November 19, 2014

**SBIR Phase II: S2.04-9446**  
**Contract# NNX14CM05P**

## Need for Lightweight Telescope Optics

- Decrease the weight of current Wolter Type I optics to allow for greater shell packing and thus increase effective X-ray collection area (i.e. increase the optical surface area per unit mass)
- Reduce the requirements and cost of telescope launch vehicle

Chandra X-ray observatory utilizing 4 nested zerodur optics with the outer shell measuring 1.2 meters in diameter.

Cross sectional view of Wolter I optic showing grazing angle reflection and nested reflector capability

XMM Newton

Current State of the Art X-ray observatory (XMM Newton) utilizing 58 nested reflector shells; largest reflector 70cm diameter.

Note the increased number of shells compared to that of Chandra resulting in greater optical area and thus greater X-ray collection

## Benefit of Electroformed Optic

- Individual mirror thickness reduced by greater than an order of magnitude (1mm vs. 20mm)
- Reduced mirror thickness allow for a greater number of shells to be nested

## Disadvantage of Electroformed Optic

- Density of Ni compared to zerodur
- Figure accuracy not as good as zerodur

## Electroformed nickel replication (ENR)

---

Repeat

### Benefit of the Electroforming Process

- Well suited for precision replication (widely used in optical manufacturing)
- Superpolished mandrel is reuseable, can be “touched up” as necessary

### Disadvantage of Electroformed Optic

- Density of Ni compared to zerodur ( $8.9\text{g/cm}^3$  vs  $2.5\text{g/cm}^3$ )
- Figure accuracy not as good as zerodur

**NiCo alone is too heavy for X-ray telescope missions**

**There exists a need to replace much of the NiCo with a less dense material**

# Telescope Optics: Proposed Innovation

## Current Standard

20mm Zerodur

## Current State of the Art

1mm NiCo

## Proposed Innovation

≤100μm NiCo  
200μm Al<sub>2</sub>O<sub>3</sub>

Dense Al/Al <sub>2</sub> O <sub>3</sub>
Porous Al/Al <sub>2</sub> O <sub>3</sub>
Electroformed Ni

cross section

Thickness of NiCo remains constant as shell diameter increases

### Comparison : Mass of Wolter I Optic with a 70cm diameter, 60cm long

68.7 kg

11.8 kg

1.9 kg

### Proposed Innovation

- Replace zerodur optic with NiCo shell and thermal spray ceramic support structure
- Utilize NiCo electroforming to replicate the surface micro-roughness of the mandrel
- Combine a graded-density lightweight ceramic support coating to hold figure accuracy and supply rigidity for handling

## Thermal Spray Processes

Twin Wire  
Arc

Flame /

#### Characteristics

Flame Temperature:  
 Approximately 12,000 - 20,000°F  
 (6,000 - 11,100°C)

Gases Used:  
 Ar/H<sub>2</sub>  
 N<sub>2</sub>/H<sub>2</sub>

Particle Speed:  
 800 - 1,800 ft/s (240-550 m/s)

