, 2, and 3 may indicate overall mild wind patterns, but they do not illustrate the potentially severe Santa Ana wind conditions. NPS studies of Santa Ana wind speeds collected from the Cheeseboro Canyon RAWs site between 1997 and 2010 found maximum wind speeds between 34 and 45 miles per hour (mph) during Santa Ana wind events, with 0 to 6.8 events per month. Raphael ("The Santa Ana Winds of California", <i>Earth Interactions</i> , Vol. 7, Paper No. 8, 2003) found a mean number of 20 Santa Ana weather events occur per year, lasting typically 1.5 days per event. The Draft EIS should evaluate the ability to control fugitive dust during high wind/low humidity conditions lasting both day and night.	0225-69
46.	Hazardous Materials and Waste Executive Summary Section ES-5.0 and 5.3.3 Table ES-4 Environmental Consequences Hazardous Materials and Wastes Section 4.12	The Draft EIS states conflicting impact levels for the Hazardous Materials and Waste topic. The Executive Summary states an overall finding of a " <i>significant</i> , beneficial, local, and long term" impact for the removal of hazardous wastes. Environmental Consequences Table 4.12-2 summarizes eight individual impacts, with only one finding of a <i>moderate</i> , beneficial impact—for reduction or removal of hazardous material from soils and groundwater. No significant impacts were identified in the Environmental Consequences. Furthermore, the Executive Summary (Section ES-5.3.3) proceeds to justify the significant beneficial impact based only on the large volume of soil removed, without regard for any other quantitative or qualitative factors. NPS finds this inconsistency important, because in return for only a moderate long-term positive impact for hazardous waste removal (and water quality) from the cleanup-to-background action alternative, there are several significant or moderate long-term negative impacts on all other resource areas, including natural and cultural resources of concern to NPS.	0225-70
47.	Reduced Maintenance Cost Purpose & Need Section 1.2	While NEPA does not require preparation of a cost-benefit analysis, if one has been prepared that would substantiate that the proposed project would reduce site maintenance costs, the cost-benefit analysis needs to be included in the Draft EIS (40 CFR 1502.23).	0225-71
48.	Topics Dismissed Land Use Project Description Section 2 Table 2.5-1	Dismissal of Land Use: The Draft EIS does not include the basic information of existing land use and zoning classifications assigned by Ventura County to SSFL and the NASA component. The Draft EIS also does not present any surrounding land use classification typically found in a "Setting" description within an EIS.	0225-72

<p>49.</p>	<p>Topics Dismissed Land Use Project Description Section 2 Table 2.5-1</p>	<p>The dismissal of land use as a topic does not correlate with the Draft EIS's Need statement to prepare the property to support future disposition. The Draft EIS does not follow the advice provided in CEQ's list of 40 questions on implementing NEPA. Question 18 addresses uncertainty about indirect impacts and discusses uncertainty related to land use in the event of disposition. The advice notes that an EIS preparer should discuss indirect impacts on an issue like land use when trends are ascertainable or potential purchasers have made themselves known. At least one potential purchaser (recipient) of the property has been officially identified: Santa Ynez Band of Chumash Indians (notification to GSA as an interested party). Boeing has also expressed commitment to native open space as a future land use. While the Boeing property is jurisdictionally separate from the NASA land within the overall SSFL site, there is no ecological distinction between the two ownership areas, and Boeing has offered in the past to convey their property to the state for public parkland. The potential to hold the land as a native habitat and cultural resource protection open space park has been widely discussed among parkland agencies, including at meetings of the interagency Linkage Implementation Alliance (LIA). LIA participants include NPS and several other parkland and resource management agencies with jurisdiction in the Santa Monica Mountains and Simi Hills, as well as CalTrans. The LIA seeks solutions to protect and preserve habitat linkages between Los Padres National Forest and the Santa Monica Mountains. NPS and the other participants have been anticipating disclosure in the Draft EIS of cleanup impacts, particularly impacts on future land use as well as on natural and cultural resources. The disclosure of the project's indirect impacts on future land use is critical to NPS's or other agencies' decision-making tree to pursue acquisition of the NASA property.</p>	<p>025-73</p>

Re: U.S. Department of Energy (DOE) comments on the National Aeronautics and Space Administration's (NASA's) Draft Environmental Impact Statement for Proposed Demolition and Environmental Cleanup Activities at Santa Susana Field Laboratory, July 2013

Dear Mr. Elliott:

DOE appreciates the opportunity to comment on NASA's Draft Environmental Impact Statement for the Proposed Demolition and Environmental Cleanup Activities at the Santa Susana Field Laboratory.

DOE notes that the cumulative impacts analysis in Section 4.13, page 4-156, of NASA's Draft EIS contains outdated information that was provided to NASA by DOE in April 2012 as a preliminary estimate of the potential soil volume that may need remediation. Specifically, the text states that "the remediation project . . . is estimated to require the removal of a minimum of 184,000 [cubic yards] of soil" (page 4-156). DOE's estimate of 184,000 cubic yards of soil was generated before the Radiologic Look-Up tables were published by the California Department of Toxic Substances Control (DTSC) in January 2013 and before DTSC published in June 2013 the Chemical Look-Up Tables. The Look-Up Tables can be found on DTSC's website at: http://www.dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/ssfl_document_library.cfm. At that time, DOE's estimate was based on 50 areas within Area IV and the Northern Buffer Zone that DOE had previously identified as clearly contaminated and likely to need remediation.

0186-01

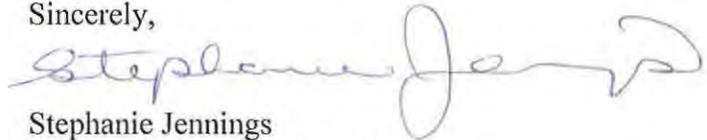

DOE is currently completing the chemical data gap sampling and is re-evaluating sampling results for all of Area IV and the Northern Buffer Zone from all phases of chemical and radiologic sampling. This evaluation is based on the recently published Look-Up tables. DOE is developing information from all phases of chemical and radiologic sampling to further refine our estimates and the scope of the necessary cleanup. DOE's initial review indicates that the revised volume estimates for preliminary remediation areas are significantly larger than we had estimated previously (information in NASA's Draft EIS).

0186-02

In 2014, after DOE completes sampling, evaluates the sampling results, and continues our EIS process, DOE will be able to share more complete information not only with NASA, but with DTSC, and stakeholders.

We look forward to continued collaboration with NASA as you complete your EIS process. If you have any questions regarding DOE's comments or process, don't hesitate to contact me.

Sincerely,

Stephanie Jennings

Ref: Draft Environmental Impact Statement (DEIS) for Demolition and Environmental Cleanup for the NASA-administered portion of the Santa Susana Field Laboratory (SSFL), Ventura County, California

Dear Mr. Elliott:

We have reviewed the DEIS for the referenced undertaking and have the following comments. Our comments are provided to assist the National Aeronautics and Space Administration (NASA) in fulfilling its responsibilities under Section 106 of the National Historic Preservation Act (NHPA) and the Advisory Council on Historic Preservation's regulations (36 CFR Part 800).

Our comments primarily focus on the anticipated effects to historic properties associated with the cleanup of the facility, and with the potential preservation of significant historic properties once the property leaves NASA's jurisdiction. Our overall concern with the DEIS is that critical information to inform NASA's decisions is either not clearly presented, or is missing. Specifically, the document lacks sufficient information on measures to minimize adverse effects and ensure the long-term preservation of historic properties on the parcels to be conveyed to another party (or parties), and the parameters limiting the range of possible preservation outcomes.

0191-01

First, the DEIS presents little substantive information on the existing cleanup agreements between NASA and the environmental regulatory agencies (e.g. with the California Department of Toxic Substances Control, on pages 4-15 and 4-18). Further information is needed, as these agreements largely direct the efforts and levels needed to remediate the site, which in turn can circumscribe NASA's ability to fully consider alternatives to avoid or lessen adverse effects to historic properties.

0191-02

For example, the DEIS notes that several cleanup levels were initially considered, but only the preferred alternative meets the letter of the 2010 cleanup agreement. While we understand that the extent and nature of contaminants cannot be fully known until additional testing is undertaken, the final EIS should more fully explain the process by which NASA will make final decisions on the type and extent, of

0191-03

ADVISORY COUNCIL ON HISTORIC PRESERVATION

1100 Pennsylvania Avenue NW, Suite 803 • Washington, DC 20004
Phone: 202-606-8503 • Fax: 202-606-8647 • achp@achp.gov • www.achp.gov

remediation(s) to be implemented, the criteria it will use to make decisions, and how the cleanup will take place in light of the agreements prior to conveyance to the General Services Administration (GSA). As you are aware, lack of this information has caused some confusion and redundant discussions in the consulting party meetings that have been held recently.

GSA will handle the disposal of the property once NASA has completed the remediation. The DEIS does not discuss GSA's role in this process, or whether GSA may be amenable to preserving anything on the property. At a recent consultation meeting there appears to have been some confusion about GSA's conditions for accepting the property from NASA. The FEIS should consider reasonably foreseeable effects associated with this undertaking, which we believe include the expected sale of the property or potential neglect of the property (36 CFR § 800.5(a)(1-2)). The FEIS should present information about the role of GSA in disposing of the property—how it identifies potential recipients, how it evaluates offers, and how it considers historic values in the excessing process. GSA's qualified personnel could likely provide helpful input in this area.

0191-04

An illustrative example of this problem is presented on page 4-25 of the DEIS, where it is stated that protective measures to prevent vandalism at the Burro Flats Painted Cave may need to be removed at the request of GSA. This appears to be the kind of historic preservation issue that needs to be addressed in NASA's FEIS, and will require coordination between NASA and GSA to answer. The document should address the circumstances under which this kind of action could occur, and why. Again, while many of these questions cannot be answered at this time, the parameters of what can be preserved, what GSA will accept and what is conveyed to GSA for ultimate disposal, need to be explored in the FEIS in more detail so that the consulting parties clearly understand the preservation possibilities or opportunities.

0191-05

0191-04

Second, the list of mitigation measures proposed in the DEIS (page 4-25) are general and formulaic. The FEIS should contain more detail that reflects the results of the ongoing consultation process. NASA has said it may be possible to preserve (at least) one test stand (Cultural Mitigation Measure 1), depending, among other things, on the character of the contaminants that surround it and may lie beneath it. As noted above, NASA hasn't been clear about whether GSA truly considers retention of a test stand (or other facility) a viable option or not.

0191-06

0191-04

In a September 10, 2013 email to the consulting parties, NASA included some rough estimates for the cost to remove asbestos, hydraulic fluids, and other regulated materials from each test stand, and encapsulate their lead paint. The email also included an annual maintenance cost for each stand of perhaps \$25,000. This information should be included in the FEIS discussion regarding mitigation measures, and should include any other available information about the possibility of retaining a test stand. For example, the FEIS should consider whether NASA would be responsible for initially preserving and preparing the structure for interpretation. In addition, the FEIS should address how organizations with an interest in preserving and interpreting such a facility will be identified by GSA and under what criteria (e.g., the need to have sufficient financial resources, etc.) GSA would select a recipient or partner. The document should also include information on the role GSA would play if NASA decides to preserve a test stand; for example, whether NASA would provide an allowance for the annual maintenance of that stand. In the event a test stand cannot be saved, it will be important to explore creative ideas that provide for telling the story of the SSFL and its historic significance. Since there is a link between the SSFL and the development of the Space Shuttles (and the Shuttle Endeavour is on display at the nearby California Science Center), perhaps some of the mitigation measures set forth in the 2011 Memorandum of Agreement for retirement of the Space Transportation System could be applied or linked to the SSFL.

0191-07

0191-04

0191-08

Third, the FEIS should provide additional information on the cleanup options (e.g., excavation and offsite disposal, ex- and in-situ onsite treatment, and to what level) and how each will affect the integrity of the significant Burro Flats Site. Again, while the extent and nature of contaminants is incomplete at this time, the manner in which NASA will consider this National Register-listed site's significance and value to living communities needs to be more fully explored in the FEIS, including the process for further consultation by NASA if additional alternatives are identified.

0191-09

In summary, the FEIS is intended to evidence NASA's compliance with Section 106. In order to fulfill its statutory and regulatory role, the document needs to present more detailed information on how the significant characteristics of the historic properties on NASA land may be affected by the cleanup, what the cleanup criteria and parameters currently are, and the role played by GSA in decisions about what it may be feasible to preserve for future generations and the Native American community. Further, because of the nature of the historic properties on the SSFL (ranging from prehistoric archaeological sites and properties of traditional religious and cultural significance to Indian tribes through mid-20th Century rocket test facilities), the range of consulting parties and interests in the future of the property, and the fact that another federal agency is tasked with disposing of NASA's property (and whose mission and interests are not necessarily in concord with NASA's), we believe NASA should strongly consider embodying the measures agreed upon to avoid, minimize, or mitigate adverse effects to historic properties in a Memorandum of Agreement.

0191-10

We appreciate the opportunity to review the DEIS. If you have any questions, or would like to discuss these issues, do not hesitate to contact Tom McCulloch at tmcculloch@achp.gov or 202-606-8554.

RE: Draft Environmental Impact Statement for Proposed Demolition and Environmental Cleanup Activities at Santa Susana Field Laboratory, Ventura County, California

Dear Mr. Elliott:

This letter provides comments from the State Historic Preservation Officer (SHPO) on the Draft Environmental Impact Statement (EIS) and continues Section 106 consultation regarding the undertaking at Santa Susana Field Laboratory (SSFL). In a letter dated June 30, 2011, NASA notified the SHPO of its intention to substitute the National Environmental Policy Act (NEPA) process and documentation required for the preparation of the EIS to meet its Section 106 responsibilities in accordance with 36 CFR 800.8(c). NASA notified the SHPO that the Draft EIS was issued on August 2, 2013, and requested comments before the end of the public comment period on October 1, 2013. SHPO comments regarding the DEIS are included in this letter. On August 29, September 11, and September 20, 2013, further consultation meetings were held among the consulting parties, including the SHPO, regarding cultural resources. The SHPO also met with representatives from NASA, the California Department of Toxic Substances Control (DTSC), and the Santa Ynez Band of Chumash Indians on September 18, 2013.

Please note that the SHPO has no interest in delaying implementation of necessary environmental cleanup. However, several aspects of the compliance effort are problematic with regard to the treatment of historic properties. These include NASA's decision to limit alternatives under consideration, statement of purpose and need for the project, as well as NASA's level of efforts in identification and evaluation of historic properties, and proposed process to resolve adverse effects to historic properties.

0184-01

Through this letter, the SHPO is notifying NASA of its concerns with these aspects of the Draft EIS and with the successful fulfillment of the 36 CFR 800.8(c) substitution process by which NASA has attempted to satisfy its Section 106 responsibilities.

Foreclosure of Ability of the Advisory Council on Historic Preservation to Comment

In 2007, NASA signed a Consent Order for Corrective Action with Boeing, the US Department of Energy, and the California DTSC. This order "identified the required activities for cleanup of soil, groundwater, and surface water at SSFL" (Draft EIS, ES-1).

0184-02

In 2010, NASA and DTSC executed an Administrative Order of Consent (AOC), which “stipulates specific remedial requirements, including characterization and cleanup of soil contamination on the NASA-administered areas of SSFL to Look-Up Table values” (Draft EIS, ES-1).

NASA references these two agreements throughout the Draft EIS to justify the restriction of alternatives considered through the NEPA process and as evidence that NASA has committed to soil cleanup at SSFL to Background levels and the remediation work that entails.

According to its Federal Preservation Officer, NASA conducted no NEPA review or Section 106 consultation with the Advisory Council on Historic Preservation (ACHP) or the SHPO (or any other parties) regarding either of these documents (Consulting parties’ conference call, August 29, 2013). By signing these two agreements, NASA committed to a course of cleanup activities that has the potential to cause adverse effects to historic properties at SSFL. Additionally, by signing these two agreements without conducting Section 106 consultation, NASA appears to have foreclosed on the opportunity of ACHP to comment on those two undertakings. By continuing to limit alternatives under consideration in the current Draft EIS based upon these two agreements, NASA is approaching a third instance of foreclosure regarding cleanup activities at SSFL.

The SHPO previously raised these concerns in conversations with NASA and in the December 3, 2012, comment letter. No response has been received as of the date of this letter.

0184-03

Purpose and Need Is Unjustified

In the June 30, 2011, letter initiating Section 106 consultation, NASA defined the undertaking as demolition and cleanup activities on the NASA-administered portion of SSFL. In the December 3, 2012, comment letter, the SHPO stated that the Draft EIS should “contain a clear and complete explanation of any and all actions that are anticipated to follow from the cleanup and remediation activities that may affect cultural resources, including any possible excess property declaration and plans for disposal that may include transfer out of federal ownership. Demolition, cleanup, and disposal all constitute Undertakings as defined in 36 CFR Part 800.”

0184-04

NASA responded that the purpose of the undertaking was remediation of contaminated soils and groundwater, and that General Services Administration (GSA) will be conducting separate environmental compliance for the disposal of the property.

The Draft EIS states the following Purpose and Need for the Action: “The purpose of the Proposed Action is to remediate the environment to a level that meets NASA’s environmental cleanup responsibilities and to undertake the demolition actions necessary to support both remediation and **property disposition** of the NASA-administered portion of SSFL (emphasis added).”

Inclusion of “disposition” in the Purpose and Need presents several problems for this consultation. The Draft EIS contains no analysis or specifications for what portion of demolition of architectural resources is related to cleanup, and what portion of demolition is related to disposition.

In the September 11, 2013, consulting parties meeting and conference call, NASA representatives stated that demolition of up to 100% of the buildings and structures is intended to prepare the property for disposal rather than to facilitate soil or groundwater cleanup. On the same occasion, the GSA representative stated that his agency has communicated no requirements for demolition to NASA, and no binding agreements between the two agencies on this subject exist. Instead, GSA told NASA that disposition will be easier if there are no buildings or structures remaining.

In a meeting on September 18, 2013, the state DTSC clarified that neither the 2007 Consent Order nor the 2010 AOC mandates demolition of buildings and structures. Instead, the documents requested that NASA submit a demolition plan, and DTSC would determine if it was sufficient to facilitate soils and groundwater remediation. If buildings not proposed for demolition hindered full cleanup to background levels, DTSC could require further demolition. If NASA has submitted a demolition plan, the SHPO has not received a copy of it.

0184-05

It appears that total demolition to facilitate disposal is a discretionary decision on NASA's part that is not mandated by the cleanup agreements, and nothing restricts NASA from considering alternatives that include something less than total demolition. Yet, the DEIS does not contain sufficient analysis of such alternatives, because NASA maintains that their "hands are tied" by the AOC which, in their interpretation, precludes all other alternatives except those included in the DEIS.

0184-06

Furthermore, it is the SHPO's opinion that splitting environmental compliance for cleanup activities from compliance for disposition artificially and improperly segments the undertaking, which appears to be NASA's disposal of its property at SSFL. The Section 106 consultation and EIS should take into account both the cleanup activities and disposition of the property rather than falsely contend that they are separate and unrelated activities.

0184-07

Insufficient Consideration of Feasible Alternatives

0184-08

In the Draft EIS, NASA has chosen to limit the number of alternatives considered to two: a No Action alternative; and the Proposed Action, which complies with the 2007 Consent Order and 2010 AOC by including demolition of up to 100% of the architectural features at SSFL, soil cleanup to Background levels through excavation, disposal, and some in situ methods, and groundwater cleanup to risk-based levels. (However, the most recent consulting parties meeting on September 11, 2013, revealed that demolition is not specifically mandated in either of these agreements.)

According to the Draft EIS, NASA eliminated from further consideration three other alternatives. These included cleanup of soils at SSFL to Residential, Commercial / Industrial, or Recreational levels, all of which require less remediation than Background level cleanup. According to the Draft EIS, "These risk-based alternatives were eliminated from further consideration because they would not meet the requirements of the 2010 AOC" (Draft EIS, 2-34).

Other than the No Action alternative, which is mandated by NEPA, NASA has not given full consideration to reasonable alternatives that would avoid the adverse effects to historic properties that will result from the Proposed Action. The Draft EIS contains no evidence that NASA has made an effort to analyze the feasibility of retaining any of the historic buildings and structures or to avoid large-scale soil removal at SSFL.

The magnitude of adverse effects / significant impacts that will result from the Proposed Action warrants serious consideration of alternatives that avoid or minimize effects / impacts. These should be analyzed at the alternatives stage rather than suggested as possible mitigation measures at the end of the process.

0184-09

Section 106 Consultation Under 36 CFR 800.8(c) – Substitution of NEPA for Section 106

When a federal agency chooses to use the NEPA process for Section 106 purposes, the documentation submitted must meet the standards outlined in 36 CFR Part 800.8(c)(1)(i-v), which are intended to accomplish the goals of the consultation process outlined in 36 CFR Part 800.3 through 6. The SHPO finds that these standards have not been met during this consultation and that the substitution process has not been sufficient for the following reasons.

0184-10

Defining the Undertaking

As described above, NASA has excluded disposition of its property from the undertaking and consultation, but is using disposition as justification for an unspecified amount of demolition of historic structures at SSFL. The undertaking should properly consider both cleanup activities and disposition if disposition influences the Proposed Action. If it does not, then disposition should not factor into the Purpose and Need for the Proposed Action / Undertaking.

0184-11

Identifying Consulting Parties

Given NASA's agreements with DTSC and reliance upon the Consent Order and AOC for determining the level of cleanup, the consultation should properly include active participation from DTSC. On several occasions, NASA has told the SHPO that DTSC has not only mandated cleanup to Background levels, but any work NASA proposes will have to be approved by DTSC. As stated above, NASA, SHPO, and Santa Ynez Band of Chumash Indians met on September 18, 2013, (ACHP declined to participate). This meeting provided much needed clarity regarding the two DTSC agreements with NASA. It would have been ideal to hold discussions such as this one early in the process as mandated by 36 CFR 800.8(c), and the SHPO encourages ongoing coordination between these consulting parties in an effort to resolve adverse effects.

0184-12

It is not clear that all other potential consulting parties have been identified or contacted, such as the U.S. Army Corps of Engineers (for a Section 404 permit).

