

APPENDIX K

Public Comments on Environmental Impact Statement

This page intentionally left blank.

APPENDIX K

Public Comments on Environmental Impact Statement

The National Aeronautics and Space Administration (NASA) is the federal lead agency for meeting the National Environmental Policy Act (NEPA) requirements to evaluate the impacts to the environment from proposed activities resulting from the cleanup of soil and groundwater and associated demolition of structures on the NASA-administered property at Santa Susana Field Laboratory (SSFL) in Ventura County, California. Environmental review of the proposed project is one element of the federal requirements. NASA has elected to conduct an Environmental Impact Statement (EIS).

Project Scoping

Scoping, as defined in the Council on Environmental Quality (CEQ) Regulations Section 1501.7, is an early step in this NEPA process during which the public, agencies, and interested stakeholders are engaged in defining the scope and range of considerations for the EIS. More specifically, public scoping helps identify the range of activities, alternatives, environmental effects, and measures to be analyzed in depth. NASA seeks to engage the community and one method of doing so is to prepare a Responsiveness Summary regarding comments received during the Scoping Period. This process allows sharing of comments received and explains NASA's general approach and responses to the primary concerns. Public scoping helps NASA prepare a comprehensive and focused EIS by identifying environmental resources and concerns that are important to the community. The scoping does not resolve differences concerning the merits of a project or anticipate the ultimate decision about a proposed project.

The project's public scoping process is to:

- Inform public agencies and interested members of the public about the Proposed Action, including compliance with NEPA and NASA's actions.
- Assist with identifying the range of concerns and project-related issues to be considered in the EIS.
- Assist with identifying mitigation measures, strategies, and approaches to mitigation that might be useful and explored further in the EIS.
- Develop an expanded mailing list of agencies and individuals interested in the future actions relative to the EIS.

A Notice of Intent (NOI) was published in the *Federal Register* on July 6, 2011. The NOI notifies interested agencies, organizations, tribal governments, and individuals of NASA's intent to prepare an EIS to comply with NEPA. A draft EIS then was prepared by NASA to include an evaluation of alternatives to address soil and groundwater cleanup and possible demolition of structures on the federally owned portions of SSFL administered by NASA and known as Area II, and a part of Area I (also referred to as the liquid oxygen [LOX] plant). NASA will use the NEPA process to comply with Section 106 of the National Historic Preservation Act (NHPA). Section 106 defines the process for consultation with Native Americans, the California State Historic Preservation Office (SHPO), the Advisory Council on Historic Preservation (ACHP), and other consulting parties regarding federally owned historic properties and cultural sites where an action is proposed by the federal government.

The NOI initiated a public comment-scoping period that began on July 8 and ended on September 19, 2011. During that period, NASA hosted a series of public scoping meetings:

- August 16, 2011: Chatsworth Hotel, 9777 Topanga Canyon Road, Chatsworth, CA 91311
- August 17, 2011: Grand Vista Simi Valley, 999 Enchanted Way, Simi Valley, CA 93065
- August 18, 2011: Corporate Pointe at West Hills, 8413 Fallbrook Ave, West Hills, CA 91304

(Note: NASA also hosted an informational meeting on March 27, 2012, in Chatsworth California, outside both the scoping period and the public comment period on the draft EIS [DEIS]. The purpose of the information meeting was to provide project updates during the project planning process. The public was notified of the meeting date via e-mail on January 11, 2012, and during the week on March 15, 2012. The meeting date and information were posted to NASA's website on February 7 and to Twitter on February 8, 2012. Reminders were e-mailed to the SSFL Program distribution list on February 15 and March 15, 2012.)

In addition to the NOI publication, NASA advertised these meetings and provided project updates in the following ways:

1. Published an article in the NASA *FieldNOTES* newsletter, distributed by United States (U.S.) mail to more than 60,000 local residences, as well as to interested parties. The newsletter article discussed the kickoff of the NEPA process.
2. Distributed by e-mail on July 6, 2011, a notice to the more than 600 e-mail addresses on the SSFL Program distribution list announcing the public scoping meetings.
3. Published newspaper advertisements on August 5, 2011, in English in the *Ventura County Star*, the *Los Angeles Daily News*, and the *Simi Valley Acorn*, and in Spanish (August 7, 2011) in *La Opinion*.
4. Distributed a "reminder" e-mail on August 12, 2011, to the SSFL Program distribution list regarding the then-upcoming public scoping meetings.
5. Tweeted notice (February 15, 2011) of the scoping meetings by NASA's Environmental Communications Twitter account (@NASAEnvComm <http://twitter.com/nasaenvcomm>).
6. Posted the public notice and other project updates pertaining to the NEPA and Section 106 planning processes on the project website: <http://ssfl.msfc.nasa.gov/environmental-cleanup/environmental-impact-statement/>.
7. Identified mechanisms and contact information for public submission to NASA of comments and questions.

NASA contacted Native American tribes by direct mail and invited them to the scoping meetings.

NASA prepared a fact sheet summarizing the project description, initial alternatives, and contact information for the scoping meeting. The NOI, meeting materials, and publications complied with Section 508 of the federal Rehabilitation Act so that the information on the NASA web page was accessible and available to people with disabilities.

NASA accepted written and verbal submittals of comments from public scoping meetings and throughout the 74-day scoping period (July 8 through September 19, 2011). During the public meetings hosted August 16 through August 18, 2011, 55 oral submittals were transcribed by a court reporter. Also, 231 submittals from agencies, organizations, and individuals were received by e-mail, U.S. postage, or hand delivery at the meetings. Because many submittals contained multiple comments in each submittal, about 756 individual comments were identified.

Following is a summary of comment submittal totals (some individuals spoke multiple times or submitted multiple e-mails—each is counted separately in the following):

- Oral submittals at public meetings 55
- Written submittals during meetings 3
- Written submittals after meetings (e-mail) 228
- Total Submittals Received 286

(These totals do not include letters and e-mails submitted to NASA following the end of the Scoping Comment period.)

Most submittals included one or more similar themes and naturally fell into groupings of like topics:

- Complete cleanup to background in accordance with standards in the December 2010 Administrative Order on Consent (AOC) signed between NASA and the California Department of Toxic Substances Control (DTSC).
- Support a balanced cleanup that considers the resources and future use of the site.
- Limit the alternatives evaluated in the EIS to only cleanup to the background agreed to in the AOC.
- Support a comprehensive EIS evaluation and range of alternatives for better decision-making and to evaluate the benefits of a cleanup to background versus another alternative.
- Preserve the valuable natural, historical, and cultural resources at SSFL.
- Coordinate better with DTSC and other responsible parties.
- Address transportation routes and effects of potentially increased traffic.
- Oppose the AOC in general and its requirements for cleanup to background.
- Consider future use of the site and understand General Service Administration's (GSA's) plans.
- Investigate offsite contamination and related health effects.
- Investigate and study groundwater contamination.
- Understand more about how the future Look-Up Tables (and future cleanup standard) will be developed.
- Consider multiple cleanup technologies for inclusion in the EIS.
- Take into account radiological contaminants and include them in the disposal of soil.

Individual comments were then placed in the categories described previously. Some comments included a variety of themes, so a single commenter's comments might have been placed in multiple categories. A few comments did not relate to any of these themes and were categorized as "miscellaneous." Of the approximately 756 separate comments identified in the scoping meeting comments (including public meeting comments, e-mails, and letters received) the percentage of comments in each category was as follows:

- Comply with AOC and Cleanup to Background—37 percent
- Limit Alternatives Evaluated in the EIS—34 percent
- Preserve Natural, Historical, and Cultural Resources—9 percent
- General Comments Regarding Contaminants and Health Effects—4 percent
- Multiple Cleanup Technologies Should Be Considered—3 percent
- Opposition to AOC and Cleanup to Background—2 percent
- Support a Balanced Cleanup—2 percent
- Concerns About Future Use of Site—2 percent
- Support Comprehensive EIS Evaluation—1 percent
- Groundwater Investigation and Studies—1 percent
- Development of Look-up Tables (Cleanup Standard)—1 percent
- Radiological Contaminants and Disposal of Soil—1 percent
- Coordinate Better with DTSC and Other Responsible Parties—1 percent
- Transportation Routes—1 percent

This document is NASA's response to those comments. The comments have been consolidated into the categories discussed previously with examples of the comment language followed by NASA's response.

Summary of Scoping Comments and Responses

Comment Category: Comply with AOC and Cleanup to Background

Synopsis of Comments:

Many comments urged NASA to comply with the AOC. An example comment is, “I strongly urge NASA to comply rigorously with the agreement to clean up the site to background.” Another example is “...you [NASA] are bound by the agreement to clean up to background level! Period! Stop dragging your feet. Get on with the cleanup!” Others questioned whether NASA was trying to select a cleanup standard different from the AOC, for example: “Its [NASA’s] recent NOI was so poorly crafted that significant confusion has resulted in the community as to whether NASA was trying to break out of the AOC requirement to cleanup to background.”

NASA’s Response:

NASA’s August 8, 2011, letter to DTSC reiterated NASA’s commitment to the AOC and cleanup of the federally owned portion of SSFL. NEPA is a statutory requirement (42 United States Code [U.S.C.] 4321 *et seq.*) and, as such, is reflected as a requirement of the AOC. The AOC obligates NASA to make specific decisions about how to conduct a cleanup to background in accordance with NEPA. As a result, the implementation of NEPA is consistent with the requirements of the AOC. In NASA’s EIS, the Proposed Action is the cleanup to background levels as agreed to in the AOC. NEPA requires NASA to evaluate a range of alternatives. For the Proposed Action, NASA considered a range of remedial technologies to address how to best meet the cleanup goal. The EIS considers the potential effects of the range of technical options related to the Proposed Action. Completing the NEPA process will provide NASA with the necessary information to make an informed decision regarding how best to conduct a cleanup to background in accordance with the AOC, thereby avoiding or mitigating potential unintended environmental consequences.

With regard to NEPA, the AOC specifically requires the following:

4.0. ENVIRONMENTAL REVIEW PROCESSES

4.2. National Environmental Policy Act (NEPA).

4.2.1. NASA shall make its specific decisions on how to conduct the cleanup to background defined in this Agreement in accordance with the requirements of the National Environmental Policy Act of 1969 (NEPA), as amended (42 U.S.C. 4321 et seq.).

4.2.2. DTSC shall cooperate with and provide necessary information for NASA to conduct NEPA.

4.2.3. NASA shall conduct all activities under this Order in a way that will promptly comply with the requirements of NEPA. DTSC shall not approve these activities prior to complying with the requirements of CEQA.

By following the NEPA process, NASA complies with its statutory requirements (42 U.S.C. 4321 *et seq.*) and Section 4.0 of the AOC. NASA continues to work expeditiously with DTSC and the public to complete the actions called for in the AOC.

Comment Category: Limit Alternatives Evaluated in the EIS

Synopsis of Comments:

There were a number of mostly identical comments requesting limiting the alternatives evaluated in the EIS. Example comments include: “The scope of the alternatives that NASA is proposing to evaluate in its EIS must be modified because all but one of the current alternatives are inconsistent with the AOC.” Or “NASA should limit the scope of review to what is required in the cleanup agreement--how to implement the cleanup to background—rather than considering whether to abrogate it by using less protective standards.” Or “We recommend that NASA narrow the scope of its environmental analysis to the decisions about which it has discretion and which do not violate the AOC...”

NASA's Response:

NASA is committed to cleaning up its portion of SSFL in accordance with the AOC. NEPA provides the opportunity for public disclosure of the impacts of cleanup alternatives. Federal regulations promulgated by the CEQ as part of Executive Order (EO) 11991 require federal agencies to evaluate all reasonable alternatives or a range of reasonable alternatives in enough detail so that a reader can compare and contrast the environmental effects of the various alternatives. As directed by CEQ, Sec. 1502.14, the EIS shall "... (c) Include reasonable alternatives not within the jurisdiction of the lead agency[;] (d) Include the alternative of no action; [and] (e) Identify the agency's preferred alternative or alternatives, if one or more exists, in the draft statement and identify such alternative in the final statement unless another law prohibits the expression of such a preference." Reasonable alternatives include those that are practical or feasible from a technical and economic standpoint and use common sense, rather than alternatives that simply are desirable from the standpoint of the applicant. The identification and evaluation of alternative ways to meet the purpose and need of the Proposed Action is the heart of the NEPA analysis. Consequently, NASA has identified several alternative technologies that are being considered to meet the requirements of the AOC. The impacts of this range of technical options is evaluated in enough detail so that the public can compare and contrast the environmental effects of the various methods of achieving soil and groundwater cleanup. Additionally, the CEQ regulations require analysis of a no action alternative. This analysis provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives. It is also an example of an alternative that must be analyzed that is outside the jurisdiction of the agency.

In June 2012, NASA received correspondence from the White House CEQ that stated:

In view of NASA's administrative cleanup resolution with the State of California, which turns upon NASA's commitment to clean the site to background, CEQ's view is that – under this rule of reason - NASA is not compelled to consider less comprehensive cleanup measures as alternatives.

NASA issued the following statement:

We received comments from Senator Boxer and the Council on Environmental Quality regarding the evaluation of alternatives for the preparation of our Environmental Impact Statement. As a result, NASA has chosen to streamline its review in the Draft Environmental Impact Statement (DEIS) and analyze only the alternatives of (a) cleanup to background and (b) the no-action alternative.

NASA's decision was published on NASA's website at <http://ssfl.msfc.nasa.gov/environmental-cleanup/environmental-impact-statement/>. Afterward, the Agency received several letters from interested parties including the San Fernando Valley Audubon Society, Santa Susana Mountain Park Association, National Park Service, California State Historic Preservation office, and private individuals requesting NASA to reconsider its decision to limit alternatives. Included among the letters was a legal memorandum prepared for the Santa Ynez Band of Chumash Indians that questions the legality of limiting the scope of an EIS to only the Proposed Action and the No Action Alternative. NASA considers the NEPA process essential to enabling the public to be fully informed of the environmental cleanup process alternatives. Engaging in this process affords NASA critical knowledge on which to make informed decisions relative to the SSFL cleanup, thereby avoiding potential unintended environmental consequences. NASA's decisions regarding how to best conduct a cleanup in accordance with the AOC will be made after NASA completes the NEPA process.

Comment Category: Preserve Natural, Historic, and Cultural Resources**Synopsis of Comments:**

There were many comments urging NASA to protect natural and cultural resources at the site. Example comments are, *"As much as possible, before, during and after the SSFL cleanup operations, the natural, cultural, historical, and archaeological treasures must be protected and preserved to be enjoyed by present*

and future generations[.]” and “I strongly urge preservation of these elements (test stands and rock art) of the Santa Susana Field Laboratory and their eventual incorporation into an environment that permits controlled and informed public access.”

NASA’s Response:

NASA is considering the potential effects of project alternatives and related actions on natural, cultural, and historic resources. As part of NASA’s implementation of the National Historic Preservation Act (NHPA) Section 106 Consultation, NASA is consulting with the appropriate regulatory agencies and other consulting parties to identify the potential effects of each alternative on historic properties and cultural and natural resources. Following the scoping meetings, NASA created a portion of its web page to facilitate the public’s application for a request to be a “Section 106” consulting party (http://ssfl.msfc.nasa.gov/environmental-cleanup/environmental-impact-statement/nhpa_section_106.aspx). The consulting parties will discuss potential mitigation for several cleanup options. The EIS will analyze the potential effects of the Proposed Action on resources and the Record of Decision will include appropriate mitigation measures that might offset these impacts. Public input regarding these effects and related mitigation measures (included in the DEIS) will be considered. NASA is in consultation, under Section 7 of the Endangered Species Act, with the U.S. Fish and Wildlife Service (USFWS). NASA submitted a draft Biological Assessment and received comments from the USFWS. A revised Biological Assessment was then submitted to the USFWS and will be followed by the issuance of a Biological Opinion by the USFWS.

Comment Category: General Comments Regarding Contaminants and Health Effects

Synopsis of Comments:

A number of comments regarded protecting public health, investigating contamination in nearby water bodies, addressing contaminant migration, addressing offsite health impacts, and monitoring the environment until the cleanup is completed. An example comment is, “...*offsite testing might be the thing that gets people to calm down once they realize there is nothing out here, or maybe there is something and they do have a reasonable argument.*” One commenter noted that “[t]he EIS should address the migration of contaminants off the site...,” while another commenter asked that the scope of the EIS include “...*an epidemiological study of the illnesses of residents in the area*” and a “[s]tudy of surface water risks in all directions from the site.”

NASA’s Response:

NASA has based its proposed remediation area on previous and ongoing soil site characterization studies. Some contamination extends off the NASA-administered property, but is located within the SSFL facility. NASA’s EIS evaluates the potential environmental effects (such as air quality, impacts to critical resources, and greenhouse gas emissions) of NASA’s proposed demolition and environmental cleanup actions on SSFL. The EIS considers direct and indirect effects of these actions and will develop mitigations (if needed) to offset these impacts. The scope of the EIS analysis will not include an offsite health study, a study of the effects of contamination, or offsite sampling. Sampling of contaminated media (such as soil) extends from the source outward (and even offsite, if needed) to identify the location and extent of the contaminated media. This is part of the data gathering included in the current Field Sampling Plans.

Comment Category: Multiple Cleanup Technologies Should be Considered

Synopsis of Comments:

Several commenters suggested technologies for consideration and supported looking at many alternatives. One said, “*I also think, as I said before, that all potential remediation activities must be considered at all sites, including encapsulation or storage on site.*”

NASA’s Response:

NASA is considering a range of remedial action alternatives to compare impacts from various cleanup actions. The EIS considers the effects of each cleanup option (such as, excavation, ex situ treatments, and soil vapor

extraction) on items such as native vegetation, air quality, truck traffic, noise, wildlife, and cultural resources at SSFL.

For soil, a focus was placed on identifying technologies that have the potential to successfully destroy or degrade the contaminants of concern (COCs), which are identified as “treatable COCs.” The treatable COCs include polycyclic aromatic hydrocarbons (PAHs), semivolatile organic compounds (SVOCs), total petroleum hydrocarbons (TPHs), and volatile organic compounds (VOCs). In comparison, non-treatable COCs in soil cannot readily be destroyed or degraded and will require excavation and offsite disposal. Non-treatable COCs include dioxins, polychlorinated biphenyls (PCBs), metals, pesticides, and energetics.

For this DEIS analysis, more than 40 technologies initially were considered. In view of the restrictions in the AOC for remedial action, geologic setting, site-specific COCs, effects on specific habitat, and other site-specific components (available power, site access, size of site, and extent of contamination), six technologies met the evaluation criteria, and thus were considered most promising for pilot test implementation. They are Land Farming, Bio Venting, Chemical Oxidation, Thermal Desorption, Soil Vapor Extraction, and Soil Washing. In some cases, complementary technologies were combined with other candidate alternatives for evaluation.

Comment Category: Opposition to AOC and the Cleanup to Background

Synopsis of Comments:

Some comments opposed the AOC and a cleanup to background. An example comment noted that “...changes to the AOC may be necessary.” One commenter noted that the AOC provides “...no room for balancing, no reason” and another commenter added that the site should “...remain recreation and that the soil not be too disturbed.” Another comment was that risk assessments should be considered for determining cleanup levels.

NASA’s Response:

NASA notes the opposition from these commenters for following the AOC and cleaning up to background.

Comment Category: Support a Balanced Cleanup

Synopsis of Comments:

There were several comments seeking a balanced cleanup approach that considers the preservation of historic, cultural, and natural resources. Most of these said that the protection of public safety was most important. Example comments include, “I want to protect the cultural, the historic, and archeological [resources], but I want to do it in a safe manner” and “Other analysis should be performed so as to articulate the value of existing land use entitlements, infrastructure, site work, and facilities that could be put to use for a variety of functions to accommodate economic development and job growth.”

NASA’s Response:

NASA considered the potential effects of the Proposed Action on cultural, historic, prehistoric, and archaeological (Native American) resources. NASA is consulting with the appropriate regulatory agencies to identify the potential effects of the Proposed Action on historic properties and cultural, archaeological, and natural resources. Section 106 of the NHPA requires federal agencies to consider the potential effects of their proposed actions on historic properties. (Section 106 refers to such actions as “undertakings”). The Section 106 process seeks to incorporate historic and cultural values into project planning through consultation among the federal and state agencies, and other parties with an interest in the effects of an undertaking on historic properties. The various consulting parties are working together to discuss options provide multiple viewpoints, and strive to seek common agreement regarding the incorporation of historic preservation values into the project.

The protection of public health and safety would take priority over protection of the historic and cultural sites. Moreover, the EIS considers preservation of resources in areas that do not require remedial action or where remediation goals are possible without the removal of structures, including the historic test stands.

A decision about future land use of the site is not within NASA's purview nor part of NASA's EIS. As required by NEPA, the EIS considers a Proposed Action (consisting of demolition and several technical options for soil and groundwater cleanup) along with the No Action Alternative. Any decision about the future land use will be made as part of the disposition process through the GSA. GSA will be conducting a separate NEPA review to address the potential impacts of transferring the property out of federal ownership. NASA notes that cleaning up its portion of SSFL to background in accordance with the AOC will ensure that any option for future use of the property will not be impeded by remaining soil contamination.

Comment Category: Concerns About Future Use of Site

Synopsis of Comments:

Some comments requested that the cleanup be based on future use and that the future use be open space. A related comment also expressed concern about GSA's plans for the site.

NASA's Response:

A decision about future land use is not within NASA's purview nor part of NASA's EIS. As required by NEPA, the EIS considers several cleanup and demolition options within the Proposed Action cleanup to background and the No Action Alternative. Any decision about future land use will be made as part of the disposition process conducted by the GSA. The GSA will be undertaking a separate NEPA review to address the potential impacts of transferring the property out of federal ownership. NASA notes, however, that cleaning up its portion of SSFL to background in accordance with the AOC will ensure that any option for future use of the property will not be impeded by remaining soil contamination.

Comment Category: Support Comprehensive EIS Evaluation

Synopsis of Comments:

There were several comments offering support of the scope of the EIS review. Example comments are, "...the EIS is going to be very important because it's going to give us a true basis of something ..."; "...the information contained in this EIS is important..."; and "I fully endorse your approach, NASA's approach, to the EIS."

NASA's Response:

NASA notes that these commenters and subsequent letters support a comprehensive EIS that includes the alternatives originally proposed during the scoping period. However, the use of the range of alternatives proposed prior to the Scoping Comment period was altered following the comment period. On July 18, 2012, NASA published the following on its website: "We received comments from Senator Boxer and the Council on Environmental Quality regarding the evaluation of alternatives for the preparation of our Environmental Impact Statement. As a result, NASA has chosen to streamline its review in the Draft Environmental Impact Statement (DEIS) and analyze only the alternatives of (a) cleanup to background and (b) the no-action alternative."

Comment Category: Miscellaneous

Synopsis of Comments:

There were comments noting that the public did not understand the NEPA process.

NASA's Response:

At the scoping meetings NASA provided handouts, made formal presentations and discussed the NEPA process at individual posters staffed by our NEPA experts.

The link to NASA's presentations is

http://ssfl.msfc.nasa.gov/documents/presentations/NASA_EIS_Scoping_Meeting_20110816.aspx.

The link to the fact sheet describing the EIS process for the specific Proposed Action is

http://ssfl.msfc.nasa.gov/documents/factsheets/NASA_EIS_SSFL_Factsheet_2011-08-25.pdf.

NASA also provided a link to CEQ's publication, "A Citizen's Guide to the NEPA" at http://ceq.hss.doe.gov/nepa/Citizens_Guide_Dec07.pdf.

Information about the NEPA process is also available on the web at <http://www.epa.gov/compliance/basics/nepa.html>.

NASA continued to provide explanatory material and opportunities for feedback from the public, including an opportunity for public discussion of NASA's NEPA process at a community meeting on March 27, 2012.

Synopsis of Comments:

There were comments asking that non-expert members be involved in historic and cultural consultations.

NASA's Response:

Interested members of the public were notified of the opportunity to join as a Section 106 consultation party. The process for application was noted at the Scoping public comment meetings and via e-mail to the SSFL Project e-mail distribution list (October 4, 2011), as well as in response to individual requests to become a consultation party.

Synopsis of Comments:

There were comments requesting that impacts on paleontology, transportation, and groundwater be included.

NASA's Response:

NASA considered in its EIS the potential effects of a range of technology options and potential impacts on natural (e.g., paleontology), ecological, cultural, social (e.g., transportation), and environmental (e.g., groundwater) resources at SSFL. The EIS provides a comparative analysis of the anticipated effects of the cleanup activities.

Synopsis of Comments:

There were comments about wanting a security fence.

NASA's Response:

NASA recently implemented a number of security measures. NASA considers additional measures such as a security fence as part of the site investigation and oversight activities. The need for and a decision about a fence is outside the scope of the EIS.

Comment Category: Groundwater Investigation and Studies

Synopsis of Comments:

Some comments were related to studying groundwater contamination. An example comment is, "...how the groundwater problem in this area will be handled." One commenter asked that the scope of the EIS include a "Study of groundwater contaminants in wells all over the valley."

NASA's Response:

NASA has based its proposed groundwater remediation area on previous and ongoing groundwater site characterization studies. Some contamination extends off the NASA administered property, but is located within the SSFL property. NASA's EIS evaluates the potential environmental effects (such as air quality, impacts to critical resources, and greenhouse gas emissions) of NASA's proposed demolition and environmental cleanup actions on SSFL. The EIS considers direct and indirect effects of these actions and will develop mitigations (if needed) to offset these impacts. The scope of the EIS analysis will not include offsite groundwater sampling.

Comment Category: Development of Look-up Tables (Cleanup Standard)

Synopsis of Comments:

A few comments were related to understanding how the Look-Up Tables will be developed. There was concern about not having reasonableness included in the development of the tables and the incorrect use of method detection limits (MDLs) and reporting limits (RLs) in the process. An example comment is, *"I look forward to discussing these issues when DTSV [sic] starts its lookup table public deliberations. It has been said that there are ways to deal with these issues, other than to create a moonscape, and I hope to see them early in the lookup table process."*

NASA's Response:

DTSC posted the AOC Look-Up Tables (LUTs) on June 11, 2013, and final decisions on the LUT values are DTSC's to make.

Comment Category: Radiological Contaminants and Disposal of Soil

Synopsis of Comments:

There were a few comments expressing concerns about radiological contamination and the disposal of any soils containing radioactive wastes. These comments were, *"...tests for radiation should include all types of radiation which came from the site."* and *"[a]ll health impacts from the contamination that occurred and remains, should be a part of the study."*

NASA's Response:

NASA conducted no radiological activities at SSFL, but recognizes the possibility that activities in other parts of SSFL could have resulted in the deposition of radionuclides on NASA's portion of SSFL. U.S. Environmental Protection Agency (EPA) undertook a study to characterize radionuclides on Area IV (the area historically leased by the U.S. Department of Energy [DOE]) and completed the study in December 2012. The Area IV radiological reports present only the data and do not provide interpretation of the data. The surface and subsurface soils in Area IV do not appear to have contamination that might have migrated across Area III into Area II and Area I, with one exception—the drainages from Area IV to Area III. The following potential concerns were identified:

- Two areas of elevated (meaning exceeded draft DTSC LUT values) radiological concentrations are isolated to the Area IV and Area III boundary, but it is unknown if the elevated contamination would affect NASA-administered property.
- Drainages crossing into Area III and leading to and from the Silvernale Pond also have elevated radiological concentrations and there is a potential that this drainage might affect the NASA-administered property.

In addition to EPA's radiological survey, NASA reviewed historical documents and data associated with activities on the NASA-administered portion of SSFL. This historical information will be used to inform the AOC Field Sampling Plans currently being developed. Radiological sampling will be performed on all building being demolished and on all soils being transported offsite for disposal. Appropriate facilities will be chosen in accordance with applicable laws and regulations and the 2010 AOC.