Photo Courtesy of Westaim Ambeon

Associated with more than 100 variables

#### Spray Conditions:

- Torch Settings
- Powder
- Substrate Condition
- Spray Pattern

#### In Flight Particles:

- Temperature
- Velocity
- Trajectory

#### Coating Build-up:

- Splat Morphology
- Microstructure
- Porosity
- Interlamellar Contact

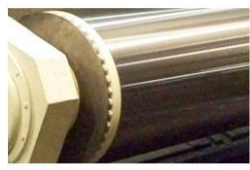

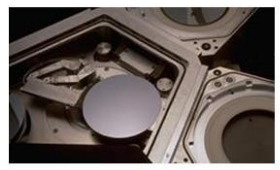

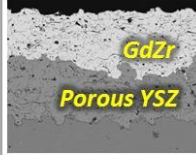

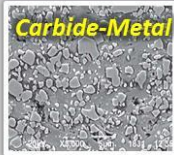

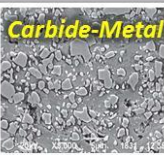

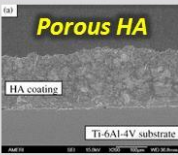

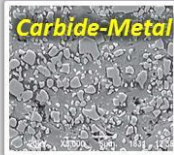

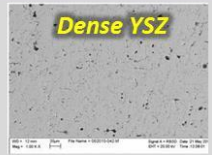

#### Properties:

- Mechanical
- Thermal
- Reliability

# Why Thermal Spray for this Application?

## Materials Selection

- Wide array of materials to select from
  - Metals, ceramics, polymers, composites
- Ability to tailor the material to not only match the expansion but also provide compliance via defects (thermal cycling compliance)

## Process Parameters

- Ability to tailor the microstructure, density, and interface through use of graded layers
- Ability to control deposition temperature
  - Robot raster speed
  - Secondary cooling

NiAl deposited onto canvas

## Component Manufacturing

- Ability to deposit onto large cylindrical geometries
  - Easily scalable
  - Deposit directly onto electroformed shell
- Cost effective and efficient
- Established industry base, does not require large capital expense for application

Defined Challenges	Proposed Mitigation Strategies
Light weight, rigid & high toughness carrier layer	<ul style="list-style-type: none"> <li>▪ Base structure of Al<sub>2</sub>O<sub>3</sub> or other porous ceramic coating</li> <li>▪ Al<sub>2</sub>O<sub>3</sub>-Aluminum composite/functionally graded structure</li> </ul>
Scale up production & manufacturing	<ul style="list-style-type: none"> <li>▪ Demonstrate on 1/2m diameter mandrel surface</li> </ul>
No damage to the electroplated NiCo layer	<ul style="list-style-type: none"> <li>▪ Minimal to no peening stress during TS coating deposition</li> <li>▪ Ductile metallic layer as a bond coat</li> <li>▪ Hard PVD interlayer (PVD TiN or BN)</li> </ul>
TS Coating residual stress compatibility	<ul style="list-style-type: none"> <li>▪ Select similar CTE coating material as NiCo</li> <li>▪ TS coating deposition using in-situ coating sensor (ICP) to monitor residual stress evolution &amp; determine the optimal process parameters</li> </ul>
Low substrate deposition temperature	<ul style="list-style-type: none"> <li>▪ Limit quenching stress</li> <li>▪ Low APS process condition. Explore Twin Wire Arc and Flame Spray</li> <li>▪ Cooling jet, faster raster speed, off-angle deposition</li> </ul>
Strong adhesion to smooth NiCo layer	<ul style="list-style-type: none"> <li>▪ Apply a similar CTE bond coat</li> <li>▪ First coating pass analysis using ICP sensor for adhesion criteria</li> <li>▪ SEM cross-sectional metallography</li> <li>▪ ASTM C633 bond strength test for quantifying adhesion strength</li> </ul>