0184-13

Identification and Evaluation of Historic Properties

In spite of previous requests and comments from the SHPO and other consulting parties, Historic Property Identification and Evaluation remains incomplete. Most recently, the SHPO's letter dated May 20, 2013, provided comments on archaeological identification efforts that have not been fully addressed by NASA. In order to inform and seek comments from the public, Tribal groups, agencies, and stakeholders regarding impacts to the cultural resources, the following items should be completed and the results of these studies should be included in the draft EIR.

0184-14

- NASA's archaeologist(s) should write an archaeological context for the area and use it to address the potential presence of an archaeological district. The Traditional Cultural Property (TCP) study and Cultural Landscape Assessment that are currently under

0184-16

preparation do not substitute for this analysis. The archaeological district identification and evaluation should take into consideration the known properties resulting from the 1-mile literature survey. There are several cultural resources on the Boeing property that may very well be considered part of an archaeological district with Burro Flats as a focal point.

- Restricting the study area to the boundaries of the NASA-administered property is insufficient. NASA contends that it is unable to conduct identification and evaluation efforts on property it does not own. The scale of adverse effects from soil removal and other remediation efforts warrants a broad study of resources in the area, including on Boeing and Department of Energy (DOE) property, because of the potential for effects to resources that span the property boundary. 0184-17
- The Draft EIS states that NASA is consulting exclusively with the Santa Ynez Band of Chumash Indians with regard to the designated Sacred Site, TCP, and Cultural Landscape Assessment (Draft EIS, 4-19). Nothing in the regulations requires or justifies exclusion of the SHPO and ACHP from this consultation, and both play a regulatory role in the evaluation of historic properties such as TCPs and Cultural Landscapes. 0184-18
- Along with the archaeological context and district evaluation, the TCP study and Cultural Landscape Assessment should form the cornerstone for historic property identification and evaluation efforts. Failure to complete these studies in time for them to inform alternative selection will result in a failure to adequately comply with 36 CFR 800.8(c)(1)(ii), which compels the federal agency to identify historic properties and assess effects consistent with the standards and criteria of 36 CFR 800.4 through 800.5. *Inclusion of historic preservation issues.* Completion of this identification effort is especially vital given the destructive nature of the remediation efforts and potential effects to the archaeological resources, as well as impacts to traditional cultural values and practices. 0184-19
- The Burro Flats site (as well as the other two identified archaeological properties) needs to be analyzed under all National Register of Historic Places (NRHP) eligibility criteria, not just Criterion D. 0184-20
 - NASA should not be relying solely on a 38-year old NRHP nomination.
 - NASA should consider updating the NRHP nomination to reflect current site conditions and also addressing all NRHP criteria.
 - NASA should reconcile all of the available information on the Burro Flat site, including but not limited to a resurvey of the site, locating / spot-checking all of the identified loci from the previous surveys and studies, etc.
 - Boundary delineation should occur at this stage to fully inform the assessment of adverse effects, rather than postponing it and considering it a mitigation measure. 0184-21
- The SHPO disagrees with NASA's assertion that the boundaries of a potential archaeological district at SSFL are limited to the boundaries of the Burro Flat National Register Archaeological District. 0184-22

Assessment of Adverse Effects

The SHPO concurs that the Proposed Action will adversely affect historic properties. The scale of adverse effects, while still being determined, is disturbing and disappointing. As mentioned above, the SHPO understands the necessity for environmental safety and has no interest in delaying reasonable cleanup of hazardous materials. 0184-23

However, the extent of adverse effects remains unknown until the full scope of cleanup activities is known and identification and evaluation efforts are complete. NASA does not intend to complete these steps prior to its Record of Decision (ROD), making it extremely difficult to agree upon appropriate resolution of the adverse effects.

Unanticipated Discoveries

The Draft EIS contains language that, “Appropriate measures, such as preparing a plan for unanticipated discoveries, should be implemented to address the possibility of impacts on buried resources from the undertaking” (Draft EIS, C-52). However, the document does not specify when this plan will be written, how or when consulting parties will be able to review and comment on it, or how NASA will demonstrate its commitment to following the plan.

0184-24

Resolution of Adverse Effects

As mentioned above, the full extent of adverse effects remains unknown. NASA proposes to continue working on the TCP and Cultural Landscape analysis and will adjust the Area of Potential Effects in accordance with the findings of these studies. However, NASA has offered no plan to allow consulting parties to comment on this analysis, either prior to release of the Final EIS or after it is released.

0184-25

Furthermore, the mitigation measures included in the Draft EIS are premature and insufficient.

0184-26

- NASA proposes the retention of a single test stand as a mitigation measure. 0184-27
 - Retention of a test stand would properly be considered an avoidance or minimization measure, but first should be included in the alternative analysis.
- NASA proposes HABS / HAER recordation of the nine individually-eligible structures at SSFL. 0184-28
 - The nine individually-eligible structures are not the only historic properties proposed for demolition. Recordation should properly include all contributors to the three historic districts associated with the test stands, too.
 - No level of recordation is specified.
- NASA proposes to produce an in-depth ethnographic study based upon research from the TCP study. 0184-29
 - An ethnographic study should be produced prior to issuance of the Final EIS so NASA can use it to identify and evaluate historic properties, assess effects, and develop appropriate avoidance, minimization, and mitigation measures.
- NASA proposes to delineate the boundaries of the Burro Flats Painted Cave archaeological site, which was listed in the NRHP in 1976. 0184-30
 - As with the ethnographic study, the boundaries of this site (and a possibly associated archaeological district) should be delineated prior to issuance of the Final EIS so NASA can use it to identify and evaluate historic properties, assess effects, and develop appropriate avoidance, minimization, and mitigation measures.
- NASA proposes to design and install temporary protection measures for the Burro Flats site during implementation of the proposed action. 0184-31
 - The SHPO appreciates NASA’s willingness to implement protection measures, but these should be part of the scope of work rather than a mitigation measure.
 - Consultation regarding protection measures should also include Tribal groups.

- NASA also should prepare a permanent protection plan for Burro Flats that extends beyond the duration of cleanup activities, and propose a Section 106 consultation plan for its implementation. 0184-32
- NASA has not proposed protection measures for any of the other historic properties at SSFL. 0184-31
- As discussed in the August 29 consulting parties' conference call, the SHPO agrees that existing historic property recordation and nominations should be updated as a mitigation measure. 0184-32

Throughout the consultation process and in the Draft EIS, NASA states that resolution of adverse effects and the Section 106 process will be finalized in the Record of Decision for the Final EIS. Given the schedule NASA has for adoption of the ROD and the limits of current cultural resource identification noted above, a resolution of adverse effects that would meet minimum standards consistent with 36 CFR Part 800.8(c)(1)(i-v) cannot be reasonably achieved. Without a substantive and enforceable agreement document, the requirements of 36 CFR 800(c) are not satisfied and the SHPO would have to consider submitting objections to NASA in accordance with 36 CFR 800.8(c)(2)(ii). 0184-33

The SHPO continues to believe, as stated on several occasions during this consultation, that an agreement document would be a more appropriate vehicle for resolving adverse effects, given the complexity of the undertaking, phased identification contemplated, scale of adverse effect, and multiple years required to implement the undertaking. Whichever document is utilized, it is essential that NASA enter into a legally-binding and enforceable agreement to resolve adverse effects to historic properties. 0184-34

Finally, outstanding issues remain from the 2010 AOC, including the definition of "Native American artifacts" and the manner by which NASA can apply the 5% exception provision to historic properties. Per the September 18, 2013, meeting with DTSC, NASA, SHPO, and Santa Ynez Band of Chumash Indians, neither NASA nor DTSC could provide an explanation of how the 5% exemption was determined or what scientific or other basis informed this decision. It appears that the exemption of 5% is arbitrary and capricious and artificially limits the consideration of alternatives, options for avoidance and minimization, and mitigation of adverse effects to historic properties. Along with discussions about extending the timeline, the SHPO recommends ongoing discussions with DTSC and signatory parties to resolve these issues. 0184-35

The SHPO appreciates the opportunity to comment on the NEPA document and looks forward to continuing consultation on this undertaking in order to resolve these issues. If you have any questions regarding these comments, please contact me directly at (916) 445-7043 / carol.roland-nawi@parks.ca.gov, or Dr. Susan Stratton at (916) 445-7023 / susan.stratton@parks.ca.gov, or Mark Beason, at (916) 445-7047 / mark.beason@parks.ca.gov.

Sincerely,

Carol Roland-Nawi, Ph.D.
State Historic Preservation Officer

Mr. Allen Elliot
Santa Susana Field Laboratory Project Director
NASA MSFC AS01, Building 4494
Huntsville, Alabama 35812
msfc-ssfl-eis@mail.nasa.gov

Subject: Draft Environmental Impact Statement for Proposed Demolition and Environmental Cleanup Activities at Santa Susana Field Laboratory, Ventura County, California

Dear Mr. Elliot:

The California Department of Fish and Wildlife (Department) appreciates this opportunity to provide comments on the above-referenced Draft Environmental Impact Statement (DEIS). The DEIS was prepared by the National Aeronautics and Space Administration (NASA) to evaluate potential environmental impacts from its Proposed Action to conduct demolition activities and remediation of contaminated groundwater and soil located on the NASA-administered property at Santa Susana Field Laboratory (SSFL).

The SSFL is located on the top of the Simi Hills and covers approximately 2850 acres. The DEIS addresses only the NASA-administered portion of the SSFL, including all of Area II (409.5 acres) and Area I (41.7 acres). The remaining acreage at the SSFL is currently owned by the Boeing Company (Boeing) and will also be subject to cleanup and remediation, to be addressed in collaboration with the Department of Energy (DOE).

State Environmental Review:

The California Department of Toxic Substances Control (DTSC) is preparing a separate Environmental Impact Report (EIR) under the California Environmental Quality Act (CEQA) (DEIR pg. 1-7). This state-led environmental review will be documented in a Programmatic EIR. DTSC will analyze the potential environmental effects of environmental cleanup activities occurring on SSFL-wide by NASA, Boeing, and DOE. The DTSC EIR is likely to be prepared following publication of NASA's EIS. DTSC will also prepare project-specific EIRs that evaluate the localized remedial activities (DEIS Section 1.3).

Overview of the Proposed Action:

The Proposed Action entails three primary components: 1) demolition of existing structures; 2) soil cleanup to background levels; and 3) groundwater cleanup. Existing buildings and infrastructure would be dismantled and contaminated subsoil removed. Soil remediation is anticipated to occur on a minimum of 105 surface acres, or about 23% of the NASA lands. Contaminated soil would be excavated to a minimum depth of 2 feet (in some places up to 20 feet) and disposed of at off-site locations. Roughly 43 acres are covered with buildings, roads or parking lots, and 62 acres are open space supporting wildlife habitat. On open space, all

existing biological resources would be removed to allow for soil treatment and disposal. Between 320,000 and 500,000 cubic yards of soil would be transported off site. Fill would be imported from on-site borrow sites and off-site locations to replace about 1/3 of the soil and subsoil removed during remediation. Additional direct impacts to about 1/3 of the on-site project area could occur from ground water cleanup technologies that would alter surface and subsurface hydrology and may include dewatering. Adverse impacts to off-site downslope habitats could occur. The duration of groundwater treatment technologies may extend across years, decades, or centuries.

Habitats and Sensitive Species:

The SSFL project area occupies hilly terrain and is located in the Cretaceous Chatsworth Formation, supporting marine sedimentary rock including sandstone, shale and conglomerate. Generally, developed facilities and roads proposed for demolition are located in localized valleys between ridges of sandstone rock outcrop. Soil contamination areas are typically located in the valleys and associated stream channels. Groundwater contamination affects broad expanses of habitat including rock outcrops and extending off site. Ephemeral and intermittent drainages are present in the valley areas and carry runoff to adjacent downslope areas; this area is the headwaters of Bell and Dayton Creeks.

The project vicinity supports essential habitat for the state-listed rare plant species, Santa Susana tarplant (*Deinandra minthornii*), a perennial sub-shrub and geographic endemic typically found on sandstone rock outcrops and soils derived from sandstone. The predominant natural plant communities include Venturan coastal sage scrub (64 acres), chaparral (172 acres), coast live oak woodland (13 acres) and coast live oak riparian forest (9 acres) (DEIS Table 3.4-1). Sensitive wildlife species observed in the project area include the state- and federally-endangered least Bell's vireo (*Vireo bellii pusillus*); coast horned lizard (*Phrynosoma coronatum*), two-striped garter snake (*Thamnophis hammondi*) and loggerhead shrike (*Lanius ludovicianus*) (all California Species of Special Concern (CSSC). A ringtail (*Bassariscus astutus*), a California Fully Protected Species, was observed just outside the NASA boundary of Area II. The project vicinity is an important habitat linkage area providing connectivity between the Santa Susana Mountains to the north, the Simi Hills, and Santa Monica Mountains to the south (DEIS page 3-23).

Trustee Authority:

The fish and wildlife resources of the state of California are held in trust for the people of the state by the Department (Fish and Game Code Section 711.7(a)). The Department provides these comments as state trustee agency with jurisdiction over the conservation, protection and management of fish, wildlife, native plants, and habitat necessary for biologically viable populations of those species (Fish and Game Code Section 1802).

The Department is also California's designated natural resource trustee and representative authorized to act on behalf of the public as a trustee for natural resources pursuant to section 107(f)(2)(B) of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA). The Department will have a continuing interest in coordinating any natural resource issues as a result of proposed remedial activities at SSFL. The Department will consider the biological and natural resources at the site, the proposed remedial activities,

contaminants of concern and any potential resource impacts in identifying California's relevant and appropriate resource protection laws and regulations for the SSFL.

Specific Concerns and Recommendations

The following are the Department's specific concerns regarding impacts to biological resources and recommendations for additional avoidance and mitigation measures.

Evaluation Criteria for Analyzing Environmental Effects:

Table ES-1 identifies various impact evaluation criteria. Short term impacts are defined as limited to the immediate demolition and remediation period. The Department is concerned with this definition being applied to the groundwater remediation period, as the remediation activities themselves could extend across a timeframe of years, decades, or centuries (Table 2.2-8). The Department considers impacts extending beyond five years to be long term.

0274-01

Evaluation criteria are defined as local where impacts are confined to within the boundaries of the NASA properties, and regional when they extend beyond those boundaries. The Department notes that impacts from ground water remediation treatments are frequently described in the DEIS as local and our review suggests impacts should be defined as regional because downslope and off site areas could be affected by altered hydrology.

0274-02

Groundwater cleanup technologies:

The groundwater cleanup component of the Proposed Action will involve testing various technologies before they are employed across the groundwater treatment area. There is little description or quantitative information regarding the direct and indirect impacts to biological resources from implementing these technologies. The Department estimates that approximately 1/3 of the NASA lands could be physically impacted by groundwater treatment technologies (Fig 2.2-4). Associated alterations in hydrology, including potential dewatering, could directly and indirectly affect additional habitat areas. Adverse impacts are likely to occur to on site and downstream/downslope habitats reliant upon surface, subsurface and groundwater from the project area.

0274-03

The DEIS states that additional habitat areas would be subject to topsoil removal for groundwater remediation in areas outside the soil cleanup footprint (DEIS 4-41). The Department was unable to find specific information regarding the extent and location of these additional soil removal areas, and impacts do not appear to be addressed.

0274-04

Wells would be installed under various technologies and could extend 50 - 900 feet below the ground surface. The Pump and Treat technology is described as requiring the installation of "additional wells". The Department requests more information be provided regarding the number of new wells that are anticipated, well locations, and the impacts to biological resources from installation, operation and, maintenance. The DEIS also describes that 13,000 feet of above-ground pipeline would be added under Pump and Treat. The amount of pipeline necessary to implement other treatment technologies is not described.

0274-05

Three additional technologies would involve installation of a network of wells described as being spaced 10 - 20 feet apart with interconnecting pipes (DEIS Sec. 2.2.3.2). There is little

0274-06

information regarding how much physical habitat would be disturbed to install and maintain these wells and pipelines, or how they would be installed on steep rock outcrops and habitat areas. The Department anticipates additional adverse effects to occur from removal of wells and pipelines; impacts from removal are not identified.

The DEIS describes clearing vegetation to create pathways for well and borehole installation and pipeline configuration (DEIS pg. 2-31) under the In Situ Chemical Oxidation description, but it would appear that all the technologies that use wells, bore holes and pipes have potential to result in extensive clearing of vegetation in habitat areas, which could lead to mortality or displacement of wildlife in the Department's opinion. The DEIS analysis concludes that impacts to wildlife are minor and short term in areas subject to ground water remediation, in part because the "wells would be located far apart". At a spacing of 10 - 20 feet apart, the entire treated area would likely be adversely affected by habitat removal, ground disturbance and equipment. It is possible that the In Situ Chemical Oxidation technique may result in fewer impacts to biological resources and may better protect local soil moisture and hydrology, but the DEIS does not provide detailed analysis to evaluate whether or not certain technologies may pose fewer risks to on-site and off-site biological resources and habitat function. Effects on biological resources from the potential use of chemical oxidation, heat, and vacuum extraction are largely not described. The Department recommends that technologies be evaluated for their impacts to physical habitat features, biological resources and watershed function, and those with fewer adverse impacts on the environment should be employed. The Department would appreciate the opportunity to review and provide input to this evaluation.

0274-07

0274-08

Alteration in existing hydrology and potential dewatering for groundwater remediation will affect downslope streams and nearby springs, seeps, stands of phreatophytes and other vegetated habitats along channels. Areas of impacted ground water extend beyond the NASA boundaries of Area I and Area II (Fig 2.2-4). Surface water is currently being treated at various wells and is being released into existing outfalls depicted on Figure 3.6-1, and this is guided by the Ground Water Interim Measures Work Plan (GWIM) (DEIS 2-27).

The Department is concerned that surface water is being collected for treatment from specific local subwatersheds, but is released at outfalls located in a different subwatershed. Residents of Bell Canyon have raised this concern with the Department. We recommend that the GWIM be modified such that current and future pumping activities include new outfall locations which better maintain surface and subsurface hydrology for on-site and downslope biological resources. The DEIS does not seem to address impacts to biological resources from constructing additional outfalls and associated pipe systems necessary to reach those outfalls. Biological resource assessments for areas that could be impacted outside the NASA property do not appear to have been conducted.

0274-09

The Department is concerned that seeps and springs may support unique biological resources and that adverse effects to these biological resources have not been addressed, while some seeps and springs have already been dewatered (DEIS 4-79). Impacts to water associated with seeps and springs are described as negligible and local, but should be described as moderate and regional.

0274-10

The DEIS states that wells would not be located in wetlands and consequently, there would be no impact to wetlands from groundwater cleanup (DEIS 4-42). Alterations in site hydrology associated with groundwater remediation are likely to affect wetlands on site and downstream

and these impacts are not addressed in the DEIS. The wetland definition used in the DEIS does not identify springs and seeps as wetlands (DEIS 3-34), and is focused on areas of federal jurisdiction under the Clean Water Act.

Wetlands in the state of California are addressed in various Fish and Game Commission policies, and the state definition of wetlands relies upon the United States Fish and Wildlife Service wetland definition and classification system (Cowardin, et al. 1979). Springs and seeps constitute wetlands under state policy, and changes in water availability to these areas could potentially result in significant, regional and long term impacts to biological resources.

There is potential for springs and seeps to be recharged following soil excavation and disposal, via local infiltration associated with the creation of a series of shallow ponds that would replace ephemeral and intermittent stream reaches in specific locations (DEIS 4-77). The groundwater treatment component overlaps with these locations in several areas, which suggests that infiltration may be hampered by long term dewatering activities. Additional planning and study, with input from the Department, would appear necessary to precisely determine how to recharge specific springs and seeps, including those downslope and off site.

0274-11

Soil Remediation Impacts:

Figure 2.2-2 shows the estimated boundaries of areas that would be subject to soil remediation, habitat removal, and subsequent excavation. This figure also depicts access and staging areas. There are numerous areas depicted on this figure where isolated areas are shown and are not located by existing dirt or paved roadways. The DEIS states that NASA would develop temporary access roadways (pg. 2-13) in those situations. The Department is concerned that direct and indirect impacts to habitat and wildlife from "temporary" roadways are not included in the impact analysis. Single or repeated passes of heavy equipment traversing such areas is likely to cause long term impacts along access routes, additional habitat removal, introduce weeds, alter runoff patterns, compact soils, and cause direct mortality to wildlife.

0274-12

The DEIS describes that additional on-site borrow sites would be excavated to provide some fill material for remediation areas (DEIS 2-19; 4-77). The Department could not locate any further information regarding proposals for on-site borrow pits. Impacts to biological resources associated with this component of the project should be specifically addressed in the DEIS.

0274-13

Soils BMP-1 (associated with landslides) seems to be the only measure describing that following soil excavation, backfilled areas would be "sloped and if necessary compacted". We assume this likely applies to all areas that might receive backfill. The DEIS should identify the characteristics of the finished slopes, how they would be configured, and the degree of compaction proposed. Compaction rates need to be designed to ensure that native vegetation including shrubs and trees can successfully root into the new material.

The DEIS should further describe if acreage impacts include those required to create finished slopes at locations where excavations and backfill abut natural topography. If, as described, backfill volume is about one-third of the volume that would be removed, it is not clear how finished slopes would meet up with natural topography in areas with shortfalls of backfill (Table 2.4-1). It seems likely that adjacent acreage would be affected to achieve finished slope requirements beyond the boundary of excavation areas, and those impacts have not been identified.

0274-14

Vegetation Communities

On-site plant communities were mapped in fall 2010 using a Holland 1986-based plant community classification (Appendix D). This mapping does not meet current standards for incorporating floristic based classifications that better describe local, regional and state-wide botanical diversity. The second edition of the Manual of California Vegetation should be utilized for the purposes of describing on-site vegetation at the alliance level (Sawyer et al. 2008). Additionally, the project area lies within the Santa Monica Mountains National Recreation Area, and vegetation in this general area has been addressed at a more specific local and regional level (Keeler-Wolf and Evens, 2006). It should be noted that this evaluation did not include field sampling of vegetation stands supporting Santa Susana tarplant.