Comment Category: Coordinate Better with DTSC and Other Responsible Parties

Synopsis of Comments:

Many comments had multiple subjects covered in the same submission. One of those topics was a desire that NASA and DTSC coordinate more effectively. An example comment is *"NASA's coordination of its NEPA activities must be better coordinated with similar activities DTSC must conduct under the California Environmental Quality Act (CEQA)."*

NASA's Response:

NASA continues to work closely with DTSC and the public to complete the actions called for in the AOC, including the EIS. The NASA EIS is expected to be completed prior to DTSC's Environmental Impact Report (EIR) and will become a source of information for the EIR. In addition, NASA briefs DTSC both in written form and verbally at meetings as to the status of the EIS and provides advanced copies of materials prior to public release. NASA's EIS will look at the potential impacts from the federal (NASA) actions contemplated at the site, while DTSC's EIR will look at all proposed actions, both federal and private party. NASA's EIS includes an analysis of cumulative impacts that incorporates activities planned by DOE and Boeing at SSFL.

The California Environmental Quality Act (CEQA) requires environmental review of all projects that require discretionary approval by a non-federal government agency. CEQA compliance is DTSC's responsibility. NASA will provide DTSC with information from NASA's EIS for DTSC's EIR, including backup data such as the surveys that informed NASA's analysis.

Comment Category: Transportation Routes**Synopsis of Comments:**

Some comments identified concerns about the volume of wastes to be transported offsite and the routes through the communities. These comments had a wide variety of themes such as: 1) provide information on the number of trucks required to travel to and from the site daily and the hours of operation; 2) provide information on how many total truck loads will be needed; 3) provide transportation routes; 4) consider constructing a dedicated new road for trucks, and 5) greenhouse gas emissions from truck traffic.

NASA's Response:

One of the technologies considered is soil excavation and offsite disposal. The EIS considers several landfill and disposal facilities and includes an evaluation of the potential traffic, roadway, noise, and air quality effects (including greenhouse gas emissions) of using these routes. As part of the NEPA process and in accordance with Executive Order (EO) 12898, *Federal Actions to Address Environmental Justice in Minority and Low-Income Populations*, the EIS considers the potential for disproportionate impacts, including health concerns to minority and low-income populations. Building an additional road was considered.

Actions NASA Took based on Scoping Comments

During the 74-day scoping period NASA received 286 separate comment submittals. The public comments were essential to guiding NASA's approach for the DEIS. Following the close of the comment period, NASA refined the definition of the Proposed Action, streamlined the alternatives to be reviewed, and initiated the environmental analysis. Matters raised during the scoping period and in early consultation were considered in the analysis and are reflected in the Draft EIS.

On the basis of other specific requests, NASA also made the following changes to the planning process:

- Contracted a Native American monitor to accompany the field archaeologists during an archaeological survey completed in October 2011.
- Included a California red-legged frog habitat survey and looked for bryophytes and invertebrates along the rock outcrops (where feasible) during the wetlands delineation.
- Analyzed soil conditions around the offsite Braunton's milkvetch (*Astragalus brauntonii*) to assess whether common conditions occur on the NASA-administered property.
- Encouraged applications from community members and groups to participate as NHPA Section 106 consulting parties.
- Considered additional remedial technology options based on specific public request (for example, storage and encapsulation and monitored natural attenuation).
- Considered roadway repairs and a new access route.

- Incorporated information from the DOE's quantitative study of existing noise and traffic conditions.
- Hosted an informational meeting in March 2012 to provide an additional opportunity to share initial findings with the public and to collect additional feedback prior to completion of the DEIS.
- Coordinated with Boeing and the DOE regarding related activities that might affect parallel planning processes and coordinated with DTSC to keep the agency informed of NASA's approach and findings.

Draft Environmental Impact Statement

Following the scoping period, NASA prepared a DEIS to include an evaluation of alternatives to address soil and groundwater cleanup and demolition of structures on the federally owned portions of SSFL administered by NASA, known as Area II and a part of Area I. NASA used the NEPA process to comply with Section 106 of NHPA, in accordance with NHPA regulations. The DEIS was noticed and circulated according to CEQ Regulations Sections 1506.6 and 1502.19. The public, agencies, and interested stakeholders were given the opportunity to review and comment on the DEIS according to Section 1503.

A Notice of Availability (NOA) was published in the *Federal Register* on August 2, 2013. The NOA initiated a public comment period for the DEIS that began on August 2 and initially was set to end on September 16, 2013. In response to requests by several members of the public, NASA extended the public comment period for an additional 15 days to October 1, 2013.

During the public comment period, NASA hosted two public meetings:

- August 27, 2013: Corporate Pointe at West Hills, 8413 Fallbrook Ave, West Hills, CA 91304
- August 28, 2013: Corporate Pointe at West Hills, 8413 Fallbrook Ave, West Hills, CA 91304

NASA circulated the DEIS for review in the following ways:

- Posted on NASA's website at <http://www.nasa.gov/agency/nepa/news/SSFL.html> for public review on August 2, 2013.
- Provided hardcopies to the following repositories:
 - Simi Valley Library, 2969 Tapo Canyon Road, Simi Valley, CA
 - Platt Library, 23600 Victory Blvd., Woodland Hills, CA
 - California State University, Northridge Oviatt Library, 18111 Nordoff Street, 2nd Floor, Room 265, Northridge, CA
 - Department of Toxic Substances Control, 9211 Oakdale Avenue, Chatsworth, CA
- Distributed a limited number of hardcopies of the DEIS to elected officials; federal, state, and local agencies; tribes; organizations and companies; and individuals who requested them.

In addition to the NOA publication, NASA advertised these meetings and provided project updates in the following ways:

- Distributed a notice via e-mail on August 2, 2013, to more than 600 e-mail addresses on the SSFL Program distribution list announcing the NOA of the DEIS in the *Federal Register*.
- Published newspaper advertisements on August 22, 2013, in English in the *Ventura County Star*, the *Los Angeles Daily News*, and the *Simi Valley Acorn*, and in Spanish in *La Opinion*.
- Provided an update to NASA's EIS environmental review, consultation process, and other SSFL activities in the *2012 Year In Review* and the *2013 Year In Review* (NASA, not dated [n.d.]), which were distributed at public meetings, to attendees of tours, and to the NASA SSFL e-list and, posted on the SSFL website.
- Tweeted notice on August 5, 2013, by NASA's Environmental Communications Twitter page (<http://twitter.com/nasaenvcomm>) announcing availability of the DEIS.

- Tweeted notice on August 20, 2013, by NASA’s Environmental Communications Twitter page (<http://twitter.com/nasaenvcomm>) informing the public of the 15-day extended review period.
- On August 20, 2013, distributed an e-mail notice to more than 600 e-mail addresses on the SSFL Program distribution list. The e-mail informed the public of the 15-day extended review period.
- Hosted public meetings on August 27 and 28, 2013, to present the DEIS and provide the public with an opportunity to comment on the DEIS. Verbal comments were captured in meeting transcripts.
- September 11, 2013, published notice in the *Federal Register* advising the public that the comment period would be extended by 15 days to October 1, 2013.

NASA accepted written and verbal submittals of comments from public meetings and throughout the 65-day comment period (August 2 through October 1, 2013). During the public meetings hosted August 27 and August 28, 2013, oral comments were transcribed by a court reporter. Also, submittals from agencies, organizations, and individuals were received by e-mail, U.S. postal service, or hand delivery at the meetings. Approximately 4,160 individual comments were received.

Public comments on the DEIS and NASA’s responses to the comments are included in the following table. All comments on the DEIS, including those provided at public meetings, letters, and e-mails, are available at <http://foia.msfc.nasa.gov/docs/SSFL/index.html>.

Public Comments on the Draft Environmental Impact Statement

NASA published its request for comments on the DEIS on August 2, 2013, with a 45-day deadline to submit comments as required by NEPA. At the request of the public, NASA added an additional 15 days to the public review period for a 60-day deadline to review the DEIS. Because of the government shutdown that occurred on day 60 of the public comment period, NASA accepted any comments received during this time up through October 17, 2013. NASA received 2,185 individual submittals of comments on the DEIS, which contained 4,164 separate comments. In general, comments could be classified into two groups. The first group is those that support the AOC and urged NASA to move forward with the cleanup. The second group is those who either did not support the AOC and support health risk-based cleanup, or who wanted to ensure that in carrying out cleanup to meet the AOC, the impacts to the community and the environment are minimized or avoided.

NASA reviewed each comment and has provided responses to the individual comments in the following table. The table document identifies the person who submitted the comment, the comment as it was extracted from the submittal, and NASA’s response to the comment. Some responses refer to specific sections in the EIS where answers can be found to the comments or questions, some indicate that information was added or updated to reflect the comment, others were comments on topics that were outside the scope of the EIS, some responses answer questions or comments directly, and some simply acknowledge the statement made in the comment. Copies of individuals’ comments are located on the NASA Freedom of Information Act website at (<http://foia.msfc.nasa.gov/docs/SSFL/index.html>).

Specifically, 2,622 of the comments were similar form letters or similar in content and supported NASA’s commitment to the AOC. Some stated that they “were pleased that the AOC provides sufficient protection for endangered species and Native American artifacts,” referring to the exceptions clauses of the Agreement in Principle attached to the AOC. Others voiced concerns that the way NASA presented the impacts was distracting for the overall AOC goal.

Of the remaining comments (1,542), at least 30 comments focused on the 2017 deadline as being “artificial” or a concern that is influencing the way the cleanup can be achieved. More than 140 were concerned about biological resources and another 95 focused on transportation issues (such as the number of trucks driving through communities). In the mix were comments about the future use of the site, which is not covered by this EIS. More than 350 comments were concerned with the limited alternatives considered in the EIS. A little more than 430 comments expressed concerns regarding cultural resources or historic properties. Additionally, a number of the comments about cultural resources indicated that more archeological surveys should be conducted. Some

commenters mentioned that the EIS was premature, because NASA still has to complete its final soil and groundwater field sampling and treatability feasibility studies it is conducting with DOE and Boeing. Some also recommended that the EIS should be deferred to accommodate DTSC's California Environmental Quality Act process.

Agency Comments on the Draft Environmental Impact Statement

Comments were received by multiple federal, state, and local agencies, including the U.S. Department of the Interior (DOI), EPA, Advisory Council on Historic Preservation, California Office of Historic Preservation, and California Department of Fish and Wildlife; and the Santa Ynez Band of Chumash Indians and other federally recognized tribes. A few of the agency comments are summarized in the following paragraphs.

EPA provided a letter with several concerns regarding the information provided in the EIS. EPA rated the DEIS as Environmental Concerns – Insufficient Information (EC-2), recommending that NASA offer a specific preferred treatment option for soil removal and groundwater cleanup. Their letter also noted that, "If NASA determines that any part of the federal land is a Sacred Site or Traditional Cultural Property, we also encourage you work proactively with California Department of Toxic Substance Control and tribal representatives to mitigate project impacts."

DOI comments focused on concerns regarding the proposed action on historic structures, archeological sites, and important wildlife linkages.

The letter from the Santa Ynez Tribe noted concerns about "significant unmitigated impacts to Sacred Sites and cultural resources" including "avoidance of adverse physical effects in accordance with E.O. 13007." The Santa Ynez also requested additional investigations, including "subsurface archeological testing in areas scheduled for any excavation." Their submission noted that, "To the extent feasible, NASA should exhaust all nonexcavation methods of remediation before performing any excavation that could potentially impact cultural and historic sites." The letter also requested that the entire southern half of NASA's Area II be protected, including the removal of the Coca Historic District and test stands. Included in their requests for consideration of new mitigation was a Cultural Interpretive Center.

The Ventura County Air Pollution Control District provided input regarding proposed use of equipment and trucks that would cause emissions, noting that air monitoring programs and permits might be required for certain remediation technologies.

The County of Ventura Resource Management Agency (VCRMA) provided guidance regarding the diversion of uncontaminated waste from waste streams for recycling, roads, and concern for evaluation of impacts on biological resources and native soils. The comments from VCRMA mentioned concerns with proposed mitigation measures for biological resources and provided suggested revisions such as preconstruction surveys for wildlife. VCRMA raised concerns that the proposed clearing of vegetation and soil to achieve cleanup goals "is not consistent with the County's goals of preserving natural resources" and expressed concern that the site would not be returned to its "natural state . . . given NASA's plan to remove such large amounts of soil and vegetation." The Planning Division with VCRMA expressed concerns that "without an analysis of . . . reasonably anticipated future land use" it is difficult to conclude that remediation decisions are, indeed, consistent with existing and/or future land uses. The submission also included numerous comments regarding resolution of adverse effects on historic properties, traditional cultural properties, and Indian Sacred Sites.

Comment Response Table, Acronyms and Abbreviations

ACHP	Advisory Council on Historic Preservation
ACI	Archaeological Consultants, Inc.
AADT	Annual average daily traffic
AIG	area of impacted groundwater
AOC	Administrative Order on Consent for Remedial Action
APE	area of potential effect

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Matthew	Aarsvold	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Matthew	Aarsvold	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Ofra	Abadi	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ofra	Abadi	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ofra	Abadi	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ofra	Abadi	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jon	Ackerman, M.D.	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Romanus	Akabuogu	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Romanus	Akabuogu	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Naomi	Amos	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Linda	Antonioli	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Linda	Antonioli	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. First Name	Last Name	Comment	NASA Response
Ronda	Apodaca	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronda	Apodaca	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronda	Apodaca	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronda	Apodaca	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Arbuckle	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Record of Decision Must Mitigate any Impacts to Cultural Resources</p> <p>The FEIS is considered in making the agency's decision about whether and how to proceed with the action that was the subject of the EIS. This decision is recorded in a Record of Decision (ROD). According to 40 CFR 1505.2, the ROD must:</p> <p>State what the decision was.</p> <p>Identify all alternatives considered.</p> <p>Specify the alternative or alternatives considered to be "environmentally preferable." (Note that the agency does not have to select the environmentally preferable alternative, but it does have to discuss what it is.)</p> <p>Identify and discuss the factors balanced in making the decision (whether for or against the environmentally preferable alternative).</p> <p>State whether "all practicable means to avoid or minimize environmental harm ... have been adopted, and if not, why they were not."</p> <p>Having notified the world of its decision, the agency implements it. In doing so, it must carry out any mitigation, i.e., "means to avoid or minimize environmental harm," it has said in the ROD or EIS that it will carry out (40 CFR 1505.3).</p>	NASA acknowledges your comments.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Deferral of Mitigation does not Comply with NEPA</p> <p>Deferral. With respect to historic properties, a very common problem is "deferral," in which the agency:</p> <p>Acknowledges that it does not know much about what effects there may be on historic properties (often because such properties have not yet been identified); but</p> <p>Says that whatever effects there may be, NHPA Section 106 review (of the National Historic Preservation Act), to be performed later, will take care of them; and</p> <p>Concludes that therefore, whatever alternative is decided on, impacts on historic properties will not be a problem.</p> <p>Considering environmental impacts after a decision has been made defeats NEPA's purpose of considering impacts in preparing to make decisions. It also almost guarantees last-minute conflicts between project implementation and historic preservation.</p>	<p>NASA plans to conclude the Section 106 process with a Programmatic Agreement (PA) identifying MMs to resolve adverse effects to historic properties. The PA will be included as an attachment to the ROD. In accordance with the PA and/or ROD NASA will be setting up a Native American Advisory Board to assist NASA in its stewardship of important Native American sites during the implementation of the proposed actions.</p>
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Failure to consider things that are not historic properties. With respect to other kinds of cultural resources, a common problem is that they are not considered at all. Historic properties, or even more narrowly, archeological sites, are sometimes the only things discussed in the "cultural resource" part of an EIS. If social impacts are considered, they are often considered only terms of easily quantifiable socioeconomic variables like population, employment, and use of public services. The result is that impacts on many classes of cultural resource simply are not identified or considered in deciding whether significant impacts may occur.</p>	<p>NASA endeavored to analyze impacts to multiple cultural resources including Indian Sacred Sites and TCPs as well as known and unknown archeological sites and features and plants of interest to Native Americans.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	Deferral of eligibility determination: A determination of eligibility of CA-VEN-1803, in consultation with the SHPO and the federally recognized tribes, needs to be completed before cleanup began if this site were to be affected by soil cleanup activities.	Archeology site CA-VEN-1803 would not be impacted by cleanup activities.
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	Deferral of boundary research as to VEN-1072 and VEN-1803: Additional boundary research is required to conclude that any avoidance of excavation within the boundaries of Burro Flats (CA-VEN-1072) and CA-VEN-1803 would diminish or eliminate adverse impacts to known archeological sites and reduce the impacts to negligible, negative, local, and long term and could result in a finding of no adverse effect under Section 106.	The Burro Flats site was listed in the National Register in 1975; the nomination form included a boundary for the site. NASA used this boundary and added a buffer area to form the Archeology Resource Management Area for the Burro Flats site. Previously NASA coordinated the consolidation of multiple locii into one larger archeological site with a new boundary known as CA VEN 1072. While there is no requirement under the law for additional boundary delineation as part of identifying historic properties, NASA intends to review material and further identify the boundary in consultation with Boeing prior to commencement of cleanup due to the fact that a large percent of the site occurs on private land.
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	Deferral of additional testing as to unknown archaeological deposits: Additional subsurface testing is required to conclude that reducing the amount of excavation on newly discovered archeological deposits (commonly referred to as "inadvertent or accidental discoveries") could minimize the impact if the newly identified sites were avoided, thus reducing the impacts to minor, negative, local, and long-term impacts from excavation.	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	It is important to note that a sacred site may not meet the National Register criteria for a historic property and that, conversely, a historic property may not meet the criteria for a sacred site. However, in those instances where an undertaking may affect a historic property that is also considered by an Indian tribe to be a sacred site, the Federal agency should, in the course of the Section 106 review process, consider accommodation of access to and ceremonial use of the property and avoidance of adverse physical effects in accordance with E.O. 13007.	NASA has fully accepted the importance and requirements of the identification of the Indian Sacred Site in accordance with 13007.

Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Failure to address the NASA Site as a Traditional Cultural Property (TCP) eligible for protection on the National Register:</p> <p>A. Locations for traditional ceremonies are defined as a TCP. The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices. A location where Native American religious practitioners have historically gone.</p> <p>B. Mountain tops and rock outcroppings like at SSFL are TCP's: NPS Bull. No. 38, p. 2, provides: Traditional cultural properties are often hard to recognize. A traditional ceremonial location may look like merely a mountaintop.</p> <p>C. NASA must engage specialists as part of its TCP study: NPS Bull. No. 38, p. 10, provides: In general, the only reasonably reliable way to resolve conflict among sources is to review a wide enough range of documentary data, and to interview a wide enough range of authorities to minimize the likelihood either of inadvertent bias or of being deliberately misled. Specialists in ethnography, sociology, history, and other relevant disciplines.</p> <p>D. Specific events like the Solstice ceremony at SSFL qualify as TCP: A culturally significant natural landscape may be classified as a site, as may the specific location where significant traditional events, activities, or cultural observances have taken place. A natural object such as a tree or a rock outcrop may be an eligible object if it is associated with a significant tradition or use.</p> <p>E. Native American ceremonies qualify as TCP: NPS Bull. No. 38, p.15, provides: Properties can be listed in or determined eligible for the Register for their association with religious history, or with persons significant in religion, if such significance has "scholarly, secular recognition." 13 The integral</p>	<p>Thank you for your input on the TCP. NASA has conducted a preliminary investigation of the potential for a TCP. The Santa Ynez will be given the opportunity to comment on the TCP report.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Traditional Cultural Landscapes must also be included in Section 106 consultations and the EIS</p> <p>Traditional cultural landscapes, because they are often a property type such as a district or site, are identified in the same manner in the Section 106 process as other types of historic properties of religious and cultural significance to Indian tribes or Native Hawaiian organizations.</p> <p>To determine the scope of identification efforts, a federal agency, in consultation with the State Historic Preservation Officers (SHPO)/Tribal Historic Preservation Officer (THPO), must:</p> <ol style="list-style-type: none"> 1. Determine and document the area of potential effect for its undertaking; 2. Review existing information; and, 3. Seek information from consulting parties including Indian tribes or Native Hawaiian organizations. <p>Based on the information gathered through these efforts, the federal agency, in consultation with the SHPO and any Indian tribe or Native Hawaiian organization that attaches religious and cultural significance to historic properties that may be affected by the undertaking, develops and implements a strategy to identify historic properties within the area of potential effects. Identification efforts may include background research, oral history interviews, scientific analysis, and field investigations.</p>	<p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>U.N. Declaration on the Rights of Indigenous Peoples must now be followed after December 2010</p> <p>The ACHP will now incorporate UNDRIP in the Section 106 review process:</p> <p>While the Advisory Council on Historic Preservation's (ACHP) work already largely supports the United Nations Declaration on the Rights of Indigenous Peoples, additional and deliberate actions will be taken to more overtly support the Declaration. The Section 106 review process provides Indian tribes and Native Hawaiian organizations (NH Os) with a very important opportunity to influence federal decision making when properties of religious and cultural significance may be threatened by proposed federal actions. While federal agencies are required to consult with Indian tribes and NHOs and to take their comments into account in making decisions in the Section 106 review process, adding the principles of the Declaration to that consideration may assist federal agencies in making decisions that result in the protection of historic properties of religious and cultural significance to Indian tribes and NHOs.</p> <p>http://www.achp.gov/docs/UN%20Declaration%20Plan%203-21-13.pdf.</p>	<p>NASA, in accordance with US policy, supports the UN Declaration on the Rights of Indigenous Peoples. NASA will be setting up a Native American Advisory Board to assist NASA in its stewardship of important Native American sites during the implementation of the proposed actions.</p>
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Official recognition in the DEIS need to be made of the areas surrounding Burro Flats</p> <p>A. The entire Southern half of Area II District needs to be protected. Sec. 3.3.3.4, p. 3-17</p> <p>B. All structures should be removed in the Coca Historic District. These structures impinge on the ceremonial areas. If a decision is reached to save a test stand, Alfa or Bravo should be retained instead of Coca.</p>	<p>These comments have been taken into consideration during Section 106 consultation and development of the Programmatic Agreement. Please refer to the Programmatic Agreement and/or ROD for the resolution of adverse effects.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>While the Southern half of Area II contains the pictographs and additional 16 sites, the Northern half of SSFL needs additional investigation, including, without limitation:</p> <p>a. Geography-this areas contains numerous flat areas that would be suitable camp sites;</p> <p>b. Areas of food-this areas contains forests and riparian areas that could be utilized in the gathering of food;</p> <p>c. Support for ceremonial area in the Southern half of Area 11-It is not inconceivable that the Northern half of the SSFL site provided support for the ceremonies in the Southern half of SSFL;</p> <p>d. Separate areas for different tribes-if SSFL was an inter-tribal gathering place, then each tribe would have congregated separately in different parts of the site.</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Subsurface testing is required.</p> <p>Pedestrian surveys are of limited utility and never alone are sufficient when there are known areas of habitation or ceremony. We are informed that NASA has recently completed a Phase I Pedestrian Survey of the site. While such Phase I is an excellent first step, we request additional subsurface archaeological testing for all areas scheduled for any excavation.</p> <p>If the soils profile of the project location shows that heavy erosion has washed away soils then it may explain the absence of cultural resources. However, if the soils profile is depositional then there may be a need to conduct additional subsurface testing, particularly in areas where ground disturbance is planned. In archaeological terminology, this is referred to as "Extended Phase I" testing because it is an intermediate step between Phase I (survey), and Phase 2 (controlled excavation to assess the significance of a site). Extended Phase I testing often done by excavating a small pit with a shovel and screening the excavated soil through steel mesh ("shovel test pit" or "STP").</p>	<p>NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Following is a list of environmental and cultural factors that should be considered when assessing the overall cultural sensitivity of the SSFL. (Please note that this list is not exhaustive and each factor must be weighted both individually and collectively on a case-by-case basis.)</p> <ul style="list-style-type: none"> a. Areas with high viewshed or visibility such as or ridgelines, peaks, ledges, outcrops, benches, or prominent hills; and b. Areas with a relatively high density of sites in the vicinity; and c. Areas where past ethnographic studies have revealed associated placenames. Keep in mind that placenames do not always refer to places where evidence of past cultural activity exists; and d. Areas near known sites. Mapped boundaries of sites most frequently reflect only cultural residue that was visible on the surface when the site was recorded and do not necessarily reflect the actual extent of the site. In addition, loci such as cemeteries or other areas may be adjacent to or nearby but separate from the main habitation; and e. Areas near known rock art sites or rocky outcroppings of the type where rock shelters and art have traditionally been located; and f. Areas in or near known gathering areas; and g. Though all sites are potentially worthy of protection, named, ethnohistorically documented village sites are of the highest priority and therefore warrant the greatest amount of protection possible. 	<p>Thank you for your suggestions. In conducting NASA's TCP study, many of these factors were considered.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	Figure 2.2-3, p. 2-21, illustrates the Preliminary Remediation Area Types Under the Proposed Action. To the extent feasible, NASA should exhaust all non-excavation methods of remediation before performing any excavation that could potentially impact cultural and historic sites.	Thank you for taking the time to provide comments on the DEIS. NASA considered a range of remedial action technologies to comparatively identify what impacts may result from the background cleanup to meet the AOC deadline of 2017. Technologies analyzed in the EIS included options to soil removal. The EIS considered the effectiveness of each technology and effects of impacts on items such as native vegetation, air quality, truck traffic, noise, wildlife, and cultural resources at SSFL. Some of the technologies considered include excavation (not applicable to groundwater or bedrock), enhanced biological treatment, in-situ treatment, and ex-situ treatment.
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	Soil Prior disturbance is NOT Dispositive: The mantra that cultural sites have been disturbed and therefore automatically are not significant is oftentimes incorrect: a. Disturbed sites still may contain valuable information. The newer approach is to treat disturbed sites as having the potential to provide information even if they have been disturbed; b. Disturbed sites still have spiritual significance; c. Disturbance may only be on the surface, while much excavation may continue to depths of up to 20 feet.	NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	Need to Analyze Cumulative Impacts to Cultural Resources: The DEIS fails to account for other remediation projects in other areas of SSFL: a. Need to add Department of Energy (DOE) cultural sites; b. Need to add Boeing cultural sites; c. Other areas within SSFL.	NASA acknowledges your comment. In addition to DTSC, NASA has been coordinating with USFWS, USACE, SHPO, DOE, Boeing, consulting parties, Tribes, and National Park Service. CEQA analysis typically includes private and public property impacts. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	NEW MITIGATION: Cultural Interpretive Center: a. Can use existing building; b. Preferably near saved historic structure and/or test stand; c. Preferably away from CA-VEN-1072; d. Need to Reserve maintenance funds.	Thank you for your MM suggestion. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments. However, NASA does not know who the future owners of the property will be.
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	NEW MITIGATION: Native American monitoring during any ground disturbing activities.	A process for monitoring in known archeological sites will be developed in consultation with the SHPO and tribes and will be included in the agreement document, which will be signed by SHPO.
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	Need to protect CA-VEN-1072 from trespassers and vandals.	In consultation with SHPO and the tribes, NASA is developing appropriate protection measures for the Burro Flats site.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Deferral of Mitigation until Record of Decision (ROD):</p> <p>a. It is problematic to defer any mitigation until ROD as it prevents meaningful comment;</p> <p>b. Commenter reserve the right to ask for recirculation of the DEIS and EIS for any such deferred mitigation.</p> <p>Use of NEPA EIS instead ofNHPA 106-Recent ACHP guidance: Substitution under 36 C.F.R. § 800.8(c) permits agencies to use the NEPA review to comply with Section I 06 as an alternative to the process set out in 36 C.F.R. §§ 800.3- 800.6.</p> <p>If, as the result of an objection under 36 C.F.R. § 800.8(c) (2)(ii) or during consultation to resolve adverse effects, disagreement reaches a point where the substitution process is no longer prudent, then agencies may return to the appropriate step in the standard Section I 06 process with notification to consulting parties.</p>	Please refer to the Programmatic Agreement and/or ROD which identifies stipulations to resolve adverse effects.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	<p>Need NEPA Mitigation Plan</p> <p>To provide for the performance of mitigation, agencies should create internal processes to ensure that mitigation actions adopted in any NEPA process are documented and that monitoring and appropriate implementation plans are created to ensure that mitigation is carried out.</p> <p>Agency NEPA implementing procedures should require clearly documenting the commitment to mitigate the measures necessary in the environmental documents prepared during the NEPA process (40 C.F .R. § 1508.10) and in the decision documents such as the Record of Decision. When an agency identifies mitigation in an EIS and commits to implement that mitigation to achieve an environmentally preferable outcome,</p> <p>then the agency should ensure that the mitigation is adopted and implemented.</p> <p>Methods to ensure implementation should include, as appropriate to the agency's underlying authority for decision-making, appropriate conditions in financial agreements, grants, permits or other approvals, and conditioning funding on implementing the mitigation. To inform performance expectations, mitigation goals should be stated clearly. These should be carefully specified in terms of measurable performance standards to the greatest extent possible. The agency should also identify the duration of the agency action and the mitigation measures in its decision document to ensure that the terms of the mitigation and how it will be implemented are clear.</p>	<p>Thank you for your MM suggestion. NASA will consider this and other recommendations as it finalizes the agreement document stipulating NASA's commitments.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	If funding for implementation of mitigation is not available at the time the decision on the proposed action and mitigation measures is made, then the impact of a lack of funding and resultant environmental effects if the mitigation is not implemented warrant disclosure in the EA or EIS. In cases where, after analyzing the proposed actions with or without the mitigation, the agency determines that mitigation is necessary to support the FONSI or committed to in the ROD, and the necessary funding is not available, the agency may still be able to move forward with the proposed action once the funding does become available. The agencies should ensure that the expertise and professional judgment applied in determining the appropriate mitigation measure is reflected in the administrative record, and when and how those measures will be implemented are analyzed in the EA or EIS.	NASA acknowledges your comments. Please refer to the Programmatic Agreement and/or ROD.
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	Under NEPA, a federal agency has a continuing duty to gather and evaluate new information relevant to the environmental impact of its actions. See 42 U.S.C. § 4332(2)(A). For agency decisions based on an EIS, the regulations require that, "a monitoring and enforcement program shall be adopted ... where applicable for mitigation." 40 C.F.R. § J 505.2(c). In addition, the regulations state that agencies may "provide for monitoring to assure that their decisions are carried out and should do so in important cases." 40 C.F.R. § 1505.3. Monitoring plans and programs should be described or incorporated by reference in the agency decision documents.	If new information becomes available that substantially changes the conclusions of the FEIS, NASA will develop a Supplemental EIS.
Vincent	Armenta (Santa Ynez Band of Chumash Indians)	Incorporation by reference of Memo dated Nov. 29, 2012, "NEPA alternatives analysis for selection of cleanup standards for the Santa Susana Field Laboratory Site."	Thank you for this reference.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John John	Armstrong	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small igniters that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the igniters. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John John	Armstrong	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Dolly	Aron	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carl	Arrechea	<p>I am a huge supporter of NASA and all its amazing accomplishments. However, I'm writing this in stiff opposition to the proposed clean-up of the Santa Susana Field Lab. I live adjacent to the old lab and travel daily on Topanga Blvd, the main artery for proposed removal of lab debris. This blvd is already past maximum vehicle capacity and extremely congested. Proposed heavy truck traffic hauling debris would result in catastrophic disruption of travel in this area, not to mention diesel truck pollution and noise. Besides, our roads are already in disrepair due to underfunding by the City of LA, and this would totally destroy the roadbeds .</p> <p>You need to halt this proposed clean-up activity until a more suitable means of hauling debris can be devised. One suggestion worth considering is by rail, since there is already rail tracks in the immediate vicinity.</p>	<p>Section 2.4 in the EIS discusses alternate transportation considerations (overland conveyor and rail transport of soil and option to build a new haul road). NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements. Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p> <p>NASA must continue to abide by its obligations under the AOC as drafted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Caroline	Aslanianc	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Caroline	Aslanianc	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Caroline	Aslanianc	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community ini the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Caroline	Aslanianc	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Caroline	Aslanianc	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

