Revised M2M Objectives Roll-up

- **63 Top-Level Objectives across 10 Top-Level Goals**
  - 26 Science
  - 13 Infrastructure
  - 12 Transportation & Habitation
  - 12 Operations

- **9 Recurring Tenets (RT)**
  - Common themes across objectives

- **Updated Glossary**

**Recurring Tenets**

- RT-1: International Collaboration
- RT-2: Industry Collaboration
- RT-3: Crew Return
- RT-4: Crew Time
- RT-5: Maintainability and Reuse
- RT-6: Responsible Use
- RT-7: Interoperability
- RT-8: Leverage Low Earth Orbit
- RT-9: Commerce and Space Development
Lunar Infrastructure Goal and Objectives

**Lunar Infrastructure (LI) Goal:** Create an interoperable global lunar utilization infrastructure where U.S. industry and international partners can maintain continuous robotic and human presence on the lunar surface for a robust lunar economy without NASA as the sole user, while accomplishing science objectives and testing for Mars.

LI-1: Develop an incremental lunar power generation and distribution system that is evolvable to support continuous robotic/human operation and is capable of scaling to global power utilization and industrial power levels.

LI-2: Develop a lunar surface, orbital, and Moon-to-Earth communications architecture capable of scaling to support long term science, exploration, and industrial needs.

LI-3: Develop a lunar position, navigation and timing architecture capable of scaling to support long term science, exploration, and industrial needs.

LI-4: Demonstrate advanced manufacturing and autonomous construction capabilities in support of continuous human lunar presence and a robust lunar economy.

LI-5: Demonstrate precision landing capabilities in support of continuous human lunar presence and a robust lunar economy.

LI-6: Demonstrate local, regional, and global surface transportation and mobility capabilities in support of continuous human lunar presence and a robust lunar economy.

LI-7: Demonstrate industrial scale ISRU capabilities in support of continuous human lunar presence and a robust lunar economy.

LI-8: Demonstrate technologies supporting cis-lunar orbital/surface depots, construction and manufacturing maximizing the use of in-situ resources, and support systems needed for continuous human/robotic presence.

LI-9: Develop environmental monitoring, situational awareness, and early warning capabilities to support a resilient, continuous human/robotic lunar presence.
Mars Infrastructure Objectives

*Mars Infrastructure (MI) Goal:* Create essential infrastructure to support initial human Mars exploration campaign.

- MI-1\(^{M}\): Develop Mars surface power sufficient for an initial human Mars exploration campaign.
- MI-2\(^{M}\): Develop Mars surface, orbital, and Mars-to-Earth communications to support an initial human Mars exploration campaign.
- MI-3\(^{M}\): Develop Mars position, navigation and timing capabilities to support an initial human Mars exploration campaign.
- MI-4\(^{M}\): Demonstrate Mars ISRU capabilities to support an initial human Mars exploration campaign.
Lunar Infrastructure Goal Rationale

LUNAR INFRASTRUCTURE (LI)

Goal: Create an interoperable global lunar utilization infrastructure where U.S. industry and international partners can maintain continuous robotic and human presence on the lunar surface for a robust lunar economy without NASA as the sole user, while accomplishing science objectives and testing for Mars.

Rationale: This goal articulates the foundational capabilities and services required to support continuous human presence and exploration of the Moon. The intention is to enable access and support across the entirety of the Moon’s surface, not limiting exploration to one location or region that constrains scientific gain or extension to Mars. The language of this goal reinforces the important tenet of inviting industry and international partners to fully participate in and contribute to this endeavor. It supports the creation of markets and services that can endure with commercial value. Finally, this goal reinforces the key drivers for lunar exploration, which are scientific gains and practice for Mars.

One objective for each major infrastructure technology reflects the expectation that these capabilities will be achieved on different time scales and phased accordingly, and that their completion will be assessed by different metrics. LI-1 through LI-3 address the overarching “utilities,” that will be needed to support continuous lunar presence: power, communications, and position, navigation, and timing. These areas are fundamental elements that are essential to multiple scales of exploration throughout the build-up of assets on the lunar surface. LI-4 through LI-6 describe additional primary capabilities that will enable robust exploration and sustained presence: mobility, precise landings, and manufacturing and construction. LI-7 and LI-8 are the advanced capabilities that suggest industrial scale production and a fundamental shift to the use of lunar surface resources for sustainment and reduced logistics from Earth. LI-9 explicitly calls out some of the functions that will provide resilience and situational safety for astronauts and assets.
Mars Infrastructure Goal Rationale

**MARS INFRASTRUCTURE (MI)**

Goal: Create essential infrastructure to support an initial human Mars exploration campaign.

**Rationale:** To enable the potential for human presence and exploration of Mars beyond one mission, this goal acknowledges that foundational capabilities and services will be needed to properly prepare for and support this challenging endeavor. As technologies mature and the Mars architecture evolves, the exact meaning of the word “campaign” and the supporting objectives will be further defined.

