## IXPE Cost Trace Proposal to ORR

## Background

- Imaging X-ray Polarimetry Explorer (IXPE)
- Principal Investigator (PI) Managed Mission
- PIMMC = \$175M in FY15 \$M including \$50M for launch vehicle
- Small Explorer Class (SMEX)
- Class D
- Proposal Submitted in December 2014
- Dr. Martin Weisskopf (MSFC) - Principal Investigator
- Detectors Provided by the Italian Space Agency
- Istituto di Astrofisica e Planetologia Spaziale (IAPS) - Detector Fabrication
- Istituto Nazionale di Fisica Nucleare (INFN) - Detector Assemblies and Calibration
- Agenzia Spaziale Italiana (ASI) - Ground Station
- Ball Aerospace and Technology Corporation - Spacecraft Development and System Integration

## Science

- IXPE uses X-ray polarimetry to expand dramatically observation space and to provide new input to our understanding as to how X -ray emission is produced in objects such as neutron stars, pulsar wind nebulae, and stellar and supermassive black holes. The two-year mission is very low-risk, making use of mature flight elements combined in a system with conservative resource margins and run by a team with extensive mission experience, in X-ray astronomy and especially X-ray polarimetry.

Figure D-4: Chandra images of the Crab (left), with its torus and jet; the Vela pulsar (center) and PWNe, with its peculiar double arcs; and the MSH 15-52 complex. The circles denote LXPE's $30^{\prime \prime} \mathrm{HPD}$; the square, $L X P E$ 's field of view.

## Approach

- Download CADRe files for IXPE milestones from One NASA Cost Engineering (ONCE) Database
- 2014 Proposal (IXPE was originally proposed in 2008)
- CSR (Concept Study Report)
- SRR (System Requirements Review)
- PDR (Preliminary Design Review)
- CDR (Critical Design Review)
- SIR (System Integration Review)
- ORR (Draft cost from John Howell - IXPE Business Manager)
- Compare to Parametric Cost Estimates from the same milestones
- Check changes and data with IXPE Project
- Present findings
- COVID impact cost included in SIR cost $\sim$ \$14M (~12.5M in FY15)
- Launch Schedule change from Launch Services Provider (LSP) resulted in $\sim \$ 1 \mathrm{M}$ increase (\$0.9M in FY15)
- Launch vehicle cost not included
- Phase A not included
- Contributions not included
- Italian Instrument Cost
- Parametric cost shown are the Most Likely estimate average from the PRICE and SEER cost models
- Reserves included
- 30\% Phase B-D
- 15\% Phase E-F

## Main Comparison

- Engineering Cost Office
- Proposal
- Phase B/C/D Estimate = \$110.4M in FY15
- Project
- As of June 2021
- Phase B/C/D Cost = \$136.4M in FY15
- Includes roughly \$12.5M in COVID impacts
- Includes a month (\$0.9M) delay on the launch due to launch scheduling
- $11.4 \%$ growth without impact increases included
- 23.6\% growth with impacts included

## 2014 Proposal Cost Estimate

Figure H-1: $I X P E$ Parametric Cost Estimates Compared to the PIMMC Estimate.

- Parametric Estimates focused on Spacecraft and Payload Cost
- The graph is from the 2014 proposal cost validation section.
- Section references a 74\% mission confidence level as seen below, but no Scurve is included.
distributions. The result of the risk analysis showed the proposed Phase $\mathrm{B} / \mathrm{C} / \mathrm{D}$ cost for $I X P E$, less the cost of the launch services but including all reserves and CM\&O overhead costs, is at a confidence level of $\mathbf{7 4 \%}$. The coefficient of variation for the probability distribution is 0.18 , which is consistent with the high degree of heritage on the spacecraft combined with the more technically challenging science payload.

## IXPE-II Mission CL Results <br> Gate C Presentation - Dec 2014

## IXPE-II Total B/C/D Cost Confidence Level Analysis

Cost does not include Launch Vehicle Services.

## CSR Estimates FY15 \$M

Figure K-1e IXPE PIMMC (excluding reserves)
was validated by MSFC internal analyses and by Aerospace Corporation ICE. See Table K-2.

## Technical Changes from Proposal to SIR

- Updated Design Feature:
- Launch Locks on Inverted Bipods
- Solar Arrays received iterative design changes
- Proposal - $2.2 \mathrm{~m}^{2}$ generating 534W EOL
- SIR - $1.7 \mathrm{~m}^{2}$ generating 306W EOL
- Spacecraft Shear Panels
- X-ray Shields
- New Design Feature:
- Mirror Module Assembly (MMA) TSS Ring
- Thermal shield for MMA
- Coarse Sun Sensor (CSS) on solar array panel
- DU Adaptor Plate
- $2^{\text {nd }}$ GPS Antenna
- Hinges for the Inverted Bipods
- Moved Components:
- Inverted Bipods - from payload deck to spacecraft
- Magnetometer - from spacecraft to payload deck
- Changed from Pegasus XL to SpaceX Falcon 9
- Orbit changed from 540km to 600km

## Configuration by Milestone

Engineering Cost
Office

SIR

## Project Results

- Total Mission RY \$M (including LV)
- Proposal = \$216.1M
- CSR = \$192.3M
- $\quad$ SRR $=\$ 192.7 \mathrm{M}$
- $\operatorname{PDR}=\$ 193.4 \mathrm{M}$
- CDR = \$194.0M
- SIR $=\$ 211.6 \mathrm{M}$
- Draft ORR = \$212.6M
- Mass Growth of Current Best Estimate (CBE) from Proposal to SIR:
- Total Observatory $=81.6 \mathrm{~kg}$ (33\%)
- Payload = 57.8kg (39\%)
- Spacecraft $=23.8 \mathrm{~kg}$ ( $24 \%$ )
- SIR Mass $10.5 \%$ above Proposal with mass margin

## Parametric vs Project Results

- Percentage project cost growth from CSR:
- To CDR = -0.83\%
- To SIR = 15.43\%
- Percentage parametric cost growth from CSR:
- To CDR = 6.32\%
- To SIR = Not

Estimated

| Cost Trace |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 180.00 |  |  |  |  |  |
| $160.00 \sim$ |  |  |  |  |  |
| 140.00 |  |  |  |  |  |
| 120.00 |  |  |  |  |  |

| 20.00 |  |  |  |  |  |
| - | CSR | SRR | PDR | CDR | SIR |
|  |  | Cost | Param | nate |  |

## Conclusions

- Growth of $11 \%$ without COVID impacts.
- From Andy's Paper "Being Certain about Uncertainty Part 2":
- Median Cost Growth seen by NASA projects is $35.1 \%$
- Mean Cost Growth seen by NASA projects is $56.2 \%$
- Great Leadership Team!
- Congratulations to MSFC, Ball, and Italian Space Agency!