First Name	Last Name	Comment	NASA Response
David	Atkins	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Jill	Bachelis	<p>Over many decades, NASA’s poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Melissa	Baffa	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Matthew	Bailey	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Courtney	Baltazar	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Laurie	Barlow	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dena	Barskin	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dena	Barskin	Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Dena	Barskin	I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dena	Barskin	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Melis	Basman	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Albert	Bechtel	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patricia	Becker	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Stephen	Behee	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Scott	Bersbach	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kris	Bertrand	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

Kris	Bertrand	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Claudia	Bill	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Anitab	Bixenstine	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cheri	Blessing	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carol	Bley	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

First Name	Last Name	Comment	NASA Response
Michael	Bock	Through decades of sloppy environmental practices, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been migrating off the property.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6)</p>

Michael	Bock	<p>After years of dragging its feet on cleanup, in 2010 NASA executed a binding cleanup agreement with the State of California, promising to clean up all the contamination to background.</p> <p>NASA has now published a Draft Environmental Impact Statement on the cleanup, portions of which have created concern that some within the agency are working at cross purposes to the agreement NASA is pledged to carry out.</p> <p>I write to call on NASA to live up to its commitments in the 2010 cleanup agreement, totally and without any efforts to wriggle out of it.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
William	Bodden	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Linda	Bodian	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Linda	Bodian	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Peter	Bodlaender	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David	Boito	I strongly urge NASA to meet its responsibilities regarding the toxic contamination which has the potential to negatively affect the health of hundreds of thousands of residents living nearby. Please deliver on your promise to fully clean up this area.	NASA respects public concern regarding offsite health issues. Information summarizing the health studies previously conducted will be added to the EIS (Sections 3.9.5 and 3.9.6).
Carla	Bollinger	And I also ask this crowd, and NASA and everyone involved in this room with this process, to think about the immoral act of taking our dirt and dumping it on Kettleman or Buttonwood or any other place that's very poverty stricken. Why should we think it's okay to do that? It's immoral.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carla	Bollinger	I think the best thing to do is to continue on with the remedial technological processes of cleaning it up, minimize whatever has to be moved, and I don't know if you even know if you have all this worked out. Where are you going to move with all the 80,000 trucks?	<p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p> <p>Section 2.4 in the EIS discusses alternate transportation considerations (overland conveyor and rail transport of soil and option to build a new haul road). NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements. Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carla	Bollinger	<p>Rock Art to Rocket Ship: There is no other place on Earth representative of human’s achievements in a broad range from prehistoric to modern time (circa AD1000 to 2006) as represented in the historic and sacred districts of Native Americans artifacts juxtaposed with rocket engine test stands. The site teems with Native American archeological and cultural assets including Burro Flats’ pictograph representations of earth, animals, humans, symbolism and astral images. Rocket engine development and testing on Alfa, Bravo and Coca test stands built in the dramatic sandstone rock formations are testimony to the greatest culmination of mankind’s scientific engineering achievements.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Carla	Bollinger	<p>Each Test Stand in NASA Area II Historic Resources, built in the natural boulder settings, has rocket development historical significance: Alfa 1 and 3: Tested Navajo, Jupiter, Thor, RS-27, Cold War Intercontinental Ballistic Missiles (ICBM) and Atlas engines (supported first manned orbital flight, 1962.) Bravo Test Stands 1 and 2: Thor, F-1, Atlas, E-1 and Delta engine programs, project Mercury Missions, 1st manned mission: Mars Mariner. Coca 3 and 4: Atlas, supported the second stage of Saturn 1B and V (Apollo,) Atlas, J2 (Space Shuttle Main Engines SSME)</p>	<p>Thank you for this information. NASA recognizes the historical importance of the test stands and is conducting section 106 consultation in accordance with the National Historic Preservation Act to resolve potential adverse effects from the proposed action on historic resources.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carla	Bollinger	<p>Sacred and historical districts of Native American and Rocket Engine development/test stand sites must be preserved, not demolished. Rocket engineers and scientists lamented Rocketdyne/Boeing’s destruction of the first test stand built, Vertical Test Stand I in the “Bowl” area. Further demolition of any remaining test stand is destruction of historical assets and a callous disrespect to all the men and women who worked tirelessly during the 1940’s through the present decade to make California and America a leader in outer space exploration. NASA rightfully calls the test stands “Historic Resources”. All remaining test stands need to be preserved, not just one, an Alpha Test Stand, as suggested in the September Section 106 Consulting Meeting.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carla	Bollinger	<p>There are many “legal potholes” to the AOC, everything from the lack of implementation and adherence to the NEPA process to a comprehensive health risk assessment of an extreme cleanup to background level. The destruction of a natural landscape can lead to greater ecodestruction from future climate conditions, wildfires, flooding after a drought period made more severe from loss of natural vegetation, an insurmountable loss of habitat in the Simi Hills, a crucial wildlife corridor. The AOC needs to be legally challenged because it lacks the proper procedures to follow historical, cultural, and environmental federal and state laws. SB990 was found to be unconstitutional and lacking scientific evidence that the SSFL requires a radical cleanup procedure or poses any significant threat to public health. (Ref: Report #IG-13-007, Appendix F) The AOC is just as unlawful as the SB 990.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>
Carla	Bollinger	<p>Environmental Justice: The contamination cleanup is challenging but better served to apply technical scientific methods on site, ongoing monitoring and cleanup while minimizing the need to remove soil/vegetation as opposed to moving tons of hazardous and non-hazardous earth and rock to other southwest locations. Locations such as Buttonwillow or Kettleman in the San Joaquin Valley, already recipients of large volumes of various contamination materials, are protesting future waste dumping. The Center on Race, Poverty and the Environment, (CRPE) has sponsored a bill, AB1329, that passed the California Assembly in May, 2013 and Senate in September, 2013, to prevent hazardous waste dumping in over-burdened communities; an environmental initiative that ensures justice fair and equitable environmental policies for all residents. NASA and Boeing have targeted these communities to receive SSFL hazardous and non-hazardous soil. Another targeted contamination dumping site, the Mojave Desert, must also be protected and not made into a manmade giant toxic dumping ground.</p>	<p>Requirements of the AOC require removal of large quantities of soil that will be moved to landfills in other areas. The landfills are permitted and regulated.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carla	Bollinger	<p>Health and Safety Risk Assessment: Moving 80,000 truckloads of soil and rock through the San Fernando Valley and beyond will cause great risk to lives. The beginning of the route from SSFL, Woolsey Canyon Road, was built to support delivery of materials to the SSFL. Los Angeles City and County does not have records on file of the load capacity for Woolsey Canyon. This road does not support the proposed truckload hauling of soil and rock. Because of the rock formations along the route the road is steep with hairpin turns. Full size dump trucks cannot make these turns without crossing over the 2-lane dividing lines, a road condition with high-risk accident danger. Because of the natural terrain, the road cannot be rebuilt or widened to accommodate years of heavy truck usage. The turn at Woolsey Canyon onto Valley Circle Boulevard is another high risk point and will severely hamper the movement of traffic at this turning point and throughout the route from the SSFL to any designated landfill site.</p>	<p>Section 2.4 in the EIS discusses alternate transportation considerations (overland conveyor and rail transport of soil and option to build a new haul road). NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements. Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p> <p>As a BMP for efficient and safe traffic management, NASA will develop a Construction Transportation and Control Plan (N-CTCP); similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan.</p>
Carla	Bollinger	<p>How much water during a natural drought condition will be needed to prevent huge dirt-dust contamination being kicked up during soil-rock digging in the surrounding area? What is the effect of diesel fumes and the release of toxic chemicals during excavation on the population located near the SSFL and along the truck routes that will occur in an extreme cleanup for a projected ten years? The risk assessment factors for an extreme cleanup need to be addressed.</p>	<p>NASA will update the EIS to address the amount of water usage that will be required during remediation activities (Section 4.10.1). The potential impacts from dust and diesel fumes is discussed in Section 4.7 of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carla	Bollinger	<p>Contamination Assessment: Is it possible to perform an accurate assessment of the actual amount of chemical residue from the Topanga fire, 2005, versus rocket engine cleaning chemicals that are in the soil? How can the State of California and the federal government determine fracking, a process of shooting a 90 plus toxic chemical cocktail deep into the earth, known to cause earthquakes and poison our water, is acceptable yet there is a hyperbole legislation to cleaning SSFL to background level? DTSC has tested and found that the land at the base of Runkle property, adjacent to the SSFL, downhill on the Simi Valley side and in the SSFL watershed, is not contaminated and a large housing development can be built at this location. The Summit Mobile Home property on Woolsey Canyon on the Los Angeles County side, within one mile of the SSFL has also been soil tested and not shown to have SSFL contamination. Bell Canyon Creek supports a healthy population of amphibians and reptiles. The SSFL site is home to all species of wildlife from flying, crawling and walking. This is an indication that the ongoing SSFL on-site cleanup is working.</p>	<p>Collecting background samples is a method used to evaluate chemicals that occur in the environment from natural processes such as wildfires versus chemicals that have been released from industrial activities such as rocket engine testing. DTSC has collected background samples in areas that have the same wildfire burning history as SSFL to evaluate the chemical "residue" remaining in the soil and have not received chemicals from rocket engine testing. The results of the background data set have been incorporated into the Look-Up Tables that will be used to screen data collected onsite.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carla	Bollinger	<p>Rational Approach to Cleanup: A seemingly punitive and irrational approach to the SSFL cleanup has prevailed by a group of activists. There is no question or argument that during the post-WWII/Cold War and rocket exploration that rocket engine cleanup and chemical handling was not properly handled and cases of health conditions, including cancer, may be attributed to this factor. However, this was also the era of smoking, even smoking on the job. There is no way to determine which caused a slightly higher cancer incidence at the SSFL, chemicals or smoking. While there is a slightly higher incidence of cancer for SSFL workers, many of the engineers, including Samuel Hoffman, North American Aviation-Rocketdyne team leader of rocket propulsion (1949 through 1970), lived a long life (1902 – 1995). There are many SSFL engineers, scientists, machinists, workers who have lived beyond 80 years old.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments.</p>
Carla	Bollinger	<p>Recently Boeing has been threatened with a lawsuit for demolishing and moving “contaminated” structures and materials from the SSFL to other sites. An extreme cleanup by NASA to the rigid AOC background level will require moving “hazardous” and “non-hazardous” material to other locations. This supports the concern that an extreme cleanup will cause another contamination problem in a new location where SSFL soil will be relocated.</p>	<p>The disposal facilities where NASA might take any waste are all designed and licensed to meet requirements of the RCRA, and design, permitting; and operation requirements of California Code of Regulations, Title 27 within California, or the requirements of the state where the disposal facility is located.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carla	Bollinger	A cleanup to background level as outlined by the AOC, will cause great harm to the environment, at the site and offsite, destroy historical and sacred Native American archaeological districts, historic rocket development test stands and structures, and threaten a sensitive ecological habitat.	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>Please refer to the Programmatic Agreement (PA) and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 were incorporated in the PA and/or ROD.</p>
Carla	Bollinger	At risk from an AOC cleanup are the rare and endangered Branton's Milk-Vetch and Santa Susana Tarplant as well as many other native plants. SSFL, an integral part of the crucial wildlife corridor in the Simi Hills connecting the Santa Susana with the Santa Monica Mountains, must be protected, not destroyed.	<p>Wetland, wildlife, and plant surveys were conducted in accordance with approved methodology. NASA believes that the assessment of impacts and findings are reasonable, based on the best information available to date. NASA will comply with the Biological Assessment and mitigations as concurred by the USFWS, however as a federal agency, is not required to comply with state and local policies. NASA is making efforts to cooperate with state and local policies when appropriate.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carla	Bollinger	The National Park Service (NPS) is considering the takeover/management of the SSFL as an open space – historic park site. If the mandates of the AOC are enforced, the land will be destroyed along with all cultural/historic assets. All will be lost. NPS will not be interested in the property.	NASA notes your concern.
Carla	Bollinger	Eventually, the possibility of a large developer of residential property will want to purchase this land. This must be prevented from happening by preserving the natural and manmade resources at the SSFL site. The community and environment is much better served by having NPS and possibly the Native Americans, Santa Ynez Chumash, become the stewards of this unique landscape and historical site.	Your comment is noted.
Carla	Bollinger	In summary, common sense, respect for the natural environment and historic sites, federal law on federal property, not state law, must be applied to handling the NASA-SSFL cleanup. A responsible cleanup without destruction to a natural place, acceptance of a long-range ecological restoration without severe damage to the environment caused by excavation and relocation, is a rational approach. We, the current caretakers of this sensitive eco-system, Native American sacred sites, cultural, and historic sites from prehistoric to modern technological structures, must preserve all that is sacred.	NASA appreciates your consideration and comment on the DEIS. NASA analyzed the potential effects of demolition actions and cleanup to background on multiple resources in the EIS and recognizes that cleanup to background will have significant impacts on many resources.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
William Preston	Bowling	The Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) raises questions as to whether some within NASA are trying to break out of the 2010 Administrative Order on Consent (AOC)...	Your comment is noted.
William Preston	Bowling	The AOC requires all contamination to be removed, but the EIS considers leaving in place old rocket test stands, trying to call them historical.	<p>The test stands sit on top of bedrock which will not be removed during the cleanup. NASA is conducting sampling around the test stands to determine the location of contamination that needs to be cleaned up to meet the 2010 AOC and 2007 Consent Order. NASA is also evaluating in situ technologies that may be capable of removing contaminants without demolishing the structures.</p> <p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p> <p>The test stands have been evaluated and identified as eligible for listing on the National Register of Historic Properties. Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. Comments such as yours are considered during that process. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects. Please refer to the PA and/or ROD for further information.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
William Preston	Bowling	The EIS goes way beyond the AOC provisions and seems to raise the possibility of just declaring all of the contaminated soil throughout the 2850 acres of the site sacred and then not comply with the AOC cleanup requirements all. This is unacceptable and would completely violate the agreement.	The Santa Ynez Band of Chumash Indians has declared the NASA-administered Area an Indian Sacred Site under EO 13007.
William Preston	Bowling	NASA uses the truck traffic "Scare Tactic" that would be needed supposedly to remove the contamination for disposal at toxic waste disposal facilities.	<p>The number of trucks required is predominately a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus not being a valid option. Section 4.5 in the EIS discusses transportation routes further (also see Alternate routes do exist, see Figure 4.5-1).</p> <p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Theresa	Brady	<p>The DEIS on the SSFL is flawed in its assessment of the no action alternative. There is a significant impact on the community of leaving benzene, radioactive waste and other toxics in the soil and the water. The draft should be amended to include the information that assesses these hazards in the long term. Some of this information is available from the committee to bridge the gap and the study done by UCLA of community impacts.</p> <p>I think the EIS should be amended and recirculated because of this large flaw.</p> <p>There should be careful and independent testing of toxicity and the test stands should not stand in the way of the community getting peace of mind that the toxins have been removed.</p>	<p>Information summarizing the health studies previously conducted as well as the risk assessment of potential exposures from current chemical contaminants at the site will be added to the EIS (Sections 3.9.5 and 3.9.6). DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm). According to the DTSC summaries there were two UCLA studies, one in 1997 dealt with radiation exposures and a second in 1999 which dealt predominately with hydrazine exposures. Both were funded by DOE. Another study performed by the ATSDR, was published in 1999. According to DTSC's summary, "The preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects."</p> <p>Additionally, DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p>

Polly	Braiwick	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

Polly	Braiwick	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Polly	Braiwick	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Polly	Braiwick	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Polly	Braiwick	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jennie	Brand	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Brandlin	Slavish adherence to the 2010 AOC which compels the parties to attain clean-up levels that bear no relation to the public health risk posed by the site.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.
Richard	Brandlin	As the result of political pressure from Senator Barbara Boxer and the Council of Environmental Quality Chair Nancy Sutley, and in contravention of the letter and spirit of the NEPA process, NASA has produced an analysis of only two alternatives, one of which is the “No Action” alternative, itself a creature of the 2010 AOC which leaves no room for a middle ground.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Richard	Brandlin	Failure to consider the combined effects of three separate but parallel cleanup actions from the Responsible Parties.	The AOC requires NASA to develop a NEPA document. In order to meet the 2017 cleanup completion date, NASA must proceed with the EIS.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Brandlin	<p>From the technical side, some of the analysis that did occur failed to adequately account for the preservation of historical and cultural resources as well as a failure to analyze or mitigate impacts from cleanup activities, specifically truck traffic impacts on surrounding streets and communities.</p>	<p>The number of trucks required is predominately a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus not being a valid option. Section 4.5 in the EIS discusses transportation routes further.</p> <p>The best way to reduce the number of trucks is to reduce the soil volume required to be transported offsite. NASA is evaluating several treatment technologies that have the potential to reduce the truckloads by 36% (9,500 truckloads). The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p> <p>[Note: For NASA's estimate calculations, the capacity of soil to be transported in each truck is 19 cubic yards...thus for 500,000 cubic yards of soil that is over 26,000 truckloads.]</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Brandlin	I urge you to review and revise your analysis regarding the preservation of Native Peoples sacred grounds, particularly the Burro Flats area, and preservation of the Alpha and Bravo test stands and ancillary buildings and structures that are critical to historical perspective on the U.S. space program, and to retain as much as possible for future generations.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic proeprties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Brandlin	As to truck traffic, the DEIS should be revised to include the transportation risk in terms of additional morbidity/mortality per transportation mile for the evaluated alternative. ANY fatalities from site remediation activities are completely unacceptable.	<p>NASA agrees that any fatalities as a result of remediation activities would be tragic and unacceptable. Section 4.5 of the EIS states "In the United States in 2010, large trucks accounted for 4 percent of all registered vehicles and 10 percent of the total VMTs). These large trucks accounted for 8 percent of all vehicles involved in fatal crashes and 3 percent of all vehicles involved in injury and property-damage-only crashes. In California, trucks were only involved in 6.5 percent of fatal crashes in 2010, less than the national average (U.S. Department of Transportation, 2012). The overall crash rate in the U.S. for all vehicles was 1.22 fatal crashes per 100 million miles traveled and 20 injury crashes per 100 million miles traveled."</p> <p>As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing's existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. NASA will coordinate traffic control plans with Boeing and DOE.</p>
Richard	Brandlin	Given the oppressively destructive consequences of NASA adherence to the AOC, I offer my position that the No Action alternative is actually preferable to AOC-level clean-up.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Brandlin	I also strongly support a Modification In Principle of the type supported by the SSFL Community Advisory Group that would allow parties to the AOC to revert to the risk based clean-up scenario contemplated by the CA Dept. of Toxic Substances Control-approved SSFL Standardized Risk Assessment Methodologies, rev. 2007, to implement a cleanup standard consistent with the future land use of administered parcels, thereby creating a path forward toward resolution of the contamination issues at the SSFL, and final disposition of the site.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted. Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).
Bonnie	Brandon	Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found. Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ashley	Branstetter	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Ashley	Branstetter	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cardoza	Brian	<p>And No. 1, I'd like to thank NASA for at least showing some interest in doing something at the site. But I do feel that there's an issue that has been overlooked. And in reviewing the EIR, I find fundamental flaws in terms of the limitations and the scope and the breadth of this particular project. ...</p> <p>As a resident of Bell Canyon, we are the neighbors to the south of this particular location. We do not appear to have been considered dually in terms of the environmental impacts of this project. There's a lot of discussion about what is taking place, what are the impacts within the NASA-administrated areas of project site; however, these impacts are going to go well beyond the borders of this site and will affect the neighboring communities surrounding this particular site.</p> <p>We are already -- we believe we are already feeling the effects of some of the water treatment activities that are taking place on the site. In reviewing the EIR, it notes that there are current pumping and treating groundwater activities that are taking place as we speak. It is further acknowledged that moderate negative local and long-term impacts on surface and groundwater quality are going to result from these activities.</p> <p>Well, the question is, it's not enough to identify potential impacts, what are those impacts? What are we doing to understand? What are the long-term impacts of these activities?</p> <p>We also recognize by the EIR, it's apparently admitted, that there can be changes to surface hydrology. Well, as a downstream owner of property of this site, what specifically will be the downstream change to hydrology, or the hydrological changes that can occur here?</p>	<p>On an acreage basis approximately 25% of the NASA area will be impacted. The EIS states that the likely outcome of this significant excavation would be to create new ponded areas. Although surface flows would be decreased, the additional infiltration would increase discharges from existing seeps, thus increasing surface flows downstream of the seeps. A portion of the increased infiltration, however, would be lost to deep percolation, resulting in an overall net decrease in surface flows. The small overall net decrease in surface flows would be considered a minor, negative, local, and long-term impact (Water Impact 2a). Further, the EIS analyzes impacts to surface water hydrology from demolition soil remediation activities, and from groundwater remediation activities (see EIS Section 4.7). Impacts are determined to range from negligible to moderate, but all impacts would be reduced to negligible with the implementation of MMs Water MM-1 through Water MM-3. NASA believes the level of detail in the EIS is acceptable under NEPA.</p> <p>NASA recognizes the parallel DTSC processes under CEQA, and the additional level of detailed review that will be conducted in project-specific EIRs that evaluate localized remedial activities. This EIS describes the context and intensity of impacts under NEPA, including the expected nature and extent of hydrologic changes locally and regionally. As individual remedial technologies are further developed and deployed, additional site-specific information (e.g., grading and drainage plans) will be developed and used to evaluate hydrologic impacts at a greater level of detail in project-specific EIRs.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ruth	Briggs	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ruth	Briggs	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Brin	The proposed traffic volume needs to be reduced.	<p>The number of trucks required is predominately a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus not being a valid option. Section 4.5 in the EIS discusses transportation routes further (also see Alternate routes do exist, see Figure 4.5-1).</p> <p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Daniel	Brin	The WHNC requests that NASA reconsider its decision to limit the selection of one cleanup method and look at other alternatives and procedures that would mitigate the negative effects of this DEIS.	<p>NASA originally proposed to evaluate a cleanup to background (proposed action) that meets the 2010 AOC requirements, a no action alternative, and three other alternatives that are normally analyzed for a typical Superfund cleanup based on common cleanup goals associated with risk-based scenarios to evaluate the full range of options and their associated environmental or cultural impacts. Additionally, we always included evaluation of the different technological approaches to soil and groundwater cleanup. These additional three alternatives included a cleanup to suburban residential, industrial, and recreational cleanup standards. Based on input from multiple parties, NASA streamlined the evaluation to only one alternative which reflects the AOC background cleanup levels, while examining impacts of various technologies to meet that goal, that is, how to meet the AOC level. CEQ's letter dated July 19, 2012 states, "However, there is no requirement that NASA consider alternatives that cleanup to other standards that differ from the agreement with the State."</p> <p>Additional information regarding the eliminated alternatives is provided in Section 2.4.1 of the EIS and at http://ssfl.msfc.nasa.gov/environmental-cleanup/environmental-impact-statement/default.aspx.</p>

