

NASA Space Communications and Navigation (SCaN) Planetary Weather Activity

Grades 3-5

Each planet in our solar system has its own unique weather. NASA SCaN uses satellites to send back data and pictures of their atmospheres through the Deep Space Network, our collection of huge radio antennas located around Earth.

To learn what weather NASA has found on our seven planetary neighbors, scan the QR code below, choose your favorite planet, then draw its weather around you (the astronaut) in the snow globe!

Read on about the weather found on some of our solar system's moons.