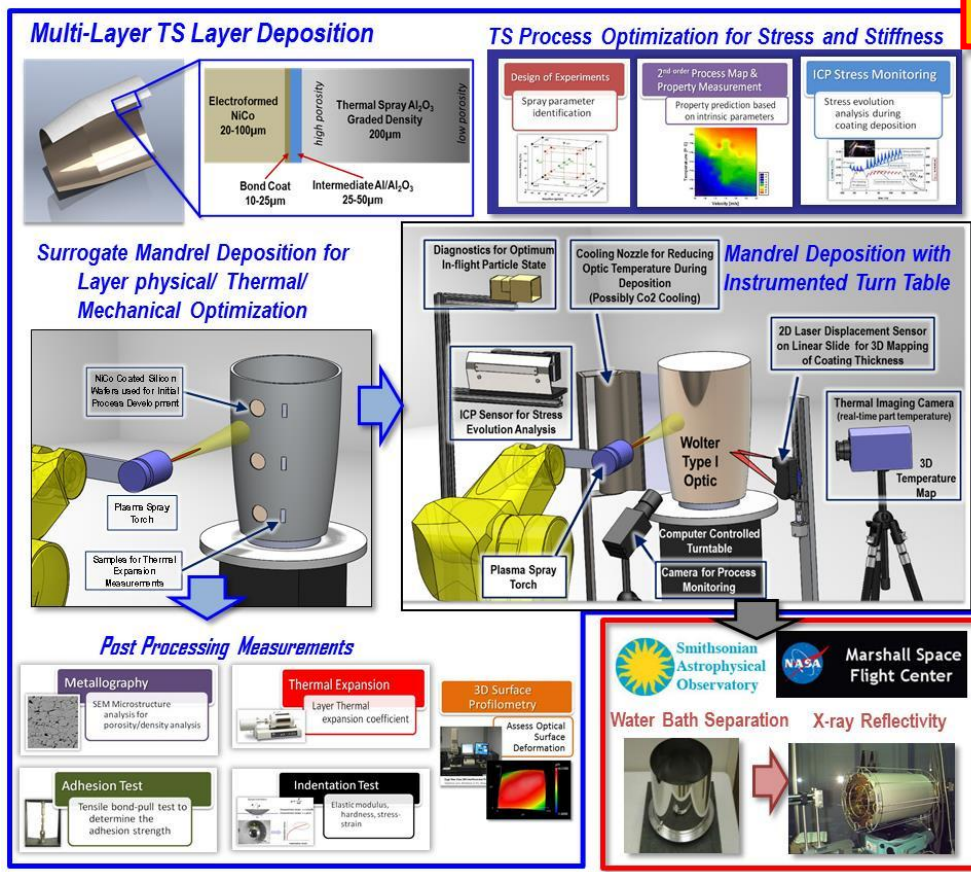

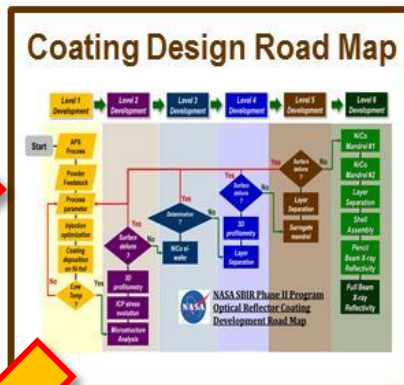

## Proposed Coating Development

	Optic Shell	Barrier Layer	Bond Coat	Graded Ceramic
<b>Composition</b>	NiCo	TiN BN	No Bond Coat Al Ni-5%Al	Al <sub>2</sub> O <sub>3</sub> 5% wt Al / 95% wt Al <sub>2</sub> O <sub>3</sub> 10% wt Al/90% wt Al <sub>2</sub> O <sub>3</sub>
<b>Thickness</b>	25µm 50µm 75µm 100µm	No Barrier 1-2µm	No Bond Coat 10µm	150µm 200µm
<b>Process Variables</b>	Bath chemistry, pH, Stress	Deposition rate, Pressure, Gas flow, Target-sub distance	Nozzle, Torch Power, Total gas flow, Robot speed, Spray distance, Particle temperature, Particle velocity	

- Proposed Innovation**
- Replace zerodur optic with **NiCo shell and thermal spray ceramic support structure**
  - Utilize NiCo electroforming to **replicate the surface micro-roughness of the mandrel**
  - Combine a **graded-density lightweight ceramic support coating** to hold figure accuracy and supply rigidity for handling

**Aluminum Powder**

Fine powder size to minimize particle energy

## Initial Test Substrates

Evaluate potential particle damage using nickel and aluminum foil

## NiCo Coated Si Wafer

2" test mandrels

Process development using NiCo plated silicon wafers (due to mandrel availability), continued testing on flat and conical mandrels to evaluate X-ray performance