Robert	Brostoff	<p>I am in total disagreement with the conclusion that NASA will adhere to the AOC which requires cleanup of the NASA property at SSFL to background levels. It makes no sense whatsoever to clean up that property to such a level when it is highly unlikely that the property will likely be used as some kind of open space, such as a wildlife preserve or park. No one will live there, and therefore, no one will be exposed to contamination by toxic substances to the extent that it might be injurious to human health. The idea that it needs to be cleaned up to background is a major waste of public funds and destruction of natural habitat for many wild animals, plants, and trees. Not to mention the health risks for people who live, work, and play, along the roads that will be used by the diesel trucks to cart away the "contaminated" soil.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Robert	Brostoff	<p>There is no scientific evidence that any persons have been affected, off site, by any contamination that exists there. The review of cancer clusters Cancers in the Urban Environment by Dr. Thomas M. Mack, July, 2004, found no scientific evidence for cancer clusters around SSFL that would lead to SSFL as the source.</p>	<p>NASA respects public concern regarding offsite health issues. Information summarizing the health studies, as well as the risk assessment of potential exposures from current chemical contaminants at the site, will be added to the EIS (Sections 3.9.5 and 3.9.6).</p>
Robert	Brostoff	<p>NASA has made a decision that there are only two choices with the cleanup, the AOC agreement or nothing at all. No consideration has been given to intermediate possibilities. This decision, it is rumored, has been arrived at through political pressure from Congress and the State Legislature. Political ideologies should not override scientific analysis.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative are presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Robert	Brostoff	<p>Lastly, if, despite the sentiments of many residents surrounding SSFL as to the level of cleanup, this enormous task of removing thousands of yards of soil does go ahead, there needs to be included in the final EIS report an explanation of how the roads that will be used and severely damaged, by NASA's own statements, will be repaired. This should not be the responsibility of local government. It's not a local government project. This damage should be the responsibility of the owners of the SSFL property from which the soil is removed, ie, Boeing, NASA, and DOE.</p>	<p>Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, and reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that go toward road maintenance.</p>
Marjorie	Brown	<p>One is I must admit that I have no plans to read the EIS. It's too long. I'm still hopeful that someday you'll be able to have the time to do summaries for us.</p>	<p>NASA developed a brief yet encompassing Executive Summary to assist with reviews such as yours.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marjorie	Brown	<p>And what I'm concerned with is whether, in the DEIS, had you ever talked about the possibility of, instead of all those trucks, to have a -- to build a railroad spur to take that contamination off the hill? With all the money that will be spent on trucks, you need to know that there is a railroad line. There's a huge tunnel at the end of Chatsworth Park South. That's on the Chatsworth Formation that leads right up to the eastern part of the field lab. And if there's a way to build a train spur, I would like to see that considered.</p>	<p>Section 2.4 in the EIS discusses three alternate transportation considerations: 1) overland conveyor and rail transport of soil; 2) build a new haul road; and 3) truck from site to rail and transport by rail to disposal facility.</p> <p>(1) NASA considered an alternative rail or conveyor system for hauling materials from SSFL. The analysis showed that a conveyor system would require building the system over private land and constructing a railroad facility to keep trucks off the local roads. NASA concluded that the system could not be built in the AOC timeframe requirement, and there could be opposition to acquiring rights-of-way over private lands.</p> <p>(2) NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission to, current private property. Alternative access was dismissed due to the inability to obtain access permits and environmental assessments, and to construct the road in time to meet NASA's 2010 AOC schedule requirements.</p> <p>(3) NASA considered a truck-rail combination for soil disposal. Using existing local roads to rail would not alleviate traffic on local community roads.</p> <p>Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marjorie	Brown	The only other comment I have is that you folks in NASA are part of my government, which I have long worked in, the county government, and I expect you, when you sign an agreement, like an AOC, to keep it.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. To meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.
Margery	Brown	Reading the entire DEIS, I have unfortunately come to the conclusion that NASA appears to be leaning in the direction of breaking it's AOC agreements, as can be seen in many parts of the DEIS. NASA appears to be very skilled in presenting, or not presenting statements and material that could be, to the average reader, both somewhat subtle, but, also very manipulative.	The impacts described in the NASA DEIS are real based on the best information we have at this time. They are simply a statement of the facts. NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL.
Margery	Brown	Both at the two recent meetings regarding the DEIS that were held at Corporate Pointe, and also in the DEIS itself, it was quite obvious that NASA is really anxious to effectively frighten the stakeholders by constantly talking about all of those hundreds and hundreds of trucks that will surely be a menace to school children, even though the schools are undoubtedly quite capable of formulating plans to prevent injuries to the students, possibly by keeping their street crossing guards on duty for longer periods of time.	NASA reported the number of truck and transportation routes, including school crossings, that would be used during demolition and cleanup activities in order to evaluate the potential impacts to transportation as required by NEPA.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Margery	Brown	<p>ALL of those test stands need to be demolished, but the DEIS seems to leave one of them standing for "historic" purposes. There are 500,000 gallons of TCE in the ground underneath those rusty test stands and the evaporating fumes from the TCE are harmful. Any test stand left standing can also be very dangerous to a child trying to climb up on one, who is liable to become history himself...or herself. One can picture the future lawsuits and wonder who will be liable for a serious injury or death to a victim. The test stands have already served their historic purpose and ALL of them need to be removed so that a complete cleanup of the soil can be accomplished.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Margery	Brown	<p>The DEIS, in Section II states that NASA only needs to discuss the AOC's and NO ACTION, alternatives....but then goes on,incredibly, to present three other alternative standards for cleanup...Suburban Residential, Commercial and Recreational, complete with a fairly lengthy explanation and a chart showing yards of soil that would need to be removed...truck trips and etc. It appears tha"Recreational" probably means a subtle attempt to describe an Open Space standard, which would leave almost 90% of the contamination in the soil....saving a ton of money, of course.</p> <p>And just exactly WHY does NASA tell the reader that they have "eliminated" the above additional standard calculations....and then proceed on to describe them anyway? Why,especially since Sen. Barbara Boxer and the Council On Environmental Quality had banned NASA from doing this particular thing? It certainly does appear that NASA has broken it's commitment to the aforementioned and important parties, and that it is quite manipulatively letting us know that it is planning on walking away from the AOC's.....sooner or later, and also telling us that NASA cannot be trusted to carry out it's commitments! It also lets the stakeholders know that they can stop worrying about having to dodge so many NASA trucks on the roads and near the schools. This supposedly "eliminated section needs to be ELIMINATED"</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Margery	Brown	There is very little mention of the contaminants, either chemical or radioactive, that are present in great quantities in the SSFL soil or groundwater. This lack of information appears to be an attempt to minimize this kind of danger to human beings in order to possibly support a lower standard of cleanup than that of Background. Former workers on the site, and neighbors living close to it have contracted cancer from those contaminants, but the DEIS omits the studies that have been done regarding this too often fatal disease.	Information summarizing the health studies previously conducted as well as the risk assessment of potential exposures from current chemical contaminants at the site will be added to the EIS (Sections 3.9.5 and 3.9.6). DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm).
Margery	Brown	<p>It is amazing and disconcerting to note that the whole DEIS is much more concerned with the welfare and fate of the California Tar Plant and the Red Legged Frog, that it is with the human beings who have been its victims, over the years. The same could be said of the SSFL plants, in general...but yet, there is no described plan to replace those that would be necessarily be destroyed during the cleanup.</p> <p>If this is kind of concern and reporting is an attempt to minimize the harm done by the NASA portion of the SSFL, it, again, appears to be intended to support the impression that NASA is about to break it's AOC agreement to clean up to background by making the whole NASA portion of the SSFL seem to be an endangered species. And, while endangered plants, wildlife and etc. are certainly an environmental concern, the welfare of human beings needs to come FIRST!</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Margery	Brown	<p>While the DEIS does not describe how much soil would need to be removed around the Burrow's Flats, there are exceptions listed in the DEIS that would spare or prevent harm to this site, and possibly others. In other cases, if bones or skulls were to be unearthed, they would be removed to some other place than the SSFL. But, in any event, the welfare of human beings, past, present and future needs to be the primary consideration.</p>	<p>We acknowledge your comment regarding archeological resources. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts.</p>
Margery	Brown	<p>The NASA DEIS does an extremely very poor job of describing supposed problems surrounding the possibility of using empty railroad cars to remove contaminants, instead of all of those scary trucks. We are not told what possible routes could be used, or why a conveyor belt would be necessary. We are not told just which land owners would need to give their permission for a conveyor belt, or if any of them have even been contacted. There are just a few off-hand paragraphs as to why using train cars cannot be done...in orthr words, pretty much just dismissed out of han.</p> <p>How about improving a mountain road, and hauling the removed soil on trucks over to a rail road spur line? Has that even been considered? Instead, the impression is that NASA prefers to keep on hyping up the dangers of all of those hundreds of trucks on our city streets, in order to hopefully get the cleanup standard lowered.</p>	<p>Section 2.4 in the EIS discusses alternate transportation considerations (1) overland conveyor and rail transport of soil; (2) build a new haul road (3) truck from site to rail and transport by rail to disposal facility.</p> <p>(1) NASA considered alternative rail or conveyor system for hauling materials from SSFL. The analysis showed that a conveyor system would require building the system over private land and constructing a railroad facility to keep trucks off the local roads. NASA concluded that the system could not be built in the AOC timeframe requirement, there could be opposition to acquiring rights-of-way over private lands.</p> <p>(2) NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements.</p> <p>(3) NASA considered a truck-rail combination for soil disposal. Using existing local roads to rail would not alleviate traffic on local community roads.</p> <p>Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Margery	Brown	<p>The DEIS, as it stands, appears to be an interesting combination of NASA appearing to present all of the needed facts, combined with manipulative and not so subtle attempts to greatly feature a number pieces, of information, while ignoring others that are necessary and important to an EIS that is purporting, supposedly, to describe a cleanup to background. This AOC agreement was signed by NASA, in good faith, but the impression is inescapable that the agency has some other plans, like getting itself out from under this agreement and lowering the cleanup background possibly even to whatever this "recreational" standard is. And, it is probably just another description of an Open Space Agreement. THIS IS NOT ACCEPTABLE !!!!</p> <p>NASA....You contaminated this property, and, YOU MUST NOW CLEAN IT UP TO BACKGROUND !!!!!!!</p>	Your comment is noted.
Gary	Brown	<p>The EIS is inconsistent about stating whether its purpose and goal are to address disposal of NASA property in addition to structure demolition and environmental cleanup. This is a serious matter since potentially the federal government would relinquish its control over Section 106 compliance if property is transferred to other ownership. The title of the document, for instance, says nothing about property transfer. Discussions with stakeholders have indicated that the latter is GSA responsibility, but this is unclear in the analysis.</p>	<p>NASA's proposed actions include only the cleanup and demolition activities at the site. NASA has formally requested that GSA commence excess procedures, and GSA is responsible for following 36 CFR 800 for the disposal.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Gary	Brown	<p>Whatever the case, the result is a huge impact to historic and prehistoric cultural resources. The adverse effects on both historic and prehistoric cultural resources are justified on the basis that prior agreements to cleanup the property to incredibly high standards which were made without NEPA or NHPA consultations. Despite these agreements, failure to consider alternatives is not justifiable because the document itself (“Suggested Mitigations”) implies considerable flexibility in whether or not some cultural resources could be spared to “mitigate” the destruction of others.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts. Please refer to the Programmatic Agreement for further details.</p>
Gary	Brown	<p>The documentation of prehistoric archaeological resources provided in the contractor’s report (Appendix C) is far from commensurate with the significance of the National Register site (CA-VEN-1072) and likely NRHP district that is the centerpiece of the prehistoric cultural landscape. There is no evidence that the contractor even consulted the existing NRHP document, outdated as it is. The 1970s nomination form indicates acreage larger than even the 1990s documentation conducted as pure research by Albert Knight on just the NASA portion of the site complex.</p>	<p>NASA relied on information collected between the 1950s and 2007. The Burro Flats site was revisited and resurveyed in June 2007 to reassess the nature and extent of the previously recorded Burro Flats site in NASA’s Area II. As a result, of this investigation, California Department of Parks and Recreation Primary Record forms for Burro Flats were updated and submitted to SHPO.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Gary	Brown	<p>At this stage in the analysis of impacts, determination of archaeological site boundaries (horizontal) and site depth (vertical) should minimally have been performed so that effects would be possible. Yet, no information is provided on these critical parameters or such basic characteristics as artifact assemblage and integrity. Even significance at CA-VEN-1072 is questionable without current information on such key factors.</p>	<p>NASA will seek to avoid disturbance of CA VEN 1072 in accordance with the Programmatic Agreement and/or ROD. In addition, NASA has conducted Phase I pedestrian archeological investigations on all of the NASA-administered property at SSFL in accordance with state and federal standards. All archeological field surveys were conducted in accordance with Section 106 of the NHPA and the Secretary of the Interior's Standards and Guidelines for Identification and in accordance with CEQA, Public Resources Code Section 5097.2, and CEQA Guidelines Section 15064.5. Archeological survey methodologies were consistent with professional standards and in accordance with common practice for such studies in the state of California.</p> <p>No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources.</p>
Gary	Brown	<p>Limited archaeological testing at CA-VEN-1072 has been advised repeatedly during Section 106 Consulting Party discussions, and would have resolved these uncertainties, but no subsurface identification or assessment procedures have been implemented and even current surface documentation is scant.</p>	<p>No additional surveys are planned prior to the FEIS. NASA will do additional archeological investigations in sensitive areas identified in consultation with SHPO and the Santa Ynez Band of Chumash Indians prior to commencing cleanup activities as part of the MMs to minimize impacts to potential archeological resources. Please refer to the Programmatic Agreement and/or ROD for additional details.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Gary	Brown	The assertions that any areas which might be disturbed by the proposed undertaking at CA-VEN-1072 (and even sites that have yet to be discovered) lack integrity is unfounded. Existing data are limited, but they indicate that the Burro Flats site complex contains deep, stratified, and substantial archaeological deposits including middens that are most likely intact. How existing infrastructure could be removed and environmental cleanups accomplished without directly impacting such deposits is not addressed. Instead, it is assumed that they are already disturbed and don't matter.	We acknowledge your concerns and comments. NASA has identified in Section 4.3 potential significant impacts to known and unknown archeological deposits by the proposed action.
Gary	Brown	The suggestion that appropriate mitigation measures could be devised through consultation with SHPO and other consulting parties after the Draft EIS is finalized is optimistic, at best. This is true of both Burro Flats and the historic structures which have been better documented through compliance work to date, although impacts and mitigation have also yet to be identified. Instead, the existing analysis assumes the worst (total destruction would be an adverse effect) and that some mitigation is possible.	We acknowledge your comments and concerns regarding impacts to historic properties. Please refer to the Programmatic Agreement and/or ROD which addresses impacts to historic properties.
Gary	Brown	The issue of disposition is not adequately addressed. The assumption is made that likely future owners would not find cultural resources to be beneficial, thus removal is desirable. However, past discussions have emphasized the likely transfer to parklands where historic structures and archaeological resources are potential assets. The interconnected nature of these undertakings needs to be considered before either of them can move forward.	Future Use is the responsibility of Government Services Administration (GSA) and outside the scope of this EIS. GSA will develop a NEPA document that will address the future uses of the site.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Carrie	Brown	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Amy	Browne	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Amy	Browne	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Richard	Browne	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Browne	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

Richard	Browne	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Richard	Browne	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas. We just know you'll do the right thing because you are a real life hero that can make science frontiers an advantage to mankind not just another way we hurt each other. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. Edie	Bruce	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. Edie	Bruce	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bruce	Burdick	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Patrick	Burke	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Martha W D	Bushnell	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Martha W D	Bushnell	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Ray	Bustos	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Emma	Campbell	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jean	Cannon	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

First Name	Last Name	Comment	NASA Response
Jean	Cannon	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Capaldi	<p>We were very encouraged when we heard that the AOCs, requiring cleanup to background, had been signed by both NASA and DOE on December 6, 2010. The AOCs brought peace of mind to our community. Whenever the Santa Ana's blow or the heavy rains come we feel extremely vulnerable living below and in the direct path of migrating deadly toxins. Our community is well aware that the Water Board has reported numerous violations of contaminants leaving the site. This is very disconcerting to us when we live below with creeks running through many of our properties.</p> <p>When our HOA Board members go to meetings and hear a few people further from the site showing little regard for cleaning up we try to understand. It is obviously hard for them to comprehend our fear of raising children and possibly exposing them to deadly carcinogens. For many years the contamination has been downplayed, but studies are proving otherwise. Our fear is magnified when we read reports showing studies that breast cancers are highest at the East end of Simi Valley and the West end of the San Fernando Valley.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>
Sandra	Capaldi	<p>We feel that the EIS needs to commit to focusing on the pollution that needs to be cleaned/removed in order to meet the background levels defined in the AOCs. When our neighborhood sees the EIS focusing on truck trips that are necessary to remove the contaminants and equates it to children's safety rather than recognizing the possible harm inflicted on all the children living beneath the site by migrating contamination we feel that NASA's EIS is missing the point.</p>	<p>NASA respects public concern regarding offsite health issues. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Capaldi	<p>We feel that the test stands are given more consideration than the health and welfare of our communities below. The AOC requires all of the contamination to be cleaned up. Much of that contamination is beneath the test stands. One cannot realistically meet NASA's commitment to clean up to background without getting the test stands out of the way to allow for a full cleanup of the ground beneath which we all know was horribly contaminated by TCE and other chemicals.</p> <p>Native American Artifacts are already protected under the AOC. But the discussion in the EIS seems to go far beyond the AOC to suggest that one might simply declare the whole 2850 acres of the longdegraded SSFL land "sacred" and rather than restoring the polluted land from its contaminated state perhaps walk away from one's cleanup obligations. The AOC does not permit that.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Capaldi	<p>We now live with the knowledge that UCLA and the Agency for Toxic Substances and Disease Registry have found elevated cancers in the workers and in people living offsite and close to the SSFL. This information enforces the realization that the site requires cleanup to background.</p>	<p>With respect to the UCLA studies you reference, the first study was published in 1997 and according to the DTSC's summaries, dealt only radiation and bases conclusions on workers exposed to radiation. NASA did not do any radiological research and as such would not have any workers in this category.</p> <p>The second UCLA study, published in 1999, was also funded by DOE and primarily dealt with presumptive exposures to hydrazine. It was a review of no-site workers, not neighboring populations.</p> <p>The third study you reference, by ATSDR, was published in 1999. According to DTSC's summary, "The preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects."</p> <p>See DTSC website at: http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm</p>
Sandra	Capaldi	<p>We applaud NASA for signing and committing to the AOCs and to a full cleanup to background. Please don't drag your feet or take the focus away from the important work of removing the contaminants and returning this beautiful site to how it was before you came. Future generations should have the privilege to safely experience the magnificence of this site.</p> <p>Our fundamental message about the EIS is that NASA must fully live up to the obligations it assumed in the AOC to completely clean up the pollution it created so close to our homes and families. There must be no backtracking.</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sandra	Capaldi	<p>NASA signed the Agreement on Constent (AOC) with the State of California in 2010 to cleanup it's property at SSFL to background levels. It was a happy day - the contamination would be taken care of and we would finally be rid of this terrible burden.</p> <p>Since NASA has released it's Draft Environmental Impact Report, I can see the importance of NASA following the AOC to the letter, period. The DEIS reveals the large extent of contamination NASA has created close to our community. The AOC requires that the contaminants be cleaned up and we expect you to live up to your commitments to do so. ...</p> <p>Many. many of us positively commented and supported the AOCs over 3700 - we ARE aware of the details. This is the only way that our neighborhood can be safe ad free of this terrible contamination!!!</p> <p>This is our home. We love it here - we have been lied to from the very start with this contamination being covered up for so very long. It is past time for all of the polluters involved to make it right and stop trying to weasel out of their responsibilities. NASA MUST fully comply with all of its obligations under the AOC.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Carpenter-Madoshi	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Beth	Caskie	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kenneth	Chan	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Christopher	Cherry	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Wendy	Cherry	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Wendy	Cherry	Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Wendy	Cherry	I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Wendy	Cherry	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Phoury	Chhun	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. Ming	Choi	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jess	Cirricione	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Susan	Clark	Through decades of sloppy environmental practices, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been migrating off the property.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6)</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Debbie	Cohen	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Debbie	Cohen	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Debbie	Cohen	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>
Tim	Cojocnean	<p>The EIS is deeply flawed, creating the impression that some lower level personnel at NASA are trying to sabotage the cleanup agreement entered into by their agency. For a science agency, the EIS is peculiarly non-scientific, seeming more a piece of propaganda than science.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Tim	Cojocnean	<p>It is supposed to examine the environmental impacts of cleaning the site up versus No Action, i.e., not remediating all that pollution NASA created. But the EIS is virtually silent about the latter, the big issue, all the contamination. Instead, the EIS tries to hype a far more secondary matter, how many truck trips it would take to clean the site up.</p> <p>But the fundamental issue is all the pollution your agency created by decades of poor practices. The EIS is virtually totally silent about those impacts. The EIS says there can be negative impacts on groundwater and surface water if there were cleanup, fairly bizarre. But it says virtually nothing about the environmental impacts of having groundwater, a beneficial resource, with vast amounts of TCE, perchlorate, and other toxic materials. The no action alternative would leave that beneficial resource environmentally destroyed for generations but you say virtually nothing about that.</p> <p>Surface water is constantly being contaminated by the soil contamination at the site, so that when rain falls it carries off the contaminants offsite, at levels the Water Board deems unsafe. The EIS hypes nutty claims about impacts on surface water if you clean up, but is essentially silent about the impacts of leaving that contamination to keep migrating offsite in surface runoff if the No Action alternative were adopted.</p> <p>The EIS makes hyped claims about impacts on biological resources if you have to clean up the contamination. This is great exaggeration because much of the contamination is in the already degraded areas where NASA built its structures that released the contamination. But you should focus on the revegetation and restoration necessary to restore the degraded land. Instead, you hype the effect of cleanup. But you are silent about the environmental damage done to biological resources by all the contamination you released and are essentially silent about the continued</p>	<p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
David	Comfort	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Louise	Corwell	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Louise	Corwell	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Edward	Costello	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diane	Crosley	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diane	Crosley	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diane	Crosley	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Jelena	Csanyi	<p>The whole project is not acceptable Damage to the health of the community far outweigh that of not doing anything Stripped this will produce dust for the next 100 years. How do you anticipate that Leave it alone / Fence it / Make it a museum / park/ At maximum if it must be done Do only residential standard.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jelena	Csanyi	<p>I have had the pleasure to visit the NASA property, to see the stands. I understand the concern of the people. If I were going to approach it from a simplistic point of view, this happened quite a few years ago. Let's say a few -- almost as old as I am. And as far as I understand, the pollution is in the rocks. You're going to remove the soil that has been washed by years and years of rain and leave the dirty, polluted rocks, and then let the rain continue washing those rocks.</p>	<p>Your comment involves two aspects of the cleanup efforts -- backfill and contamination within bedrock. As for backfill, whenever possible, topsoil from within SSFL will be used to replace the remediated topsoil; however, the sources of native topsoil within the vicinity of SSFL are limited and are unlikely to supply enough topsoil to replenish the entire area. The following potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California:</p> <ul style="list-style-type: none"> - P. W. Gillibrand Company, located in Simi Valley, California - Rindge Dam, located in Malibu Canyon, California - Santa Paula Materials, Inc., located in Santa Paula, California - Grimes Rock, Inc., located in Fillmore, California - Tapo Rock and Sand Products, located in Simi Valley, California <p>These soils will need further evaluation to determine if they meet the 2010 AOC requirements.</p> <p>For bedrock, most is beneath the groundwater level and, as such, becomes a groundwater cleanup issue that is discussed in this EIS. If contaminated bedrock exists in unsaturated (above groundwater) locations, it predominantly concerns volatile constituents and also is dealt with as part of the groundwater cleanup.</p>
Jelena	Csanyi	<p>And on top of that, you're going to use some of our precious, precious water because you're going to have to be watering during the work you are doing. And have you considered how much of our water are you going to be using up that we have to pay a lot of money and you're going to have to pay a lot of money if you're probably paying the money that you're going to be paying.</p>	<p>NASA will update the EIS to evaluate the potential impacts to water resources as a result of water usage during the remediation activities (Sections 4.10 and 4.10.1.2).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jelena	Csanyi	<p>And that water is going to wash more of the pollutants off the rocks. So for those people who are concerned about the water pollution, I think the top soil and the plants are protecting the erosion. Nothing is going to protect it. Once you make it naked, it's going to be naked for 100 years.</p>	<p>Site activities would take place in accordance with the statewide General Permit for Stormwater Discharges Associated with Construction Activity. As required by this permit, NASA would prepare plans that specify site management activities to protect stormwater runoff and to minimize erosion during construction, operation, and maintenance of the project. These management activities would include construction stormwater BMPs (silt fences, sand bags, straw waddles, and tire washes), dewatering runoff controls, containment for chemical storage areas, and construction equipment decontamination. NASA also would continue monitoring offsite drainages for increased sediment load and contamination.</p> <p>Once the soil was removed, the existing micro-ecosystem might never be restored. It can take years for native species to reestablish in disturbed areas, and the species composition would be different from what was originally there, despite reseeding with approved native plant seeds. Whenever possible, topsoil would be imported, along with backfill, to replace the remediated topsoil; however, the sources of native topsoil within the vicinity of SSFL are limited and are unlikely to supply enough topsoil to replenish the entire 39-acre area. If non-native soil were to be used, it would be unlikely to support the current plant distributions on SSFL.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jelena	Csanyi	For people who don't know what the covered truck traveling down the road dispenses, let's put it that way, ride behind one on a motorcycle. It's covered. They did everything that they are supposed to do, but you're going to be bombarded with more than you can possibly stand. And you can stay three, four vehicles behind, and you're going to still be getting the dust and the rocks. It just does not go that we covert and it's gone.	<p>Your comment is noted.</p> <p>Fugitive dust emissions would be controlled by measures prescribed by VCAPCD Rule 55. Specifically, NASA would load materials carefully to minimize the potential for spills or dust creation; implement water spraying as needed to suppress potential dust generation during loading operations; take care to apply dust suppression water to the top of the load or source material to avoid wetting the truck tires; and would not perform loading during unfavorable weather conditions (such as high winds or storms). Material spilled during loading would be collected for subsequent loading. After loading, trucks would pass through the decontamination and inspection station before weighing and departure from SSFL.</p>
Jelena	Csanyi	And you're going to be -- as far as I know, we live on one Earth. You take the pollution from here and you're going to go pollute it somewhere else, and then people from there say, oh, move it somewhere else. When are we going to start moving it to moon because, oh, we don't want it here?	NASA recognizes your concern regarding moving contamination from one area to a landfill. A landfill will provide safe and final disposal.
Jelena	Csanyi	We just -- it is absolutely unbelievable to me that you are not considering the -- every aspect of this. Water. I mean, we barely have enough water for what we have now. You're going to -- how many gallons of water are you going to use? Where are those numbers?	NASA will update the EIS to include an evaluation of the water that will be required for dust suppression during soil excavation activities and its potential impacts (Sections 4.10 and 4.10.1.2).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jelena	Csanyi	Where are the -- and the truck numbers. Probably below the normal. And that you should -- for people who don't understand how many those trucks are, compare it to traffic on the freeway. I live on Topanga Canyon. Most of the people here know me. Took me ten minutes this morning at 8:00 o'clock to get out of my house. Ten minutes, because there was -- there was just so much traffic. Add to it 80,000 trucks. I might as well buy a helicopter.	Your comment is noted. The number of trucks required is predominantly a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities, and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus are not valid options. Section 4.5 in the EIS discusses transportation routes further (also for Alternate routes that do exist, see Figure 4.5-1).
Jelena	Csanyi	This project needs to be redone from the ground up as it was presented it is totally not acceptable.	NASA appreciates the comment but believes the analysis is adequate.
Jelena	Csanyi	Starting from the point that clean up need to be done, the next logical step is a decision what will be the land used for after clean up is completed. Presuming we do not want to do more damage than good or spend more taxpayer money then we must, the level of cleanup must be related to future plan for use of land.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jelena	Csanyi	<p>This land contains precious irreplaceable archeological sites of national importance and is part of a wildlife corridor so the only logical use for it is to make an National Park.</p> <p>Cleaning it to a standard higher then even residential is ridiculous...excessively damaging to the environment, waste of money and resources.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>Please refer to the Programmatic Agreement and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 will be incorporated in the Programmatic Agreement and/or ROD.</p>
Jelena	Csanyi	<p>The proposed plan does not address the amount of potable WATER that will have to be used for dust mitigation.</p> <p>We have a water shortage around here. Additional demand will impact this, further raise prices and burden all of us.</p> <p>The water needed to mitigate dust from the "clean up to unreasonable Background standard" is vital for our residents, farmers, ranchers, plants, animals.</p> <p>By the way this is probably more water than the total rain fall on the area in the last 50 years.</p>	<p>NASA acknowledges your comment. NASA will consider re-using the water from the truck wash down for the remediation dust suppressant. NASA will consider discussing with DTSC being able to use the treated GETS water for dust suppression.</p> <p>NASA will update the EIS to evaluate the potential impacts to water resources as a result of water usage during the remediation activities (Sections 4.10, 4.10.1.2).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jelena	Csanyi	<p>DUST: The undisturbed soil in these hills contain Valley fever spores. This was NEVER considered. There MUST be a study of health effect of the action on the population down wind from NASA site, Chatsworth, Lake Manor etc.</p> <p>Area is very windy. This bring me to question if the plan has taken into consideration the following facts....that even with watering to control the dust while working and the area worked ...no one waters at night or area not worked but already stripped. Who will water to keep dust down for years after it is all stripped.... How does this fit into AQMD standards.</p>	<p>Valley fever is caused by a fungi, Coocidiodes immitis or Coccidioides posadasii, found in arid desert soils. When the soil is disturbed, spores are released into the air and can be carried on the wind. People are exposed when they breathe in the spores. Most people who are exposed do not get sick; however, valley fever can cause flu-like symptoms and, in rare cases, cause meningitis and even death. The soils at SSFL have not been sampled for the fungi that cause valley fever. To meet the AOC cleanup requirements, approximately 500,000 cubic yards of soil will be disturbed. If cleanup alternatives other than soil removal could be used, the amount of soil disturbed would be reduced by approximately 180,000 cubic yards and the dust emissions reduced by approximately 19% . Release of dust during remediation and demolition will be controlled by wetting the soil, limiting the stockpile area to 0.14 acre and height to 8 feet, covering roads with gravel, etc., limiting speed of vehicles, placing tarps over or barriers around stockpiles of soil, ceasing loading during high winds or storms, and removing bulk material from trucks. After remediation, the previously vegetated areas will be planted with a native seed mix.</p>
Jelena	Csanyi	<p>AIR QUALITY...Problems</p> <p>There are estimates of 80.000 truck loads of soil to be moved-driven of site.. more to bring some soil back.... How many tons of exhaust particulates are added, calculating total for all of the haul routes... Inevitable loss of "contaminated soil" along the route (try riding a motorcycle behind a properly covered dirt truck and you will understand the concern).</p> <p>Exhaust fumes...the travel route is via communities of Lake Manor and Chatsworth to name only the first two, route passes by Chatsworth Park Elementary School located on the corner of Topanga and Devonshire...what do we do --Close the School for the "few" years this will take. These issues MUST be addressed....MUST.</p>	<p>NASA will consider using newer model-year haul trucks or alternative-fueled construction equipment, which would have a co-benefit of reducing criteria pollutant emissions as well as GHG emissions. More information can be found in Section 4.5 of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jelena	Csanyi	ECO SYSTEM --Sorry but I do not believe it will recover nothing grows on a rock.	The analysis shows that impacts to soils and biology will be significant. The removal of large amount of soils is required to meet the cleanup standards in the AOC. It is possible that the eco system may take years to recover or never recover to its native state.
Jelena	Csanyi	There is but one Planet Earth.... This clean up is done because there is contamination HERE, to take care of it... the proposal is to take the top layer of soil someplace else-thus contaminating other area or 2 or 6. I called it "spread the poo" ...WHY...the rocks will still have contaminants ...the ground water will not be clean..	The analysis shows that impacts to soils will be significant. The removal of large amount of soils to landfills is required to meet the cleanup standards in the AOC. Groundwater remediation is being planned.
Jelena	Csanyi	Are the residents near the land fills the soil is taken to aware of this import or is the country going to be facing another CLEAN UP years from now.	NASA has already had communications with the landfills about the project.
Jelena	Csanyi	I know you are required to "CLEAN IT UP" BUT People worried about the soil should just not go there when it becomes a NATIONAL PARK. People concerned with ground water can- DRINK BOTTLED WATER but WE CANNOT BREATHE BOTTLED AIR ...PLEASE take that into consideration.	NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments.

