HELIOS: Heterogeneous Laser Transmitter Integration for Low SWaP

- **PI:** Jonathan Klamkin, Boston University
- **Collaborators:** Bryan Robinson, MIT/LL, Hamid Hemmati, JPL

**Research Objectives**
- Apply heterogeneous photonic integration to deep space laser transmitter technology
- System-on-chip integration for low SWaP, increased reliability, and higher performance
- TRL 1-2 at start: Technology study, conceptualization, feasibility, benefits
- TRL 2-3 at end: Proof-of-concept development, design, prototype fabrication and characterization

**Approach**
- Collaborations with leading space flight transmitter experts at MIT/LL and JPL to evaluate potential impact and define specs.
- Heterogeneous integration approach for best-of-class component performance
- Photonic integration library of building blocks for ease of design
- Industrial foundries for rapid prototyping and to create path for increasing TRL

**Potential Impact**
- Unprecedented SWaP and cost reduction
- Added functionality, flexibility and re-configurability
- Module convergence by electron-photonic integration and optical interconnects
- Introduces new paradigm for space laser communication hardware design with potential to enable new missions

**Research Objectives**