## Air Plasma Spray (APS) Deposition

## Electroformed NiCo / Ni-5%Al Bond Coat & Al Coating

**As-Deposited**

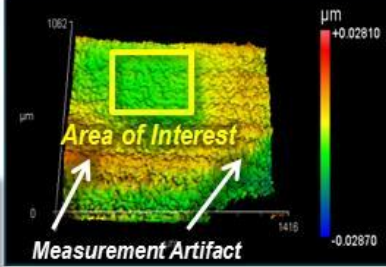

TS Al Coating (~200um)  
Strong Coating Adhesion to NiCo Layer

**Si Wafer**

Si wafer exhibited no surface deformation

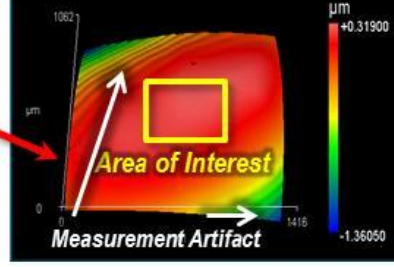

Area of Interest  
Measurement Artifact

**NiCo - Si Wafer Side**

Ni-5%Al Coating

Area of Interest  
Measurement Artifact

No visible surface deformation on NiCo layer

## Electroformed NiCo / Ni-5%Al Bond Coat / Al/Al<sub>2</sub>O<sub>3</sub> Blend / Al<sub>2</sub>O<sub>3</sub> Top Coat

**As-Deposited**

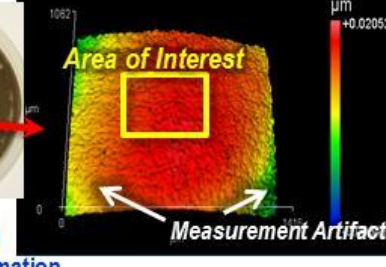

Ni-5%Al Bond Coat, Al/Al<sub>2</sub>O<sub>3</sub> Blend Layer, and Al<sub>2</sub>O<sub>3</sub> Top Coat

Uniform TS Coating Coverage with good adhesion

**Si Wafer**

Si wafer exhibited no surface deformation

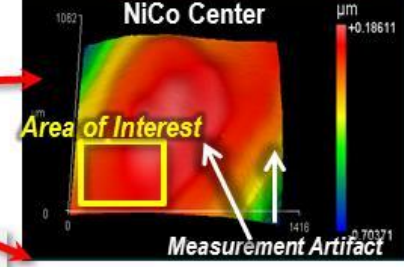

Area of Interest  
Measurement Artifact

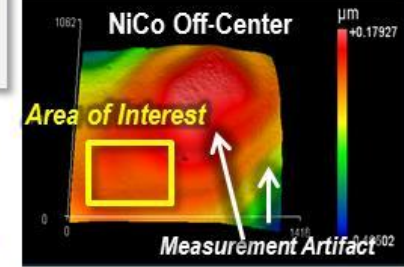

**NiCo - Si Wafer Side**

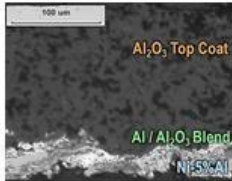

- No visible surface deformation of NiCo layer
- Uniform NiCo Surface roughness

NiCo Center  
Area of Interest  
Measurement Artifact

NiCo Off-Center  
Area of Interest  
Measurement Artifact

As-received NiCo mandrel

NiCo mandrel mounted on a turn table

Post Ni-5%Al deposition

Post Al-Al<sub>2</sub>O<sub>3</sub> deposition

Successfully released reflector coating from the mandrel

Post TS coating deposition state

Post Al<sub>2</sub>O<sub>3</sub> deposition

NiCo coated Mandrel

Thermal spray coated mandrel

Separated NiCo/TS layer from the Mandrel

Past feasibility study between Stony Brook-SAO

Two images showing the interior of a cylindrical component. The left image shows a dark, reflective surface with visible imperfections. The right image shows a white, matte surface.

Imperfections easily seen on optical surface

Current Accomplishment RCT-SAO Team

Two images showing the interior of a cylindrical component. The left image shows a white, matte surface with a grid pattern. The right image shows a dark, reflective surface with a grid pattern.

Optical surface considerably better as evident by the ability to image lines

- Coating deposition on silicon wafers attached to surrogated mandrel on a instrumented turntable
- Assess optical surface deformation via 3D surface profilometry
- Coating microstructural analysis
- Mechanical properties: indentation, adhesion tests, stiffness
- Thermal properties: CTE analysis for stress evolution analysis