Richard	Cusano	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Cusano	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Cusano	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Richard	Cusano	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

First Name	Last Name	Comment	NASA Response
Richard	Cusano	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Robert	Dager	<p>Although the problem of dust control is touched on in the DEIS, no concern is paid to the millions of gallons of fresh drinking water that will be required for this onsite control.</p> <p>Water is, and always has been, a vital concern to the communities and population of Southern California.</p> <p>Where is the examination of this aspect of the proposed cleanup ?</p>	<p>NASA will update the EIS to evaluate the potential impacts to water resources as a result of water usage during the remediation activities (Sections 4.10, 4.10.1.2)</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Robert	Dager	<p>This DEIS is flawed in that it violates the spirit of the National Environmental Protect Act and the California Environmental Quality Act by presenting only the alternatives of ""no cleanup" and the draconian "background cleanup".</p> <p>These two environmental protection acts require that all practical levels of cleanup be presented and are balanced against costs, and cultural and environmental impacts.</p> <p>Even though this EIS may have been made through some twisting of the letter of these laws, it should be rewritten to comply with the spirit of the laws.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>In addition to the Proposed Action, NASA considered alternatives other than a cleanup to background as stipulated in the 2010 AOC. The action alternatives considered and evaluated would implement the soil and groundwater remediation technologies previously discussed to achieve various risk-based cleanup levels, specifically the Suburban Residential, Commercial/Industrial, and Recreational risk-based cleanup levels. These risk-based alternatives were eliminated from further consideration because they would not meet the requirements of the 2010 AOC. In addition, a CEQ letter dated June 19, 2012 (Appendix A), states that NASA is not compelled to consider comprehensive cleanup measures as alternatives that are less than the cleanup to local background levels described in the 2010 AOC. Additional information regarding these alternatives is provided on NASA's SSFL website.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Robert	Dager	<p>In the NASA Draft EIS, it states that "existing and proposed land uses do not conflict with Federal or State land use plans, policies, regulations or laws. Therefore no impacts to land use would occur.</p> <p>This completely avoids the topic of future land use.</p>	<p>This is intended as a statement regarding if the action eliminates future land uses. NASA believes the proposed demolition and environmental cleanup activities would not result in a change in land use on the NASA-administered property; implementation of the Proposed Action or action alternatives would not require a change in zoning, and no easements or land encroachments would be necessary. No land use acquisitions or transfers would be required.</p> <p>While the soil, topography, and biological resource impacts may diminish the use as park space, it does not preclude that use.</p>
Robert	Dager	<p>How can you exclude the proposed action's impacts on future land use without considering that future land use and analyzing it? The cleanup should fit the future use, not some draconian standard that moonscapes the property without any consideration of what it will really be used for.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background. Thank you for your comments.</p>
Robert	Dager	<p>The DEIS addresses the sites available to receive the contaminated soil removed from the 100+ acres of land at the Santa Susana Field Laboratory, but fails to mention where the soil will be found to replace it. From my reading of the document, about the removed soil will be replaced by "clean" soil of approximately 1/3 of the amount removed.</p> <p>Where are you going to obtain that amount of soil that is compatible with this area? It will have to meet the DTSC standards (Lookup Tables) and be of similar components to allow the natural plants of this area to regrow.</p>	<p>Whenever possible, topsoil from within SSFL will be used to replace the remediated topsoil; however, the sources of native topsoil within the vicinity of SSFL are limited and are unlikely to supply enough topsoil to replenish the entire area. The following potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California:</p>

Diana	Delgado	<p>I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Delgado	<p>NASA activities led to widespread contamination of soil and groundwater with very toxic materials such as perchlorate, dioxins, and TCE. Some of the contaminants have been migrating offsite. As a local resident, I am very concerned about the potential health impacts of these materials and want the site cleaned up properly.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Lori	DeMersseman	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Pamela	Demirdjian	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Pamela	Demirdjian	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ann	Dente	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

First Name	Last Name	Comment	NASA Response
Ann	Dente	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Debbie	Diamond	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>
Dixon-Davis	Diana	I, as a scientist, say this DEIS applies to the NASA property as it exists now.	NASA appreciates your comment.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dixon-Davis	Diana	First, I think you need to define clearly the definition of agricultural cleanup ... But you'll find every one of these levels of contamination as DTSC and, I think, the federal government also used, to define what is called agricultural cleanup, what is called rural residential, urban residential, and parkland. That would be at one table.	NASA will develop a table of the primary chemical of concern that shows the various cleanup values in comparison to the Look-up Tables values published by DTSC. This table will be posted on the NASA SSFL website.
Dixon-Davis	Diana	Another table would be the same chemicals showing the current level of each of those chemicals as measured throughout the site, with the realization that different parts of the site have different levels of these chemicals.	Table 3.8-2 lists the COCs by RI Group. A table was added to the H&S section listing the COCs that were risk drivers and what exposure scenario(s) are at risk (Section 3.9.5).

First Name	Last Name	Comment	NASA Response
Dixon-Davis	Diana	<p>Secondly, I'd like to see a table with each of these chemicals, which ones have had actual epidemiologic studies or toxicological studies done showing at what level a toxic result is there. ... We have to look at what is a reasonable level of contamination, one that has actually health effects. And this is what I consider the major deficit in this study is that it does not define the level of health effects of the current conditions at the lab.</p>	<p>Table 3.8-2 lists the COCs by RI Group. A table was added to the H&S section listing the COCs that were risk drivers and what exposure scenario(s) are at risk (Section 3.9.5).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dixon-Davis	Diana	<p>I think there needs to be a protocol in all the DEIS, throughout all the earth moving to test for Valley Fever. Valley Fever is a fungus. It's in all of our soils every time soil is disturbed in this area. Earthquakes do it, ground movement, grading, whatever. The fungus goes into the air and people get sick. And Valley Fever is a rather serious disease and cannot be easily treated or easily even detected. So I think there needs to be a protocol in the DEIS that says the Valley Fever fungus will be tested for in all excavation sites on an ongoing basis.</p>	<p>Valley fever is caused by a fungi, <i>Coccidioides immitis</i> or <i>Coccidioides posadasii</i>, found in arid desert soils. When the soil is disturbed, spores are released into the air and can be carried on the wind. People are exposed when they breath in the spores. Most people who are exposed do not get sick; however, valley fever can cause flu-like symptoms, and, in rare cases, cause meningitis and even death. The soils at SSFL have not been sampled for the fungi that cause valley fever. To meet the AOC cleanup requirements, approximately 500,000 cubic yards of soil will be disturbed. If cleanup alternatives other than soil removal could be used, the amount of soil disturbed would be reduced by approximately 180,000 cubic yards and the dust emissions reduced by approximately 19% . Release of dust during remediation and demolition will be controlled by wetting the soil, limiting the stockpile area to 0.14 acre and height to 8 feet, covering roads with gravel, etc., limiting speed of vehicles, placing tarps over or barriers around stockpiles of soil, ceasing loading during high winds or storms, and removing bulk material from trucks. After remediation, the previously vegetated areas will be planted with a native seed mix.</p> <p>See EIS Section 4.7, Air Quality BMP-1, and Air Quality MM-3.</p>
Karen	DiBiase	<p>I strongly suggest that an alternate choice for the proposed demolition and Environmental cleanup be considered. the proposed action of "cleanup to background levels" will destroy the local landscape, endanger already protected plant and animal life, be hazardous to the local community concerning the trucks removing soil and traveling through our local neighborhoods.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Karen	DiBiase	Page 2-36 from the SASA DEIS lists the offsite dumpgrounds for soil removed from the SSFL. These trucks will travel across the street from several schools, retirement homes, three shopping centers and one park before continuing on the freeways to the eventual dump site (between 51 miles and 712 miles from the SFL site). There is no mention anywhere in the DEIS stating how these truck will be covered, and therefore protecting the local neighborhoods. There is also no mention anywhere in the DEIS were "clean soil" will be acquired to replace 1/3 of what is removed. This still leaves a major hole in the ground.	<p>Table 6.1-1 describes how excavated materials will be handled. After loading, trucks would pass through the decontamination and inspection station before weighing and departure from SSFL. Decontaminate trucks by dry brushing before they leave the staging and loading areas to prevent track out. For transportation, use properly secured tarps that cover the entire surface area of the load or use a container-type enclosure, maintain a minimum of 6 inches of freeboard, or water or otherwise treat the bulk material to minimize loss of material to wind or spillage. It is expected that use of secured tarps and maintaining six inches of freeboard could reduce fugitive dust emissions by up to 91 percent.</p> <p>Section 2.2 of the EIS identifies potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California. According to the 2010 AOC backfill soil must meet the LUTvalues. These sources have not been evaluated to determine if they can meet the 2010 AOC requirement. (see DTSC website - http://www.dtsc-ssfl.com/files/lib_look-uptables/chemical/66073_06112013LUTand_cover.pdf)</p>
Karen	DiBiase	This picture demonstrates that more harm than good will be caused by removing soil to this level. Native plants and animals will not survive this type of destruction. This area is a migratory area for birds and animals that are protected and can not be diverted or relocated to other nearby areas.	NASA acknowledges your comment
Karen	DiBiase	These test site structures should be preserved for future generations to show our nation's space technology. These test sites are not replaceable. Again, "cleanup to background level" will destroy this history of our area and can be replaced.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Karen	DiBiase	I respectfully submit that alternate cleanup or no action alternative be chosen (see page 2-35 of the DEIS).	NASA acknowledges your comment

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jan	Dietrick	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kevin	Diggs	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Kevin	Diggs	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Kevin	Diggs	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

Kevin	Diggs	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Mark	DiMaria	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. Diana	Dixon-Davis	Merrilee Fellowes has directed me to request from you a hard copy of the DEIS for the SSFL /DEIS July 2013. (I have the CD, but find it harder to analyze re maps, etc.).	NASA staff provided a limited number of paper copies on a first-request basis.
Diana	Dixon-Davis	And one of the first things I wanted to ask is in the DEIS, they constantly refer to the Chatsworth Reservoir. Since 1984 it's been the Chatsworth Nature Preserve, and I hope that that will be changed in your document. And also, in the evaluation, every single truck that comes and goes and every single worker that comes and goes, goes right around that nature preserve. And the pollution from those vehicles is affecting that nature preserve, and it is a nature preserve, not a reservoir.	NASA appreciates the comment and will reflect the appropriate terminology in the EIS (Table 3.12-1 and Appendixes D, E, F, and G).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	<p>Second point, I think we have -- that before the EIS can be complete unless current -- measure, identify, quantify, and verify the current health risks that exist at the site. Right now it is a lot of suppositions. Yes, it has all these chemicals, but frankly, if any of you ever smoked a cigarette, you've all been exposed to about 1000 chemicals plus lots of radiation, or if you've even smelled cigarette smoke.</p> <p>So it's the quantity that's important, not the existence of the chemicals. So that's my second point. So I want all -- I would like to have this DEIS expanded with, again, identifying, measuring, and verifying the fact that there is a health risk from the current -- from the current land at the -- at the site.</p>	<p>Based on these and other comments, NASA will revise the EIS to reflect the impacts of contaminants if left in place, as well as to include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	<p>Thirdly, I'd like to identify the final use and have -- in other words, there are several final uses. It could be used as a park. It could be -- and that's one of the major things that people are pushing for. It could be used to build homes on, which is residential cleanup. It could be used to grow food on, which is pretty unlikely, but that's what we're actually measuring even cleaner than what you would need for growing food on the land.</p> <p>So there needs to be an identification of the various ways that the land can be used and then various ways to mitigate, to meet those ultimate needs. Right now the cart is before the horse in terms of the way the EIS is written.</p> <p>I want to have developed alternatives, like I said, on the basis of final use, the various scenarios for final use, and for different areas, because different parts of the -- of the NASA property, in fact of the entire land, are to have differential levels of impact on humans. We have a buffer zone, which is basically pristine land from before anybody was here except for the Native Americans. And then we have areas which have been heavily impacted.</p> <p>We need to have alternatives meet the -- matched to the area's level of contamination, not just a wholesale everybody gets -- you know, everyone is treated the same, as which is currently in the DEIS.</p>	<p>For soil cleanup, the AOC requires the most restrictive cleanup. As such, the result will allow for any land use that the future owners might desire. NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS, and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	I also want to mention the fact that they talk about repairing the Woolsey Canyon Road. Well, these trucks, if the current mitigation plans go through as postulated, they will damage not only Woolsey Canyon but Valley Circle, Lake Manor Drive, Plummer, Roscoe, Topanga, et cetera. Those -- they must also commit to repairing all those roads and considering the impacts on those roads.	Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that go toward road maintenance.
Diana	Dixon-Davis	And lastly, I want to tell you the story of Chatsworth Elementary. Chatsworth Elementary has a set of classrooms which are no further away from Topanga Canyon than you are on the stage from me. Those classrooms used to be so noisy that LAUSD, before they air conditioned all the other schools and spent money on that finally, they actually air conditioned that whole wing and put in double-pane windows because the noise in the classroom, if you opened up a window, was so loud from the road that the teacher could not be heard at the back of the classroom.	NASA acknowledges your comment.
Diana	Dixon-Davis	In addition, trucks -- big trucks at that intersection, one truck fell over and killed a crossing guard. So it is a dangerous intersection. And in fact, the traffic plans, they are averages. They don't consider peak flow, and I can tell you that there's a series of intersections, Roscoe, Lassen, Chatsworth -- I mean, Devonshire and Chatsworth all back up a block of traffic, two blocks of traffic every day during the morning rush hour, at noon, in the afternoon when school's out, and in the evening So if you leave the free times that are available, you only get two or three hours a day when the traffic flows freely on Topanga. That needs to be added into your traffic study.	As described in the EIS, after trucks leave Woolsey Canyon Road, project-related traffic is negligible as compared to the existing traffic levels.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	<p>And I wanted to mention that Department of Toxic Substance Control has currently considered capping as an alternative way of mitigating hazards, especially -- we have a situation in Chatsworth Park South where there are actual lead pellets on the ground.</p> <p>And they are -- instead of removing all the soil, they are actually capping it and it's going to -- they consider that to be an acceptable alternative, which I think must be considered given all the problems with removing soil. And it is an acceptable method being used in our area, given our winds and our soil and our winds, et cetera. So anyway, I hope that's included in the revised EIS.</p>	<p>The AOC does not allow for contamination to remain in place; therefore, capping was not selected as a remedial technology. It was eliminated from consideration as described in Section 2.4.2.1 of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	<p>The second thing I wanted to mention was the wildlife corridors. ... For some unimaginable reason, the wildlife corridors do not cover the NASA property. And yet right south -- very few animals can tell the difference between this side of a line and that side of a property line in an open field.</p> <p>Frankly, all of these areas are part -- this whole area is a wildlife corridor. There are a number of -- also the County has identified a number of significant ecological areas all along the edge of the L.A. County, and I'm currently trying to get similar data from Simi Valle</p> <p>They have identified this whole area as a critical wildlife corridor and a choke point for the wildlife that are up in the Santa Clarita woodlands area leading down to the Santa Monica Mountains. And they feel that if this area is choked off for some reason, not just removing all plants and soil and things like that, there will be a -- it will create an island effect for the Santa Monica Mountains.</p> <p>So maintaining the wildlife corridors is another rationale for doing as minimal as possible removal of soil biota from that area.</p>	<p>NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. Although the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area. The EIS text will be revised to reflect that the migration corridor may include SSFL (Sections 3.4.2, 4.4.1.2, and 4.4.1.3).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	<p>The NASA DEIS contains three major deficiencies in regard to wildlife corridors:</p> <ol style="list-style-type: none"> 1. Effects on Chatsworth Nature Preserve are not evaluated. 2. Ignoring known , research verified, wild life ranges, 3. Use of flawed resources for DEIS wildlife corridor characterizations. 	<p>The wildlife corridor map was obtained from the Ventura County Planning Commission.</p>
Diana	Dixon-Davis	<p>There needs to be a reassessment of singular impact (NASA) and cumulative impacts (remainder of the SSFL Site i.e Boeing and DOE) and the effects of Clean Up to Background (CUB) on Biology. It can not be claimed that CUB is considered beneficial to Biology. (Table ES-2). Air pollution and water pollution and diversion must be factored into a cost/benefit analysis as to the impact on local communities, not just the SSFL site.</p>	<p>NASA considers that there are some net beneficial impacts to the cleanup by removing contaminants from the soil that could affect wildlife. NASA also recognizes in section 4.4.1.3. that there will be significant impacts to native vegetation communities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	I and my community want to be presented alternatives that will leave the area as natural as possible. I want the area to become a State or Federal Park; connected up with the Rim of the Valley master park, with a realistic preservation of this "choke point" wildlife corridor from the Santa Clarita Woodlands to the Santa Monica Mountains National Recreational Area.	NASA recognizes public concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been addressed in the EIS. NASA acknowledges that there could be reduced impacts by using risk-based alternatives. NASA has chosen to analyze only the alternatives of (a) cleanup to background and (b) the no-action alternative. NASA will comply with the current AOC as drafted. NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area.
Diana	Dixon-Davis	The Chatsworth Nature Preserve (CNP) is repeatedly identified as the Chatsworth Reservoir thorough out the DEIS (i.e Figure 2.1-1, et al). This Los Angeles City, Department of Water and Power property was reclassified as a Nature Preserve in 1997 with some areas having a Perpetual Environmental Easement as of 2011. This needs to corrected throughout the DEIS.	NASA appreciates the comment and will reflect the appropriate terminology in the EIS (Table 3.12-1 and Appendix D, E, F, and G)..

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	The individual and cumulative effects of air pollution, accidents, and dust and debris from the large number of trucks removing and bring in soil under CUB must be assessed on this Nature Preserve and its Permanent Environmental Easement wetland. Since all truck traffic and employee traffic will pass around a significant part of the Chatsworth Nature Preserve. The CNP's Permanent Environmental Easement is within a few feet of the intersection of Woolsey Canyon Road and Valley Circle Drive. This level of traffic will negatively effect movement of wildlife into and out of the CNP. The community of Lake View Manor and along Roscoe Blvd will also be subject to major traffic impacts.	NASA has explored techniques for reducing the amount of material to be moved offsite per Section 2.2 of the EIS. The EIS addressed impacts and MMs such as air pollution, noise, and traffic related to transportation of materials to the landfills. The project would result in a temporary increase in traffic and would be minimized to the furthest extent possible through implementation of Traffic MM-1 and MM-2. NASA will comply with the CTCP during the implementation of the demolition and environmental cleanup activities. Implementation of the CTCP will minimize traffic impacts to the extent feasible, including minimizing impacts to wildlife movement.
Diana	Dixon-Davis	The individual and cumulative effects of the diversion and disruption of water flow into the Chatsworth Nature Preserve and local Blue Line streams (Bell Canyon, Black Canyon) must also be evaluated.	Refer to Section 4.6 for impacts to water resources and Section 4.13 for cumulative impacts
Diana	Dixon-Davis	Wildlife corridors and ranges cover all of the SSFL, including the NASA area. Wildlife do not recognize the boundaries of the NASA property, As shown by Dr. Seth Riley Assistant Adjunct Professor, UCLA, Department of Ecology and Evolutionary Biology who has mapped the home ranges of many of the Los Angeles and Ventura County mountain lions. (See mapped home ranges at http://aprodxn.com/laist/zfiles/LAist-mountain-lion-map.jpg). The wildlife corridor section of the SSFL DEIS must be corrected based on this research and the effects of CUB re-evaluated.	NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	<p>The use of questionable data and unverified sources must be corrected. This portion of the DEIS must be redone.</p> <p>An expert on wildlife corridors has evaluated the “Wildlife Corridors” described in the DEIS with the following criticisms: “In sum, this NASA DEIS statement: “However, the NASA administered portions of SSFL are outside of the critical habitat corridors in the region identified by the U.S. Fish and Wildlife Service (USFWS) (Figure 23.)4(-Ventura County, 2005)” contains two important factual errors 1. the corridors were not identified by the USFWS and 2. the citation is not to the source of the corridor maps either, it was taken from another source and printed in the UCSB report then is cited as “Ventura County, 2005”. This is a serious error of professional judgment; the use of unvalidated predictive wildlife movement models for the purpose of impact assessment.</p>	<p>The wildlife corridor map was obtained from the Ventura County Planning Commission.</p>
Diana	Dixon-Davis	<p>IN SUMMARY A cost/ benefit should be done to analyze costs associated with CUB cleanup versus costs to the surrounding communities and the Chatsworth Nature Preserve of truck traffic, damage to environment, and destruction of historical and cultural treasures. These costs must be weighed against currently unknown community health benefits of CUB on site. Cleanup of SSFL to Parkland Standards also has the very high and known benefits of creating a large park connecting the Santa Monica Mountains National Recreational Area, through the Rim of the Valley (proposed National Park) , Santa Susana State Historic Park, with the Santa Clarita Woodlands Park, and the Angeles National Forest.</p>	<p>Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, and reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that go towards road maintenance.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	The current NASA DEIS is so limited in scope and constrained in considerations of remediations that it makes no sense under the NEPA process or subsequent laws. NEPA does not prohibit any actions, rather it should consider all possible and reasonable alternatives.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.
Diana	Dixon-Davis	The large number of trucks needed to haul out dirt from the SSFL, will produce large swatches of air pollution all along their routes. Numerous studies have been done on the negative effects of air pollution on Southern California communities.	The air quality impacts are in Section 4.7 and include short-term increases in emissions of criteria pollutants, GHGs, and/or fugitive dust associated with proposed activities or long-term increases in emissions of criteria pollutants, GHGs, and/or fugitive dust associated with the operation of remedial technologies.
Diana	Dixon-Davis	The NASA DEIS presented traffic studies do not match my on the ground observations.	The impacts of the truck traffic, as defined by studies and data, is presented in Section 4.5. Although the studies may not represent all conditions at all times, the studies are an accurate representation of the anticipated truck traffic.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	Another way to reduce the impacts of the site cleanup is to reduce the amount of demolition and soil removal. The cost/benefit of STIG, phytoremediation, treat in place, encapsulation, etc. and other remediation strategies must be considered.	NASA considered a range of remedial action technologies to comparatively identify what impacts may result from the background cleanup to meet the AOC deadline of 2017. Technologies analyzed in the EIS included options to soil removal. The EIS considered the effectiveness of each technology and effects of impacts on items such as native vegetation, air quality, truck traffic, noise, wildlife, and cultural resources at SSFL. Some of the technologies considered include excavation (not applicable to groundwater or bedrock), enhanced biological treatment, in-situ treatment, and ex-situ treatment.
Diana	Dixon-Davis	No soil or debris removal during peak traffic hours.	In order to meet the deadlines in the AOC, NASA will need to transport soil offsite during peak hours. However, if the AOC deadlines change, NASA will limit truck traffic during peak hours.
Diana	Dixon-Davis	A NASA paid crossing guard at the Topanga and Devonshire intersection to protect children from truck traffic unless prohibition of truck traffic during school arrival and dismissal hours is implemented. Consider crossing guards and extra traffic signals all along the residential portions of the haul routes.	As noted in the EIS, the project-related truck trips represent a negligible increase in traffic on the study roadways. Although the potential for a crash to occur does exist, the truck crash rate would not change with the project-added truck trips. Additional mitigations should not be necessary but was considered by NASA.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	<p>In order for the decision makers and the public to better understand the nature of the Clean up to Background (CUB) and have accurate information for making decisions and to do realistic cost/benefit analysis the following points below need to be added to the DEIS.</p> <p>The current level of risk of the SSFL to human health must be measured. A cost/ benefit and health-risk based re-evaluation of the all cleanup proposals based on the ultimate use of the SSFL and NASA sites must be added to the DEIS.</p> <p>A summary/cumulative assessment made which combines the singular impact (NASA) and cumulative impacts (remainder of the SSFL i.e.Boeing, DOE Site) and the effects of Cleanup to Background (CUB) on Health Risks—current and future, and those caused by CUB and if finally presented, each one of the proposed cleanup standards and proposals.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>NASA has compared the risk for cleanup to residential and the cleanup to background. Based on this comparative analysis, cleanup to the background scenario is more conservative than necessary to protect human health and the environment based on three factors: (1) application of cleanup levels that are 2 to more than 1 million times more conservative than risk-based levels, (2) potentially requiring cleanup of up to 51 chemicals that do not pose risk, and (3) potentially impacting 87 additional acres when compared to a suburban residential risk-based cleanup.</p> <p>Consequently, the benefit to human health and the environment of cleaning up to background is questionable for several reasons. The more aggressive remediation of the site that would occur under the background cleanup (more soil removal, more trucks entering the site, more emissions, more road miles, more soil to dispose of in landfills, etc.) could result in an increase in traffic accidents, spills, and habitat modification and disturbance of wildlife, all of which might result in reduced net benefits when compared to the risk-based cleanup scenario. Because only 10 percent of those analytes detected in soil are identified based on risk estimates as requiring remediation under the background cleanup scenario, the overall net benefit of cleaning up to background for all chemicals as opposed to a risk-based cleanup is low.</p> <p>Additional information can be found at NASA's SSFL website.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	<p>Replacing “contaminated” soil with more contaminated soil is an unacceptable alternative.</p> <p>This requirement for identifying acceptable quantity and quality of fill soil must be met before any cleanup strategy is selected.</p> <p>Once the supply of “clean replacement soil” is used up, no more soil removal should occur.</p> <p>The DEIS currently only proposes replacing 1/3 of the soil removed. This is also an unacceptable solution.</p> <p>Because the top 2 feet of soil is deemed non-treatable by the DEIS, it will under the current DEIS all be removed. This is an unacceptably rigid standard.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Diana	Dixon-Davis	<p>There needs to be a revision of the NASA DEIS which will, at a minimum, include the standard 6 alternatives between “Do Nothing” plus the Look up Tables (LUT) “Cleanup to Background” (CUB) levels for the approximately 450 trigger point chemicals and compounds. To my knowledge all other EIS evaluation for major projects done for California and all other states include these varied standards. Exclusion of these intermediate evaluations for only the NASA/ DEIS raises serious questions as to its even minimal usefulness.</p>	<p>NASA originally proposed to evaluate a cleanup to background (proposed action) that meets the 2010 AOC requirements, a no action alternative, and three other alternatives that are normally analyzed for a typical Superfund cleanup based on common cleanup goals associated with risk-based scenarios to evaluate the full range of options and their associated environmental or cultural impacts. Additionally, we always included evaluation of the different technological approaches to soil and groundwater cleanup. These additional three alternatives included a cleanup to suburban residential, industrial, and recreational cleanup standards. Based on input from multiple parties, NASA streamlined the evaluation to only one alternative which reflects the AOC background cleanup levels, while examining impacts of various technologies to meet that goal, that is, how to meet the AOC level. CEQ’s letter dated July 19, 2012 states, “However, there is no requirement that NASA consider alternatives that cleanup to other standards that differ from the agreement with the State.”</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	The current existing total level of health risk to the community that the current SSFL site poses (as is, before cleanup) must be calculated and compared to the postulated "improvements" resulting from the CUB cleanup, in order to see if cleanup achieves a measurable level of improvement to public health.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Diana	Dixon-Davis	Health Risk evaluations must include all realistic ,on-site and off-site risks.	Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Diana	Dixon-Davis	Evaluation of the cost/benefits of slower but equally/ almost as effective remediation alternatives such as phytoremediation (plant based), treat soil and water in place, encapsulation of contaminated soil, and natural attenuation must be done. There is no requirement that the SSFL Cleanup be completed by a date certain, only a politically set date. (ES-3.1.2.2)	The 2010 AOC between DTSC and NASA says "The schedule shall ensure that the identified activities can be accomplished by 2017 or sooner." This can only be changed by mutual agreement with DTSC. NASA will meet with DTSC to seek clarification of this requirement.
Diana	Dixon-Davis	Consideration of differential/ alternative cleanup treatments for different areas within the site must be evaluated. This consideration must be done in regards to the Chumash religious and cultural areas and the Test Stand areas so that these historical sites are preserved and not destroyed or altered by the cleanup process.	Please refer to the Programmatic Agreement (PA) and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 were incorporated in the PA and/or ROD. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as NASA determines whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.
Diana	Dixon-Davis	Consideration of the ultimate use of the SSFL as a park and then work backward to re-evaluation of the health risks and the cost/benefits of the entire cleanup with this outcome in mind.	NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.