0274-15

Sensitivity rankings used in the DEIS are from the California Natural Diversity Data Base (CNDDDB) and represent state-wide and global ranks that do not factor in local or regional rarity. The DEIS states that only 9% of the habitats on site are of high conservation priority (i.e. sensitive, Venturan coastal sage scrub and southern willow scrub). The majority of the acreage to be impacted is described in the DEIS as predominantly chaparral (a general term that does not describe a plant community), coast live oak woodland and riparian forest, and Venturan coastal sage scrub. The primary mitigation proposed for loss of or damage to these communities is seeding with commercially obtained seed on a subset of the remediated ground where backfill topsoil is available (Biology BMP-1). The amount of habitat area that would not be revegetated and therefore could be permanently damaged is undescribed.

The unique local and regional character and sensitivity of key on-site habitats and species were missed in the general nature of the vegetation analysis. Since sandstone rock outcrops are inherently valuable to plant and wildlife species and represent a specialized niche, vegetation types associated with sandstone outcrops are locally and regionally unique and therefore are considered sensitive by the South Coast Region of the Department. For example, two sensitive vegetation communities were identified on adjacent Boeing properties and are described below:

0274-16

Steep Dipslope Grassland- this unique vegetation type was identified by SAIC (2009) during assessments of adjoining land in Area IV and the northern buffer. Stands are dominated by outcrops and varying depths of thin soil overlaying rock, creating conditions for dominance by bushy spike moss (*Selaginella bigelovii*) and a suite of associated species including native wildflowers and local, endemic geophytes (*Calochortus* sp); typically this habitat is on north facing slopes. This same habitat would be classified floristically as *Selaginella bigelovii* herbaceous alliance, and is state-ranked S3, which the Department considers to be locally and regionally rare (Sawyer et al. 2008). The DEIS should identify that this sensitive habitat type could be present on site and would be adversely affected by soil and groundwater remediation and impacts are potentially significant and long term. Areas supporting this unique habitat type should be identified on maps and marked in the field, and stands of bushy spike moss alliance should be protected from direct and indirect impacts.

Sandstone Outcrops Northern Mixed Chaparral- this vegetation type was identified by SAIC (2009) and represents the bulk of the habitats associated with the large sandstone outcrops in Area IV. This same habitat type is likely present on the NASA lands. SAIC identifies that this habitat on site typically supports the state-listed rare endemic *Deinandra minthornii* (Santa Susana tarplant). The combination of sandstone outcrops with diverse chaparral that also supports a rare local endemic suggests that this is likely a unique local and regional plant

association. The DEIS should identify that this is a sensitive habitat type that could be adversely affected by soil and groundwater remediation and impacts are potentially significant and long term.

Additional on-site habitat types reported in the DEIS are considered sensitive by the Department because of their high value for wildlife, proximity to stream channels, and continued declines in the local and regional area. Southern coast live oak riparian forest is considered regionally sensitive by the Department, and typically, these areas lie within the Department's streambed jurisdiction as they represent riparian resources. Coast live oak woodland is also reported from the area, and is also declining in the regional area. Vegetation affiliated with springs and seeps does not appear to be described in the DEIS. On-site and off-site woodlands, forests, riparian areas, springs and seeps are considered sensitive by the Department. The DEIS does not identify these habitats as sensitive and there are no proposals to ensure these specific habitats are replaced or restored. Impacts to oak woodlands and forests are potentially significant, regional and long term, especially given the time frame necessary for replacement oaks to mature sufficiently to provide shade, forage, acorns, cavities and crevice habitats.

0274-17

The DEIS analysis of impacts to vegetation communities and sensitive plant associations relative to groundwater remediation activity seems to be limited in scope and analysis. The DEIS should describe the physical impact area necessary to access and install a system of wells and pipes and to maintain it over a protracted timeframe. Impacts are briefly identified as: 1) dewatering to remove subsurface moisture affecting vegetation; 2) vegetation could be physically disturbed; and 3) weeds could increase or spread. Adverse effects to habitats downslope from changes in soil moisture due to remediation activities are not addressed.

0274-18

The DEIS indirectly describe how the function of stream channels would be altered by proposed soil and groundwater remediation activities. The DEIS concludes that impacts to topography from soil removal are negligible and short term, despite proposals to only backfill about 1/3 of the volume removed. Alteration of natural topography affects habitat development and function. Where stream courses are altered by excavation, how would stream flow and sedimentation processes be affected? If stream courses are replaced by instream "shallow ponds", will these reaches continue to transmit natural sediment loads to downstream areas? Where substantial soil volumes are removed and not replaced, how will this affect ground water recharge within local watersheds and downslope areas?

0274-19

The DEIS concludes that impacts to native vegetation from soil excavation are significant and long term, after mitigation. Impacts to "high priority conservation areas" (ie. southern willow scrub and Venturan coasts sage scrub) are also considered significant and long term, but with mitigation, the DEIS concludes impacts are moderate. Biology Mitigation Measure-1 addresses this impact and indicates soil might be removed using pick axes, shovels, or vacuum trucks in sensitive habitats. Such methods would still result in disturbance to sensitive habitat areas and are unlikely to meaningfully reduce impacts. It may be feasible and beneficial to reduce impacts to adjoining woody vegetation such as trees and shrubs, located at the edges of excavation areas, by using such methods and immediately protecting exposed roots to prevent desiccation.

0274-20

Sensitive Species Analysis

For the purposes of the DEIS analysis, sensitive species were defined as: a) plants or animals that are either listed by the United States Fish and Wildlife Service (USFWS) or by the state of

California (DEIS pg. 3-23) as threatened or endangered; b) federal candidates; c) California Species of Special Concern (CSSC); d) California Fully Protected Species; or e) state listed rare plants.

The DEIS does not address local, regional, and state wide rare plants which the Department tracks through the CNDDDB. Special status vascular plants on Rare Plant Lists 1 and 2 generally are considered to meet the definition of threatened or endangered species and should be addressed in the DEIS. The DEIS does not address the potential for impacts to rare non-vascular plants which are also tracked in CNDDDB.

0274-21

The DEIS should address locally rare plant and animal species that have been identified in Ventura County and are currently listed as Locally Important Species. These lists have been developed in consultation with local experts and represent local and regionally rare species that are not represented on state-wide or national lists. Species on these lists are considered to generally meet the definition of threatened, endangered, or rare, as defined in the California Environmental Quality Act (CEQA) Section 15380. The lists are updated annually through a documented process of consulting with local experts. The current lists can be found at this link: <http://www.ventura.org/rma/planning/conservation/locally-important-species.html>

Sensitive Plant Species

Santa Susana tarplant

The general project area at the SSFL supports habitat essential for the continued persistence of Santa Susana tarplant, a state-listed rare plant species, and its native insect pollinators. The project site is in the center of this species' limited geographic range where the majority of the tarplant populations occur on the local Chatsworth Formation (sandstone). The DEIS indicates the species was observed in numerous locations on NASA properties and is distributed throughout Ventura and Los Angeles counties (DEIS 3-23). The DEIS should be modified to indicate this species is a highly restricted endemic and occurs only in localized areas in the Santa Monica Mountains and Simi Hills (CNDDDB, 2013; Baldwin et al. 2012). The Chatsworth Formation in and around the SSFL area is the core habitat for this species.

0274-22

The DEIS provides no quantitative evaluation of the numbers of individuals or acreage extent of occupied habitat for Santa Susana tarplant that would be directly or indirectly affected by remediation activities. Individual tarplants were mapped in the field with a global positioning satellite unit, but the DEIS does not overlay impact areas with this information (Figure 3.4.3). The amount of habitat occupied by Santa Susana tarplant that would be unaffected by direct and indirect impacts from the Proposed Action should be identified in the DEIS. The Department is therefore unable to fully evaluate the environmental consequences of the proposed action.

0274-23

Potential adverse impacts to tarplant include direct loss of individuals and seed bank in areas subject to soil and groundwater remediation. Habitat for native insect pollinators and alternative pollen and nectar sources (i.e. other plant species they visit) would be eliminated in areas subject to soil remediation, and degraded in adjoining habitat areas and in groundwater remediation areas. A variety of adverse indirect effects are also likely to occur. Areas currently supporting soil conditions suitable for tarplant could be replaced with backfill from off-site

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 9 of 20

sources which could be unsuitable for subsequent re-establishment, leading to the permanent long term loss of suitable occupied tarplant habitat. Additional permanent loss of occupied tarplant habitat could occur at locations where top soil is not replaced or where reseeding is not successful at re-establishing native plant communities. .

Occupied habitat adjacent to remediated areas could experience a variety of adverse indirect effects, including: a) weed invasion associated with increased habitat fragmentation; and b) altered local hydrology, which could change sheet flow, runoff and infiltration patterns which sustain individual plants.

As shown in Figure 2.2-4, extensive areas would potentially be affected by groundwater remediation. Should wells be installed at 10-20 foot intervals as described, it is foreseeable that most of the acreage would be cleared of vegetation, driven on by heavy equipment and this would lead to significant long term adverse impacts to Santa Susana tarplant and most other plant and animal species who reside here.

Groundwater remediation technologies will also capture and remove subsurface water potentially leading to desiccation of surrounding habitat areas across a long time frame. The DEIS states that impacts to vegetation from changes in ground water availability would be minor, as plants around the SSFL are adapted to drought and repeated fires. In the Department's opinion, impacts of long term dewatering are likely to adversely affect most species of plants occupying the treatment zones. Even in summer months or during droughts, specific species of plants have their own unique soil moisture requirements that must be met or they will die. Santa Susana tarplants also utilize subsurface moisture for their survival and therefore, groundwater remediation could potentially reduce soil moisture below a level where they can survive dry periods and droughts; tarplant vigor, biomass, and reproductive output could be adversely affected.

0274-24

It should be noted that native insect pollinators are essential components of Santa Susana tarplant habitat, and service a broad array of on-site and nearby off-site native plant species. Many native insect pollinators are various types of ground nesting solitary bees and flies. These insects have their own requirements for nesting, and often, areas with specific soil texture and soil moisture are relied upon for successful production of larvae. Dewatering and soil excavation could adversely affect such species.

0274-25

The currently proposed mitigation for impacts to Santa Susana tarplant proposed in the DEIS is to avoid tarplants where practical and to train workers to identify and avoid it to the extent possible (Biology Mitigation Measure-2). No other mitigation is proposed.

The DEIS concludes that, with implementation of Biology Mitigation Measure-1, impacts to Santa Susana tarplant are minor, negative, local, and short term. The Department does not agree with this conclusion. Impacts to tarplant would be moderate to significant, negative, regional, and long term in our opinion. Impacts to tarplants are likely long term in areas where soil and groundwater remediation would: a) remove soils derived from Chatsworth Formation; b) where the proposed reseeding does not successfully restore native natural communities; and c) where topsoil is not replaced and no revegetation occurs. Impacts from groundwater remediation would also be long term at locations where the technology may operate for years to centuries (Table 2.2-8). We agree with the statement on page 4-43, indicating it can take years

0274-26

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 10 of 20

for native species (ie. plants) to re-establish in disturbed areas and for that reason, impacts to tarplant should be described as long term.

The Department recommends additional mitigation measures and impact avoidance be incorporated into the final DEIS to more specifically address adverse impacts to Santa Susana tarplant.

0274-27

A dedicated biological monitor should be present during grubbing and vegetation clearing in order to identify tarplants to be avoided in all areas where demolition, soil removal or groundwater treatments occur and including adjoining access and staging areas. A biological monitor should identify travel routes for drilling equipment and access which avoid tarplants and other sensitive plant resources. This information shall be mapped using geographic information systems. Acreage impacts and a tally of individuals affected should be provided.

Santa Susana tarplant growth and vigor should be monitored during groundwater remediation activities in representative areas to determine whether groundwater treatments are causing adverse effects.

A Santa Susana tarplant restoration plan should be prepared for Department review and approval and this plan should detail how tarplant habitat would be restored to conditions suitable for re-occupation by tarplants and other appropriate on-site local native species. Tarplant seed should be successfully re-introduced into localized restored habitats areas.

Enhancement of existing Santa Susana tarplant habitat in locations outside the soil remediation footprint through effective weed management could be considered as an additional mitigation measure to address impacts stemming from loss of occupied habitat during the remediation and revegetation period which are not addressed in the DEIS.

Braunton's milkvetch

The DEIS identifies the presence of the federally endangered Braunton's milkvetch (*Astragalus brauntonii*) and its federally designated Critical Habitat, to the west at SSFL Area IV on Boeing property. No Braunton's milkvetch were observed during field surveys of the NASA properties conducted in 2011. The DEIS states that potentially suitable soil conditions exist on portions of Area II and Area I for Braunton's milkvetch, however the DEIS concludes that there would be no impacts.

In spring of 2010, a hill just outside the boundaries of the Critical Habitat unit in Area IV was subjected to vegetation trimming for the purposes of conducting gamma testing by the EPA. Braunton's milkvetch was not detected there during project surveys but following vegetation trimming, the disturbance stimulated a population to emerge from dormant seed bank. The Department observed this habitat area in July 2013. Braunton's milkvetch experienced intense direct herbivory on flower stalks by mule deer and most plants observed in 2013 had been topped, producing little or no seed as a result. In this localized area, cutting back shrub vegetation created browse conditions which were exploited by the local mule deer population, and this created negative impacts for Braunton's milkvetch reproductive output.

The Department is therefore concerned with the potential that Braunton's milkvetch may in fact occupy suitable soils in Areas II and Area I. The suitability of habitats in this area combined with

0274-28

the response of Braunton's milkvetch dormant seedbank to disturbances in nearby areas at SSFL suggests that the DEIS should in fact recognize the potential for adverse impacts to potentially occupied habitat. Loss of soil seed bank and/or individuals producing flowers and fruits would be a significant adverse and long term impact.

Other State Rare Plant Species

The DEIS does not evaluate the environmental consequences of the Proposed Action on local, regional, and state tracked rare plant species.

0274-29

A state rare plant species was identified in the 2011 spring surveys conducted on NASA lands. Slender mariposa lily (*Calochortus clavatus gracilis*) is state ranked S-2, and a California Native Plant Society (CNPS) list 1B-2 (threatened). Another regionally rare lily, *Calochortus plummerae*, was also observed. The DEIS does not address impacts to these species. The Department observed a previously undetected population of *Calochortus fimbriatus* (state ranked S-3 and CNPS list 1B) in mowed habitat in Area IV in July 2013. Downslope of Area II in Bell Canyon, a population of tiger lilies has been verified (*Lilium humboldtii* ssp. *oscellatum*) (CDFW files). These types of rare geophytes have narrow habitat preferences and are vulnerable to changes in soil moisture and herbivory pressure when they are exposed by removal of adjoining vegetation.

The Department is concerned that the imperiled shrub, Malibu baccharis (*Baccharis malibuensis*) may be present on NASA lands. This native shrub is extremely rare (state-ranked S-1 very threatened) and exists at a handful of locations with very few individuals (CNDDDB, 2013). Vegetation mapping and surveys conducted by SAIC in 2009 for DOE in Area IV did not identify Malibu baccharis, but it was subsequently detected in 2010 during vegetation trimming by consultants with Envicom Corporation. Malibu baccharis was reported as co-dominant with chamise, suggesting it was common in the habitat where it had been overlooked, and these shrubs were apparently mowed for gamma testing (HydroGeologic and Envicom, 2011). Given that the species was not identified during field assessments on adjacent lands, there is potential for it to have been overlooked on NASA lands. The Department therefore requests that additional focused surveys be conducted to ensure that all Malibu baccharis are detected. Should it be found on site, it is imperative that a comprehensive seed collection be undertaken for both long term conservation and restoration purposes and a conservation strategy be developed, in consultation with the Department, to address adverse impacts.

Revegetation in Soil Remediation Areas

The DEIS describes that following soil remediation, seeding with commercially obtained native seed would occur on some portion of the impacted area that receives topsoil (Biology BMP-1). Seeding with propagules obtained from on-site populations of native trees, shrubs, and herbs is not proposed.

Department staff previously reviewed a seed mix proposed by Boeing for a nearby on-site demolition project and we raised a number of concerns regarding the proposed mix which we reiterate here. Commercially available native plant seed often is from limited, non-local sources that are potentially poorly adapted to local conditions and do not capture local genetic diversity. Few plant species on Boeing's palette with commercially available seed were sourced from within 30 miles of the SSFL area. Some species included in the Boeing palette were not known

0274-30

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 12 of 20

to occur in the project area and other important species in the project area were not included in the seed mix. Additionally, annual non-native grasses and forbs were included in the seed mix and could reduce establishment of shrubs and trees.

The Department recommends commercially-sourced seed be limited to: a) sources from within 30 miles of the SSFL; b) from within the coastal Los Angeles basin; or c) from sources from Chatsworth formation-derived soils. Local on-site propagules should be collected and utilized to augment commercially-sourced seed. Seed should also be collected from obligate seeding species which require wildfire conditions to stimulate seed germination. Seeds should be cleaned, labeled and properly stored until needed and we encourage on-site seed collection be initiated early in the process to maximize the diversity and volume of material for future use.

On-site propagules should also be obtained for important tree species such as coast live oak (*Quercus agrifolia*), sycamore (*Platanus racemosa*), and California black walnut (*Juglans californica*). An on-site nursery could be established to produce and maintain material for subsequent outplanting. There may be challenges re-establishing vegetation due to the presence of herbivores such as mule deer, which are attracted to young plants and favored browse species. It may be necessary to use temporary fencing or caging to allow for favored browse species to re-establish, including oaks.

0274-31

Biology BMP-1 discussion suggests that seeding would only occur at locations where topsoil is available. What is the source of top soil? If it is from off-site sources, it would likely contain weed and non-local plant propagules. Additional information is needed to evaluate the environmental consequences of using this material. If the topsoil contains weeds or a lot of annual grasses, re-establishment of native species could be impaired. It might be possible to control weeds on imported topsoil and then introduce new seed thereafter.

0274-32

What is the expected outcome for future vegetation and soil protection where topsoil is not available and no seeding would occur? The DEIS does not identify what proportion of the excavated areas would be left in this condition. At such locations, impacts are potentially long term and permanent. The Department recommends that soil amendments be evaluated for use in locations where topsoil is unavailable. Certain native species may perform better than others and test outplantings could be used to determine appropriate palettes for such locations.

0274-33

The Department recommends that local palettes be developed for each plant community to be removed by soil remediation or other forms of disturbance. Slope and aspect as well as local reference sites can be used to inform recommendations for revegetation for specific treatment areas. A site-specific revegetation plan is necessary in order to develop effective strategies to replace habitats impacted by soil remediation and ground water cleanup.

0274-34

Biology BMP-1 includes a restoration goal of 50 percent native cover three years after disturbance in areas subject to seeding (DEIS 4-43). This standard would allow as much as 50 percent of the seeded area to be dominated by non-native weeds. Native cover is not defined (i.e. relative cover, foliar cover or absolute cover). Three years is generally not considered an adequate amount of time to restore native shrub communities such as coastal scrub and chaparral. It will be necessary to effectively control weeds prior to seeding with natives, which would extend the restoration period. Five to seven years seems more appropriate, and survival through at least one year of drought is necessary to demonstrate the re-established vegetation is resilient. The Department recommends that cover standards be developed for each plant

0274-35

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 13 of 20

community target, and that cover values be established for each layer, i.e. herb, shrub, and/or tree layers. Woodland and forest habitats should include a longer revegetation period spanning at least ten years to ensure re-establishment has occurred and new individuals will survive periods of drought.

The discussion at Biology BMP-1 indicates it could take years for native species to re-establish in disturbed areas, but the DEIS concludes that after implementation of this BMP, impacts would be short term (i.e. over once remediation is complete). This conclusion is not supported by the information provided.

0274-36

Erosion BMPs

Biology BMP-2 describes various soil stabilization measures that could be used in conjunction with reseeded or in locations where topsoil is unavailable. Some erosion control products such as erosion mats, straw wattles and others, contain non-biodegradable mesh which can entrap and kill wildlife. To avoid adverse impacts to wildlife, the Department requests that this measure be modified to ensure that such products are specifically prohibited. Most erosion control products are designed for temporary, short term use and it is not clear how such products would be effective at preventing long term erosion in locations where revegetation does not occur or is unsuccessful.

0274-37

The Department also requests that no gabions be installed along or within stream channels, as the wire and mesh associated with these structures are also hazardous to wildlife and can break down and become a nuisance. For the purposes of stabilizing soils along stream channels, we recommend that only natural rock be used. Boulders, rocks and cobble associated with on-site stream channels should be retained or stockpiled for reuse following remediation, to the degree that this is feasible. Limbs, trunks, and woody debris could be retained on-site and distributed to protect soil and increase habitat availability. Brush piles could also provide additional soil protection and cover for wildlife and could be placed in revegetation areas. Chipped native biomass free of weeds could be used to protect exposed soil surfaces, but should not be placed in stream channels or in locations where a native herb layer needs to be established.

Weed Management

The proposed action has potential to introduce new weeds to the SSFL site from off-site locations and for on-site weeds in ruderal locations to expand into areas disturbed by soil and groundwater remediation. Imported backfill and topsoil will also contain weed seeds and non-local plant propagules. On-site weeds in ruderal areas will pose an ongoing threat to efforts to revegetate nearby disturbed areas, and could reduce re-establishment of shrub and tree-dominated communities, exacerbating long term erosion.

Biology Mitigation Measure-3 indicates NASA would implement a weed management plan to eradicate noxious and invasive species. This measure should be modified to also address prevention of new weed invasions and spread of existing on-site weeds. The Department recommends that protocols be established to ensure that all vehicles and equipment that would operate in habitat areas are cleaned of soil and weed seeds prior to arriving at the SSFL site. Personnel and hand equipment/tools should also be checked and cleaned before accessing the area. On-site biological monitors should inspect equipment and personnel.

0274-38

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 14 of 20

Equipment and personnel staging in disturbed areas on site may also convey weeds into currently weed free areas, so measures to prevent this from occurring are recommended. The California Invasive Plant Council has useful protocols for addressing weed invasion for land managers (<http://www.cal-ipc.org/ip/prevention/landmanagers.php>).

The Department would appreciate the opportunity to review and provide input to the weed management plan proposed under Biology Mitigation Measure-3.