As with the Lunar Infrastructure Objectives, the Mars Infrastructure Objectives are broken into specific functions that are foundational to efficient, safe, and sustained human exploration in **MI-1 through MI-3:** power; communications; and position, navigation and timing. **MI-4** reflects the importance of long-lead technology developments demonstrating the use of in-situ resources for repeated exploration missions and future sustained presence.

- **MI-1**: Develop Mars surface power sufficient for an initial human Mars exploration campaign.
- **MI-2**: Develop Mars surface, orbital, and Mars-to-Earth communications to support an initial human Mars exploration campaign.
- **MI-3**: Develop Mars position, navigation and timing capabilities to support an initial human Mars exploration campaign.
- **MI-4**: Demonstrate Mars ISRU capabilities to support an initial human Mars exploration campaign.

Use Cases

Functions

Characteristics & Needs

Moon to Mars Objectives

Use Cases: Operations that would be executed to produce the desired Needs and/or Characteristics.

Functions: Actions that an architecture would perform to complete the desired Use Case.

Characteristics: Features or activities of exploration mission implementation necessary to satisfy the Goals and Objectives.

Needs: A statement that drive architecture capabilities, is necessary to satisfy the Moon to Mars Objectives, and identifies a problem to be solved, but is not the solution.

Objectives & Goals:

Objectives & Goals:
Leadership defines what is needed to achieve the blueprint vision and Moon-to-Mars endeavor.

Reference Missions / ConOps

Elements / Requirements

Elements
(programs, projects, or systems)

Architecture organized by Segments and Sub-architectures in the ADD to group similar features and express progression of capabilities over time.

Characteristics & Needs:

C&Ns are the first level of decomposition of the objective, from the objective owners, to provide additional context/details on the objective's intent. This enables the architecture teams to provide direct traceability of the Use Cases and Functions to C&N statements.
Architecture Processes

Strategic Analysis Cycle

NASA MOON TO MARS ARCHITECTURE WORKSHOP – JUNE 2023
Segment: A portion of the architecture, identified by one or more notional missions or integrated use cases, illustrating the interaction, relationships, and connections of the sub-architectures through progressively increasing operational complexity and objective satisfaction.

**Sub-architecture:** A group of tightly-coupled systems, functions, and capabilities that perform together to accomplish architecture objectives.

Communication, Positioning, Navigation, and Timing • Habitation • Human Systems • Logistics • Mobility Systems • Power • Transportation • Utilization Systems
ESDMD Treatment of Infrastructure Objectives

Sustained Lunar Evolution (Notional Use Cases)
Enhancing Foundational Capabilities for Lunar Surface Access, Mobility, Habitation, Logistics, Power, Manufacturing, Construction & In-Situ Resource Utilization / Production

Expanded Power for Expanded Missions
More mission opportunities further from the South Pole for longer durations.

Increased Crew Size & Duration
Replicated surface habitats, laboratories and increased logistics.

Permanent Lunar Outpost
Crew/cargo access to and from the lunar surface enabled by ISRU, scores of crew.

Minimal ISRU & Regolith Utilization
100s of kgs of water/propellant produced.

ISRU Derived Propellants
1000s of kgs of water/propellant produced, minor civil engineering.

Industrial Scale ISRU & Mining
10,000s of kg of ISRU propellant with regolith used for raw materials, 3D printing, propellant manufacturing, and mining.

Expanded Mobility & Range
10s of km to 100s of kms range from South Pole.

Increased Sample Return
100s of kg from non-polar regions cached and returned to Earth in addition to FE capabilities.

Lunar Global Access (Crew & Cargo)
1000s of kg from global locations returned to central location, then returned to Earth.

Increased Duration & Population
Increased Economic Opportunity
Increased Science Capability

</table>
## Power Envisioned Future
### Sustainable Living and Working Further from Earth

Developing sustainable power sources and other surface utilities to enable continuous Lunar and, ultimately, Mars surface operations.

### Power Generation

- Up to 50 kW_e-class modular Earth-sourced Photovoltaic Arrays for Lunar Polar surface outposts and ISRU prospecting/production plants.
- 40 kW_e-class mobile Fission Power Systems to support Lunar Polar operations, bootstrap a global Lunar surface power grid to support Lunar industrialization at lower latitudes, and support Mars surface exploration

### Energy Storage

- Up to 50 kW_e-hr Secondary Batteries for mobility
- Up to 1 MW_e-hr Regenerative Fuel Cells for Polar Outpost/ISRU energy storage
- Large scale energy storage systems gathered from Lunar-sourced minerals

### Power Distribution

- 1000 V, radiation-hard, high reliability power electronics
- Up to 10 kW_e-class low mass Cables and spools for multi-km power distribution grids
- Up to 10 kW_e-class Power Beaming for up to 5 km line-of-sight.
- High power, long distance transmission lines printed from Lunar-sourced aluminum.

---

Not all activities depicted are currently funded or approved. Depicts “notional future” to guide technology vision.
EXPLORER: Develop Next Generation Communications and Navigation Technologies

Develop communications, navigation, and sensing infrastructure capable of handling high data volumes with near real-time communication (cislunar), and increased onboard navigation and time-keeping autonomy.