Diana	Dixon-Davis	Alternate uses for Federal Funds. It is quite possible that the funds spent on the highest level of cleanup could be much more effectively used for public health measures that would broadly benefit everyone living around the SSFL site. This might reduce health risks much more than CUB will do. See especially the current use of ground water and wells in the Simi Valley area. NASA and the Federal Government must decide how much money will be spent on this project and to what benefit., especially when many other cleanup projects go unfunded.	NASA continues to seek funding for the cleanup through the President's Annual Budget request to Congress. The CUB under the AOC will set the requirements for how much funding is required. NASA has many cleanup projects that are equally important to our Agency. NASA must continue to abide by its obligations under the AOC as drafted.
G	Dobosh	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon	Dormani	<p>I am voicing my disapproval of the proposed cleanup procedure of the Santa Susana Field Laboratory. I have read that currently the only option being looked at is the use of heavy trucks transported the contaminated soil via high traffic arteries in the local area at an average of 142 truck trips per day for THREE YEARS. This is not acceptable.</p> <p>What if a truck should spill it's load? Never mind the air pollution, noise and congestion that will be added to our local streets. I feel that there is a better way to safely and efficiently transport the contaminated soil from our area and that is the "use of the railroad." We have easy access to cargo trains here in the San Fernando Valley. Please consider this option prior to moving forward.</p>	<p>Section 2.4 in the EIS discusses alternate transportation considerations (1) overland conveyor and rail transport of soil; (2) build a new haul road (3) truck from site to rail and transport by rail to disposal facility.</p> <p>(1) NASA considered alternative rail or conveyor system for hauling materials from SSFL. The analysis showed that a conveyor system would require building the system over private land and constructing a railroad facility to keep trucks off the local roads. NASA concluded that the system could not be built in the AOC timeframe requirement, there could be opposition to acquiring rights-of-way over private lands.</p> <p>(2) NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements.</p> <p>(3) NASA considered a truck-rail combination for soil disposal. Using existing local roads to rail would not alleviate traffic on local community roads.</p> <p>Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p>

	Dr. Aarons	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
	Dr. Aarons	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Martha	Drain	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Joshua	Drewes	<p>NASA's callous disregard for safety has put the SSFL site and surrounding area at risk. The only good thing about this situation is that it is not irrevocable.</p> <p>NASA has now published a Draft Environmental Impact Statement on the cleanup. Within it, NASA has made mention of the regrettably large lengths a proper clean-up would require. Costs would include large numbers of trucks and soil displacement. I believe that the expense of the clean-up only serves to corroborate the expense of the pollution.</p> <p>You have a chance to do the right thing in the surrounding area for this generation and the next. You have a chance to prove that NASA is a responsible organization worthy of the support of the environmental community.</p> <p>I write to call on NASA to live up to its commitments in the 2010 cleanup agreement, totally and without any efforts to wriggle out of it.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL.</p>

Denise	Duffield	The DEIS should also have included information that SSFL's contamination has already impacted public health.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>
Denise	Duffield	A thorough remediation of SSFL is critical for the health and well-being of Southern Californians and the environment.	Your comment is noted.
Denise	Duffield	Asserting that the site may possibly be declared uninhabitable and public access restricted to a few hours of day hikes, and the groundwater declared forever polluted and its use barred, as some have suggested, would breach longstanding environmental requirements.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Denise	Duffield	<p>In the DEIS, NASA suggests that the old rocket test stands not be demolished and instead be considered “historical.” However, NASA is fully aware that much of the contamination is located at the test stands, and that there is no way to clean up the contamination without removing them. This is a direct violation of the AOC, and would also have impact on the surrounding communities as the contaminants continue to migrate offsite.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Denise	Duffield	<p>The DEIS states how many fewer truck trips there would be if NASA does not cleanup the majority of the contamination. The DEIS also misleads by inflating truck trips, and failing to identify mitigation measures such as additional routes, spreading the trucks over the other routes available, or utilizing an existing fire road or rail spur. NASA could also use natural gas trucks or electric trucks to reduce diesel emissions and global warming effects, but these options are not examined in the DEIS. The DEIS provides no reference to the number of trucks that have gone in and out of the facility for decades, and that the truck trips used for cleanup would actually be a small fraction of that.</p>	<p>The number of trucks required is predominately a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus not being a valid option. Section 4.5 in the EIS discusses transportation routes further (also see Alternate routes do exist, see Figure 4.5-1).</p> <p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Denise	Duffield	The DEIS claims negative impacts on biological resources, surface water and groundwater from cleaning up contamination, yet does not address harmful impacts of the pollution of these beneficial resources and the impact on the environment contaminated aquifer if one didn't clean up the aquifer, or if one allowed contamination to continue to pollute the streams leading off the property. The DEIS should address the environmental damage that NASA has done, the type and quantity of the contaminants left behind, what negative they have on health and ecological systems.	NASA considers that there are some net beneficial impacts to the cleanup by removing contaminants from the soil that could affect wildlife these are cited throughout Section 4.4. NASA also recognizes in section 4.4.1.3. that there will be significant impacts to native vegetation communities. Please also refer to Section 3.9 for and assessment of health risks associated with current contaminants.
Denise	Duffield	The DEIS states that the cleanup to AOC would damage the cave paintings at the Burro Flats area. But the AOC is entirely protective of cave paintings, and explicitly exempts from the cleanup to background requirement anything that might damage recognized Native American artifacts.	NASA acknowledge your comments on the 2010 AOC exceptions. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the exception clause in the 2010 AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further information.
Denise	Duffield	The purpose of NASA's DEIS should have been to examine the impacts of the contamination, the impacts of cleanup, and the best ways to cleanup per the AOC that would mitigate potentially negative impacts. Instead, NASA refused to address the effects of the contamination, and deliberately portrayed the cleanup as unnecessary and harmful – when it is just the opposite that is true. The cleanup, per the AOC standards and provisions, is necessarily to protect public health, and myriads of mitigation measures were left unexplored.	The purpose of conducting an DEIS (EIS) is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. However, based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Julie	Dunlap	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Julie	Dunlap	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Brendan	Dwyer	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Tricia	Ebert	<p>Over many decades, NASA’s poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Oscar	Echeverria	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Oscar	Echeverria	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Janet	Eckhouse	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
John	Ecklund	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. First Name	Last Name	Comment	NASA Response
Phyllis	Elliott	<p>Over many decades, NASA’s poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Timothy	Ellis	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Bette	Empol	<p>I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bette	Empol	<p>NASA activities led to widespread contamination of soil and groundwater with very toxic materials such as perchlorate, dioxins, and TCE. Some of the contaminants have been migrating offsite. As a local resident, I am very concerned about the potential health impacts of these materials and want the site cleaned up properly.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Mitchell	Englander (Los Angeles City Council)	<p>While I have long advocated for the full clean-up of the site and the Agreements on Consent between NASA and the DTSC, I feel compelled to express my extreme disappointment at the lack of consideration for other methods of soil and demolition debris removal from the site.</p>	<p>NASA considered a range of soil cleanup technologies, and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3, Soil Cleanup Technologies, of the DEIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mitchell	Englander (Los Angeles City Council)	The City of Los Angeles has proposed a \$3 Billion infrastructure improvement project to repair 8,700 miles of failed streets within a ten-year period. Much of this damage to City streets has been caused by the very type of heavy vehicle traffic proposed for this cleanup. The wear and tear to City streets is expected to add to this deterioration and pushing the cost of that repair onto the City taxpayer is unacceptable.	Materials and wastes that will be transported from the site would be handled in compliance with the applicable federal, state, and local laws and regulations, including licensing, training of personnel, accumulation limits and times, prevention and response to spills and releases, and reporting, and record keeping. Commercial trucks traveling on public roads pay state and federal taxes and fees that go towards road maintenance.
Mitchell	Englander (Los Angeles City Council)	I feel compelled to add that it is quite unbelievable that some other option for conveyance of the contaminated materials from the site was not studied - other than the truck routes proposed.	<p>Section 2.4 in the EIS discusses alternate transportation considerations: 1) overland conveyor and rail transport of soil; 2) build a new haul road; and 3) truck from site to rail and transport by rail to disposal facility.</p> <p>(1) NASA considered an alternative rail or conveyor system for hauling materials from SSFL. The analysis showed that a conveyor system would require building the system over private land and constructing a railroad facility to keep trucks off the local roads. NASA concluded that the system could not be built in the AOC timeframe requirement, and there could be opposition to acquiring rights-of-way over private lands.</p> <p>(2) NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and inability to construct the road in time to meet NASA's 2010 AOC schedule requirements.</p> <p>(3) NASA considered a truck-rail combination for soil disposal. Using existing local roads to rail would not alleviate traffic on local community roads.</p> <p>Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p>

First Name	Last Name	Comment	NASA Response
Mitchell	Englander (Los Angeles City Council)	By your own evaluation, the impacts are significant, negative, regional and long-term. This does not even take into account the concurrent work that will be done on the other SSFL parcels that will result in an unbearable cumulative impact for the area.	In addition to DTSC, NASA has been coordinating with USFWS, USACE, SHPO, DOE, Boeing, consulting parties, Tribes, and National Park Service. CEQA analysis typically includes private and public property impacts. Currently there are no cleanup efforts on private lands associated with this project. The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The cumulative analysis reflects information that is currently available.

Eric	Estrin	<p>My family and I live a few miles from the Santa Susana Field Lab. We have been concerned for years by the studies indicating elevated rates of certain cancers the closer one lives to the site -- both for ourselves and for the exposed workers at SSFL. We have been deeply troubled also by all we have learned of the immense pollution at the site, much of which is NASA's responsibility, and some of which has been migrating offsite. And we were very disappointed by the years of foot-dragging by NASA (and others) during which it strenuously resisted meeting its responsibilities to clean up the toxic stew it had created in the midst of our communities.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Eric	Estrin	<p>We were therefore exceedingly pleased, as were so many of our neighbors, when NASA signed the Administrative Order on Consent (AOC), a binding agreement to clean up the area to background. There were great hopes that the resistance to remedying the environmental disaster NASA had created in our neighborhood was finally over and that soon we would be protected.</p> <p>But now NASA has issued a draft Environmental Impact Statement that looks like it was written by people trying to blow up the deal. The same people who failed in their duties to manage the property in an environmentally responsible way, who allowed vast quantities of toxic materials to just be dumped in the soil, pollute the groundwater, and illegally leave the property in groundwater and surface water, seem to be trying to subvert the agreement their agency solemnly executed to undo the damage.</p>	Your comment is noted.
Eric	Estrin	<p>The draft EIS raises the question: Is NASA incapable of keeping its word? Is it truly a science agency or, as suggested by the draft EIS, is it yet another cheesy political operation willing to twist the facts into a pretzel in order to try to squirm out of commitments it made to rectify the huge environmental damage it has created?</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Eric	Estrin	<p>One would think that an Environmental Impact Statement on cleaning up toxic contamination -- indeed, one that includes the option of taking "no action" for cleanup -- would carefully and in detail document the injury to the environment that decades of NASA sloppiness created and the continued serious environmental impact that would occur if no action were taken. Yet the EIS is almost completely silent on the matter. Instead, it shamelessly tries to scare people about, of all things, trucks! Trucks have been going in and out of that site for decades, dragging in huge rocket engines and vast quantities of rocket fuel, as well as irradiated nuclear fuel for the reactors. Huge numbers of cars have gone in and out during those decades of operation. Not a peep from NASA then; if truck and car traffic were so horrible, the facility should never have been allowed to operate. The EIS doesn't disclose how much traffic has already occurred, but exaggerates (by its own admission, takes a "worst case" approach to) the numbers of trucks. In fact, if dispersed over several available routes, we are talking at most about a few trucks an hour, trivial in the scheme of things. But NASA shamelessly tries to inflame fears of trucks, while remaining silent about what the public really fears -- the toxic waste NASA has dumped throughout the property that must get cleaned up in order to protect those of us living nearby.</p>	<p>The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. However, based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Eric	Estrin	<p>There is essentially no analysis, no disclosure, of the environmental impacts of the pollutants. NASA claims serious impacts if it cleans up the groundwater or surface water, for example, but says almost nothing about having polluted a vast aquifer with horrible contaminants and the impact that has had and will continue to have if NASA walks away from its cleanup obligations. NASA claims serious impacts to biological resources if it cleans up the pollution, but completely downplays the impacts on the natural environment of all that contamination and the effects if the AOC is breached and the contaminants left intact. This seems like climate science denial rather than the kind of science one expects from NASA.</p>	<p>The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. However, based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).</p>
Eric	Estrin	<p>NASA destroyed an aquifer by dumping half a million gallons of TCE into it. Shouldn't one disclose and analyze that, and make clear the vast damage that would continue if NASA refuses to clean up the aquifer? NASA dumped vast quantities of highly toxic materials into the soil as well. But instead of disclosing and analyzing that environmental insult, the agency deals with the vastly more trivial impact of trucks taking the waste to a licensed disposal site, as though one were shipping Kleenex or children's toys. This pollution has to be removed. If you are concerned about trucks, use natural gas or electric ones, or take the shipments to a rail spur, all of which options you have refused to address. It seems clear someone at NASA is trying to push to break the AOC. The EIS is an absurd document, not addressing the real environmental impacts of "no action" and hyping trivial matters.</p>	<p>Non-diesel, electric, and natural gas truck usage will be considered.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Eric	Estrin	For example, the EIS makes a big deal regarding the 0.65 acres at the Burro Flats cave, which contains some cave paintings, implying that cleaning up to the AOC requirements could damage the paintings. But the AOC expressly exempts recognized Native American artifacts from the cleanup to background requirement. NASA knows that yet nonetheless tries to suggest the AOC could damage the cave paintings. Such conduct is really beneath what one should expect from a federal agency.	NASA will clarify the text. The Burro Flats site includes many rock features and areas of soil too. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the exception clause in the 2010 AOC referencing Native American artifacts. Please refer to the Programmatic Agreement and/or ROD for further information.
Eric	Estrin	The EIS should thoroughly examine the environmental impacts of all the pollution NASA created, but it fails to do that, trying instead to scare people with false assertions about trucks and Native American cave paintings. The EIS should identify mitigations -- additional truck routes, natural gas or electric trucks, use of rail spurs, dispersing shipments over several routes, and serious revegetation plans for land NASA has already scraped away to build its test stands in the first place -- yet it doesn't do any of this. Instead, it plays games, suggesting leaving the test stands in place, for example, when NASA knows perfectly well that is where the contamination is, and you can't clean it up if you can't get to it.	The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place (Section 3.9.5).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Eric	Estrin	<p>The EIS is shameful. Someone is dishonestly manipulating what is supposed to examine environmental impacts of NASA's polluting of that site into instead an argument for why NASA should be allowed to walk away from the great majority, or all, of the contamination it created. If NASA were to do an EIS before having started at SSFL, proposing to strip the vegetation away to build rocket test stands, buildings, fuel storage, etc., and to dump a million gallons of TCE in the ground and vast quantities of PCBs, dioxins, perchlorate, VOCs, heavy metals, etc., contaminating soil, groundwater, surface water, and air, it would show immense environmental impacts that would be very hard to justify. But NASA's EIS is on whether to clean up all the contamination or to walk away from all the contamination, and there is no serious analysis of what the latter would do. It's like seeing a doctor who tells you that if you choose to try to control your diabetes you are going to have watch your diet, increase your exercise and maybe take insulin, and how much of a drag that would be, without mentioning that if you don't do those things you can go blind, have limbs amputated, have a much higher risk of dying from a heart attack, etc.</p>	<p>NASA will follow the AOC. By following the NEPA process, NASA complies both with statutory requirements (42 U.S.C. 4321 et seq.) and Section 4.0 of the AOC. NASA continues to work expeditiously with DTSC and the public to complete the actions called for in the AOC. NASA realizes that the EIS describes the negative impact of cleanup to background, as required by NEPA. The 2017 schedule and cost for completion are a function of the AOC.</p>
Eric	Estrin	<p>Live up to the commitments made in the AOC. Clean it up to background, as promised. No more games.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Eric	Estrin	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Linda	Estrin	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Linda	Estrin	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Linda	Estrin	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Linda	Estrin	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Dinda	Evans	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Ronald C	Faas	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Katharina	Feldman	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Katharina	Feldman	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Katharina	Feldman	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Katharina	Feldman	<p>If the contamination at SSFL is not fully cleaned up, it will continue to threaten us locals every time the wind blows or it rains, causing the toxic materials to migrate offsite to neighboring areas.</p> <p>So, do the right thing. Stop trying to resist fulfilling what NASA promised to do. Fulfill your obligations under the AOC to the letter, fully complying with all of its provisions to clean up the Santa Susana Field Laboratory to background levels. Those of us who live near the site are the ones who will be affected most.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Raylean	Fetterman	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Raylean	Fetterman	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Geoffrey	Fettus	<p>The draft EIS spends significant time on the issue of truck transportation and very little attention to the environmental issues associated with the contamination at the site that creates the need for the project in the first place. Such priorities are misplaced and should be rectified. Each and every contaminant present at the site in greater than background concentration amounts should be identified, their health effects described, the extent of the contamination for each specified, and the nature of the environmental media affected (surface soil, subsurface soil, groundwater, surface water, vegetation, buildings, etc.) described and analyzed.</p>	<p>All impact areas are covered in the DEIS. Details about the historical releases, nature and extent of contamination, and risks are included in the RI reports that are referenced in the DEIS and available on DTSC's website.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Geoffrey	Fettus	The history of violations of pollution discharge requirements should be examined, including identification of instances where limits and benchmarks for offsite migration of the pollutants were exceeded. Most important, the degree to which those limits were exceeded should be analyzed in detail.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Geoffrey	Fettus	Health studies conducted onsite for workers and offsite for members of the public should be examined and analyzed, with special attention to any findings of potential detrimental effects from the toxic releases.	<p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p> <p>DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm). According to the DTSC summaries there were two UCLA studies, one in 1997 dealt with radiation exposures and a second in 1999 which dealt predominately with hydrazine exposures. Both were funded by DOE. Another study performed by the ATSDR, was published in 1999. According to DTSC's summary, "The preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects."</p> <p>Additionally, DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Geoffrey	Fettus	Potential mitigation measures should be examined in substantially more detail, such as use of natural gas or electric trucks or use of rail for shipments, and plans for re-vegetation. The contaminated areas have long been degraded by NASA activities and are not pristine by any quantitative measure; once the decades of significant pollution have been addressed, thoughtful restoration plans should be commenced to attempt to restore it to the condition it was in before NASA's activities began.	Your desire for NASA to follow a strict AOC cleanup is noted.
Geoffrey	Fettus	The Draft EIS appears to consider not demolishing some of the rocket test stands and other structures and simply declaring them historical. There is no analysis of how the agency could take such action and still comply with the requirements in the AOC to clean up all soil to background. Much of the contamination is centered at the test stands and the agency cannot realistically clean up the soil without getting the test stands or similar structures out of the way. The discussion of the option of leaving these structures should be removed if NASA does not have a plan for cleaning up the contamination beneath them.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Fulvio	Fiorentini	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Sharon Lee	Ford	<p>I have very deep concerns about the document, due to the politics involved by state and federal legislators, the federal court, and a monied, public interest group. Decisions, accusations, threats and a lawsuit have been made, without any consideration of the consequences to the site, the environment and the surrounding communities in two different counties.</p>	<p>Your comment is noted.</p>
Sharon Lee	Ford	<p>The Santa Susana Field Laboratory (SSFL) is located within Ventura County, however, it is the public and communities of Los Angeles County that will suffer the greatest consequences. The SSFL site is only accessible via the gate on Woolsey Canyon Road, located within the boundaries of Los Angeles County.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	<p>Although NASA, Department of Energy (DOE) and Boeing, the largest landowner of the SSFL site, appear to be working together, internally, with the Department of Toxic Substances Control (DTSC), and the public, in reality, it appears that each are doing, or have proposed their own method of cleanup, without DTSC oversight. For example, Boeing was granted permission by the authorities in Ventura County for the demolition of their structures. . Where is the DTSC? Now, NASA has released their DEIS for the proposed cleanup of NASA owned land, and it is very limited and extremely destructive. The DEIS is incomplete, inadequate and flawed.</p> <p>Department of Energy (DOE) also owns acreage involved in the cleanup, and, is subject to the same NEPA laws/regulations as NASA. Segmentation of two federal agencies and two AOCs, leads to a piecemeal analysis of an environmental document. This does not provide a true or full picture of the amount of soil to be excavated, number of buildings to be demolished, number of truckloads hauling soil to and from the SSFL site, damage or total destruction to cultural and architectural sited, or identified, remedial soil and water implementation plans. Each agency should not have its own DEIS; there should be one document governing both. The DEIS is incomplete, without necessary information, yet to be provided in the not yet written/released DEIS by DTSC.</p>	<p>The AOC requires NASA to develop a NEPA document. In order to meet the 2017 cleanup completion date, NASA must proceed with the EIS. NASA is coordinating with DOE and Boeing and will update the EIS as information becomes available (Section 4.13). The cumulative analysis section of the EIS shows additive impacts from NASA, DOE, and Boeing activities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	<p>Providing only two, extreme alternatives, clean-up to background or no cleanup, is unacceptable and inadequate, and the consequences devastating. It is not clear, in the DEIS, which clean-up to background standard has been considered: industrial, agricultural, residential, or recreational. Alternatives for residential or recreational use must be considered for the land to become parkland.</p> <p>A health risk assessment must be considered over any level of cleanup to background. This is the most important issue of concern, to the people in the communities surrounding the SSFL site. Cleanup to background, does not imply health risks. It is quite possible, and likely, for some cleanup to background levels, to be higher than health risk levels set by the EPA. There is no doubt, by anyone, that some soil removal is necessary, but, if the AOC was modified to a health risk assessment, the amount of soil to be excavated would be greatly decreased, lowering the actual health risks to the public.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>NASA has developed a paper that summarizes the human health and ecological risk evaluations that compare a background cleanup scenario (based on background levels as the cleanup levels) with a risk-based closure scenario (based on risk-based screening levels as the cleanup levels) for the NASA-administered property at SSFL (SSFL). It can be found on the NASA SSFL website (http://ssfl.msfc.nasa.gov/)</p> <p>Additional information regarding risk assessments is provided in the draft RFI and RI Reports for Groups 2, 3, 4, and 9, located on the NASA SSFL website (http://ssfl.msfc.nasa.gov/environmental-cleanup/environmental-impact-statement/default.aspx).</p>
Sharon Lee	Ford	<p>The DEIS is flawed because the level of cleanup is not balanced against costs, cultural impacts and environmental impacts required by NEPA and CEQA. This is a clear case of putting “the cart before the horse.” Cleanup to background would devastate the natural ecosystem, sensitive habitat, sacred Native American cultural sites, and the historic rocket test stands. It makes no sense to allow for demolition and soil removal, then have CEQA and DTSC step in to evaluate the environmental and health risks. It would be too late.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p> <p>Soil cleanup will not start until DTSC has completed its CEQA process.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	<p>The AOC driving the project was based on a California legislative bill, SB990 (Kuehl2007), which was later struck down by a Federal District Court decision. The AOC goes beyond EPA recommended requirements for human health and safety, however, intervention by politicians and a monied activist group have forced NASA into the “all or nothing” position, without weighing any of the consequences.</p> <p>The AOC needs modifications that are implementable, that are not time constrained, that address the concerns and needs of the surrounding public, and protect the environment and habitat. This includes use of existing and future alternative technologies, to minimize damage to the environment. A “no way or the highway” plan is unacceptable.</p> <p>It is extremely doubtful that cleanup can be accomplished by 2017. It is an artificial date, not based on science, but set by “emergency” type pressures, to create environmental decision documents, prior to completion of studies or input from the California Department of Toxic Substances (DTSC). Due to the size and complexity of the project, no technologies should be ignored or dismissed. Studies on new technologies are currently being conducted at local universities.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>While changing the schedule to be later than 2017 makes the implementation of the AOC requirements more manageable, it does little to reduce the significant impacts from taken the cleanup actions.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	Excavation and transportation of contaminated soil is a major public concern.	<p>The number of trucks required is predominately a function of the volume of soil excavated and disposed offsite. NASA evaluated the possibility of building a conveyor system to get the soil to a train spur and transport via train to disposal facilities and building a new haul road. These options require prerequisite surveys, studies, engineering/designs, permits, and access across private property. These requirements preclude the concept from meeting the AOC requirements and thus not being a valid option. Section 4.5 in the EIS discusses transportation routes further (also see Alternate routes do exist, see Figure 4.5-1).</p> <p>NASA considered a range soil cleanup technology and viable ones were evaluated. To assess which remedial technologies could best suit the different types of contaminants present at SSFL, the technology was first evaluated for ex situ and in situ general response actions that included solids, physical, chemical, biological, and thermal treatments. Technologies that were down selected for further evaluation include: SVE; Ex situ treatment using land farming; Ex situ treatment using thermal desorption; Ex situ and in situ chemical oxidation; and In situ anaerobic or aerobic biological treatment. The technologies selected have a proven capability to treat the COC, but it is not proven that they can meet the 2010 AOC cleanup levels. These technologies continue to be studied, through ongoing field-scale and lab-scale tests planned for 2014, to evaluate their effectiveness to achieve the cleanup levels required by the 2010 AOC. Further information can be found in Section 2.2.2.3 Soil Cleanup Technologies of the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	The DEIS does not address how, or if, replacement soil will be obtained.	<p>The one third backfill estimated was based on historic cleanup activities at the site and is subject to specific site conditions and availability of backfill material that meets 2010 AOC requirements. The following potential offsite sources (others might be identified at the time of remediation) have been identified in the project vicinity in southern California:</p> <ul style="list-style-type: none"> • P. W. Gillibrand Company, located in Simi Valley, California • Rindge Dam, located in Malibu Canyon, California • Santa Paula Materials, Inc., located in Santa Paula, California • Grimes Rock, Inc., located in Fillmore, California • Tapo Rock and Sand Products, located in Simi Valley, California <p>See EIS Section 2.4 for more information.</p>
Sharon Lee	Ford	Nor, does it address the environmental consequences of soils foreign to the SSFL site. Soils foreign to the site, can pose a threat to the current ecological biodiversity. Non-native plant species can have a significant impact on the wildlife food chain.	NASA discusses some possible source locations for backfill in Section 2.2.2.3. Additionally NASA recognized the impacts of introduced soil are identified in Section 4.4.1.3