Wildlife Assessments and Protection Measures

Wildlife surveys conducted for the DEIS are based upon a fall 2009 field survey (DEIS pgs. 33-23) documented in Appendix D. This fall evaluation states that wildlife surveys were opportunistic. Systematic active searches for specific non-federally listed wildlife species were not conducted (Appendix D pg. 3-2). During field surveys conducted in spring 2011, additional opportunistic wildlife species surveys were conducted concurrently with special status plant surveys (Appendix E pg. E-28) and are described as not systematic. Under these scenarios, on-site sensitive wildlife species could easily be missed or their extent underestimated, based upon the timing, weather, survey limitations and level of effort.

0274-39

DEIS Table 3.4-3 lists the results of these field assessments and sightings are plotted in Figure 3.4-4. Four sensitive wildlife species were confirmed on site and include a single August sighting of the state and federally endangered least Bell's vireo; species of special concern: coast horned lizard, loggerhead shrike, and two-striped garter snake. A ringtail (California Fully Protected Species) was sighted just off site in rock outcrop habitat near a spring but is described as not present in the ROI (region of influence, Table 3.4-3). Boeing has documented additional sensitive wildlife species on adjoining properties and in the Department's opinion, these species have a high likelihood of occurring on NASA lands and/or downslope off site. Documented observations of species which could be adversely affected by the proposed project includes the California Fully Protected Species: white-tailed kite (*Elanus leucurus*) and golden eagle (*Aquila chrysaetos*); California Species of Special Concern: silvery legless lizard (*Anniella pulchra pulchra*), coast range newt (*Taricha torosa torosa*), western spadefoot (*Spea hammondi*), yellow warbler (*Setophaga petechial*), and San Diego desert woodrat (*Neotoma lepida intermedia*); and the CDFW Watch List coastal western whiptail (*Cnemidophorus tigris multiscutatus*), San Bernardino ringneck snake (*Diadophis punctatus modestus*), Cooper's hawk (*Accipiter cooperii*), Southern California rufous-crowned sparrow (*Aimophila ruficeps*) (Boeing, 2013). Given the opportunistic nature of the wildlife surveys in support of the DEIS for NASA lands, the DEIS should more fully evaluate the potential for adverse impacts based upon habitat suitability.

The extensive sandstone rock outcrops support a variety of crevices, ledges and cavities which serve as unique physical feature exploited by both sensitive and non-sensitive wildlife species. Golden eagles were documented nesting just off site to the north in spring 2011 (HydroGeoLogic and Envicom, 2011). A variety of species nest or roost within sandstone outcrops including white-throated swift (*Aeronautes saxatalis*), barn owl (*Tyto alba*), cliff swallow (*Petrochelidon pyrrhonota*), barn swallows (*Hirundo rustica*), canyon wren (*Catherpes mexicanus*), raven (*Corvus corax*), turkey vulture (*Cathartes aura*), golden eagle, honey bees (*Apis mellifera*), San Diego desert woodrat and various bats species (SAIC, 2009).

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 15 of 20

The wildlife that use these rock outcrop special habitat features are highly specialized and are often dependent upon them for reproduction, foraging, or predator avoidance. The stability and persistence of these features encourage the repeated use of specific areas as breeding habitat. Small mammals such as San Diego desert woodrat and native mice are found in this general habitat type. Rock shelters also provide very important roosts for bats. These features are important to a variety of reptile species as well and provide thermally favorable refuges, cover, and hibernacula. Snakes are particularly dependent on rock outcroppings for winter dens. Often, snakes are intimately tied to their hibernacula, returning to the same den their whole lives. The destruction of a den site often results in the reduction or elimination of local snake populations.

Coast live oak woodlands and chaparral habitats are also very high value wildlife habitat. The fall biological survey report for nearby Area IV and the northern buffer identifies the importance of coast live oak woodlands and chaparral to local and regional wildlife (SAIC, 2009).

Ringtail Impact Avoidance:

Ringtail sightings are extremely rare, and this California Fully Protected Species is likely occupying rock crevices in sandstone outcrops, foraging in nearby habitats and typically is not far from a water source. Ringtail should be described as potentially present on NASA lands at low density in areas with lower levels of human activity. Remediation of soil pockets in isolated habitat areas could adversely affect ringtail individuals or expose den sites. Depending upon the methods selected, ground water remediation wells or bore holes could puncture crevices and ringtail or their young could be directly killed or their dens damaged. Young could be abandoned, leading to direct mortality. Additional dewatering of seeps and springs could also compromise ringtail's ability to survive in the general area.

To avoid direct mortality to ringtail, the Department recommends that rock outcrop habitats and other locations slated for soil remediation or ground water remediation be evaluated by a knowledgeable biologist in order to locate all potentially ringtail-suitable caves, and crevices and this effort should include searches for hibernacula, and bat roosting and colony sites. Once located, these areas should be mapped and appropriate avoidance buffers should be established in consultation with the Department in order to prevent the location from being adversely affected by human activity and/or damaged by ground water boring, wells, or travel and access routes.

0274-40

Impacts to Birds:

The impact analysis for project impacts to birds underestimates the severity of impacts from soil and groundwater remediation. The DEIS addresses only migratory birds and impacts are described as short term for the soil remediation component, while impacts to the native vegetation communities which support nesting and foraging bird populations are described as long term (DEIS pg 4-35). The DEIS states that it could take years for native vegetation to re-establish in disturbed areas and the species composition would likely be different, which suggests that impacts to wildlife including birds who rely upon native vegetation communities would likely extend over years as well, and therefore, this appears to be a long term impact.

0274-41

Impacts to birds and other wildlife from the groundwater remediation component are also considered short term (DEIS 4-42), and described only as a minor disruption to wildlife. The

0274-42

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 16 of 20

DEIS states that ground water treatments would involve additional wells that "would be located far apart"; thereby limiting disturbance during installation (DEIS 4-43). This description conflicts with the description of various ground water treatment technologies which would involve wells or bore holes installed 10-20 feet apart and operating for years, decades, or centuries. It is likely that installation and maintenance activities including the interconnected systems of pipes and electricity could cause further disruption of vegetation and associated wildlife.

Furthermore, the DEIS should acknowledge that Biology Mitigation Measure-4 does not address the permanent loss of nesting and foraging habitats for bird species should habitats no longer be suitable following remediation activities. The Department recommends that NASA undertake a more intensive effort to restore on-site habitats following remediation. The Department is available to work with NASA to develop goals and objectives for a more effective restoration effort.

0274-43

Bird Species Avoidance Measures:

Fish and Game Code Section 3503 prohibits the take of birds and their nests regardless of their status under the Migratory Bird Treaty Act (MTBA). Fish and Game Code Sections 3503.5 and 3513 provide additional protection for raptors and other migratory nongame birds listed under the MBTA. Biology Mitigation Measure-4 addresses only migratory birds and indicates mitigation could include scheduling activities outside the nesting season, relocation, or compensatory mitigation. The Department recommends that work occur outside the active bird nesting season, as relocation or compensatory mitigation could still result in take of birds or their nests.

0274-44

Proposed project activities (including, but not limited to, staging and disturbances to native and nonnative vegetation, structures, and substrates) should occur outside of the avian breeding season which generally runs from March 1- August 31 (as early as January 1 for some raptors) to avoid take of birds or their eggs. Take means to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture or kill (Fish and Game Code Section 86), and includes take of eggs and/or young resulting from disturbances which cause abandonment of active nests. Depending on the avian species present, a qualified biologist may determine that a change in the breeding season dates is warranted.

If avoidance of the avian breeding season is not feasible, the Department recommends that, beginning thirty days prior to the initiation of project activities, a qualified biologist with experience in conducting breeding bird surveys conduct weekly bird surveys to detect protected native birds occurring in suitable nesting habitat that is to be disturbed and (as access to adjacent areas allows) any other such habitat within 300 feet of the disturbance area (within 500 feet for raptors). Surveys for active nests should also take place at any man- made structures that may be demolished on the project site. The surveys should continue on a weekly basis with the last survey being conducted no more than 3 days prior to the initiation of project activities. If a protected native bird is found, the project proponent should delay all project activities within 300 feet of on- and off-site suitable nesting habitat (within 500 feet for suitable raptor nesting habitat) until August 31. Alternatively, the qualified biologist could continue the surveys in order to locate any nests. If an active nest is located, project activities within 300 feet of the nest (within 500 feet for raptor nests) or as determined by a qualified biological monitor, must be postponed until the nest is vacated and juveniles have fledged and there is no evidence of a second attempt at nesting. Flagging, stakes, and/or construction fencing should be used to demarcate the inside boundary of the buffer of 300 feet (or 500 feet) between the project

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 17 of 20

activities and the nest. Project personnel, including all contractors working on site, should be instructed on the sensitivity of the area. NASA should provide the Department and USFWS the results of the recommended protective measures described above to document compliance with applicable State and Federal laws pertaining to the protection of native birds.

If the biological monitor determines that a narrower buffer between the project activities and observed active nests is warranted, he/she should submit a written explanation as to why (e.g., species-specific information; ambient conditions and birds' habituation to them; and the terrain, vegetation, and birds' lines of sight between the project activities and the nest and foraging areas) to NASA, the USFWS and the Department. Based on the submitted information, the wildlife agencies should determine whether a narrower buffer is appropriate for the purposes of avoiding take.

The biological monitor should be present on site during all grubbing and clearing of vegetation to ensure that these activities remain within the project footprint and that the flagging/stakes/fencing is being maintained, and to minimize the likelihood that active nests are abandoned or fail due to direct or indirect project activities. The biological monitor should send weekly monitoring reports to NASA, USFWS and the Department during the grubbing, and clearing of vegetation, and should notify the wildlife agencies immediately if project activities damage active avian nests.

Impacts to Bats:

The DEIS does not discuss measures to reduce mortality of bat species likely to reside on the project site. The project may result in injury or death to bats including special status bats which reside in the natural rock outcrops, in riparian areas, within trees slated for removal, or man-made structures that would be demolished on the project site. The Department recommends the following additional avoidance and minimization measures be incorporated into the project work plans and mitigation measures--

0274-45

1. To avoid direct loss of bats in the rock outcrop habitats slated for soil or ground water remediation, a qualified bat specialist should identify all potential locations that may serve as maternity roosts or colonies, these areas should be mapped and avoidance buffers should be established in consultation with the Department.
2. To avoid the direct loss of bats that could result from removal of trees and/or structures that may provide maternity roost habitat (e.g., in cavities or under loose bark), the following steps would be taken:
 - a) Tree removal should be scheduled between October 1 and February 28, outside of the maternity roosting season.
 - b) If trees and/or structures must be removed during the maternity season (March 1 to September 30), a qualified bat specialist should conduct a pre-construction survey to identify those trees and/or structures proposed for disturbance that could provide hibernacula or nursery or colony roosting habitat for bats.

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 18 of 20

- c) Each tree and/or structure identified as potentially supporting an active maternity roost should be closely inspected by the bat specialist a maximum of 7 days prior to tree disturbance to more precisely determine the presence or absence of roosting bats.
- d) If bats are not detected, but the bat specialist determines that roosting bats may be present at any time of year, it is preferable to push any tree down using heavy machinery rather than felling it with a chainsaw. In order to ensure the optimum warning for any roosting bats that may still be present, the tree should be pushed lightly two to three times, with a pause of approximately 30 seconds between each nudge to allow bats to become active. The tree should then be pushed to the ground slowly and should remain in place until it is inspected by a bat specialist. Trees that are known to be bat roosts should not be cut up or mulched immediately. A period of at least 24 hours, and preferably 48 hours, should elapse prior to such operations to allow bats to escape. Bats should be allowed to escape prior to demolition of buildings. This may be accomplished by placing one way exclusionary devices into areas where bats are entering a building that allow bats to exit but not enter the building.
- e) Maternity season lasts from March 1 to September 30. Trees and/or structures determined to be maternity roosts should be left in place until the end of the maternity season.
- f) The bat specialist should document all demolition monitoring activities, and prepare a summary report upon completion of tree disturbance activities.

3. Should maternity roosts or bat colony sites be located in the project area, consultation with the Department is recommended to determine appropriate methods for avoidance and habitat replacement.

Wildlife Movement and Corridors

The proposed project will result in a substantial increase in traffic on local roads leading to and from the SSFL site. Heavy truck traffic will primarily use Woolsey Canyon Road and Valley Circle Boulevard. Local vehicles may utilize Box Canyon Road. Truck trips to remove contaminated soil are estimated at 26,441 and trips to bring in backfill from off site are estimated at 8,814 extending across a period of about two years (Table 2.4-1).

0274-46

The truck and access routes traverse areas identified as a local and regional wildlife movement corridor (DEIS 3.4-2), and also go through local open space areas and natural preserves (Figure 4.5-2). The DEIS does not identify impacts to wildlife from roadkill associated with the increased traffic traversing off site and on site areas. Roadkill could be reduced by: a) including time restrictions that limit truck travel to full daylight hours only, thereby avoiding dawn and dusk when movement activity is high; and b) limiting speeds to 25 mph or less.

Wildlife Monitors

The proposed project will result in clearing natural habitat that supports many species of indigenous wildlife. To avoid direct mortality, the Department recommends biological monitors be on site prior to and during ground disturbance activities to relocate special status species and other wildlife species of low mobility that will be killed or injured by grubbing and ongoing

0274-47

Mr. Allen Elliot
 NASA MSFC AS01
 October 4, 2013
 Page 19 of 20

remediation activities. Wildlife should be relocated to adjacent appropriate habitat out of harm's way. Should state listed threatened or endangered species be encountered, incidental take authorization from the Department may be required.

The DEIR should acknowledge that capture and relocation of on-site common and special status species does not constitute effective mitigation for the purposes of offsetting project related impacts stemming from habitat loss.

Alternatives Analysis

The DEIS evaluates two alternatives: 1) No Action; and 2) the Proposed Project to clean up to background levels. This level means that clean up targets would be the most conservative, and would result in the greatest impact to soil and habitat (removal of up to 500,000 cubic yards of soil on approximately 105 surface acres). Alternatives 1 through 3 were eliminated from further consideration because they would not meet the previously agreed upon clean up levels (to background) described in the 2010 Administrative Order on Consent for Remedial Action (AOC) (DTSC 2010).

The Department notes that under Alternative 3, soil would be cleaned up to a level which is safe for recreational use of the project area (Table 2.4-1), which is a potential end use for the NASA properties as well as the adjoining Boeing properties. Alternative 3 would result in far fewer acres of impacts to habitat (6 acres) and cubic yards of soil removal (58,000) compared with the Proposed Project, and therefore this alternative would have far fewer substantial long term adverse impacts to biological resources and requires less backfill and restoration. Groundwater cleanup levels do not vary across the range of alternatives (Table 2.4-1), but there is potential for different treatment options to vary in terms of their impacts to biological resources.

0274-48

This concludes the Department's comments. We recognize the tremendous environmental challenge and complexity associated with addressing past contamination of this biologically sensitive area. The Department looks forward to continuing to work with NASA and DTSC to address these issues. Should you have any questions, please contact Ms. Mary Meyer, Senior Environmental Scientist (Specialist) at (805) 640-8019.

Sincerely,

Edmund Pert

RE: Draft Environmental Impact Statement (DEIS) for Proposed Demolition and Environmental Cleanup Activities for the NASA-administered portion of the Santa Susana Field Laboratory (SSFL), Ventura County, California

Dear Mr. Elliott:

California Department of Parks and Recreation (CDPR) Angeles District has reviewed the above-referenced project. CDPR interest in the project is twofold: first, the SSFL site is located near Santa Susana Pass State Historic Park (SSPSHP) and therefore would influence resource connectivity concerns affecting the park; and second, although currently in litigation, supporting documentation for Senate Bill 990 (Kuehl) included an intent to transfer the SSFL property to the State after cleanup for operation as parkland or open space, potentially involving CDPR in future management of the property. CDPR offers the following comments on the DEIS.

Purpose and Need

In the DEIS Executive Summary, the stated purpose of the action is "to remediate the environment to a level that meets NASA's cleanup responsibilities and to perform demolition actions necessary to support both remediation and property disposition." CDPR understands the need to remediate the property in order to remove contaminants and structures that could be hazardous to human health and safety. Further, we acknowledge that the Department of Toxic Substances Control (DTSC) will certify that the cleanup action of the SSFL site is complete prior to any transfer of the property.

However, CDPR is concerned that the negotiated 2010 Administrative Order on Consent (AOC) failed to account for standard risk-based assessments, uses terminology for cultural resources that are not defined under federal and state statutes, and most importantly, constituted an action subject to review under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA), a review which was not performed prior to NASA's commitment. The AOCs have significantly constrained the environmental review of the project by imposing a potentially unnecessary clean-up to background standards reflected in the State Department of Toxic Substance's (DTSC) Lookup Table. For example, the

0250-01

“Background” level of cleanup will require the removal and treatment of ten times the soil volume as the “Recreational” cleanup standard.

Additionally, although the DEIS states that demolition to support property disposition is a part of the proposed action, the document does not evaluate the cleanup in regards to potential future land use. The proposed clean-up alternatives would grossly modify the existing habitats, historic structures and aesthetic of the site, and would increase the potential for further degradation via invasive plant and animal incursions. The project site is also located within or directly adjacent to a key wildlife corridor, the Santa Monica Mountains-Sierra Madre Linkage. Because cleanup and demolition activities (105 acres) will have a direct impact on the resource values which make the SSFL site valuable as open space or parkland, the significantly degraded value of the site for open space uses is not fully considered.

0250-02

Further, NASA and the General Services Administration (GSA) have stated that a separate NEPA review will be conducted for the disposition of the property following cleanup activities. CDPR is concerned that separating these related actions constitutes piecemealing and runs counter to the requirement of full public disclosure of potential impacts under NEPA and CEQA guidelines.

CDPR is especially concerned about the time lag between NASA’s issuance of the DEIS under NEPA and the DTSC future preparation of an Environmental Impact Report (EIR) under CEQA. Typically, joint environmental documents are prepared concurrently so as to ensure a consistent review between the two processes, to economize, and to simplify public notice and consultation by the issuance of one document. CDPR is concerned that separating the federal and state environmental reviews by several months or more will create opportunities for inconsistencies and confusion. How will NASA and DTSC rectify differences in analysis between the two documents, for example?

Description of Proposed Action and Alternatives

The commitments NASA has made in the 2010 AOC has limited a fully developed range of alternatives in the DEIS that would meet a properly scoped purpose and need. By evaluating only the “Clean Up to Background” and “No Project” alternatives, NASA has given no consideration to ultimate land use decisions or to resource connectivity concerns which may affect adjacent or nearby parklands. A land use analysis must be included in this document and it must be connected to future land use options.

0250-03

For example, Figure 2.1-1 fails to adequately represent all the open space and parklands in the vicinity of the SSFL site. In particular, the boundaries of Santa Susana Pass State Historic Park are not shown, nor is the park even mentioned in the DEIS, despite the fact that the park lies on the previously mentioned wildlife corridor through the Simi Hills.

0250-04

On page 2-19, the DEIS identifies the Rindge Dam in Malibu Creek State Park as a possible offsite backfill source for the SSFL cleanup activities. CDPR is currently preparing a joint EIS/EIR with the U.S. Army Corps of Engineers to evaluate the removal of Rindge Dam and other upstream barriers in order to restore Malibu Creek habitat values. We are willing to discuss with NASA the disposal of excess sediments, however, our understanding is that preliminary testing of the impounded sediments behind Rindge Dam showed that soils would not meet the AOC Look-up Table values for Background at SSFL. Have any of the identified potential offsite sources met this threshold, and if not, how will this issue be rectified?

0250-05

Affected Environment, Environmental Consequences and Proposed Mitigation

Cultural Resources – The NASA-administered Area II contains important prehistoric and historic-period resources, including the National Register of Historic Places (NRHP) listed Burro Flats Painted Cave archaeological complex (CA-VEN-1072) and three NRHP eligible historic districts (Alpha, Bravo and Coca test areas). All of these resources would have tremendous historic and interpretive value within a parkland context.

However, CDPR finds that NASA's cultural resource identification efforts within the Area of Potential Effect (APE) are incomplete. A Traditional Cultural Property (TCP) study is currently underway, but this study should have been completed prior to the issuance of the DEIS because it is part of the cultural resources inventory process, which cannot be deferred. Further, given the size and importance of archaeological site CA-VEN-1072, and the general density of prehistoric archaeological sites documented in surrounding areas of the western San Fernando Valley and Simi Hills, it is unlikely that only two additional archaeological sites would have been identified in a 100%-coverage survey of the subject 490 acres. CDPR also finds that NASA's site boundary identification level of effort for CA-VEN-1072 through is inadequate per standard archaeological subsurface testing practices.

0250-06

Because NASA's identification and evaluation efforts of historic properties within the APE are incomplete, a thorough assessment of effects from project implementation cannot be made. As such, CDPR finds that measures to avoid or minimize impacts to historic properties have not been considered thoroughly in the alternatives analysis and that the proposed mitigation measures are insufficient to resolve the adverse effects assumed for the identified historic properties.

0250-07

Specifically, NASA is proposing to retain one test stand as mitigation for the removal of all buildings within the APE and to perform HABS/HAER documentation on all the other eligible structures prior to demolition. However, subsequent statements made by DTSC suggest that complete demolition is not required under the 2010 AOC. Since the three historic districts, including the test stands and other contributing structures, have high interpretative value for future parkland use, CDPR recommends that the 100% demolition requirement be revisited and that consideration for retention of one or more complete historic districts be evaluated in the alternatives analysis.

0250-08

Additionally, NASA is proposing the completion of the TCP/ethnographic study as mitigation, presumably for impacts to the identified Indian Sacred Site. As mentioned previously, this study should be part of the identification and evaluation process, and proposing it as mitigation for adverse effects to an important site of tribal heritage is inappropriate and does not provide the needed information to inform how best to implement the project, and avoid, minimize and mitigate potential impacts.

0250-09

Similarly, NASA is proposing to better delineate the boundaries of archaeological site CA-VEN-1072 as mitigation for adverse effects to the site. Again, this is part of the identification effort that should be used to evaluate ways to avoid or minimize impacts to the historic property. Finally, installation of protective measures for the Burro Flats site during project implementation should be considered best practices, not mitigation, and the DEIS mitigation proposals do not even require that archaeological and Native American monitoring be employed to ensure that these protective measures are enforced.

0250-10

Please refer to additional comments on the identification and evaluation of historic properties, and the resolution of adverse effects by the Office of Historic Preservation (SHPO's September 24, 2013 letter to you).