CISLUNAR AND MOON
- LunaNet framework for interoperable and resilient communication and navigation
- 1-10+ Gbps coherent optical links direct-to-Earth
- Multi-Gbps optical links to lunar surface
- Weak-signal, fast-acquisition multi-GNSS receiver for cislunar and lunar users
- High-performance atomic frequency standards for improved onboard navigation and timing
- 3GPP/5G for lunar surface
- Metric tracking data from available communication links

QUANTUM COMMUNICATIONS
- High-quality, high-rate entangled photon sources
- Entanglement swapping
- Quantum memory
- Non-demolition measurement
- Networking: repeater, error correction, etc.

OTHER CELESTIAL BODIES AND DEEP SPACE
- Extension of LunaNet framework beyond Earth-Moon for interplanetary and deep space network
- High Photon Efficiency optical links for 100s Gbps direct-to-Earth downlink
- High-performance atomic frequency standards enabling one-way metric tracking data
- GPS-like autonomous onboard navigation and timing through observation of X-ray emitting millisecond pulsars
- Metric tracking data from available communication links

NEAR-EARTH
- 200+ Gbps low-Earth orbit direct-to-Earth optical downlink for smallsats
- 1-100s Gbps optical inter-satellite links
- Multi-lingual, cognitive, wideband terminals
- Weak-signal, fast-acquisition multi-GNSS smallsat compatible receiver for above GNSS constellation users
- Metric tracking data from available communication links

Not all activities depicted are currently funded or approved. Depicts conceptual future of related technology vision.

NASA MARS ARCHITECTURE WORKSHOP – JUNE 2023
Autonomous Lunar Excavation, Construction, & Outfitting

targeting landing pads, structures, habitable buildings utilizing in-situ resources

- Site surveying, resource prospecting
- Ice mining & regolith extraction for 100s to 1000s metric tons of commodities per year

Excavation for ISRU-based Resource Production

- Construction and Outfitting
  - Landing pad construction demo scaling to human lander capable landing pads
  - Unpressurized structure evolving to single and then multi-level pressurized habitats
  - Outfitting for data, power & ECLSS systems
  - 100-m-diameter landing pads, 10s km of roads, 1000s m$^3$ habitable pressurized volume

- Construction materials production utilizing in-situ resources
  - 100s to 1000s metric tons of regolith-based feedstock for construction projects
  - 10s to 100s metric tons of metals and binders

Excavation for Construction

- Site preparation for construction: obstacle clearing, leveling & trenching
- Construction materials production utilizing in-situ resources
  - 100s to 1000s metric tons of regolith-based feedstock for construction projects
  - 10s to 100s metric tons of metals and binders

Sustainable Off-Earth Living & Working

- Commercial autonomous excavation and construction of landing pads, roads and habitable structures
- Fully outfitted buildings to support a permanent lunar settlement and vibrant space economy
- Extensible to future SMD missions and Mars settlement

Not all activities depicted are currently funded or approved. Depicts “notional future” to guide technology vision.

All activities depicted not currently funded or approved. Depicts “notional future” to guide technology vision.

*Commodities are items and consumables that can be eventually sold"
LAND: Enable Lunar/Mars global access with ~20t payloads to support human missions.

Developing landing capabilities that support unique requirements for both the Moon and Mars, to allow for landing greater payload capacity with greater accuracy

**Lunar Capabilities (Feeding Forward to Mars)**

- **Precision Landing and Hazard Avoidance**
  Safely and precisely land near science sites or pre-deployed assets (see details in separate package)

- **Retropropulsion**
  Understand flow physics and vehicle control through wind tunnel testing of Mars-relevant configurations; advance CFD modeling

- **Plume Surface Interaction**
  Reduce risks to landers and nearby assets by understanding how engine plumes and surfaces behave

- **Foundational Modeling, Testing, Instrumentation, and Computing**
  Measure EDL flight system performance and update/develop unique, critical simulations for EDL/DDL systems

**Mars Capabilities**

- **Large Scale Demonstrations**
  Large structures, including deployables, that can slow down a 20t payload in the thin Mars atmosphere

- **Earth Flight Tests, such as LOFTID**
  Assess Alternatives

- **Human Mars EDL**
  Aggregate Assets

*Not all activities depicted are currently funded or approved. Depicts “notional future” to guide technology vision.*
LAND: Technologies to Precisely Land Payloads and Avoid Landing Hazards

Developing entry, descent and landing technology to enhance and enable small spacecraft to Flagship-class missions across the solar system.

Enable anytime landings in treacherous terrains and independent of lighting
Reduce the risk of the landing for human and robotic missions to many destinations
Reduce operations time for a rover or human to reach an interesting site
Aggregate resources in one surface region for missions requiring multiple landings

Not all activities depicted are currently funded or approved. Depicts "notional future" to guide technology vision.
Questions

1. Questions or comments on the Lunar or Mars Infrastructure Goal Rationales or objectives?

2. NASA is engaging with U.S. industry partners and asking for feedback on sustainable business cases. How are other Agencies engaging their industries?

3. Which objectives align with your Agency's interests?