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	<p>Extreme damage will be done to Los Angeles County surface streets, state and federal highways, and freeways. The DEIS does not address who will pay for this damage and if there will be any mitigation.</p>	<p>In anticipation of the roadway damage identified (Traffic Impact-4), NASA would survey Woolsey Canyon Road conditions prior to the commencement of work and would repair damage caused by its demolition and cleanup activities. NASA will seek to enter into an agreement with Boeing and the DOE to share this work.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	<p>Environmental issues are of great concern to the public. The proposed amount of soil to be excavated will leave the remaining soil unstable and highly subject to erosion by wind and rain. Erosion can and will have profound affects, on the environment, due to pollution of surface water, particularly in watershed drainage areas.</p> <p>The proposed removal of such a tremendous amount of soil will also remove biota, rendering the remaining soil sterile, and unsuitable for habitat. This plan includes removal of all vegetation, including endangered plant species and very old oak trees. The AOC needs to be modified to allow for other and newer technologies.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p> <p>NASA is in the process of evaluating soil cleanup technologies (other than excavation) that have a limited possibility of treating onsite and reducing the total number of trucks required.</p>
Sharon Lee	Ford	<p>Environmental issues regarding habitat protection of flora (previously addressed above) and fauna on the SSFL site is lacking in the AOC. The SSFL site is an important habitat area for resident and migratory birds and mammals, including deer, bobcats, and a mountain lion and offspring. The site is a critical wildlife corridor that links the Santa Monica Mountains, Simi Hills, Santa Susana Mountains, Los Padres Forest, San Gabriel Mountains, and Angeles National Forest.</p> <p>To insure healthy wildlife, particularly herd animals, corridors are essential to reduce in-breeding, and to allow for migration, particularly in time of drought and climate warming. The fact that the wildlife corridor is not clearly defined in the DEIS is a major flaw.</p>	<p>NASA recognizes the impacts to wildlife in excavation areas will be significant both for species that are year-round and migratory. While the wildlife corridor map in the EIS shows that SSFL is not in the specific linkage area, we recognize that the federal site plays a role as an important habitat area.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	<p>Lack of protection of archaeological and historical resources, from damage or destruction, is as egregious as the lack of a health risk assessment in the DEIS. The DEIS is incomplete because it does not specify expected outcomes for cultural resources, both archeological and architectural.</p> <p>Protection needs must be established for archaeological sites, such as the Burro Flats site VEN-1072 and any other archaeological sites on the property. Non-excavation methods and technologies should be exhausted before performing actions that could permanently damage cultural sites.</p> <p>Protection needs to be established before cleanup for historical, architectural structures, such as the Alpha, Bravo, and Coca rocket test stands and their related structures, eligible for protection as historic structures and districts. The AOC refers to removal of structures on soil. The test stands are built on bedrock, so their removal is not necessary or warranted.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	<p>The proposed amount of soil to be excavated poses great health and safety concerns due to air and water pollution. Dust, created by soil excavation, poses a great health risk for children, the elderly, and those with respiratory issues. Disturbance of such a large amount of soil, exposes the public to potential risks from deadly diseases, such as Valley Fever and Avian Flu.</p>	<p>Valley fever is caused by a fungi, <i>Coccidioides immitis</i> or <i>Coccidioides posadasii</i>. found in arid desert soils. When the soil is disturbed, spores are released into the air and can be carried on the wind. People are exposed when they breath in the spores. Most people who are exposed do not get sick; however, valley fever can cause flu-like symptoms and, in rare cases, cause meningitis and even death. The soils at SSFL have not been sampled for the fungi that cause valley fever. To meet the AOC cleanup requirements, approximately 500,000 cubic yards of soil will be disturbed. If cleanup alternatives other than soil removal could be used, the amount of soil disturbed would be reduced by approximately 180,000 cubic yards and the dust emissions reduced by approximately 19% . Release of dust during remediation and demolition will be controlled by wetting the soil, limiting the stockpile area to 0.14 acre and height to 8 feet, covering roads with gravel, etc., limiting speed of vehicles, placing tarps over or barriers around stockpiles of soil, ceasing loading during high winds or storms, and removing bulk material from trucks. After remediation, the previously vegetated areas will be planted with a native seed mix.</p> <p>See EIS Section 4.7, Air Quality BMP-1, and Air Quality MM-3.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon Lee	Ford	<p>Fuel emissions from the trucks not only pose a health risk, but the estimated number of truckloads (80,000) hauling soil, to and from the SSFL site, poses safety risks, traffic congestion, and accidents. Approximately 3-4 schools are located within the proposed routes of the trucks. Although, the proposed schedule is for trucks to be restricted, during hours when children are going to and from school, life happens, and all the public, pedestrians and in vehicles, will be subject to issues of safety during the cleanup operational hours.</p>	<p>The impacts on safety considered the locations of schools and is discussed more in Section 4.8.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Statia	Foresti	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Statia	Foresti	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Statia	Foresti	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Statia	Foresti	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Joan	Forman	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Joan	Forman	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Frederick	Through decades of sloppy environmental practices, NASA badly contaminated its part of the Santa Susana Field Laboratory with very toxic materials, some of which have been migrating off the property.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6)</p>

Coleen	Friedmann	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Coleen	Friedmann	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Coleen	Friedmann	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Coleen	Friedmann	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Ben	Gaffin	It has come to my attention that NASA has not fulfilled it's contract with the state of California to clean up it's toxic mess at the Santa Susana Field Laboratory. Please fulfill your contract and return the area to it's previous uncontaminated, unpolluted state. You are under contract to do so, and any effort on your part to leave the area as contaminated and polluted as it is would be highly unethical on your part.	NASA has met every commitment to date in 2010 AOC.
Horace	Gaims	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Mark	Gallegos	<p>Over many decades, NASA’s poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Art	Galvan	<p>It would be a great loss to have the test stands demolished, they represent a part of history. Why could they not be carefully is assembled rather than just cut up and scrapped. It most likely would not cost any more to do it this way, it is only a change in how they would be removed. They could then be saved for a future historical display. Please consider this as an alternative, these structures are not replaceable.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as NASA determines whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Juan	Garcia	I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Juan	Garcia	<p>NASA activities led to widespread contamination of soil and groundwater with very toxic materials such as perchlorate, dioxins, and TCE. Some of the contaminants have been migrating offsite. As a local resident, I am very concerned about the potential health impacts of these materials and want the site cleaned up properly.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cynthia	George	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Barbara	George	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Poly	Georgilas	<p>As a resident of Bell Canyon, a community with perhaps one of the largest stakes in this process given its proximity to the SFL, I am deeply troubled with the NASA DEIS as presented. This document is flawed primarily because it relies on a weak foundational premise. That is, the DEIS only considers the two extreme alternatives of either, a soil cleanup to a historically unprecedented Background/Detect level, or the alternative of No Action at all. Any reasonable mind can perceive that neither course of action is viable given the many variables present at SSFL. These variables require careful and collaborative solutions, none of which the two extreme alternatives offered adequately address.</p>	<p>NASA recognizes there is community concern regarding the AOC (cleanup to background) alternative. The impacts related to the AOC alternative have been presented in the EIS and several are significant. NASA acknowledges that impacts could be reduced by using risk-based alternatives. However, NASA must continue to abide by its obligations under the AOC as drafted.</p>
Poly	Georgilas	<p>By failing to include a risk based cleanup, the DEIS fails to balance the level of cleanup with the consensus end use of the site, that being some variation of a Public Land Use. Determining clean up levels prior to establishing site end use is putting the cart before the horse, and serves to waste taxpayer dollars on a cleanup that exceeds all levels of reasonability. The Environmental, Cultural, and Biological impact of such a drastic cleanup to Background/Detect levels, leads one to contemplate which is worse the problem or the proposed solution. The DEIS fails to adequately define the current negative health effects to both Human and wildlife populations. This information would be helpful in contemplating an appropriate course of action, where short and middle term negative cleanup effects are brought to balance with the long term benefit of a site that does not put the public at risk.</p>	<p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Poly	Georgilas	<p>As the DEIS is written, the proposed cleanup to Background/Detect levels puts at risk the rich cultural and historical resources that should be preserved for posterity. The Burro Flat site VEN-1072, as an NRHP designated site should be exempt from cleanup mitigation efforts, yet the DEIS seems to include at least portions of this important site in the cleanup. Nine structures at Alpha, Bravo and Coca test stand sites, have been found eligible as historic architectural structures under NRHP and SHP. Given the significant role these test stand structures have played in our nations Space Program, they are an important symbol of our national heritage and should be preserved for posterity. As written, the DEIS cleanup to Background/detect level, will in all probability destroy these structures in the very first phase of implementation.</p>	<p>Please refer to the Programmatic Agreement (PA) and/or the ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites. Many of the comments on the DEIS and during consultation with consulting parties under Section 106 and EO 13007 were incorporated in the PA and/or ROD.</p> <p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p>
Poly	Georgilas	<p>The Traffic and Transportation impacts of a Background/detect level cleanup would involvethe removal of approximately 1/2 million cubic yards of soil and 95,000 tons of debris. This would result in 142 truck trips per day, including Twenty-Eight peak hour trips (DEIS ES 5.1.4). These numbers fail to take into account returning loads of replacement landfill (1/3 of removed soil), or empties coming into the site to collect their initial loads.</p>	<p>Thank you for your comment concerning the number of trucks that will be required to implement the proposed action. NASA lists 142 truck trips per day as one way truck trips and this number includes the backfill trips as shown in Table 2.2-5 in the EIS.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Poly	Georgilas	<p>The traffic and transportation impact also fails to take into account the truck traffic that the concurrent mitigation effort at the much larger Boeing and DOE sites would produce. The Cumulative impact on the neighboring community will be devastating. As a lifelong resident of the immediate impacted area, it is an endeavor to travel east on Roscoe and Northo highway 118 via Topanga Canyon Blvd (route 23) as it is today. One can only imagine the adverse conditions that the 14 to 250 (extrapolated per all three sites and worse case basis) truck loads of Hazardous materials would create to the immediate communities of West, Hills, Canoga Park, Chatsworth and Woodland Hill.</p>	<p>The NASA cumulative impact analysis identifies the impacts of the NASA, Boeing, and DOE cleanup projects. The AOC cleanup standards and 2017 cleanup completion date require the removal of large amounts of soil, and hence, an increase in truck traffic. As a BMP for efficient and safe traffic management, a NASA Construction Transportation and Control Plan (N-CTCP); similar to Boeing’s existing CTCP, which includes a traffic control plan, parking plan, existing and construction traffic operations, motorist information strategies, truck safety plan, hazardous materials transport plan, and ridesharing plan. The N-CTCP would include the proposed activities and be implemented through the completion of cleanup activities, which is planned for 2017. The safety and incident response measures identified in the N-CTCP are included to reduce the number and impact of incidents.</p>
Poly	Georgilas	<p>The DEIS uses a flawed Levels Of Service (LOS) threshold, that does not adequately take into account the effect of the low speeds (especially at Grade -Rocky Pointe, at peak traffic) that this volume of trucks will have on traffic times. The high density Commercial corridor on the Southern route via Topanga Canyon BLVD. (23) to interstate 101, isects an Elementary School, a High School, and one of the largest shopping malls in all of Southern California (a large portion of which is currently under construction), that stretches from Vanowen Street almost to Interstate 101. The LOS threshold numbers notwithstanding, this is a recipe for disaster.</p>	<p>The traffic analysis was based on standard methodologies for evaluating LOS using volume/capacity (v/c) ratios. The LOS assessment focuses on operations but does not include a travel time calculation, because the industry-standard methodologies (based on the Highway Capacity Manual) use other measures for assessing LOS. However, the volume of trucks expected during construction would be expected to have a negligible impact on overall average travel time.</p> <p>The impacts on safety considered the locations of schools and is discussed more in Sections 4.5 and 4.8.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Poly	Georgilas	<p>At the essence of the weakness of the DEIS is the 2010 AOC agreement that guides it. The AOC agreement as written is not workable. The remedy is to amend or modify the 2010 AOC, so as to allow the EIS to include legitimate, reasonable and risk based cleanup solutions. The 2010 AOC goes beyond EPA recommended levels for human health and safety, because it was based on Senate Bill 990 (KUEHL 2007). This Bill was stuck down by Federal District Court decision, yet the AOC survived. Section 5.26 Severability of 2010 AOC Order provides that ... "should any court determine that any state law or regulation incorporated into, referenced in, or authorizing this order is invalid or unenforceable in whole or in part, NASA shall comply with each remaining part." (5.26 Severability AOC2010 page 38).</p> <p>The 2010 AOC Order is open to Modification by mutual agreement of the parties (2010 AOC 6.0 pg 38-9), and should so be modified before any further action is taken. The modifications should include risk based PRG table for suburban residential risk levels, for the purpose of avoiding removing near background soils which do not present a risk to human health or the environment. The remediation goal should be modified to include suburban residential PRGs to enhance LUT look up table process by comparing soil condition and risk standards established by USEPA as public remediation goals.</p>	<p>NASA notes the opposition to following the AOC (as currently written) and cleaning up to background.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Andrew	Germain	<p>For the past 6 months (and continuing presently), the Santa Susanna Field Laboratory Trucks begin at 4:30 AM every morning Monday - Friday and wake up my family with extremely loud noises. 10-20 Trucks go up and down from the SSFL between 4:30 AM and 8:00 AM. We have the right to the quiet enjoyment of our home on Woolsey Canyon Road. It seems the LA Municipal Code addresses this clearly? Commercial Vehicles cannot operate in a residential area before 8:00 AM. We never sleep between 4:30 AM and 8:00 AM because of these SSFL Trucks driving up and down Woolsey Canyon Road. Some SSFL Trucks operate until 1:00 AM.</p> <p>Does it make sense that these extremely loud trucks going up our LA County Unincorporated Road (Woolsey Canyon Road - a very steep hill with hair-pin curves) operate between the hours of 8:00 AM and 10:00 PM?</p>	<p>MMs in the DEIS (Noise MM-1) would limit proposed demolition and environmental cleanup activities and hauling to daytime hours.</p>
Tina	Germain	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Gfelner	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Michael	Gfelner	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Michael	Gfelner	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Michael	Gibeault	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Suzanne	Gillhaus	As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Suzanne	Gillhaus	<p>NASA's portion of SSFL is extremely contaminated with TCE, perchlorate, PCBs, dioxins and heavy metals - all of which can have serious health impacts for anyone who is exposed. And, the contamination is prone to migrate from the site, putting all of us who live nearby at risk.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Suzanne	Gillhaus	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Suzanne	Gillhaus	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Sharon	Giunta	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. Sharon	Giunta	Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Robert	Goings	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into an AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Randy	Gold	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Deanna	Goldberg	<p>I am talking today about the health of all the residents, not only here in the Valley, Simi Valley, Conejo Valley, Calabasas. I don't know how many of you are aware that West San Fernando Valley and East Ventura County have been reported to be the highest rate of breast cancer in the state of California. Those are the areas along this site.</p> <p>I just wanted you to know that I think it's really important and that the health impacts as far as cancer and the toxins that are left there from weapons testing, rocket fuel, I believe, are affecting, of course, the groundwater. And if the soil's not removed, it's going to continue to affect groundwater. Simi Valley residents get groundwater, and it's only tested every two years, and there is radionuclides in the water. There are radionuclides in the water, along with other contaminants from the rocket fuel.</p> <p>I wanted to say that I think it's very important that residents -- unfortunately, this was not found out until 1980 and the Department of Energy was covering this all up, but because of that houses were built up to the site. Houses were built next to the site. We can't move. We don't want to move. We have jobs here. We have family here.</p> <p>If NASA is not going to clean it up, is NASA going to be paying each family either to relocate, to purchase water filters for clean water, to purchase air filters? There's no way, when Santa Ana winds blow, that we can not be exposed to Cesium and other contaminants. ... So I'm hoping, I'm stressing, that something is done to contain or clean up that area and clean up our water, our drinking water.</p>	<p>NASA has signed multiple agreements regarding the cleanup of SSFL site and remains committed to meeting the obligations of those agreements.</p> <p>DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
DeAnna	Goldberg	<p>I am worried that the Santa Susana Field Lab Site will again be bypassed for a thorough clean up all because the large organizations (NASA, Department of Energy, and Boeing) are doing everything in their power to persuade people in the public eye that it is too much money and effort to clean it up. They ruined the environment up there and now it has affected everyone that lives near this site, from the air we breathe on a windy day to the water we drink or are exposed to in and around the area.</p>	<p>Your comment is noted.</p>
DeAnna	Goldberg	<p>I was amazed to learn, approximately eight years ago, that there had been a partial nuclear meltdown so close to where I live and also amazed that they were still contaminating the area with rocket fuel up to a few years ago. There are still contaminants from the nuclear meltdown, as well as, rocket fuel waste that contaminate the ground and the ground water, which Simi Valley still uses some of this for drinking water. All these agencies need to clean up the land and the water all the way to background.</p>	<p>NASA conducted no radiological activities at SSFL. NASA has reviewed the results of EPA's radiological study at SSFL. This study does not identify any radiological contamination migration from Area IV onto the NASA-administered portion of SSFL.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
DeAnna	Goldberg	<p>It is an atrocity that it hasn't been cleaned up yet and should have been done years ago. Now, we are the leading county in the state of California with the highest breast cancer rate and with all the public communication that I do I am pretty sure that that is not the only cancer with a high rate here. Cancer is an abundant illness here and most people don't understand why.</p> <p>Most residents here are not familiar with the S.S.F.L. site; they're not educated on the condition up there and how it has affected the areas of West L.A. County and East Ventura County. Unfortunately, it is too late to stop development around the site. There are already too many houses and developments too close to such a disaster. The only way these agencies might be able to bypass any clean up would be to grant every resident within a certain several mile radius water filtration systems that provide each dwelling with clean water. Still, that won't provide anyone with any protection against the contaminants that are carried through the wind. Two nuclear scientists that I have talked with at some of these meetings have told me that they aren't really sure if there is any water filtration system out there that can take radionuclide contamination out of the water supply and they certainly can't take any contamination out of the air that we breathe unless they clean up the site to background.</p>	<p>NASA acknowledges public concern regarding offsite health issues and hopes to move forward with the cleanup quickly.</p>