Biological Resources – The extent of impacts on the Santa Susana tarplant are significant, not moderate. It is also unclear if the species could reestablish itself within cleaned up areas given the extent of soil removal and disturbance, and the apparent lack of suitable top-soil. More detailed mitigation is needed for this species, when it cannot be avoided.

0250-11

We expect the impacts on coast horned-lizard to be moderate, not minor, due to the extent of ground disturbance, and demolition activities. Care needs to be taken to avoid or relocate sensitive species such as this, and not just listed species, out of harm's way.

The site is directly adjacent, if not within, a key wildlife corridor, and the open space resources on the project site are significant for animal movement on a regional level. Project demolition activities are likely to increase the number and extent of invasive weeds and increase truck trips which will likely result in increased animal mortality onsite and along area truck routes. Therefore we disagree with the statement that there is no potential impact on migration corridors (pg. 4-32). Measures should be provided to protect wildlife movement through the area and out of construction zones (e.g. silt fence to deter wildlife moving into work areas, etc.).

0250-12

All locally sensitive plants, as well as state listed plants, should be avoided to the maximum extent feasible. Seed collection should occur from onsite or adjacent areas for reseeding or propagation prior to construction to protect the genetic integrity of species onsite and within the watershed. This is strongly preferable to purchasing commercially available mixes which are not likely to represent the same species mix or genetic lines.

0250-13

E-mail: msfc-ssfl-eis@mail.nasa.gov

Subject: County of Ventura, California Comments on Draft Environmental Impact Statement (DEIS) for demolition and cleanup activities at Santa Susana Field Laboratory (SSFL) in Ventura County, California pursuant to the National Environmental Policy Act (NEPA), as amended (42 U.S.C. §4321 et seq.) and the National Historic Preservation Act (NHPA), as amended (16 U.S.C. §470 et seq.)

Dear Mr. Elliot:

Thank you for the opportunity to review and comment on the subject document. As a potential regulating governmental agency over portions or aspects of the above-referenced project and in response to the Notice of Availability of the DEIS (78 FR 47007, 08/02/2013), the County of Ventura (COUNTY) provides the National Aeronautics and Space Administration (NASA), the NEPA lead agency for this project, the following comments pursuant to NEPA, as amended (42 U.S.C. § 4321 et seq.), the Council on Environmental Quality Regulations for Implementing the Procedural Provisions of NEPA (40 CFR Parts 1500-1508), and NASA's NEPA policy and procedures (14 CFR Part 1216, subpart 1216.3).

The COUNTY, by and through its constituent agencies, departments and divisions, reviewed the July 2013, DEIS for the SSFL project with a focus on whether the DEIS sufficiently identifies and analyzes the proposed SSFL demolition and cleanup project's environmental impacts and adequately discusses measures in which such impacts may be mitigated or avoided. To that end, the COUNTY provides the following comments based upon its duties and responsibilities under California state law and local ordinance:

Mr. Allen Elliot
 September 27, 2013
 Page 2 of 22

A. Public Works Agency, Integrated Waste Management Division (IWMD)

Pursuant to IWMD review and responsibilities, the following contract specifications pertain to all uncontaminated materials generated during demolition and environmental cleanup activities on NASA's portion of the SSFL site.

The IWMD requests that NASA comply with Ventura County Ordinances 4445 (solid waste handling, disposal, waste reduction, and waste diversion) and 4421 (the diversion of construction and demolition debris from landfills by recycling, reuse, and salvage) to assist the County in its efforts to comply with the waste diversion mandates of Assembly Bill 939 (AB 939) which mandates all cities and counties in California to divert recyclable solid waste from landfills. Both of these Ordinances may be viewed in their entirety on the IWMD's website at: www.wasteless.org/landfills/ordinances.

242-01

The following contract specifications shall apply to uncontaminated materials generated by this project:

Recyclable, Uncontaminated Construction & Demolition (C&D) Debris
 Contract specifications for this project must include a requirement that C&D debris generated by the demolition of uncontaminated buildings on the project site must be diverted from the landfill. Recyclable C&D materials include, but are not limited to, concrete, asphalt, rebar, wood, and metal. These materials must be recycled at an appropriate, permitted C&D debris recycling facility. A complete list of permitted C&D debris recycling facilities in Ventura County is available at: www.wasteless.org/construction&demolitionrecyclingresources. All uncontaminated, non-recyclable, materials shall be disposed of at a permitted disposal facility.

242-02

Uncontaminated Soil - Recycling & Reuse
 Contract specifications for this project must include a requirement that uncontaminated soil that is not reused on-site during the C&D phase(s) of this project shall be transported to an authorized and/or permitted organics facility for recycling or reuse. Illegal disposal and landfilling of uncontaminated soil is prohibited. A complete list of facilities in Ventura County that recycle uncontaminated soil is available at: www.wasteless.org/construction&demolitionrecyclingresources.

242-03

Uncontaminated Green Materials - Recycling & Reuse
 The Contract Specifications for this project must include a requirement that uncontaminated wood waste and vegetation removed during the C&D phase(s) of this project must be diverted from the landfill. This can be accomplished by on-site chipping and land-application at the project

242-04

Mr. Allen Elliot
September 27, 2013
Page 3 of 22

site if deemed appropriate by NASA, or by transporting uncontaminated materials to an authorized and/or permitted greenwaste facility in Ventura County. A complete list of authorized greenwaste facilities is located at: www.wasteless.org/greenwasterecyclingfacilities.

Recyclable, Uncontaminated Construction & Demolition (C&D) Debris – Required Reports per Ventura County Ordinance 4421:

1. Contractors selected to demolish uncontaminated buildings/structures at the Santa Susana Field Laboratory site are required to submit a completed *Form B – Recycling Plan* to the IWMD for approval. The *Form B – Recycling Plan* must specify how uncontaminated, recyclable C&D debris generated by the project (e.g., concrete, asphalt, wood, soil, greenwaste, metal) will be diverted from the landfill. A copy of IWMD's *Form B – Recycling Plan* is available at: www.wasteless.org/recycling/greenbuildingCD. 242-05

2. Contractors selected to demolish uncontaminated buildings/structures at the Santa Susana Field Laboratory site are required to submit a completed *Form C – Recycling Report* to the IWMD at the conclusion of the project. The *Form C – Recycling Report* must have original recycling facility receipts and/or other documentation attached to verify that recycling, NASA approved on-site reuse, or salvage of uncontaminated C&D debris occurred. A copy of IWMD's *Form C – Recycling Report* is available at: www.wasteless.org/recycling/greenbuildingCD. 242-06

B. Public Works Agency, Transportation Department, Traffic, Advance Planning & Permits Division

This project will generate approximately 39,000 trucks over an estimated 650 working days. The project will require 34 construction workers during the 150-day demolition phase and 15 construction workers during the 500-day excavation and disposal phase.

The COUNTY Transportation Department reviewed several documents in regard to the SSFL cleanup. Our previous comments are still valid and applicable.

Transportation Department staff offers the following comments on the DEIS for the demolition and cleanup activities in the NASA-administered areas of the SSFL:

Mr. Allen Elliot
September 27, 2013
Page 4 of 22

1. According to the Truck Route Map (Figure 4.5-1), the project proposes to access the SSFL via Santa Susana Pass Road and Box Canyon Road in the County of Ventura and Woolsey Canyon Road in the County of Los Angeles.
 - a. The project proponent should be aware that Santa Susana Pass Road from Katherine Road to Rocky Peak Road has a "No Trucks Over 2 Axles" Truck Restriction adopted by the Ventura County Board of Supervisors (BOS) February 4, 1986. 242-07
 - b. The project proponent should be aware that Box Canyon Road from Santa Susana Pass Road to the Ventura County and Los Angeles County jurisdictional boundary has a "No Trucks 3 Or More Axles" Truck Restriction adopted by the BOS September 28, 1999. 242-08
 - c. If the project proponent plans to use trucks that are not restricted on Santa Susana Pass Road or Box Canyon Road, then please include these roads in the survey of road conditions as described in Traffic MM-2 on Pages 6-3 of the DEIS.
 - i. Proper precautions should be taken to protect all County road facilities in the unincorporated areas.
 - ii. If, in the opinion of the Transportation Department, any portion of a County road is damaged by the project's operations, then it should be repaired in accordance with current standard construction details and/or in a manner acceptable to the Transportation Department. 242-09
 - iii. An Encroachment Permit is required for any work in the public right-of-way.
 - d. The Transportation Department will not allow/permit hauling on Black Canyon Road north of the project site.
2. Please notify the Transportation Department when the Final EIS is ready for review and comment. 242-10

Transportation Department review is limited to the impacts this project may have on the County's Regional Road Network.

Mr. Allen Elliot
 September 27, 2013
 Page 5 of 22

C. Resource Management Agency, Planning Division, Biological Resources

The following comments address biological resource issues associated with the Proposed Action at the NASA SSFL, including issues related to COUNTY regulations and the adequacy of impact analysis and proposed mitigation measures within the DEIS. Specific areas of comment address the following:

- General Plan goals and policies related to biological resources
- Ventura County Locally Important Species and Communities
- DEIS Data and Analysis Corrections
- Impacts and Mitigation Measures

Ventura County General Plan

242-11

Currently, the DEIS does not discuss the Proposed Action with respect to General Plan goals and policies for biological resources. Several policies in the County's General Plan support the protection of biological resources as follows:

- (1) Wildlife migration corridors, threatened or rare species and their habitats, and locally important species/communities are considered to be significant biological resources that should be preserved and protected from incompatible land uses and development (GP Goal 1.5.1);
- (2) Biological resource policies include wetland protection policies, such as a 100 foot setback from significant wetland habitat for all discretionary development (GP Policy 1.5.2.4) and a requirement to evaluate biological impacts for discretionary projects within 300 feet of waters and wetlands (GP Policy 1.5.2.3); and
- (3) The Santa Susana Field Laboratory is identified as an area with a "Significant Biological Resource" under Figure 1.5.6.2, *Biological Resource Map*, in the General Plan Resource Appendix.

The DEIS should be revised to discuss consistency with General Plan policies in identifying impact intensity, type, context, and duration. Mitigations measures should be developed that preserve and protect SSFL biological resources and incorporate recommended wetland protections.

Mr. Allen Elliot
 September 27, 2013
 Page 6 of 22

Ventura County Locally Important Species and Communities

242-12

Section 4.4 and Appendix E Section 2.1 of the DEIS do not include an analysis of Ventura County Locally Important Species, and the DEIS does not consider them as "special status species" under Section 4.4.1.1. Impacts to Ventura County Locally Important Plant Species identified on-site should be evaluated and mapped (e.g., *Allophylum divaricatum* and *Crassula aquatic*). For a complete listing of Locally Important Species please see the following link:

<http://www.ventura.org/rma/planning/conservation/locally-important-species.html>

Impacts to Locally Important Communities (e.g., Venturan coastal sage scrub, oak woodlands) should be acknowledged in the EIS. The EIS should evaluate direct and indirect (i.e., dust) impacts to Locally Important Communities.

DEIS Data and Analysis Corrections

The list below, which is not exhaustive, identifies examples of biology-related issues that need to be further addressed in the EIS analysis.

- (1) Evaluation of Presence of the Californian Gnat Catcher (CAGN). The CAGN should be discussed in Section 4.4.1.1, and included where applicable throughout the DEIS biological resource analysis. On-site Venturan coastal sage scrub, and potentially other unidentified vegetation alliances absent the DEIS analysis, provides suitable habitat for the CAGN, a **federally listed threatened bird**. In recent years, CAGN has been observed in coastal sage scrub habitats in Ventura County that were previously thought to be unoccupied. Many of these occurrences, which are near Thousand Oaks, Camarillo, Simi Valley, and Moorpark, are located in habitats similar to the habitats on the project site. Given that suitable habitat is present, and no protocol presence/absence surveys were conducted, potential exists for the presence of the CAGN. Page E-38 Appendix E describes the potential for CAGN to occur on the project site as "unlikely" based the transition from coastal sage to chaparral and the dense brush cover. This evidence is inadequate for three reasons: (a) the project site was never surveyed for CAGN, (b) suitable habitat exists on the project site, and (c) several new occurrences of CAGN were identified in the region.

242-13

Mr. Allen Elliot
 September 27, 2013
 Page 7 of 22

Given this additional evidence, protocol surveys should be conducted within suitable habitat in the areas proposed to be directly and indirectly impacted by the project to adequately evaluate the potential impacts of the project on CAGN.

- (2) Wildlife Corridor. A significant biological resource located adjacent to the project site is the regional wildlife movement corridor that connects habitats within the Simi Hills and Santa Susana Mountains with the western portion of the Santa Monica Mountains. This corridor, identified and mapped by the South Coast Missing Linkages Project (2006), is located immediately east of the project site. However, modeled corridor strands should not be taken as absolute limits to the areas of the landscape on SSL that wildlife use for movement, as nearby areas outside the modeled corridor that appears on the South Coast Missing Linkages map are likely still utilized.

242-14

The project site contains significant habitat connections and movement patterns for both transitory and permanent wildlife populations. Direct impacts from habitat destruction, fencing, and equipment can create physical barriers to wildlife movement while indirect impacts from lighting, noise, and increased human activity may also discourage wildlife use of the area. Impacts to the regional wildlife corridor, including temporary and long-term introduction of barriers to gene flow, should be considered in the DEIS. In addition, the "no impact" assessment in Section 4.4.1.3 should be corrected to reflect the appropriate intensity level, duration, and context. Additionally, Figure 4.4-2 and 3.4-2 should be updated to include on-site specific connectivity features and impediments to connectivity that would result from the project.

- (3) Vegetation Mapping. Vegetation types and sensitive communities, which are briefly categorized in the Appendices and in Section 3.4, should be mapped to the alliance level consistent with the *California Manual of Vegetation* (2010) and included in the DEIS. The entire site, and any off-site affected area (e.g., groundwater basins), should be mapped to the alliance level, which would provide an analysis of sensitive communities and habitats and a baseline for mitigation opportunities such as habitat restoration.

242-15

The EIS analysis, including Figure 4.4-1, only describes two types of communities affected by the project. Detail on the amount of vegetation

Mr. Allen Elliot
 September 27, 2013
 Page 8 of 22

removed and the area of all native vegetation alliances impacted needs to be depicted and discussed in the DEIS and its appendices.

- (4) Native Soil Import Impacts. Page 4-35 states that 39 acres of native soil would be removed as a result of the Proposed Action, and that an unknown amount of replacement native soil would be imported. The DEIS should specify the off-site locations where imported, replacement native soil would be obtained and provide an analysis of potential impacts associated with the removal of soil from that property. 242-16

If the excavation areas for the native soil fill for the proposed project are located within unincorporated Ventura County, it is presumed that a discretionary permit from Ventura County would be required, and the potential project impacts associated with the removal of native soil within the unincorporated County must therefore be evaluated in the DEIR in accordance with the County's thresholds of significance. Those thresholds are found in the Ventura County Initial Study Assessment Guidelines. In addition, the removal of off-site soil must be evaluated for consistency with the County's policies and ordinances. 242-17

- (5) Oak Woodlands Preservation. Absent from Appendix B, *Applicable Laws and Regulations*, is the California State Oak Woodland Conservation Act (OWCA) (PRC §21083.4, Fish and Game Code §1361). The Ventura County Oak Woodland Management Plan was developed in response to the OWCA, and oak woodlands have also been acknowledged as a Locally Important Community by the Ventura County Board of Supervisors. Oak Woodlands were also identified as a sensitive community by the California Department of Fish and Wildlife, and impacts to the two oak woodlands on-site should be included in the DEIS. Figure 4.4-1 only shows two communities in the context of soil clean-up boundaries. The two types of oak woodlands need to be shown on Figure 4.4-1, and the acreage removed should be quantified in the DEIS. The DEIS does not provide adequate detail to know whether direct or indirect impacts would occur to the approximately 22.5 acres of oak woodland habitat identified onsite (Appendix D, Table 10), and the document should be revised to address impacts to oak woodlands and individual oak trees. 242-18

- (6) Groundwater Clean-up: The DEIS currently lacks adequate information on potential impacts to biological resources that could result from proposed changes to hydrology. Section 4.4.1.4 (Page 4-41) of the DEIS should include more information regarding impacts both on-site and offsite related 242-19

Mr. Allen Elliot
 September 27, 2013
 Page 9 of 22

to the following changes associated with the Proposed Action: (a) changes to the water table, (b) additional topsoil removal “outside the soil clean-up footprints”, (c) on-site wetlands, and (d) effects on regional hydrology. In addition, the DEIS should include impacts to off-site and on-site native vegetation alliances that would be affected by changes to hydrology as shown in Appendix Figure 2.2-4.

- (7) Protocol Surveys. Additional protocol surveys are needed for special status species found within the SSFL study area. In the absence of protocol surveys for special status species (e.g., riverside shrimp, red-legged frog), actual impacts to wildlife from the implementation of the project are speculative. 242-20

Impacts and Mitigation Measures

The proposed project would result in extensive impacts to biological habitat for numerous special status species. The biological resource mitigation measures within the DEIS are generally inadequate under the requirements of NEPA (40 CFR 1508.20) for addressing significant regional impacts that affect sensitive biological resources. As defined under the Council of Environmental Quality (CEQ) guidance document (dated January 4, 2011), NEPA mitigation measures should include documentation, monitoring, and performance standards. The proposed BMPs and mitigation measures lack details on requirements, timing, monitoring, and success criteria. The list below, which is not exhaustive, contains examples of suggested revisions to the EIS impact assessment and mitigation measures: 242-21

- (1) Removal of Native Vegetation Communities: The removal of approximately 39 acres of native vegetation (impact biology 2a) would be regionally significant and long-term, especially in the absence of adequate mitigation as discussed below. The proposed best management practices mitigation measures would have minimal effect on mitigating this impact. Additionally, removing developed areas (biology impact 2b) would not have a beneficial effect on native vegetation, unless these previously developed areas were carefully restored. Planting an “approved seed mix” without performance criteria or an effective invasive plant removal program would not constitute restoration. 242-22
- (2) Pre-Construction Wildlife Surveys, Monitoring, and Relocation. Appendix E, Section 4.2, recommends preconstruction surveys and the development of a breeding season schedule for listed and protected 242-23

Mr. Allen Elliot
 September 27, 2013
 Page 10 of 22

species. However, the Draft EIS Section 4.4.2 only recommends avoidance if protected species are discovered by workers (BMP-4), and it includes a vague reference to red-legged frog monitoring (MM-5). Pre-construction protocol surveys and relocation should be required for all special status wildlife, including Locally Important Species that may be expected to occur, and as recommended in Appendix E, Section 4.2. Additionally, surveys should include species that are present in the vicinity, but are not identified in the DEIS as having the potential to occur (e.g., ring-tailed cat).

Typically, a biological monitor, with any appropriate permits needed, should survey the construction area prior to construction and relocate special-status wildlife outside the construction area. In addition, the construction area should be fenced to prevent the return of wildlife to the construction area. The biological monitor should also be present during project implementation.

242-24

- (3) Pre-construction Santa Susana Tarplant Surveys and Monitoring. The proposed mitigation (MM-2) and BMPs (BMP-4) are inadequate to address what should be considered a significant regional impact to the State-listed rare Santa Susana Tarplant (Impact Biology 1a and 1g). Avoidance and worker awareness (MM-2) is *not a recognized mitigation measure*. Likewise, BMP-4 is not considered an acceptable strategy for the management of this plant. The mitigation measures should be revised to include preconstruction surveys, biologist monitoring during project implementation, and relocation of impacted species.

242-25

- (4) On-site Habitat Restoration and Monitoring Plan. The proposed removal of seven (7) acres of the sensitive Ventura Sage scrub, of 0.05 acres southern willow scrub, and of unspecified impacted oak woodlands should be mitigated through on-site restoration. In addition, the on-site restoration should be implemented through mitigation that requires a Habitat Restoration and Monitoring Plan with timing and success criteria. The DEIS should include mitigation measures that require restoration at different ratios for each habitat type, as developed in consultation with the California Department of Fish and Wildlife.

242-26

The proposed BMP to reseed with a "approved mix" (BMP-1) is not adequate, and permanent restoration should be conducted with a compatible plant pallet that is derived from reference sites specific to each impacted alliance. In order to maintain the genetic integrity of the local

242-27

Mr. Allen Elliot
 September 27, 2013
 Page 11 of 22

flora, Native plants and seed stock used during the revegetation process should be locally collected or propagated from locally collected seed or cuttings (from the Simi Valley area or same watershed). An attempt should be made to restore some of the diversity of the existing native plant community by specifically including some of the less common native species currently found on the project site. For temporary revegetation, the DEIS should provide specific information that identifies seed mix, seed application, seeding methods, timing of monitoring, and reporting and performance criteria.

- (5) On-site Habitat Preservation. The loss of habitat for locally important wildlife species should be mitigated through the preservation of existing, intact plant communities and through the restoration and preservation of disturbed plant communities at an appropriate ratio in the project vicinity. 242-28
- (6) Off-site Mitigation Measures. The DEIS should include mitigation measures that require preservation of off-site biological habitats that offset the destruction of native habitat and underlying soils. 242-29
- (7) Nesting Bird Mitigation. The mitigation that would protect nesting birds (Biology MM-4) is incomplete. Proposed mitigation measures should include nesting and breeding considerations for any special status birds identified onsite, including the Least Bell's Vireo and the Loggerhead Shrike. 242-30
- (8) Dust. Indirect impacts to biological resources from dust would vary greatly depending on the amount of excavation required. The DEIS should consider impacts and mitigation measures from dust based on the excavation to 20 feet. 242-31
- (9) Wetlands. The DEIS must disclose all mitigation measures and related impacts in the current document. Currently, the DEIS (Page 4-39) states that the project could affect two (2) acres of wetlands, and it identifies this loss as moderate, regional, and long-term. The DEIS further states that "NASA would work with the USACE during the permitting process to mitigate the disturbance to waters of the U.S". Impact 6a and b of the DEIS should therefore be updated to reflect that the loss of 2 acres of wetlands is significant, regional, and long-term *unless clearly defined mitigation measures would explicitly reduce impacts*. Additionally, groundwater impacts (Biology impact 2k) to wetlands would not be "no impact" if changes in groundwater were to affect surface water availability. 242-32

- (10) Deferred Mitigation. Impacts Biology 1b, 1f, 1i, 1l, 1o, 1r, , 6a, and 6b were considered (or should be considered, in the case Impacts Biology 6a and 6b) to be “regionally significant”. However, the DEIS does not identify appropriate mitigation measures but instead defers the development of mitigation measures to future USFWS review. It is critical that mitigation measures be defined within the DEIS in order to disclose to the public whether (or not) the project under review does (or does not) have potentially significant regional impacts following the application of mitigation measures. Accepted standards for environmental review include the development of mitigation measures within the DEIS, and prior to project approval and implementation. The impact analysis is not clear and clearly defined mitigation is needed within the DEIS.

242-33

D. Resource Management Agency, Planning Division, Long Range Planning

The Ventura County Planning Division (Planning Division) Long Range Planning Section evaluated the NASA DEIS for the Proposed Demolition and Environmental Cleanup Activities at the SSFL for consistency with the Ventura County General Plan and the Non-Coastal Zoning Ordinance. This consistency evaluation provides an opportunity for the Planning Division to identify key issues of concern related to land use, and to notify NASA of local regulatory requirements that would be applicable for a non-federally owned property.

This section identifies General Plan land use issues related to the County's Open Space land use designation as well as ordinance-level land use regulations. Additional General Plan issues related to biology and cultural resource issues are identified in separate topic areas.

General Plan Land Use

The County's General Plan land use designation for the entire NASA property is "Open Space". General Plan Section 3.2, Land Use Designations, defines the purpose of the Open Space land use designation, and that definition includes the following:

- Preserve natural resources, (plants, animals, water courses, etc.);
- Manage the production of resources (forest lands, rangeland, agricultural land, etc.);
- Preserve outdoor recreation opportunities including those areas of "outstanding scenic, historic, and cultural value; areas particularly suited for park and recreation purposes"; and

Mr. Allen Elliot
 September 27, 2013
 Page 13 of 22

- Preserve areas necessary for public health and safety including those areas, "which require special management or regulation because of hazardous or special conditions..."

The County's General Plan also includes goals and policies for the Open Space land use designation. The Planning Division review identified relevant goals/policies as follows:

- (1) Retain open space lands in a relatively undeveloped state so as to preserve the maximum number of future land use options.
- (2) Retain open space lands for outdoor recreational activities, parks, trails and for scenic lands.
- (3) Recognize the intrinsic value of open space lands and not regard such lands as "areas waiting for urbanization."

While the proposed cleanup at the SSFL is intended to remove the groundwater and soil contamination present at the site, and thus return the site to its "background" condition, the proposed cleanup will occur in a manner that is not consistent with the Open Space goals of the County's General Plan. For example, the project includes significant clearing of native vegetation and soil, which is not consistent with the County's goals of preserving natural resources, using such lands for recreational purposes, or retaining the scenic value of the land. In addition, while the proposed cleanup levels may bring the contaminant levels down to "background," the site would not be returned to "its natural state prior to the introduction of contaminants" (NASA Audit Report No. IG-13-007, pg. 6; NASA SSFL Fact Sheet) given NASA's plan to remove such large amounts of soil and vegetation.

242-34

Furthermore, the Planning Division questions the elimination of future "land use" as a consideration for cleanup. Table 2.5-1 of the DEIS states the following:

"The proposed demolition and environmental cleanup activities would not result in a change in land use on the NASA-administered property; implementation of the Proposed Action or action alternatives would not require a change in zoning and no easements or land encroachments would be necessary. No land use acquisition or transfers would be required. Existing and proposed land uses do not conflict with federal or state land use plans, policies, regulations, or laws. Therefore, no impacts to land use would occur."

Although the Proposed Action may not require a change to the County's land use classifications, and would presumably not affect minor land use issues such as easements, that does not lead to a conclusion that "existing and proposed land uses do not conflict with...state land use plans, policies,

242-35

Mr. Allen Elliot
 September 27, 2013
 Page 14 of 22

regulation, or laws. The State of California requires that local jurisdictions prepare a General Plan, and (as noted previously) the Proposed Action is not consistent with the purpose or goals associated with the property's Open Space land use classification.

In addition, the Planning Division is concerned that remediation alternatives were not developed in a way that reasonably anticipates, or even discusses future land use. In fact, as part of NASA's response to comments, they state that, "(a) decision about future land use is not within NASA's purview, nor part of NASA's EIS" (Appendix K, Pg. K-7). Given the lack of analysis in the EIS, NASA's conclusion that land use can be eliminated as a cleanup consideration appears to be unfounded and premature. Without an examination of land use options (e.g. park use, recreation use, residential use, or other types of land use), it is impossible to state what effect the proposed demolition and cleanup activities will have on future land use of the property. Although not a federal Superfund site, the U.S. Environmental Protection Agency's guidance with respect to remedy selection at Superfund sites is instructive. An EPA 2010 Directive state:

242-36

"In carrying out Superfund response actions that protect human health and the environment, EPA typically considers the reasonably anticipated future land use of a site in the remedy selection process" (EPA OSWER Directive 9355.7-19).

Without an analysis of "reasonably anticipated future land use", it is difficult to conclude that remediation decisions are, indeed, consistent with existing and/or future land uses.

Zoning

242-37

In addition to the General Plan, future land use for the SSFL site will be dependent upon zoning. The SSFL site, which includes properties owned by Boeing, is also subject to a 1947 Special Use Permit issued by Ventura County. It should be noted that the current zoning for the NASA property, which is Rural Agricultural, or RA-5 acre, is not consistent with the General Plan land use designation of Open Space, which has a 10-acre minimum lot size. Consistent zones would be as follows:

- Open Space (OS), which has a 10-acre minimum
- AE (Agricultural Exclusive), which has a 40-acre minimum

The Zoning Matrix (pg. 44 of the Non-Coastal Zoning Ordinance) shows minor differences in allowable uses between the current zone and the two consistent zones. However, the minimum lot size would change from 5 acres to either 10 or 40 acres, depending on the selected zone.

Mr. Allen Elliot
 September 27, 2013
 Page 15 of 22

Tree Protection Ordinance

In addition to the County's General Plan, the County's Non-Coastal Zoning Ordinance (NCZO) guides land use actions. Notably, the NCZO includes a tree protection program (NCZO Sec. 8107-25). Tree protection regulations are a relevant local land use regulation that are not noted among the other applicable regulations listed in Appendix B of the DEIS. The County's tree protection regulations apply to the removal of protected trees in unincorporated areas of Ventura County. Within the NASA property, protected trees include all oak and sycamore tree species as well as any tree that is ninety inches (90") in circumference or larger, which are classified as heritage trees.

The NCZO requires a discretionary permit and offsets for the removal of more than four (4) oak trees. Based on the information provided in Appendix D of the DEIS, there are over 20 acres of oak woodland on the NASA property (Appendix D, Pg. D-17). Although this resource is mapped on Figure 3.4-1 (Vegetated Cover Types), these oak woodlands do not appear in Figure 4.4-1, which is the map showing the Biological Resources that will be impacted by NASA's proposed actions.

242-38

The Planning Division recommends that oak woodlands be added to Figure 4.4-1, as it appears that the remediation will remove a portion of the oak woodlands. Moreover, the Planning Division assumes that NASA's remediation plan will remove far more than four oak trees, and hence would have required a discretionary permit and commensurate offsets (such as in-lieu fees) as mitigation for the loss of this resource. In addition, Appendix B of the DEIS should be revised to include the Tree Protection Ordinance and appropriate mitigation should be included in the DEIS to account for the loss of oak woodlands that result from cleanup activities.

Noise Standards

After a review of County noise standards within the General Plan and Noise Ordinance, staff concluded that none of the standards apply to the Proposed Action as follows:

- Noise Ordinance: Appendix B of the DEIS refers to the County's Noise Ordinance as an applicable regulation (Pg. B-18), and the document states that it provides relevant night-time noise standards. However, the Noise Ordinance only applies in residential neighborhoods between the hours of 9:00 p.m. to 7:00 a.m. of the following day. Given that NASA's remediation activities will not occur in residential neighborhoods and are scheduled between the hours of 7:00 a.m. and 7:00 p.m. (DEIS, Section 4.11, Pg. 4-140), the night-time noise standard would not apply. The

242-39

Mr. Allen Elliot
 September 27, 2013
 Page 16 of 22

Planning Division recommends that the reference to this noise ordinance be removed from Appendix B, as it does not appear to be applicable.

- *General Plan:* The General Plan does contain policies related to noise (General Plan, Section 2.16.2), but the policies that would otherwise be relevant to the Proposed Action apply only when the noise being generated occurs near noise sensitive uses - which the County defines as dwellings, schools, hospitals, nursing homes, churches, and libraries (Ventura County Initial Study Assessment Guidelines, pg. 120). Given that most proposed noise-generating activities (such as demolition) will take place on-site away from noise sensitive uses, the General Plan policies would not apply.

General Plan noise policies do apply to truck traffic generated by the Proposed Action that occurs near noise sensitive uses. The DEIS discusses noise impacts generated by the trucks that will transport materials generated by proposed cleanup activities. As shown in Figure 3.11-1, one of the haul routes, Box Canyon Road, is located in Ventura County. However, Box Canyon Road is part the County's 2020 Regional Road Network (Figure 4.2.3 of the General Plan - Public Facilities Appendix), and the General Plan excludes traffic-general noise on the Regional Road Network from noise policies/standards within the General Plan (General Plan, Section 2.16.2(4)).

The County recommends that NASA clarify its truck trip calculations so that noise impacts can be properly evaluated. Currently, there's an inconsistency within the report regarding the amount of additional truck traffic that could be generated by the Proposed Action. On page 4-119 of the DEIS, it states that 3,476 trips associated with demolition hauling would take place over the course of approximately one year. However, on page 4-139 of the DEIS, it says that the "analysis assumed that up to 142 trucks per day would use the designated haul routes." Assuming 260 work days in a year, these 142 daily truck trips add up to almost 37,000 annual truck trips, which is considerably more trips than the 3,476 trips estimated elsewhere in the DEIS. In addition, in Section 4.11.1.1 (Demolition) of the DEIS (pg. 4-140), it states that demolition activities would take place between 2014 and 2016. Of course, demolition activities would result in additional truck trips and those trips do not appear to be accounted for in the 37,000 truck trips noted above.

242-40

E. Resource Management Agency, Planning Division, Cultural Heritage

Planning Division Cultural Heritage Board staff (CHB Staff) is aware of and acknowledges that NASA intends to use the NEPA process and this DEIS in lieu of procedures set forth in 36 CFR §§ 800.3 through 800.6 to review the cultural heritage impacts of the SSFL demolition and cleanup project in order to comply with the directives set forth in section 106 of the NHPA. Particular attention has been placed on Sections 3.3 and 4.3 of the DEIS and DEIS Appendix C: Section 106 Findings of Effect Consultation Report, Ventura County, California.

The CHB staff comments seek to evaluate whether “most or all of the primary structures, sites, and other improvements . . . could be considered potentially eligible for listing on both the National Register of Historic Places and the California Register of Historic Places. (Calvit and Barrier 2006:1)” (NASA, Historic Resources Survey and Assessment of the NASA Facility at Santa Susana Field Laboratory, Ventura County, California (March 2009 ver.) p. i.; see also 36 CFR Part 60) and whether the proposed project significantly affects existing cultural resources, including sacred sites and historic properties in the project’s region of influence or area of potential effects.

242-41

Identified Cultural Resources

The historic architectural resources identified in the DEIS and Appendix C (Draft Cultural Resources Study for the Environmental Cleanup and Demolition at SSFL, NASA Areas I and II) consist of three historic districts (Alfa, Bravo and Cocas Test Areas) and their contributing elements, as well as the individual eligibility of the nine structures within those districts.

The archaeological resources identified in the DEIS and Appendix C include the Burro Flats Painted Cave site of approximately 10 acres that is listed in the National Register of Historic Places (NRHP) and the California Register of Historic Resources (CRHR). Sites CA-VEN-1800 and CA VEN-1803 are being considered potentially eligible for purposes of this undertaking.

CHB staff concurs with the NRHP eligibility of the three districts and their contributing elements, as well as the nine individual eligible structures and the NRHP eligible archaeological sites as described in the May 2008 Historic Resources Survey and Assessment of the NASA facility at SSFL.

242-42

Mr. Allen Elliot
 September 27, 2013
 Page 18 of 22

Area of Potential Effects (APE)

The Area of Potential Effects, as shown in Figure 3.3-1 of the DEIS text, is also referred to as the Region of Influence (ROI). The APE includes approximately 490 acres, including 182.6 ha (451.2 acres) of NASA-administered property, 16.9 ha (41.7 acres) in Area I, and 165.7 ha (409.5 acres) in Area II. An additional 15.7 ha (39 acres) of Boeing property are included in the APE, because these areas likely would be part of NASA's remediation activities.

CHB staff believes the APE boundary is inadequate. As shown in Figure 2 of Appendix C, additional soil remediation cleanup areas are located outside of the existing APE. The APE should be adjusted to include these sites. Furthermore, the Traditional Cultural Property and Cultural Landscape Assessment ("TCP Assessment") has not been completed, so it is unknown whether these sites would be within the current APE. Once the Assessment has been completed, the results and recommendations should be incorporated into the DEIS for recirculation to the public and if necessary, the APE adjusted to incorporate these sites.

242-43

Ventura County General Plan Policies Related to Cultural Resources

The COUNTY's General Plan establishes goals and policies for paleontological and cultural resources of the COUNTY (including archaeological, historical and Native American resources) for their scientific, educational and cultural value. The Ventura County General Plan Policies which apply to cultural resources are as follows:

1.8.2.1 - Discretionary developments shall be assessed for potential paleontological and cultural resource impacts, except when exempt from such requirements by CEQA. Such assessments shall be incorporated into a Countywide paleontological and cultural resource data base.

In accordance with the above policy, the TCP Assessment and the Chumash Sacred Site boundary identification should be completed so that the full scope of the project is known. Once the assessment and the boundary identification are completed, the potential impacts to such resources can be disclosed to the general public and considered by the decision makers in their determination to implement the project.

242-44

The purpose of the DEIS is to "inform decision makers and the general public of the environmental consequences of a proposed federal action." The DEIS doesn't disclose the full magnitude of the property disturbance. Delineation of

Mr. Allen Elliot
September 27, 2013
Page 19 of 22

the contaminated areas is still underway so it is premature to circulate a NEPA document when the full scope of the project is unknown.

1.8.2.2 - Development shall be designed or re-designed to avoid potential impacts to significant paleontological and cultural resources. Unavoidable impacts, whenever possible, shall be reduced to a less than significant level and/or shall be mitigated by extracting maximum recoverable data.

Decisions presented in the DEIS should first consider project avoidance and minimization of effects, rather than mitigation. Mitigation measures should be developed to save all three test stands, and their contributing elements, as well maintaining the individual eligibility of the nine structures within the three historic districts.

242-45

1.8.2.5. During environmental review of discretionary development, the reviewing agency shall be responsible for identifying sites having potential archaeological, architectural or historical significance and this information shall be provided to the County Cultural Heritage Board for evaluation.

1.8.2.3 - Mitigation of significant impacts on cultural or paleontological resources shall follow the Guidelines of the State Office of Historic Preservation and the State Native American Heritage Commission, and shall be performed in consultation with professionals in their respective areas of expertise.

1.8.2.4. Confidentiality regarding locations of archaeological sites throughout the County shall be maintained in order to preserve and protect these resources from vandalism and the unauthorized removal of artifacts.

In accordance with the policies above, CHB staff recommends that the DEIS incorporate feasible mitigation measures identified by the Santa Ynez Band of Chumash Indians and the Native American Heritage Commission through consultation with NASA for the protection of the nationally significant Burro Flats Painted cave archaeological site, the not-yet defined Chumash Sacred Site, as well as Sites CA-VEN-1800 and CA VEN-1803. As part of the consultation, the location of the archaeological sites shall remain confidential. Additionally, feasible mitigation measures identified by the National Park Service, Advisory Council on Historic Preservation, and the State Office of Historic Preservation staff for the protection of the NRHP eligible historic architectural resources during the Section 106 consultation should be incorporated into the DEIS.

242-46

Mr. Allen Elliot
 September 27, 2013
 Page 20 of 22

Mitigation Measures (Cultural MM-1, MM2, MM3, MM4 and MM5 under Section 4.3 – Cultural Resources)

242-47

The identified Mitigation Measures “MM-1 Retaining one Test Stand,” “MM-2 HABS/HAER documentation” and “MM-3 In-depth ethnographic study” for the impacts on cultural and historic resources from proposed demolition, excavation, soil removal and groundwater cleanup do not reduce the significant adverse effects of the project to a less than significant level.

MM-1 Mitigation Measure for retention of one test stand does not meet the Secretary of Interior’s Standards and Guidelines for Preservation which requires retention of the greatest amount of historic fabric, along with the building’s historic form, features, and detailing as they have evolved over time.

242-48

MM-2 and MM-3 Mitigation measures of HABS/HAER documentation recording and the completion of ethnographic studies would avoid the loss of historical information, but do not prevent the physical loss of historically significant resources. It should be noted that photographic documentation to HABS standards of a historic building or structure is not sufficient mitigation for its demolition (Architectural Heritage Assn. et al v. County of Monterey, (2004) 122 Cal.App. 4th 1095.)

242-49

CEQA requires that all feasible mitigation be undertaken even if they do not mitigate the project below a level of significance. Therefore, additional mitigation measures should be developed to save all three test stands, and their contributing elements, as well as the nine structures within the three identified historic districts.

242-50

CHB staff concurs with using the following Mitigation Measures:

242-51

- Avoidance of excavation within the boundaries of Burro Flats (CA-VEN-1072) and CA-VEN-1803 to diminish or eliminate adverse impacts to known archeological sites and reduce the impacts to negligible.
- All three Test Stands and their contributing elements, as well as with the individual eligibility of the nine structures should be retained in-situ or relocated elsewhere on the same project site.
- Use Monitored Natural Attenuation (MNA) to monitor soils or groundwater to evaluate the reduction in contamination over a period of time once another treatment technology had been implemented or the naturally occurring attenuation processes had proven effective in reducing contamination in the subsurface.

Mr. Allen Elliot
 September 27, 2013
 Page 21 of 22

- Use of Institutional Controls including deed restrictions, fencing, signage, and other security measures to eliminate public access to the most significant sites.

Project Alternatives

The DEIS alternatives ("No Action" and 100% Demolition) discussion is inadequate. The alternatives analysis is considered the "heart" of the EIS and should discuss a range of alternatives, including all "reasonable alternatives." CHB staff recommends that the DEIS include additional alternatives that are feasible from an economic, technical, and future land use standpoint that provides for the preservation of the most significant historic resources at SSFL. The DEIS should develop mitigation measures in conformance with the *Secretary of Interior's Standards for Rehabilitation* that would result in the retention of the greatest amount of historic fabric, along with the building's historic form, features, and detailing as they have evolved over time. Other cleanup alternatives consistent with the potential future use of the land should be considered.

242-52

F. Resource Management Agency, Environmental Health Division

The Ventura County Environmental Health Division (EHD) does not have jurisdiction over the cleanup activities at Santa Susana Field Laboratory (SSFL). Nevertheless, the EHD provides the following comments upon the DEIS and the activities referenced therein:

1. The information in the DEIS indicates that the handling of solid waste and hazardous materials encountered or created in the cleanup activities appears to be in conformance with applicable regulations regarding these materials.
2. Two known closed solid waste landfills exist within the general area of the SSFL. These are identified as Area 1 Landfill Solid Waste Information System (SWIS) #56-CR-0051, and Area 2 Landfill SWIS #56-CR-0052. The EHD understands that the cleanup activities proposed in the DEIS will not impact these closed solid waste landfills, however, in the event that changing conditions during the cleanup occur which results in disturbance of either of these landfills, the EHD, as Local Enforcement Agency for Solid Waste must be contacted prior to any disturbance. Also, the EHD will continue to monitor the condition of these solid waste landfills, in conformance with State minimum standards.
3. The EHD oversees testing requirements for specified projects in proximity to the SSFL for perchlorate and trichloroethylene. The EHD does not anticipate any change to this testing protocol related to the cleanup.

242-53

242-54

Integrated Waste Management Division
MEMORANDUM**

Date: August 21, 2013

To: Allen Elliott
National Aeronautics & Space Administration (NASA)

From: Derrick Wilson, Staff Services Manager
Integrated Waste Management Division

Subject: **Non-County Project – RMA No. 13-019**
Draft Environmental Impact Statement (DEIS) for Proposed Demolition
and Environmental Cleanup Activities at Santa Susana Field Laboratory

Lead Agency: National Aeronautics & Space Administration (NASA)
Lead Agency Contact: Allen Elliott, 256/544-0662

Summary:

NASA has announced the availability of a Draft Environmental Impact Statement (DEIS) to evaluate the potential environmental impacts of proposed demolition and environmental cleanup activities on property administered by NASA at the Santa Susana Field Laboratory (SSFL) in Ventura County. NASA is preparing land they administer at the SSFL for disposition, or "excess," through the Department of General Services (GSA). NASA's preparation of the land for disposition includes consideration of the possible demolition of all structures on land they administer at the SSFL. The purpose of the DEIS is to inform NASA decision makers, regulating agencies, and the public of potential environmental consequences of the proposed demolition of buildings and structures at the SSFL, and the proposed environmental cleanup actions for groundwater and soil on NASA administered land at the SSFL. The DEIS will consider a range of remedial technologies that might be implemented to achieve the proposed groundwater and soil remediation goals. NASA will use the DEIS to consider the potential environmental, economic, and social impacts of proposed remediation actions.

Pursuant to RMA's request, the Integrated Waste Management Division (IWMD) has reviewed NASA's July, 2013, DEIS pertaining to the proposed demolition and environmental cleanup at the SSFL. The IWMD appreciates this opportunity to provide our comments.

The following contract specifications pertain to all **uncontaminated** materials generated during demolition and environmental cleanup activities on NASA's portion of the SSFL site. The IWMD requests that NASA comply with Ventura County Ordinances 4445 (solid waste handling, disposal, waste reduction, and waste diversion) and 4421 (the diversion of construction and demolition debris from landfills by recycling, reuse, and salvage) to assist the County in its efforts to comply

with the waste diversion mandates of Assembly Bill 939 (AB 939) which mandates all cities and counties in California to divert recyclable solid waste from landfills. Both of these Ordinances may be viewed in their entirety on the IWMD's website at: www.wasteless.org/landfills/ordinances.