First Name	Last Name	Comment	NASA Response
DeAnna	Goldberg	<p>There is no getting around the fact that these organizations are responsible for the clean-up. They owe it to all the residents living near and around the site to get rid of these cancer causing contaminants once and for all. Just think how many jobs they will be creating by cleaning up the site.</p> <p>Please help the residents here by taking a stand. Ensure that NASA, as well as the other responsible parties, will clean up the site responsibly to background levels.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Charles & Paula	Goldsmid	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Luis	Gomez	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Margaret	Goodman	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Cindi	Gortner	<p>I am in favor of cleaning up to background, as was agreed to by NASA in December of 2010. ... But the truth is that Santa Susana has exceeded pollution discharge hundreds of times. How do we know this? Through Boeing annual monitoring reports that go to the Regional Water Quality Board. So because I know that this stuff is getting off the hill through the water, that's why I want it cleaned up to background. And the part about the EIS that says please clean up to background, I applaud.</p>	<p>Your comment is noted.</p>
Cindi	Gortner	<p>Also, I believe there are three options for trucks, and I think that's great that that's in the EIS.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cindi	Gortner	<p>I believe the test stands need to come down, that NASA was sloppy in spilling this stuff. And if the contamination is there, I don't want the children to be in danger of this. I don't care that they're historical. My dad worked for NASA and I love NASA, but I care more about children's health than having the test stands preserved. I think the time to do an EIS and talk about the plants and the fauna and the sacredness was before NASA went up and spilled all the perchloride up there. The AOCs say that they won't be touching the Indian artifacts, so I don't think that's an issue. And what's there now, all these chemicals that are in your sheet, not much in those 368 pages, but there is one page that highlights where the chemicals are. Those chemicals cause cancer, leukemia, birth defects, genetic defects, developmental disorders, and nervous disorders.</p>	Your comment is noted.
Cindi	Gortner	<p>And I want to end with a statement from somebody who lived in Woolsey Canyon. ... When he moved there with his three year old to get away from a houseful of mold, he was absolutely horrified to find out, and he said, "Why wasn't this disclosed?" He wants you to know that he wants that soil cleaned up for his child.</p>	NASA acknowledges your comment.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cindi	Gortner	<p>And there are trucks there now. He says their trucks now, I'm finding them, he says, at 2:30 in the morning, 4:30 in the morning. So it's already miserable. He would like to request that the trucks be only between 7:00 and 7:00 because it's waking his three year old up. But he says please clean it up. It's not right.</p>	<p>Your comment is noted.</p>
Davis	Gortner	<p>And all I want to say is that the site does have substances such as perchlorate, PCBs, TCE and other VOCs, heavy metals and dioxins, all of which cause cancer. And I understand that there will be a lot of trucks that will -- that just shows how much contamination is going on in this site, and if there's that much it needs to be cleaned up.</p> <p>So what is important is that the site gets cleaned up to protect the health of thousands of people who live nearby.</p>	<p>NASA operations did not entail the use of perchlorate except in small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignition process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate, which was not detected. Therefore, NASA operational history with regard to perchlorate and sampling results indicates, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm).</p> <p>Based on these and other comments, NASA will revise the EIS to reflect the impacts of contaminants if left in place (Section 3.9.5), as well as to include information summarizing the health studies previously conducted (Sections 3.9.6 and 4.9.3).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Davis	Gortner	How can a quality conversation occur about the problems incurred by cleaning it up without discussing the benefits to the community of cleaning it up?	The EIS identifies Haz Impact-3 as a reduction in the volume of waste transported offsite for disposal by using onsite treatment methods resulting in a beneficial impact.
Davis	Gortner	Is there a chart in the DEIS that states all the health and safety hazards associated with the “no action” alternative?	NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm) Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).
Davis	Gortner	NASA signed an agreement with the state of California, and therefore with the people who live near the site, on December 10, 2010 that they would clean up to background. This raises serious questions about whether NASA can keep its word.	Your comment is noted.
Davis	Gortner	NASA should disclose how much truck and car traffic has occurred at the site over the decades of operation compared to what is predicted for the cleanup.	That kind of data is not available.
Davis	Gortner	If NASA is truly committed to the AOCs then why does Table 2.4-1 include “Alternative 1”, “Alternative 2” and “Alternative 3” with lesser cleanups to different standards?	These alternatives were included for full disclosure to the public to answer questions about the relative impacts of other cleanups allowed at other sites.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Davis	Gortner	The test stands must be taken down.	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The Programmatic Agreement (PA) and/or ROD will identify MMs selected to address the effects.</p> <p>Please refer to the PA and/or ROD for the resolution of adverse effects to historic properties including test stands, a TCP and archeological sites.</p>
Davis	Gortner	<p>There is no analysis of the environmental damage done by the pollution or the damage that would continue if no action were taken to clean it up.</p> <p>With respect to water resources, the DEIS does not inform the public of the current contamination that is occurring from SSFL.</p>	<p>Historical releases and contamination details are included in the referenced RI reports which are available on DTSC's website.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Davis	Gortner	You say nothing about the retinoblastomas—cancers of eyes—that occurred in young children downwind of your pollution, or the other cancer risks or health risks to people living near your toxic site and the continuing risks to them if you evade your cleanup obligations.	<p>NASA recognizes public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as EPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm).</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>
Davis	Gortner	We have noticed that in every case where there is a mention of benefit to remediation on Table ES-5, the mention is listed last. We find a great deal of bias in this EIS which is disturbing to us.	We will review the document to try to ensure that there is logical consistency in the way conclusions are presented.
Davis	Gortner	Fix the DEIS so that, rather than propaganda as to why NASA should be allowed to break your promises to this community and walk away from the pollution NBASA created, it instead provides an honest review of how much horrible environmental damage NASA did and why no action would perpetuate that environmental mess.	The purpose of conducting an DEIS (EIS) is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. However, based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cindi	Gortner	As a very concerned local resident only a few miles from the site, I find it misleading and offensive that the DEIS focuses almost entirely on purported negative impacts of cleaning up the contamination rather than the beneficial environmental effects and health and safety benefits to those of us who live close by. Although NASA has repeatedly stated their commitment to the AOCs, the DEIS is a misleading document which suggests otherwise.	The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. However, based on these and other comments, NASA will add information to the EIS that describes the risk associated with potential exposures from chemical contaminants currently on the site (Section 3.9.5).
Cindi	Gortner	It is imperative that NASA keep its obligation to a cleanup to background as agreed to with the state of California in 2010.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cindi	Gortner	<p>It is misleading in that it doesn't include the environmental hazards if the site is not cleaned up as promised. The document uses scare tactics to frighten people about the minor effects of the cleanup (e.g., trucks) without a discussion about the hazardous nature of the chemicals on the site. That is simply unethical. There is significant evidence from various studies of increased cancers in the nearby communities associated with closeness to SSFL. The contamination at SSFL is widespread, migrating, and composed of very toxic materials. Yet the EIS almost entirely ignores the environmental impact from having so thoroughly despoiled the land and water by all this pollution and the significant negative impact on the environment and all of us who live nearby if NASA were to default on its obligations under the AOC and leave much or all of the contamination not cleaned up.</p>	<p>The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL. Based on these and other comments, NASA will amend the Health and Safety section to reflect the impacts of contaminants if left in place (Section 3.9.5).</p>
Cindi	Gortner	<p>NASA promised the Council on Environmental Quality (CEQ) and the Department of Toxic Substances Control (CEQ) that it would not include alternatives that would breach the AOC it signed, with the exception of the standard "No Action" alternative. The draft EIS breaches that, including in several other alternatives, all of which are barred by the AOC and all of which would involve NASA walking away from most of the contamination it created in our area without cleaning it up. This raises questions whether NASA's word is worth anything. NASA should remove those sections.</p>	<p>The purpose of conducting an EIS is to evaluate the environmental impacts from a proposed federal action. The proposed action is to demolish existing structures and to remediate soil and groundwater contamination on the NASA-administered property of SSFL.</p> <p>These alternatives were included for full disclosure to the public to answer questions about the relative impacts of other cleanups allowed at other sites.</p>
Cindi	Gortner	<p>The hypocrisy of NASA playing the role of "environmental protector" of wildlife and so forth is disturbing. How can a government agency pollute hundreds of acres of land with terribly toxic chemicals and then put forth arguments against cleaning it up in the name of protecting the environment? If NASA cared about the environment, they wouldn't have caused the contamination in the first place. The environment is POLLUTED at NASA's own doing, damaging the natural environment at SSFL terribly. The right thing now to do is to clean it up to protect the people and the wildlife.</p>	<p>Thank you for your comment on the DEIS. NASA will follow the AOC. By following the NEPA process, NASA complies with its statutory requirements (42 U.S.C. 4321 et seq.) and Section 4.0 of the AOC. NASA continues to work expeditiously with DTSC and the public to complete the actions called for in the AOC.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cindi	Gortner	<p>For more than 20 years the community has relied on the SSFL Inter-Agency Workgroup for providing residents an honest and unbiased source of information. It includes community representatives who truly are representative of the community's desire for full cleanup and support of the AOCs. Recently, a controversial "Community Advisory Group" has been created at the instigation of Boeing (see http://www.enviroreporter.com/2012/12/operation-astroturf/all/1/). Boeing has been lobbying against the AOCs and to be relieved of most of its cleanup obligations. The CAG is widely viewed as an "astroturf group," (i.e., fake grassroots, instigated by the polluter). It is comprised of former Boeing employees, contractors, aerospace workers, cleanup opponents, and even a lawyer for the Santa Ynez Chumash casino interests, which many fear aims to acquire the SSFL land, block cleanup, and establish a casino there.</p>	<p>NASA recognizes that there are many and differing views on the motivations for community input. We try to focus on the science and factual basis for our analyses and conclusions, while considering the views of members of the community.</p>
Cindi	Gortner	<p>3700 comments were received when the draft AOCs were out for public comment in 2010. All but about 15 strongly supported the AOCs. That tiny minority has constituted itself as a CAG to continue its efforts, in parallel with Boeing, to somehow block most of the contamination from having to be cleaned up. But as the numbers make clear, it doesn't represent the community, is a tiny minority, and is basically a surrogate for Boeing's efforts to frustrate the cleanup. I presume this will be shown once again in this comment period, with the great majority of the comments supporting the AOC and urging full compliance with it.</p>	<p>We recognize there is community concern regarding several items noted in the DEIS. NASA will implement the requirements of the AOC. By following the NEPA process, NASA complies with its statutory requirements (42 U.S.C. 4321 et seq.) and Section 4.0 of the AOC. The cleanup will meet the established requirements for the protection of human health and the environment. Our EIS analyzes impacts required by NEPA but it does not address matters outside the purview of the statute. NASA must continue to abide by its obligations under the AOC as drafted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cindi	Gortner	<p>An EIS by design should focus on how to mitigate the environmental impacts of cleaning up to background. Instead, NASA focuses on arguments against the cleanup it had promised, without mention of the dire need for the action and the positive impacts of undoing all the decades of contamination NASA created. It is wrong to put this document forward to people without detailed information about the types of chemicals on the site, what quantities they are in, how they are hazardous, where they have been found to be offsite (water, soil, made airborne in past fires when contaminated vegetation burned, etc.) and so forth. However, the vast majority of the people that I have talked to when given a CHOICE between leaving chemical contamination and the quite minor impacts stated in the EIS about a few trucks an hour will select a cleanup to background.</p>	<p>Your comment is noted.</p>
Cindi	Gortner	<p>The AOC already has provisions if the Fish and Wildlife Service were to make findings requiring certain actions to protect endangered species. The EIS appears to imply it would like to hide behind issues of plants, etc. and not clean up contamination at the site. Instead it should focus on how it will restore and revegetate the land it has so thoroughly damaged over the past decades once the cleanup is complete.</p>	<p>Please refer to Section 4.4 for numerous references to impacts of the cleanup on biological resources including both negative and beneficial impacts. Please also refer to Section 3.9 for and assessment of health risks associated with current contaminants.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cindi	Gortner	There should be absolutely no discussion about NOT cleaning up under the test stands. We all know the test stands are where the chemicals were primarily used. It's absurd to not cleanup that area.	NASA is working closely with DTSC to identify those areas at SSFL that are contaminated requiring cleanup to the Look-up tables.
Cindi	Gortner	The AOC provides an exception to the cleanup to background requirement for soil immediately nearby the Burro Flats cave paintings. Suggesting that the cave paintings can be damaged when NASA knows the AOC protects them is quite dishonest.	NASA will clarify the text. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the AOC referencing Native American artifacts and the 5% clause.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cindi	Gortner	<p>There is no mention of any of the studies regarding how the contamination has affected humans. The UCLA School of Public Health studies found the contamination at the site resulted in excess cancers among the workers. The study by the federal Agency for Toxic Substances and Disease Registry (ATSDR) found elevated rates of cancers of the bladder, thyroid, and blood and lymph systems in people living offsite and associated with proximity to the site. The study for ATSDR by Professor Yoram Cohen and his UCLA team showed pollution from the site migrated offsite at levels in excess of EPA acceptable limits.</p>	<p>DTSC provided summaries to the various health studies that have been conducted over the years on its website (http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SSFLCancerStudyExposureAssessment.cfm). According to the DTSC summaries there were two UCLA studies, one in 1997 dealt with radiation exposures and a second in 1999 which dealt predominately with hydrazine exposures. Both were funded by DOE. The third study you reference is the ATSDR, was published in 1999. According to DTSC's summary, "The preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects."</p> <p>Information summarizing the health studies previously conducted will be added to the EIS (Section 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Cindi	Gortner	<p>I do not care at all about the increased level of trucks going off site. Traffic is already bad, and this increase is completely trivial. But there are things NASA could nonetheless do to mitigate the truck traffic, such as natural gas or electric trucks or taking the shipments to a rail spur, and dispersing the trips over several routes, but NASA refuses to even consider them in the EIS. This tips NASA's hand, as it appears it isn't interested in doing a thoughtful EIS but rather trying to find excuses to get out of the AOC it signed.</p>	<p>Section 2.4 in the EIS discusses alternate transportation considerations (1) overland conveyor and rail transport of soil; (2) build a new haul road (3) truck from site to rail and transport by rail to disposal facility.</p> <p>(1) NASA considered alternative rail or conveyor system for hauling materials from SSFL. The analysis showed that a conveyor system would require building the system over private land and constructing a railroad facility to keep trucks off the local roads. NASA concluded that the system could not be built in the AOC timeframe requirement, there could be opposition to acquiring rights-of-way over private lands.</p> <p>(2) NASA considered building a new road for use by heavy vehicles accessing and leaving SSFL. Woolsey Canyon Road is the only road accessing the site that is capable of carrying heavy construction-type vehicles. Any feasible new road routes require acquisition of, or access permission, to current private property. Alternative access was dismissed due to the inability to obtain access permits, environmental assessments, and construct the road in time to meet NASA's 2010 AOC schedule requirements.</p> <p>(3) NASA considered a truck-rail combination for soil disposal. Using existing local roads to rail would not alleviate traffic on local community roads.</p> <p>Section 4.5 in the EIS discusses transportation routes further (also see Figure 4.5-1).</p>
Cindi	Gortner	<p>NASA – do the right thing and live up to your promises. We who live near the site deserve better than the biased DEIS you put forth. Cleanup to background as you promised to do under the AOC and stop misleading the community.</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Davis	Gortner	I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.	Your comment is noted.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Davis	Gortner	<p>NASA activities led to widespread contamination of soil and groundwater with very toxic materials such as perchlorate, dioxins, and TCE. Some of the contaminants have been migrating offsite. As a local resident, I am very concerned about the potential health impacts of these materials and want the site cleaned up properly.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Davis	Gortner	<p>In 2010 NASA signed an agreement with California to clean up all the contamination to background levels, restoring the site to the condition it was in before it was polluted. NASA is responsible for the contamination, has promised to clean it all up, and should live up to those commitments and promptly and thoroughly clean up the site and carry out all the obligations it assumed when it entered into the cleanup agreement.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Devyn	Gortner	<p>As a resident living in the area near the Santa Susana Field Laboratory (SSFL), I am deeply concerned that the site is fully cleaned up. I support the agreement that was made in 2010, when NASA agreed to clean up its property at SSFL to background levels of contaminants, meaning that it would clean up ALL the contamination that it found. This is what the community had wanted all along!</p>	<p>Your comment is noted.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Devyn	Gortner	So, it is very important for me to comment on the Draft Environmental Impact Statement (DEIS) that NASA recently published. NASA must absolutely uphold all of the commitments it has made to the State of California and to our community in the 2010 agreement to clean up SSFL to background.	NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Devyn	Gortner	<p>This cleanup agreement (Agreement on Consent or AOC) has sensible provisions for the protection of endangered species and Native American artifacts. It does not, however, allow NASA to evade cleaning up contamination by trying to avoid demolishing the crumbling rocket test stands, which is where much of the pollution is located. It's not possible to clean up beneath those test stands without getting them out of the way first. And the AOC commits NASA to cleaning up all the toxic material in the soil, including around and beneath those test stands and other structures.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Therese	Graf	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Colleen	Graven	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

(see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small igniters that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the igniters. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jennifer	Griffin	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Jennifer	Griffin	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the California DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Pamela	Griffin	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Jon	Grutman	<p>I'm writing to applaud NASA for having entered into a binding agreement with the State of California in 2010 to clean up all detectible contamination at the polluted Santa Susana Field Laboratory (SSFL). In response to NASA's Draft Environmental Report on the SSFL cleanup, I now urge NASA to now fully and rigorously carry out the commitments made in that cleanup agreement. NASA should be commended for having entered into the 2010 cleanup agreement. Now it is time to, without further delay, implement this historic cleanup agreement, thoroughly and completely.</p> <p>NASA's portion of SSFL is contaminated with toxic chemicals including PCBs, perchlorate, dioxins, heavy metals, and various volatile and semi-volatile organic compounds, all of which can produce harmful health effects. These materials can cause solid cancers and leukemias as well as developmental, genetic, neurological and immune system disorders.</p> <p>NASA's contamination at SSFL has the potential to impact communities near the site and beyond. Indeed, pollutants from the site have already migrated offsite. The best way to ensure that public health is protected is to clean up to background as NASA has agreed to do.</p>	Your comment is noted.

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Harvey H	Guthrie	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. Doris	Guthrie	<p>The most contaminated place in Ventura County is the Santa Susana Field Laboratory, where reactors and rockets were tested. One atomic reactor suffered a partial meltdown there in 1959; there were tens of thousands of rocket tests. Extensive radioactive and chemical contamination resulted. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p> <p>For decades, the fight to get the site cleaned up raged. Finally, we got a breakthrough: in 2010, the U.S. Department of Energy (DOE) and NASA entered into binding agreements with California to cleanups to background levels of contaminants. In short, if contamination is detected, it is to be cleaned up. This is what the community has sought for so long. Numerous elected officials as well as thousands of community members supported the agreement and helped bring this about.</p> <p>NASA has now published a Draft Environmental Impact Statement about the cleanup for public comment. There appear, however, to be some within NASA who would like to break the agreement NASA signed. That must not happen. I was therefore pleased to learn that NASA, in response to questions by Congresswoman Julia Brownley at a recent hearing of the House Science and Technology Committee, reiterated that "NASA is committed to fulfilling our obligations under the AOC."</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA.</p>

Alma	Gutierrez	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

Bar	Hadari	<p>I write to urge NASA to fully live up to the commitments it made in its 2010 agreement with the State of California to clean up all the contamination that is found at its portion of the Santa Susana Field Laboratory, a nuclear and rocket testing site.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Bar	Hadari	<p>NASA activities led to widespread contamination of soil and groundwater with very toxic materials such as perchlorate, dioxins, and TCE. Some of the contaminants have been migrating offsite. As a local resident, I am very concerned about the potential health impacts of these materials and want the site cleaned up properly.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from the SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near the SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Helsley	Hal	I have real concern in that as you take and run these haul trips, your truck, I noticed, has tarps on it, but it's still emitting dust. Are you taking and expanding the contaminated area to all of these haul routes by that movement of that material?	Fugitive dust emissions would be controlled by measures prescribed by VCAPCD Rule 55. Specifically, NASA would load materials carefully to minimize the potential for spills or dust creation. Implement water spraying as needed to suppress potential dust generation during loading operations. Take care to apply dust suppression water to the top of the load or source material to avoid wetting the truck tires. Do not perform loading during unfavorable weather conditions (such as high winds or storms). Material spilled during loading would be collected for subsequent loading. After loading, trucks would pass through the decontamination and inspection station before weighing and departure from SSFL.
Helsley	Hal	There are techniques that can be used to cap and cover, to seal the material there. We have materials you can add to soil that basically makes it a cement cover. And at that point it can be kept in location, and we don't have to contaminate other areas with the dust that is moving from the site.	The AOC (as written) doesn't allow of any soil with contaminant concentrations greater than the Lookup Table concentrations to remain onsite. NASA must continue to abide by its obligations under the AOC as drafted.

Helsley	Hal	<p>We have a piece of history here that is a scientific basis for one of the greatest accomplishments of man on Earth. And to take and to totally demolish that, where you don't have contaminants within the steel itself, I think this is something that should be preserved for our children in the future, just as we need to seriously preserve the materials that were left by the Chumash or the other Indians or maybe other parties in front of the Chumash. They may not be the only ones.</p>	<p>NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities. These determinations will be made in coordination with DTSC, SHPO, and others. The protection of public health and safety would take priority over protection of the historic and cultural sites.</p> <p>The identified archaeological resources will be avoided where possible, and NASA will develop an inadvertent discoveries plan.</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edward	Hall	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constent (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. Edward	Hall	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Edward	Hall	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Edward	Hall	<p>There is a reason that vast majority of the community that commented when the AOCs were proposed, 3,700 in fact, supported the AOCs. And that is because we know it is the only way we can truly be protected from SSFL's harmful toxins.</p> <p>We who live in the Knolls have waited long enough. I want NASA to fully comply with all of its obligations under the AOC.</p>	Your comment is noted.
Caroline	Hall (AHP)	<p>Our overall concern with the DEIS is that critical information to inform NASA's decisions is either not clearly presented, or is missing. Specifically, the document lacks sufficient information on measures to minimize adverse effects and ensure the long-term preservation of historic properties on the parcels to be conveyed to another party (or parties), and the parameters limiting the range of possible preservation outcomes.</p>	<p>NASA will proceed with its proposed action in accordance with stipulations laid out in the Programmatic Agreement and/or ROD to avoid, minimize or mitigate impacts to historic properties.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Caroline	Hall (ACHP)	<p>First, the DEIS presents little substantive information on the existing cleanup agreements between NASA and the environmental regulatory agencies (e.g. with the California Department of Toxic Substances Control, on pages 4-15 and 4-18). Further information is needed, as these agreements largely direct the efforts and levels needed to remediate the site, which in turn can circumscribe NASA's ability to fully consider alternatives to avoid or lessen adverse effects to historic properties.</p>	<p>Primary discussions on the 2007 Consent Order and 2010 AOC are in Section 1 of the EIS. The primary drivers from both agreements that affect the scope of the cleanup actions, and thus the impacts being evaluated in the EIS are cleanup levels and schedule.</p> <p>For both agreements the schedule calls for cleanup by 2017. For the 2007 Consent Order the cleanup level is determined by risk assessment protocols as documented in the 2005 Standardized Risk Assessment Methodology approved by DTSC. For the 2010 AOC the cleanup values were determined by DTSC and are documented in the Look-up Tables (LUT) for chemical and radiological. See below for web links.</p> <p>2005 SRAM - http://www.dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/ssfl_document_library.cfm</p> <p>Chemical LUT - http://www.dtsc-ssfl.com/files/lib_lookuptables/chemical/66073_06112013LUTand_cover.pdf</p> <p>Radiological LUT - http://www.dtsc-ssfl.com/files/lib_doe_area_iv%5Cepaareaivsurvey%5Cmiscplansandreports/65848_8-Final_Tech_Memo_Lookup_Table_Recommendations_112712.pdf</p>

Caroline	Hall (AHP)	<p>For example, the DEIS notes that several cleanup levels were initially considered, but only the preferred alternative meets the letter of the 2010 cleanup agreement. While we understand that the extent and nature of contaminants cannot be fully known until additional testing is undertaken, the FEIS should more fully explain the process by which NASA will make final decisions on the type and extent, of remediation(s) to be implemented, the criteria it will use to make decisions, and how the cleanup will take place in light of the agreements prior to conveyance to the General Services Administration (GSA).</p>	<p>Final cleanup plans will be submitted to DTSC for approval once the field sampling and treatment technology studies have been completed. These cleanup plans are currently scheduled to be submitted in 2015.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Caroline	Hall (ACHP)	<p>GSA will handle the disposal of the property once NASA has completed the remediation. The DEIS does not discuss GSA’s role in this process, or whether GSA may be amenable to preserving anything on the property. At a recent consultation meeting there appears to have been some confusion about GSA’s conditions for accepting the property from NASA. The FEIS should consider reasonably foreseeable effects associated with this undertaking, which we believe include the expected sale of the property or potential neglect of the property (36 CFR § 800.5(a)(1-2)). The FEIS should present information about the role of GSA in disposing of the property—how it identifies potential recipients, how it evaluates offers, and how it considers historic values in the excessing process. GSA’s qualified personnel could likely provide helpful input in this area.</p> <p>...the parameters of what can be preserved, what GSA will accept and what is conveyed to GSA for ultimate disposal, need to be explored in the FEIS in more detail so that the consulting parties clearly understand the preservation possibilities or opportunities.</p> <p>...NASA hasn’t been clear about whether GSA truly considers retention of a test stand (or other facility) a viable option or not.</p> <p>...the FEIS should address how organizations with an interest in preserving and interpreting such a facility will be identified by GSA and under what criteria (e.g., the need to have sufficient financial resources, etc.) GSA would select a recipient or partner. The document should also include information on the role GSA would play if NASA decides to preserve a test stand; for example, whether NASA would provide an allowance for the annual maintenance of that stand.</p>	<p>NASA will comply with the AOC (as currently written) and cleanup to background which will accommodate any future use. Future Use is the responsibility of GSA and outside the scope of this EIS. GSA has made it known in scoping meetings and consultation meetings that it will proceed with its disposal process separate from NASA’s EIS. DTSC will prepare a CEQA document and GSA will develop a NEPA document that will address the futures uses of the site.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Caroline	Hall (AHP)	An illustrative example of this problem is presented on page 4-25 of the DEIS, where it is stated that protective measures to prevent vandalism at the Burro Flats Painted Cave may need to be removed at the request of GSA. This appears to be the kind of historic preservation issue that needs to be addressed in NASA's FEIS, and will require coordination between NASA and GSA to answer. The document should address the circumstances under which this kind of action could occur, and why.	NASA acknowledges your comment. NASA will incorporate the coordination of protection measures after NASA's undertaking is completed into the Programmatic Agreement and/or ROD.
Caroline	Hall (AHP)	...the list of mitigation measures proposed in the DEIS (page 4-25) are general and formulaic. The FEIS should contain more detail that reflects the results of the ongoing consultation process. NASA has said it may be possible to preserve (at least) one test stand (Cultural Mitigation Measure 1), depending, among other things, on the character of the contaminants that surround it and may lie beneath it.	Please refer to the Programmatic Agreement and/or ROD which will outline multiple MMs.
Caroline	Hall (AHP)	In a September 10, 2013 email to the consulting parties, NASA included some rough estimates for the cost to remove asbestos, hydraulic fluids, and other regulated materials from each test stand, and encapsulate their lead paint. The email also included an annual maintenance cost for each stand of perhaps \$25,000. This information should be included in the FEIS discussion regarding mitigation measures, and should include any other available information about the possibility of retaining a test stand. For example, the FEIS should consider whether NASA would be responsible for initially preserving and preparing the structure for interpretation.	Please refer to the Programmatic Agreement and/or ROD which will outline multiple MMs.

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Caroline	Hall (ACHP)	In the event a test stand cannot be saved, it will be important to explore creative ideas that provide for telling the story of the SSFL and its historic significance. Since there is a link between the SSFL and the development of the Space Shuttles (and the Shuttle Endeavour is on display at the nearby California Science Center), perhaps some of the mitigation measures set forth in the 2011 Memorandum of Agreement for retirement of the Space Transportation System could be applied or linked to the SSFL.	NASA has identified multiple MMs in its Programmatic Agreement and/or ROD that allow for telling the story of SSFL. We refer you to the final stipulations of the agreement which includes options for telling the story to the public.
Caroline	Hall (ACHP)	...the FEIS should provide additional information on the cleanup options (e.g., excavation and offsite disposal, ex- and in-situ onsite treatment, and to what level) and how each will affect the integrity of the significant Burro Flats Site. Again, while the extent and nature of contaminants is incomplete at this time, the manner in which NASA will consider this National Register-listed site's significance and value to living communities needs to be more fully explored in the FEIS, including the process for further consultation by NASA if additional alternatives are identified.	NASA will identify ways to minimize impacts to archeological resources in the Programmatic Agreement and/or ROD. NASA and DTSC will have to come to an agreement in regards to which areas are covered under the clause in the 2010 AOC referencing Native American artifacts. The Burro Flats site may fall under this definition.
Caroline	Hall (ACHP)	...because of the nature of the historic properties on the SSFL (ranging from prehistoric archaeological sites and properties of traditional religious and cultural significance to Indian tribes through mid-20th Century rocket test facilities), the range of consulting parties and interests in the future of the property, and the fact that another federal agency is tasked with disposing of NASA's property (and whose mission and interests are not necessarily in concord with NASA's), we believe NASA should strongly consider embodying the measures agreed upon to avoid, minimize, or mitigate adverse effects to historic properties in a Memorandum of Agreement.	NASA is proceeding with the development of a Programmatic Agreement to stipulate MMs and other commitments, rather than codifying those commitments in the ROD as originally planned. SHPO and ACHP would be signatories to the agreement document. Should no agreement be reached, then NASA will return to the ROD approach.

Barbara	Hallman	<p>Over many decades, NASA's poor environmental practices resulted in widespread contamination of the Santa Susana Field Laboratory near Los Angeles. Dioxins, perchlorate, trichloroethylene, heavy metals, Polychlorinated biphenyls (PCBs), and other hazardous materials pollute the soil and groundwater at the site, and some have migrated offsite. In 2010, NASA entered into a legally binding agreement with the state of California to clean up all the contamination that could be found.</p> <p>Now, NASA has published a Draft Environmental Impact Statement for the cleanup that suggests they may be trying to break its commitment. I strongly urge NASA to completely live up to its obligations, and carry out in full the thorough cleanup required by the 2010 agreement. NASA contaminated the site; NASA promised to clean it up completely; NASA should be true to its word.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of the SSFL, which includes chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>

APPENDIX K

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marcella	Hammond	Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. To date, DTSC has not found any evidence of offsite contamination from SSFL that has posed or would pose a risk to users of the Santa Susana Pass State Historic Park or residents of neighborhoods near SSFL. (see http://dtsc.ca.gov/SiteCleanup/Santa_Susana_Field_Lab/SantaSusanaFieldLabFAQ.cfm)</p> <p>NASA operations did not entail the use of perchlorate except as small ignitors that were placed in the engine. The perchlorate was encased in the ignitor and consumed during the rocket engine ignitions process. Soil and groundwater samples have been collected and analyzed for perchlorate within the NASA-administered property at SSFL due to the use of the ignitors. To date, perchlorate has not been detected in the soil at SSFL. For groundwater, perchlorate was detected at a low level in one well. The well was subsequently sampled for perchlorate and it was not detected. Therefore, NASA operational history with regards to perchlorate and sampling results indicate, to date, that perchlorate was not released to the NASA-administered property at SSFL.</p> <p>Based on these and other comments, NASA will amend the EIS to reflect the impacts of contaminants if left in place as well as include information summarizing the health studies previously conducted (Sections 3.9.5 and 3.9.6).</p>

Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Marcella	Hammond	<p>In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.</p> <p>It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do-- fully clean up the site.</p>	<p>NASA remains committed to cleaning up the environmental contamination resulting from historical operations at the present federally owned portion of SSFL, which includes predominantly chemical contamination associated with the testing of liquid-fueled rocket engines and components in support of various government space programs and activities of the USAF and NASA. Demonstrably, in 2007, NASA entered into the CO with the DTSC and other responsible parties to address investigation and remediation requirements at the site and, in December 2010, NASA entered into the AOC with DTSC. In order to meet the cleanup requirements of the CO and AOC, NASA has developed a strategy that involves working closely with DTSC and local community stakeholders to ensure transparency as NASA moves forward with this important cleanup project.</p>
Tim	Hampton	<p>I live in the Santa Susana Knolls, just beneath the Santa Susana Field Lab (SSFL). I have the distinct pleasure of living in a uniquely beautiful community, and the distinct displeasure of knowing that SSFL, with it's witches brew of chemically hazardous contaminants, is nearby.</p> <p>I long for the day that SSFL is cleaned up. I thought I might finally be able to envision that day in 2010, when NASA signed the Agreement on Constant (AOC) with the State of California to cleanup it's property at SSFL to background levels. I was thrilled beyond measure. Finally, finally the contamination would be entirely cleaned up.</p> <p>Now that NASA has released it's Draft Environmental Impact Report, I am even more emphatic that NASA must follow the AOC to the letter, period. The DEIS truly shows the large amount of contamination NASA has created close to our community. The AOC requires it all be cleaned up, and we expect you to live up to your commitments to do so.</p>	<p>NASA respects public concern regarding offsite health issues. DTSC conducted extensive reviews of environmental data relating to SSFL, including data collected by other government agencies, such as USEPA. These data include environmental measurements relating to air, soil, groundwater, surface water, and drinking water. Comments and Responses to Comments on the Draft Environmental Impact Statement

First Name	Last Name	Comment	NASA Response
Tim	Hampton	<p>Significant amounts of that pollution are located under the rocket test stands. The AOC requires it all be cleaned up, so talk of leaving the rusting test stands in place would seem to violate the requirement of cleaning up the contamination beneath them. You can't remove the contamination under them without getting them out of the way.</p>	<p>Section 106 of the NHPA requires Federal agencies to consider the potential effects of their proposed actions on historic properties. NASA analyzed the potential effects of demolition actions and cleanup to background on cultural resources in the EIS. NASA continues to consult with the appropriate regulatory agencies and other consulting parties to identify the appropriate MMs to address the effects. The ROD will identify MMs selected to address the effects.</p> <p>The protection of public health and safety would take priority over protection of the historic and cultural sites. NASA is proposing to defer demolition of the historic Alfa and Bravo structures until such time as it can be determined whether any of these facilities, including test stands, must be demolished to achieve the required cleanup goals and a future owner has identified they are unwilling to retain any of those facilities.</p>
Tim	Hampton	<p>I am also pleased that the AOC provides sufficient protection for endangered species and Native American artifacts.</p>	<p>Your comment is noted.</p>