Pursuant to IWMD review and responsibilities, the following contract specifications shall apply to uncontaminated materials generated by this project:

Recyclable, Uncontaminated Construction & Demolition (C&D) Debris

Contract specifications for this project must include a requirement that C&D debris generated by the demolition of uncontaminated buildings on the project site must be diverted from the landfill. Recyclable C&D materials include, but are not limited to, concrete, asphalt, rebar, wood, and metal. These materials must be recycled at an appropriate, permitted C&D debris recycling facility. A complete list of permitted C&D debris recycling facilities in Ventura County is available at: www.wasteless.org/construction&demolitionrecyclingresources. All uncontaminated, non-recyclable, materials shall be disposed of at a permitted disposal facility.

Uncontaminated Soil - Recycling & Reuse

Contract specifications for this project must include a requirement that uncontaminated soil that is not reused on-site during the C&D phase(s) of this project shall be transported to an authorized and/or permitted organics facility for recycling or reuse. Illegal disposal and landfilling of uncontaminated soil is prohibited. A complete list of facilities in Ventura County that recycle uncontaminated soil is available at: www.wasteless.org/construction&demolitionrecyclingresources.

Uncontaminated Green Materials - Recycling & Reuse

The Contract Specifications for this project must include a requirement that uncontaminated wood waste and vegetation removed during the C&D phase(s) of this project must be diverted from the landfill. This can be accomplished by on-site chipping and land-application at the project site if deemed appropriate by NASA, or by transporting uncontaminated materials to an authorized and/or permitted greenwaste facility in Ventura County. A complete list of authorized greenwaste facilities is located at: www.wasteless.org/greenwasterecyclingfacilities.

Recyclable, Uncontaminated Construction & Demolition (C&D) Debris – Required Reports

Per Ventura County Ordinance 4421:

1. Contractors selected to demolish uncontaminated buildings/structures at the Santa Susana Field Laboratory site are required to submit a completed **Form B – Recycling Plan** to the IWMD for approval. The **Form B – Recycling Plan** must specify how uncontaminated, recyclable C&D debris generated by the project (e.g., concrete, asphalt, wood, soil, greenwaste, metal) will be diverted from the landfill. A copy of IWMD's **Form B – Recycling Plan** is available at: www.wasteless.org/recycling/greenbuildingCD.
2. Contractors selected to demolish uncontaminated buildings/structures at the Santa Susana Field Laboratory site are required to submit a completed

Form C – Recycling Report to the IWMD at the conclusion of the project. The **Form C – Recycling Report** must have original recycling facility receipts and/or other documentation attached to verify that recycling, NASA approved on-site reuse, or salvage of uncontaminated C&D debris occurred. A copy of IWMD's **Form C – Recycling Report** is available at:
www.wasteless.org/recycling/greenbuildingCD.

Should you have any questions regarding this memo, please contact Pandee Leachman at 805/658-4315.

**PUBLIC WORKS AGENCY
TRANSPORTATION DEPARTMENT
Traffic, Advance Planning & Permits Division**

MEMORANDUM

DATE: August 20, 2013

TO: RMA – Planning Division
Attention: Laura Hocking

FROM: Transportation Department

SUBJECT: REVIEW OF DOCUMENT 13-019 Draft Environmental Impact Statement (DEIS) for Proposed Demolition and Environmental Cleanup Activities for NASA-administered portion of the **Santa Susana Field Laboratory (SSFL)**. Simi Hills, Ventura County (State)
Lead Agency: **California Department of Toxic Substances Control (DTSC)**

Pursuant to your request, the Public Works Agency – Transportation Department has completed the review of the Draft Environmental Impact Statement (DEIS) for Proposed Demolition and Environmental Cleanup Activities for the National Aeronautics and Space Administration (NASA)-administered portion of the Santa Susana Field Laboratory (SSFL) located in the Simi Hills south of the City of Simi Valley and west of the Ventura and Los Angeles County jurisdictional boundary.

Site activities at the 2,850-acre SSFL have included research, development, and testing of liquid-fueled rocket engines and components for various governmental space programs. Rocketdyne (predecessor to Boeing) began operations in the late 1940s for the Air Force and then NASA. NASA gradually discontinued testing in the 1980s, with final tests conducted in 2006. The site consists of four administrative areas known as Areas I, II, III, and IV and two undeveloped areas or buffer zones.

This project proposes a demolition of approximately 100,000 CY of debris (tests stands and other structures) and 500,000 CY of soil in the NASA-administered areas, approximately 41.7 acres within Area I and all 409.5 acres of Area II. The Boeing company manages the remaining area of the property (2,398.8 acres). This project will generate approximately 39,000 trucks over an estimated 650 working days. The project will require 34 construction workers during the 150-day demolition phase and 15 construction workers during the 500-day excavation and disposal phase.

The California DTSC oversees the comprehensive environmental investigation, monitoring, and cleanup program of contamination at the SSFL. The process for actual cleanup includes: (1) Resource Conservation Recovery Act (RCRA) Facility Investigations (RFI) Reports; (2) a Feasibility Study; (3) a Risk Assessment; (4) a draft Remedial Action Plan (RAP); (5) a draft Environmental Impact Statement (EIS); (6) final RAP; and (7) final EIS.

We have reviewed several documents in regard to the SSFL cleanup. Our previous comments are still valid and applicable.

We offer the following comments on the DEIS for the demolition and cleanup activities in the NASA-administered areas of the SSFL:

1. According to the Truck Route Map (Figure 4.5-1), the project proposes to access the SSFL via Santa Susana Pass Road and Box Canyon Road in the County of Ventura and Woolsey Canyon Road in the County of Los Angeles.
 - a. The project proponent should be aware that Santa Susana Pass Road from Katherine Road to Rocky Peak Road has a "No Trucks Over 2 Axles" Truck Restriction adopted by the Ventura County Board of Supervisors (BOS) February 4, 1986.
 - b. The project proponent should be aware that Box Canyon Road from Santa Susana Pass Road to the Ventura County and Los Angeles County jurisdictional boundary has a "No Trucks 3 Or More Axles" Truck Restriction adopted by the BOS September 28, 1999.
 - c. If the project proponent plans to use trucks that are not restricted on Santa Susana Pass Road or Box Canyon Road, then please include these roads in the survey of road conditions as described in Traffic MM-2 on Pages 6-3 of the DEIS.
 - i. Proper precautions should be taken to protect all County road facilities in the unincorporated areas.
 - ii. If, in the opinion of the Transportation Department, any portion of a County road is damaged by the project's operations, then it should be repaired in accordance with current standard construction details and/or in a manner acceptable to the Transportation Department.
 - iii. An Encroachment Permit is required for any work in the public right-of-way.
 - d. The Transportation Department will not allow/permit hauling on Black Canyon Road north of the project site.
2. Please notify the Transportation Department when the Final EIS is ready for review and comment.

Our review is limited to the impacts this project may have on the County's Regional Road Network.

Allen Elliott, SSFL Project Director
National Aeronautics and Space Administration
MSFC AS01, Building 4494
Huntsville, AL 35812

Subject: National Aeronautics and Space Administration's (NASA) Draft Environmental Impact Statement (DEIS) for the Demolition and Cleanup at the Santa Susana Field Laboratory (SSFL)

Dear Mr. Elliott,

The Ventura County Air Pollution Control District (District) appreciates the opportunity to comment on the subject DEIS for demolition and environmental cleanup activities at the NASA-administered properties at the SSFL. The DEIS evaluates the potential environmental consequences associated with NASA's proposal to demolish existing structures and to remediate groundwater and soil on the federally-owned property that NASA administers at the SSFL in Ventura County, California.

The District is the local agency responsible for attaining and maintaining state and federal air quality standards and protecting the citizens of Ventura County from the harmful effects of air pollutants. The District's responsibilities in improving air quality in the region include: preparing plans for attaining and maintaining air quality standards; adopting and enforcing air quality rules and regulations; issuing permits for stationary sources of air pollutants; inspecting stationary sources and responding to citizen complaints; monitoring local air quality and meteorological conditions; and implementing public outreach campaigns.

As a complement to its official responsibilities under state and federal clean air laws, the District regularly participates in environmental assessments of public and private proposals that may impact Ventura County's air. The District supports public agencies with their environmental assessments and documents by providing needed information, guidance, and assistance that helps those agencies address and mitigate air quality issues of projects they are proposing or considering in Ventura County.

With this background and introduction, District staff offers the following comments and suggestions regarding the air quality section of the subject DEIS.

- 1) All demolition, construction, and excavation equipment such as compressor engines, generator engines, screens, crushers, conveyors, lighting, drilling rigs, etc. shall be

0187-01

registered with the California Air Resources Board Portable Equipment Registration Program (PERP). In some cases, the equipment may not meet the applicability requirements of the PERP (function, time at facility, etc.) and will be required to obtain a District air permit. Equipment such as backhoes, bulldozers, front-end loaders, and dump trucks do not require a PERP or District permits, but must comply with the California Air Resources Board Diesel Off-Road Online Reporting System (DOORS) Program and Regulation For In-Use Off-Road Diesel Fueled Fleets. If a District air permit is required, the permit application shall comply with the best available control technology (BACT) and emission offset requirements of APCD Rule 26, "New Source Review." The air permit application shall also demonstrate compliance with District Rule 33, "Part 70 Permits", Rule 35, "Elective Emission Limits," or Rule 76, "Federally Enforceable Limits on Potential to Emit," as applicable.

- 2) The DEIS provides only preliminary details regarding the various soil cleanup technologies that are being considered as alternatives to excavation and offsite disposal. As stated, some of the soil cleanup technologies will require Ventura County APCD permits. To fully determine these permit requirements, a detailed description of each soil cleanup technology will be required. The power source for these soil cleanup technologies must also comply with District air permit requirements. Fuel-fired power sources such as an electricity generating engine may not comply with all air quality rules and grid electricity may be required to power the soil cleanup technologies. If a Ventura County APCD permit is required, the permit application shall comply with BACT and emission offset requirements of APCD Rule 26, "New Source Review." Note that the current Ventura County APCD Permit to Operate for the SSFL has permitted emissions of 2.37 tons per year of reactive organic compounds (ROC) and 5.86 tons per year of nitrogen oxides (NOx). These permitted emissions are considered to be the "baselines" when evaluating the APCD Rule 26 emission offset thresholds of 5 tons per year of ROC and 5 tons per year of NOx. 0187-02
- 3) The ex situ treatment of contaminated soils using land farming may not comply with District rules and may not be permitted as proposed. Alternative ex situ soil remediation techniques, such as a covered aerated static pile, should be considered. In this technique, the contaminated soil is covered with a tarp or other impermeable cover and the required air is provided via blowers and piping with air emissions vented to an emission control device. 0187-03
- 4) The DEIS also provides only preliminary details for the various groundwater cleanup technologies being studied. As stated, some of the groundwater cleanup technologies will require District air permits where volatile organic compounds (VOCs) or semi-volatile compounds are potentially emitted to the atmosphere. To fully determine these permit requirements, a detailed description of each groundwater cleanup technology will be required. The power source for these groundwater cleanup technologies must also comply with District air permit requirements. Fuel-fired power sources such as an electricity generating engine may not comply with all air quality rules and grid electricity 0187-04

may be required to power the groundwater cleanup technologies. If a Ventura County APCD Permit to Operate is required, the permit application shall comply with BACT and emission offset requirements of APCD Rule 26, New Source Review.

- 5) Air Quality Mitigation Measure-3 (MM-3) proposes a “Dust Control Plan” for the project. The Ventura County APCD recommends that MM-3 be expanded to an “Emissions Control and Air Monitoring Plan.” During the excavation and temporary storage of contaminated soil, VOCs and various toxic air contaminants may be released into the atmosphere. The plan should include best management practices to prevent the emissions of VOCs and air toxics in addition to preventing the emissions of fugitive dust. An air monitoring program should also be developed to make sure that the project does not cause a violation of the National and California Ambient Air Quality Standards or Ventura County APCD Rule 51, Nuisance, Rule 62.1, Hazardous Materials, and Rule 74.29, Soil Decontamination Operations. The air monitoring program should include real-time, continuous, and/or periodic monitoring for PM₁₀, VOCs, and air toxics such as polycyclic aromatic hydrocarbons and lead.

0187-05

The “Emissions Control and Air Monitoring Plan” should incorporate the following requirements of District Rule 74.29, Soil Decontamination Operations: a) a certified organic vapor analyzer should be used to make sure that the aeration of contaminated soil is minimized or prevented, b) contaminated soil piles or soil surfaces should be treated with a vapor suppressant or covered with continuous heavy-duty plastic sheeting or other covering to minimize the emissions of VOCs and air toxics to the atmosphere; and, c) trucks used to transport contaminated soil shall also be enclosed, tarped or otherwise covered to minimize the emissions of dust, VOCs, and air toxics.

- 6) The proposed demolition and remediation activities at the SSFL will involve removal of structural materials and excavation and transport of up to 500,000 cubic yards of contaminated soils over a period of two years. These activities will require significant numbers of diesel equipment and vehicles to remove and deliver the structural debris and contaminated soils to storage and treatment areas within the SSFL boundaries and to off-site disposal facilities. Moreover, up to 167,000 cubic yards of backfill material will be brought in to restore excavated areas. This material will also be delivered and placed with diesel equipment. Diesel particulate matter has been designated a cancer-causing chemical in the State of California. Therefore, a screening health risk assessment (HRA) should be conducted to assess potential health risks of diesel exhaust emissions associated with project activities to nearby populations, especially sensitive receptors, such as residences, schools, daycare centers, and hospitals. This determination can be made by an appropriate health risk assessment. The California Air Pollution Control Officers’ Association (CAPCOA) has an HRA guideline document, titled *Health Risk Assessments for Proposed Land Use Projects* (June 2009), for assessing the health risk

0187-06

impacts of airborne toxic and carcinogenic substances. The guidelines and associated documents are available from CAPCOA's website at <http://www.capcoa.org/documents>.

- 7) Vapor emissions and dust emissions from the excavation, handling, and on-site storage of contaminated soils may result in the emissions of toxic air contaminants such as chlorinated hydrocarbons and metals. Air toxics screening calculations or a HRA should be conducted to assess potential health risks of nearby populated areas as discussed above. 0187-07
- 8) The DEIS should assess through dispersion modeling whether project-generated particulate pollutants (PM₁₀ and PM_{2.5}) will exceed either state or federal air quality particulate standards in nearby populated areas. 0187-08
- 9) Project conformity is addressed in Section 4 of the DEIS and Appendix I, *AQ General Conformity Analysis*. These discussions indicate that the emissions of material from the excavation and offsite disposal for both high and low soil remedial technologies are below the South Central Coast Air Basin's (SCCAB) general conformity thresholds of 50 tons/year for VOC and NO_x. Soil remedial emission estimates for 2016 and 2017 are provided in Section 4 of the DEIS and Appendix I, *AQ General Conformity Analysis*. However, the emission estimates for demolition activities for 2014, although also below the SCCAB thresholds of 50 tons/year for VOC and NO_x, are only presented in Section 4 and not found in Appendix I, *AQ General Conformity Analysis*. This information should be included in Appendix I as well. 0187-09

Thank you again for the opportunity to provide comments and suggestions on the DEIS for this very important project. We hope you find them helpful. If you have any questions, please call me at 805-645-1440 or email me at mike@vcapcd.org.

Sincerely,

Mike Villegas

Air Pollution Control Officer

RE: Draft Environmental Impact Statement (DEIS) for Demolition and Environmental Cleanup Activities for the NASA-administered portion of the Santa Susana Field Laboratory (SSFL), Ventura County, California

Dear Mr. Elliott:

The Santa Ynez Band of Chumash Indians (“Chumash” or “Tribe”) thanks you and NASA for the opportunity to comment on the DEIS. NASA procedure requirements state that NASA is “committed to environmental stewardship, sustainable design, and green engineering.” In addition, NASA is covered by Executive Order 13175 as reaffirmed by that Presidential Memorandum on Tribal Coordination dated November 5, 2009 that reaffirmed Executive Order 13175, “Consultation and Coordination with Indian Tribal Governments,” and emphasized the importance of strengthening government-to-government relationships with Native American tribes. See also, http://nodis3.gsfc.nasa.gov/npg_img/N_PR_8580_001A_/N_PR_8580_001A_.pdf.

The Tribe, therefore, makes the following comments as to the DEIS:

(1) The EIS Must Address Cultural Resources (copied from <http://www.npi.org/NEPA/impact>)

0188-01

Cultural resources are referred to in different ways at different points in the CEQ regulations. The regulatory definition of the term "human environment" at 40 CFR 1508.14 – impacts on the quality of the human environment being the subjects of any EIS – includes "the natural and physical environment and the relationship of people with that environment." The definition of "effects" at 40 CFR 1508.8 – as in "effects on the quality of the human environment" – includes changes in the human environment that are "aesthetic, historic, cultural, economic, (or) social."

The regulatory definition of the word "significantly" at 40 CFR 1508.27 – as in "major federal action significantly affecting the quality of the human environment" – includes as measures of impact intensity:

- Impacts on an area's unique characteristics, such as "historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, and ecologically critical areas" (40 CFR 1508.27(b)(3)).
- Impacts on "districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places" and on "significant scientific, cultural, or historical resources" (40 CFR 1508.27(b)(8)).

Clearly, impacts on cultural resources are to be addressed in an EIS. Note that it is not just impacts on historic properties that should be addressed. The regulations use "historic" and "cultural" in parallel, not as synonyms.

(2) Record of Decision Must Mitigate any Impacts to Cultural Resources (copied from <http://www.npi.org/NEPA/impact>)

0188-02

Once the EIS analysis has resulted in a draft environmental impact statement (DEIS), it is subjected to public and agency review, and comments are addressed – this may require further analysis. Then, assuming the project has not been abandoned, or so changed that a supplemental DEIS is needed, a final EIS (FEIS) is prepared and published. The FEIS is considered in making the agency's decision about whether and how to proceed with the action that was the subject of the EIS. This decision is recorded in a Record of Decision (ROD). According to 40 CFR 1505.2, the ROD must:

- State what the decision was.
- Identify all alternatives considered.
- Specify the alternative or alternatives considered to be "environmentally preferable." (Note that the agency does not have to select the environmentally preferable alternative, but it does have to discuss what it is.)
- Identify and discuss the factors balanced in making the decision (whether for or against the environmentally preferable alternative).
- State whether "all practicable means to avoid or minimize environmental harm... have been adopted, and if not, why they were not."

Having notified the world of its decision, the agency implements it. In doing so, it must carry out any mitigation, i.e., "means to avoid or minimize environmental harm," it has said in the ROD or EIS that it will carry out (40 CFR 1505.3).

(3) Deferral of Mitigation does not Comply with NEPA (copied from <http://www.npi.org/NEPA/impact>)

0188-03

Deferral. With respect to historic properties, a very common problem is "deferral," in which the agency:

- Acknowledges that it does not know much about what effects there may be on historic properties (often because such properties have not yet been identified); but
- Says that whatever effects there may be, NHPA Section 106 review (of the National Historic Preservation Act), to be performed later, will take care of them; and
- Concludes that therefore, whatever alternative is decided on, impacts on historic properties will not be a problem.

Considering environmental impacts *after* a decision has been made defeats NEPA's purpose of considering impacts in *preparing* to make decisions. It also almost guarantees last-minute conflicts between project implementation and historic preservation.

Failure to consider things that are not historic properties. With respect to other kinds of cultural resources, a common problem is that they are not considered at all. Historic properties, or even more narrowly, archeological sites, are sometimes the only things discussed in the "cultural resource" part of an EIS. If social impacts are considered, they are often considered only terms of easily quantifiable socioeconomic variables like population, employment, and use of public services. The result is that impacts on many classes of cultural resource simply are not identified or considered in deciding whether significant impacts may occur.

0188-04

(4) Significant Negative Unmitigated Impacts to Sacred Sites and Cultural Resources

4.3.1.2 Soil Cleanup to Background--the total area of the remediation footprint is approximately 105 acres and includes approximately 500,000 yd³ of contaminated soil

Indian Sacred Site and Traditional Cultural Property: The tribe has already designated all of the NASA administered property as a sacred site under E.O. 13007. The impact would be **significant, negative, regional, and long term** and would constitute an **adverse effect** under Section 106. (DEIS, 4-18)

Archeological Resources: The proposed cleanup of the Burro Flats site (CA-VEN-1072); could result in **significant, negative, local, and long-term** impacts to the site and would constitute an **adverse effect** under Section 106. The proposed cleanup of CA-VEN-1803 could result in **moderate, negative, local, and long-term impacts** under NEPA. Excavation on previously undiscovered archeological sites found to be NRHP-eligible could be a **significant, negative, local, and long-term** impact on archeological resources, thus resulting in a finding of **adverse effect** under Section 106. (DEIS, 4-19)

Deferral of eligibility determination: A determination of eligibility of CA-VEN-1803, in consultation with the SHPO and the federally recognized tribes, needs to be completed before cleanup began if this site were to be affected by soil cleanup activities. CA-VEN-

0188-05

1800 would not be affected by excavation and removal of soil because it is not located within the identified cleanup areas.

Deferral of boundary research as to VEN-1072 and VEN-1803: Additional boundary research is required to conclude that any avoidance of excavation within the boundaries of Burro Flats (CA-VEN-1072) and CA-VEN-1803 would diminish or eliminate adverse impacts to known archeological sites and reduce the impacts to *negligible, negative, local, and long term* and could result in a finding of *no adverse effect* under Section 106.

0188-06

Deferral of additional testing as to unknown archaeological deposits: Additional subsurface testing is required to conclude that reducing the amount of excavation on newly discovered archeological deposits (commonly referred to as "inadvertent or accidental discoveries") could minimize the impact if the newly identified sites were avoided, thus reducing the impacts to *minor, negative, local, and long-term* impacts from excavation.

0188-07

(5) Failure to Address Executive Order 13007

On December 10, 2012, the Santa Ynez Band of Chumash Indians, a federally recognized tribe ("Tribe"), designated the NASA portion of the SSFL as an Indian sacred site pursuant to Executive Order 13007. This Indian sacred site also includes the former Rocketdyne and now Boeing portion of SSFL and the Tribe is open to discussing the exact boundaries at a later date.

E.O. 13007 requires Federal land managing agencies to accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners and to avoid adversely affecting the physical integrity of such sacred sites. It also requires agencies to develop procedures for reasonable notification of proposed actions or land management policies that may restrict access to or ceremonial use of, or adversely affect, sacred sites.

Sacred sites are defined in the executive order as "any specific, discrete, narrowly delineated location on Federal land that is identified by an Indian tribe, or Indian individual determined to be an appropriately authoritative representative of an Indian religion, as sacred by virtue of its established religious significance to, or ceremonial use by, an Indian religion; provided that the tribe or appropriately authoritative representative of an Indian religion has informed the agency of the existence of such a site." There is no review of such determinations by a Federal agency.

It is important to note that a sacred site may not meet the National Register criteria for a historic property and that, conversely, a historic property may not meet the criteria for a sacred site. However, in those instances where an undertaking may affect a historic property that is also considered by an Indian tribe to be a sacred site, the Federal agency should, in the course of the Section 106 review process, consider accommodation of access to and ceremonial use of the property and avoidance of adverse physical effects in accordance with E.O. 13007.

0188-08

The Advisory Council on Historic Preservation (ACHP) has explained
“The Relationship Between Executive Order 13007 Regarding Indian Sacred Sites and Section 106,” <http://www.achp.gov/eo13007-106.html>

To the extent that the requirements of the executive order and ACHP's regulations are similar, Federal agencies can use the Section 106 review process to ensure that the requirements of E.O. 13007 are fulfilled. For example, E.O. 13007 requires that agencies contact Indian tribes regarding effects and the Section 106 regulations require consultation with Indian tribes to identify and resolve adverse effects to historic properties.

Consultation regarding the identification and evaluation of historic properties of religious and cultural significance to an Indian tribe could include identification of those properties that are also sacred sites. Similarly, consultation to address adverse effects to such historic properties/sacred sites could include discussions regarding access and ceremonial use.

(6) Failure to address the NASA Site as a Traditional Cultural Property (TCP) eligible for protection on the National Register;

0188-09

National Register Bulletin No. 38 (hereinafter referred to as “NPS Bull. No. 38”), Guidelines for evaluating and Documenting Traditional Cultural Properties (1990; revised 1992; 1998) under NHPA
<http://www.nps.gov/nr/publications/bulletins/pdfs/nrb38.pdf>

A. Locations for traditional ceremonies are defined as a TCP: NPS Bull No. 38, p. 1, provides:

The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices. Examples of properties possessing such significance include: ***

- a location where Native American religious practitioners have historically gone, and are known or thought to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice;

- B. Mountain tops and rock outcroppings like at SSFL are TCP's: NPS Bull. No. 38, p. 2, provides:

Traditional cultural properties are often hard to recognize. A traditional ceremonial location may look like merely a mountaintop, a lake, or a stretch of river; a culturally important neighborhood may look like any other aggregation of houses, and an area where culturally important economic or artistic activities have been carried out may look like any other building, field of grass, or piece of forest in the area. As a result, such places may not necessarily come to light through the conduct of archeological, historical, or architectural surveys. The existence and significance of such locations often can be ascertained only through interviews with knowledgeable users of the area, or through other forms of ethnographic research.

- C. NASA must engage specialists as part of its TCP study: NPS Bull. No. 38, p. 10, provides:

In general, the only reasonably reliable way to resolve conflict among sources is to review a wide enough range of documentary data, and to interview a wide enough range of authorities to minimize the likelihood either of inadvertent bias or of being deliberately misled.

Authorities consulted in most cases should include both knowledgeable parties within the group that may attribute cultural value to a property and appropriate specialists in ethnography, sociology, history, and other relevant disciplines.⁷

- D. Specific events like the Solstice ceremony at SSFL qualify as TCP: NPS Bull. No. 38, p. 11, provides:

For example, the National Register defines a "site" as "the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself possesses historic, cultural, or archeological value regardless of the value of any existing structure."

9 Thus a property may be defined as a "site" as long as it was the location of a significant event or activity, regardless of whether the event or activity left any evidence of its occurrence.

A culturally significant natural landscape may be classified as a site, as may the specific location where significant traditional events, activities, or cultural observances have taken place. A natural object such as a tree or a rock outcrop may be an eligible object if it is associated with a significant tradition or use. A concentration, linkage, or continuity of such sites or objects, or of structures comprising a culturally significant entity, may be classified as a district.

E. Native American ceremonies qualify as TCP: NPS Bull. No. 38, p.15, provides:

National Register guidelines stress the fact that properties can be listed in or determined eligible for the Register for their association with religious history, or with persons significant in religion, if such significance has "scholarly, secular recognition."

13 The integral relationship among traditional Native American culture, history, and religion is widely recognized in secular scholarship.14

Studies leading to the nomination of traditional cultural properties to the Register should have among their purposes the application of secular scholarship to the association of particular

properties with broad patterns of traditional history and culture. The fact that traditional history and culture may be discussed in religious terms does not make it less historical or less significant to culture, nor does it make properties associated with traditional history and culture ineligible for inclusion in the National Register.

F. Lack of use does not make a property TCP ineligible: NPS Bull. No. 38, p. 18, provides:

The fact that a property may have gone unused for a lengthy period of time, with use beginning again only recently, does not make the property ineligible for the Register. For example, assume that the Indian tribe referred to above used the mountain peak in prehistory for communication with the supernatural, but was forced to abandon such use when it was confined to a distant reservation, or when its members were converted to Christianity. Assume further that a revitalization of traditional religion has begun in the last decade, and as a result the peak is again being used for vision quests similar to those carried out there in prehistory. The fact that the contemporary use of the peak has little continuous time depth does not make the peak ineligible; the peak's association with the traditional activity reflected in its contemporary use is what must be considered in determining eligibility.

(7) Traditional Cultural Landscapes must also be included in Section 106 consultations and the EIS

0188-10

Traditional cultural landscapes, because they are often a property type such as a district or site, are identified in the same manner in the Section 106 process as other types of historic properties of religious and cultural significance to Indian tribes or Native Hawaiian organizations. The regulations at 36 CFR Section 800.4 outline several steps a federal agency must take to identify historic properties. In summary,

to determine the scope of identification efforts, a federal agency, in consultation with the State Historic Preservation Officers (SHPO)/Tribal Historic Preservation Officer (THPO), must:

1. Determine and document the area of potential effect for its undertaking;
2. Review existing information; and,
3. Seek information from consulting parties including Indian tribes or Native Hawaiian organizations.

Based on the information gathered through these efforts, the federal agency, in consultation with the SHPO and any Indian tribe or Native Hawaiian organization that attaches religious and cultural significance to historic properties that may be affected by the undertaking, develops and implements a strategy to identify historic properties within the area of potential effects. Identification efforts may include background research, oral history interviews, scientific analysis, and field investigations.

<http://www.achp.gov/natl-qa.pdf>

There is no single defining feature or set of features that comprise a traditional cultural landscape. Such places could be comprised of natural features such as mountains, caves, plateaus, and outcroppings; water courses and bodies such as rivers, streams, lakes, bays, and inlets; views and view sheds from them, including the overlook or similar locations ; vegetation that contributes to its significance; and, manmade features including archaeological sites; buildings and structures; circulation features such as trails; land use patterns; evidence of cultural traditions, such as petroglyphs and evidence of burial practices; and markers or monuments, such as cairns, sleeping circles, and geoglyphs. <http://www.achp.gov/natl-qa.pdf>

Based on such research, the ACHP TRADITIONAL CULTURAL LANDSCAPES ACTION PLAN advises as follows:

The ACHP, as the agency with responsibility for overseeing the Section 106 review process, and DOI, through the National Park Service (NPS), as the agency with responsibility for overseeing the National Register of Historic places, should provide leadership in addressing Native American cultural landscapes in the national historic preservation program. Together, the ACHP and NPS should:

--Promote the recognition and protection of Native American traditional cultural landscapes both within the federal government and the historic preservation community as well as at the state and local levels, and,

--Address the challenges of the consideration of these historic properties in the Section 106 review process as well as in NEPA reviews. <http://www.achp.gov/pdfs/native-american-traditional-cultural-landscapes-action-plan-11-23-2011.pdf>

(8) U.N. Declaration on the Rights of Indigenous Peoples must now be followed after December 2010

0188-11

In December 2010, the United States announced support for the **United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP)**. In announcing this support, President Obama stated: “The aspirations it affirms—including the respect for the institutions and rich cultures of Native peoples—are one we must always seek to fulfill...[W]hat matters far more than any resolution or declaration – are actions to match those words.” The UNDRIP addresses indigenous peoples’ rights to maintain culture and traditions (Article 11); and religious traditions, customs, and ceremonies (Article 12); to

participate in decision making in matters which would affect their rights (Article 18); and to maintain spiritual connections to traditionally owned lands (Article 25).

The ACHP will now incorporate UNDRIP in the Section 106 review process:

While the Advisory Council on Historic Preservation's (ACHP) work already largely supports the United Nations Declaration on the Rights of Indigenous Peoples, additional and deliberate actions will be taken to more overtly support the Declaration. The Section 106 review process provides Indian tribes and Native Hawaiian organizations (NHOs) with a very important opportunity to influence federal decision making when properties of religious and cultural significance may be threatened by proposed federal actions. While federal agencies are required to consult with Indian tribes and NHOs and to take their comments into account in making decisions in the Section 106 review process, adding the principles of the Declaration to that consideration may assist federal agencies in making decisions that result in the protection of historic properties of religious and cultural significance to Indian tribes and NHOs. <http://www.achp.gov/docs/UN%20Declaration%20Plan%203-21-13.pdf>

9. Official recognition in the DEIS need to be made of the areas surrounding Burro Flats

0188-12

A. The entire Southern half of Area II District needs to be protected. Sec. 3.3.3.4, p. 3-17

Sec. 3.3.3.3 Archeological Resources, p. 3-16

The earliest documented archeological work at Burro Flats Painted Cave began in 1953 with excavations carried out by the Archaeological Survey Association of Southern California, which made five trips to the site during 1953 and 1954. The site has been recorded several times since then and under numerous separate listings; misidentifications of elements and inconsistencies in function, assemblage, and design interpretations warranted a revisit and a complete recordation of the site's elements. **In June 2007, NASA re-recorded the site and updated the site record; this effort resulted in combining 16 separately recorded sites into one site, CA-VEN-1072, with associated loci and features.**

We therefore request that the entire Southern half of Area II District needs to be protected. Sec. 3.3.3.4, p. 3-17.

B. All structures should be removed in the Coca Historic District. These structures impinge on the ceremonial areas. If a decision is reached to save a test stand, Alfa or Bravo should be retained instead of Coca.

10. Additional Investigation of the Northern Half of the SSFL site

While the Southern half of Area II contains the pictographs and additional 16 sites, the Northern half of SSFL needs additional investigation, including, without limitation:

0188-13

- a. Geography—this areas contains numerous flat areas that would be suitable camp sites;
- b. Areas of food—this areas contains forests and riparian areas that could be utilized in the gathering of food;
- c. Support for ceremonial area in the Southern half of Area II—It is not inconceivable that the Northern half of the SSFL site provided support for the ceremonies in the Southern half of SSFL;

- d. Separate areas for different tribes—if SSFL was an inter-tribal gathering place, then each tribe would have congregated separately in different parts of the site.

11. Subsurface testing is required.

0188-14

Pedestrian surveys are of limited utility and never alone are sufficient when there are known areas of habitation or ceremony. We are informed that NASA has recently completed a Phase I Pedestrian Survey of the site. While such Phase I is an excellent first step, we request additional subsurface archaeological testing for all areas scheduled for any excavation.

If the project is in a region where there are many sites, there may be reason to suspect that buried sites may be present that went undetected during the survey. If the soils profile of the project location shows that heavy erosion has washed away soils then it may explain the absence of cultural resources. However, if the soils profile is depositional then there may be a need to conduct additional subsurface testing, particularly in areas where ground disturbance is planned. In archaeological terminology, this is referred to as “Extended Phase I” testing because it is an intermediate step between Phase 1 (survey), and Phase 2 (controlled excavation to assess the significance of a site). Extended Phase I testing often done by excavating a small pit with a shovel and screening the excavated soil through steel mesh (“shovel test pit” or “STP”). If it is considered to be necessary that a large amount of soil should be examined at deeper levels, then backhoes are sometimes used and informal sampling procedures are often employed while screening the backdirt.

Sometimes the lead agency will argue that archaeological survey is not warranted for a particular project or there may be factors that justify additional investigation even though a Phase I study has been completed with negative results. Following is a list of environmental and cultural factors that should be considered when assessing the overall cultural sensitivity of the SSFL. (Please note that this list is not exhaustive and each factor must be weighted both individually and collectively on a case-by-case basis.)

0188-15

- a. Areas with high viewshed or visibility such as or ridgelines, peaks, ledges, outcrops, benches, or prominent hills; and
- b. Areas with a relatively high density of sites in the vicinity; and
- c. Areas where past ethnographic studies have revealed associated placenames. Keep in mind that placenames do not always refer to places where evidence of past cultural activity exists; and
- d. Areas near known sites. Mapped boundaries of sites most frequently reflect only cultural residue that was visible on the surface when the site was recorded and do not necessarily reflect the actual extent of the site. In addition, loci such as cemeteries or other areas may be adjacent to or nearby but separate from the main habitation; and

- e. Areas near known rock art sites or rocky outcroppings of the type where rock shelters and art have traditionally been located; and
- f. Areas in or near known gathering areas; and
- g. Though all sites are potentially worthy of protection, named, ethnohistorically documented village sites are of the highest priority and therefore warrant the greatest amount of protection possible.

12. Exhaustion of Non-Excavation Methods of remediation.

Figure 2.2-3, p. 2-21, illustrates the Preliminary Remediation Area Types Under the Proposed Action. To the extent feasible, NASA should exhaust all non-excavation methods of remediation before performing any excavation that could potentially impact cultural and historic sites.

0188-16

13. Soil Prior disturbance is NOT Dispositive:

0188-17

The mantra that cultural sites have been disturbed and therefore automatically are not significant is oftentimes incorrect:

- a. Disturbed sites still may contain valuable information. The newer approach is to treat disturbed sites as having the potential to provide information even if they have been disturbed;
- b. Disturbed sites still have spiritual significance;
- c. Disturbance may only be on the surface, while much excavation may continue to depths of up to 20 feet.

14. Need to Analyze Cumulative Impacts to Cultural Resources:

0188-18

The DEIS fails to account for other remediation projects in other areas of SSFL:

- a. Need to add Department of Energy (DOE) cultural sites;
- b. Need to add Boeing cultural sites;
- c. Other areas within SSFL.

15. NEW MITIGATION: Cultural Interpretive Center:

0188-19

- a. Can use existing building;
- b. Preferably near saved historic structure and/or test stand;
- c. Preferably away from CA-VEN-1072;
- d. Need to Reserve maintenance funds.

16. NEW MITIGATION: Native American monitoring during any ground disturbing activities.

0188-20

17. Need to protect CA-VEN-1072 from trespassers and vandals.

0188-21

18. Deferral of Mitigation until Record of Decision (ROD):

- a. It is problematic to defer any mitigation until ROD as it prevents meaningful comment;
- b. Commenter reserve the right to ask for recirculation of the DEIS and EIS for any such deferred mitigation.

19. Use of NEPA EIS instead of NHPA 106—Recent ACHP guidance:

http://www.achp.gov/docs/NEPA_NHPA_Section_106_Handbook_Mar2013.pdf

Substitution under 36 C.F.R. § 800.8(c) permits agencies to use the NEPA review to comply with Section 106 as an alternative to the process set out in 36 C.F.R. §§ 800.3-800.6. The use of a substitution approach allows agencies to use the procedures and documentation required for the preparation of an EA/FONSI or EIS/ROD to comply with the Section 106 procedures. To do so, the agency must notify the ACHP and SHPO/THPO in advance that it intends to do so and meet certain specified standards and documentation requirements as set forth in 36 C.F.R. § 800.8(c)(1).

If, as the result of an objection under 36 C.F.R. § 800.8(c) (2)(ii) or during consultation to resolve adverse effects, disagreement reaches a point where the substitution process is no longer prudent, then agencies may return to the appropriate step in the standard Section 106 process with notification to consulting parties.

20. Need NEPA Mitigation Plan

<http://www.whitehouse.gov/sites/default/files/microsites/ceq/20100218-nepa-mitigation-monitoring-draft-guidance.pdf>

February 18, 2010

MEMORANDUM FOR HEADS OF FEDERAL DEPARTMENTS AND AGENCIES
FROM: NANCY H. SUTLEY, Chair, Council on Environmental Quality
SUBJECT: DRAFT GUIDANCE FOR NEPA MITIGATION AND MONITORING
I. INTRODUCTION

To provide for the performance of mitigation, agencies should create internal processes to ensure that mitigation actions adopted in any NEPA process are documented and that monitoring and appropriate implementation plans are created to ensure that mitigation is carried out. See *Aligning NEPA Processes with Environmental Management Systems* (CEQ 2007) at 4 (discussing the use of environmental management systems to track implementation and monitoring of mitigation). http://ceq.hss.doe.gov/nepa/nepapubs/Aligning_NEPA_Processes_with_Environmental_Management_Systems_2007.pdf (<http://www.slideshare.net/whitehouse/aligning-nepa-processes>). Agency NEPA

implementing procedures should require clearly documenting the commitment to mitigate the measures necessary in the environmental documents prepared during the NEPA process (40 C.F.R. § 1508.10) and in the decision documents such as the Record of Decision. When an agency identifies mitigation in an EIS and commits to implement that mitigation to achieve an environmentally preferable outcome, or commits in an EA to mitigation to support a FONSI and proceeds without preparing an EIS, then the agency should ensure that the mitigation is adopted and implemented.

Methods to ensure implementation should include, as appropriate to the agency's underlying authority for decision-making, appropriate conditions in financial agreements, grants, permits or other approvals, and conditioning funding on implementing the mitigation. To inform performance expectations, mitigation goals should be stated clearly. These should be carefully specified in terms of measurable performance standards to the greatest extent possible. The agency should also identify the duration of the agency action and the mitigation measures in its decision document to ensure that the terms of the mitigation and how it will be implemented are clear.

If funding for implementation of mitigation is not available at the time the decision on the proposed action and mitigation measures is made, then the impact of a lack of funding and resultant environmental effects if the mitigation is not implemented warrant disclosure in the EA or EIS. In cases where, after analyzing the proposed actions with or without the mitigation, the agency determines that mitigation is necessary to support the FONSI or committed to in the ROD, and the necessary funding is not available, the agency may still be able to move forward with the proposed action once the funding does become available. The agencies should ensure that the expertise and professional judgment applied in determining the appropriate mitigation measure is reflected in the administrative record, and when and how those measures will be implemented are analyzed in the EA or EIS.

0188-24

Under NEPA, a federal agency has a continuing duty to gather and evaluate new information relevant to the environmental impact of its actions. See 42 U.S.C. § 4332(2)(A). For agency decisions based on an EIS, the regulations require that, "a monitoring and enforcement program shall be adopted...where applicable for mitigation." 40 C.F.R. §1505.2(c). In addition, the regulations state that agencies may "provide for monitoring to assure that their decisions are carried out and should do so in important cases." 40 C.F.R. §1505.3. Monitoring plans and programs should be described or incorporated by reference in the agency decision documents.

0188-25

21. Incorporation by reference of Memo dated Nov. 29, 2012, "NEPA alternatives analysis for selection of cleanup standards for the Santa Susana Field Laboratory Site."

0188-26

Sincerely,

Vincent P. Armenta,
Tribal Chairman

MITCHELL ENGLANDER

LOS ANGELES CITY COUNCILMEMBER, TWELFTH DISTRICT

August 27, 2013

Allen Elliott,
SSFL Program Director,
NASA
MSFC AS01, Building 4494,
Huntsville, AL 35812

RE: DRAFT EIS FOR REMEDIATION OF GROUNDWATER AND SOIL ON THE NASA-ADMINISTERED PROPERTY AT THE SANTA SUSANA FIELD LABORATORY

Dear Mr. Elliott, *Allen*

As the Los Angeles City Councilmember representing the Twelfth Council District, I represent the West Hills and Chatsworth communities that will be most affected by the truck traffic associated with the proposed clean-up.

While I have long advocated for the full clean-up of the site and the Agreements on Consent between NASA and the DTSC, I feel compelled to express my extreme disappointment at the lack of consideration for other methods of soil and demolition debris removal from the site.

0102-01

The transportation proposal involves 142 truck trips per day for a three-year period. Assuming a 260-day work year, this equates to 36,920 trips per year and nearly 111,000 over the three-year life of the project. These trucks are expected to have vehicle weights of up to 80,000 pounds and will traverse some of the most high-traffic arteries in the area, including Topanga Canyon Boulevard, Roscoe Boulevard, Valley Circle Boulevard and Plummer Street.

The proposed routes are shared by many schools in proximity to the site, and therefore pose additional vehicle emission exposure risk to children who walk or bike to school.

The City of Los Angeles has proposed a \$3 Billion infrastructure improvement project to repair 8,700 miles of failed streets within a ten-year period. Much of this damage to City streets has been caused by the very type of heavy vehicle traffic proposed for this clean-up. The wear and tear to City streets is expected to add to this deterioration and pushing the cost of that repair onto the City taxpayer is unacceptable.

0102-02

I feel compelled to add that it is quite unbelievable that some other option for conveyance of the contaminated material from the site was not studied – other than the truck routes proposed. By your own evaluation, the impacts are significant, negative, regional and long-term. This does not even take into account the concurrent work that will be done on the other SSFL parcels that will result in an unbearable cumulative impact for the area.

0102-03

0102-04

The traffic, environmental impacts and deterioration of City of Los Angeles infrastructure compel another look at alternatives – including some type of conveyance from the site directly to rail. I believe that most residents would prefer this option – even if it lengthens the time-period for the clean-up past the 2017 date.

I appreciate your attention to these comments.

Sincerely,

MITCHELL ENGLANDER,
Los Angeles City Council President Pro Tempore
Councilmember, Twelfth District
