| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) RH24027. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- Lab Replicate RPD
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 155 results (7.59%) out of the 2042 results (sample and field QC samples) reported are qualified based on review and 10 results (0.49%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | The lab noted the following:<br><br>Sample -015 required re-analysis multiple times. There was insufficient sample to make the serial dilution and the post digestion spike aliquots for this sample in the third analysis. Beryllium is reported from the third analysis.<br><br>The MS/MSD recoveries in batches 20672, 21130 and 21759 were outside acceptance criteria. All other QC criteria for the batch were within acceptance criteria and method control limits. The MS/MSD recovery results are attributed to matrix interference. The associated sample results were reported and no corrective action was required. |
| SW7470A | No additional comments; see Checklist for detail. |
| SW7471B | No additional comments; see Checklist for detail. |
| SW8260B | The lab narrated the following:<br><br>The ICV associated with samples -002 and -003 recovered high for DCDFM (123%). Both samples were ND for this compound.<br><br>Sample -009 failed internal standard recovery criteria due to matrix interference; result are confirmed by repeat analysis.<br><br>The ICV associated with the calibration used to analyze the sample -004, -005, -006, -007, -008 and -010 failed high for Dichlorodifluoromethane (122%) and 1,4-dioxane (125%); all samples were ND for these two compounds.<br><br>The MS/MSD recoveries in batches 20963 and 21117 were outside acceptance criteria. All other QC criteria for the batch were within acceptance criteria and method control limits. The MS/MSD recovery results are attributed to matrix interference. The associated sample results were reported and no corrective action was required. |
| SW8270D | The lab noted the following:<br><br>The LCS associated with sample -002 failed low for 3,3-Dichlorobenzidine. The sample is re-extracted and re-analyzed within hold and LCS still failed for 3,3-Dichlorobenzidine. No sample remained for third extraction.<br><br>The LCS associated with samples -011 through -014 fails low for Dibenzo(a,h)anthracene. Samples are re-extracted outside the holding with LCS passing. All runs are reported. The closing CCV failed low for Hexachlorocyclopentadiene due to matrix.<br><br>ICV associated with sample -002 had a recovery for 2,4-dinitophenol at 75% which is below DOD limits of 80-120%; All other compounds were within limits.<br><br>The MS/MSD recoveries in batches 21013 and 21092 were outside acceptance criteria. All other QC criteria for the batch were within acceptance criteria and method control limits. The MS/MSD recovery results are attributed to matrix interference. The associated sample results were reported and no corrective action was required. |

November 16, 2017

Reviewed by Gretchen Gotlieb, Data Review Chemist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 29, 2017

Reviewed by Leticia Sangalang, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ20672-001 (LB)/ RQ20672-001 | Chromium | 0.1100 | < 0.072 | < 0.5 | mg/kg | U/None | L | |
| RQ20672-001 (LB)/ RQ20672-001 | Aluminum | 11.00 | < 6.7 | < 50 | mg/kg | U/None | L | |
| RQ21759-001 (LB)/ RQ21759-001 | Zinc | 1.000 | < 0.43 | < 2.5 | mg/kg | U/None | L | |
| RQ21759-001 (LB)/ RQ21759-001 | Iron | 2.400 | < 2.3 | < 5 | mg/kg | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW6010C, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

**Quality Control Outliers for test method SW6010C, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, Total, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-RBSD1-02-082216 (EB)/ RH24027-002 | Sodium | 1.200 | < 0.33 | < 5 | mg/l | U/None | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW7471B, Total, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ20932-001 (LB)/ RQ20932-001 | Mercury | 0.01600 | < 0.0063 | < 0.083 | mg/kg | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-SD13-00-001 (N)/ RH24027-006 | 1-Bromo-4-fluorobenzene (4-Bromofluorobenzene) | 78.79 | 79 - 119 | 10 - 119 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-RBSD1-02-082216 (EB)/ RH24027-002 | 4-Chloro-3-methylphenol | 0.8900 | < 0.26 | < 1 | ug/l | U/None | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ21092-002 (BS)/ RQ21092-002 | 4-Chloroaniline | 102.0 | 10 - 95 | 10 - 95 | percent | J/None | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-SD16-00-001 (SD)/ RH24027-011MD | Hexachlorocyclopentadiene | 0.000 | 20 - 134 | 10 - 134 | percent | J/R | M | |

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Table of All Qualified Results**

| Test Method: SW8270D | Extraction Method: SW3550C | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
| CDL-SD20-00-001 | N | Hexachlorocyclopentadiene | 1900 | 1500 S U | 1500 UJ | - | ug/kg | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| D | MS RPD |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| TR | Trace Level Detect |
| V | Equipment Blank |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by CAPE FEAR ANALYTICAL, LLC, WILMINGTON, NC and were reported under sample delivery group (SDG) 9684_HDOX. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

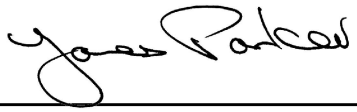
- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 1 results (0.39%) out of the 255 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

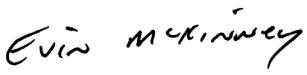
| Analytical Method | Data Reviewer Comment |
|---|---|
| E1613 | The laboratory noted that MS/MSD recoveries were outside control limits. |



November 17, 2017

Reviewed by James Parker, Senior Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.



November 28, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method E1613, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-SD20-00-001 (MS)/ 9684010 | Octachlorodibenzo -p-dioxin | 202.0 | 93 - 162 | 10 - 162 | percent | J/None | M | |
| CDL-SD20-00-001 (SD)/ 9684011 | Octachlorodibenzo -p-dioxin | 212.0 | 93 - 162 | 10 - 162 | percent | J/None | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-SD20-00-001 | N | Octachlorodibenzo-p-dioxin | 9.67 | 218 | 218 J | + | pg/g | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Table of All Qualified Results**

| Test Method: E1613 Extraction Method: SW3540C | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
| CDL-SD20-00-001 | N | Octachlorodibenzo-p-dioxin | 9.67 | 218 | 218 J | + | pg/g | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| M | MS Recovery |
| TR | Trace Level Detect |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

**Notes:**
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
NA = not analyzed
NC = not calculated
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**

J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
NA = not analyzed
NC = not calculated
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
R = result or limit of detection was rejected
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**

NC = not calculated
J = analyte was positively identified, but value is estimated
mg/kg = milligrams per kilogram
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/g = picograms per gram
R = result or limit of detection was rejected
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/kg = micrograms per kilogram

**Notes:**
NC = not calculated
J = analyte was positively identified, but value is estimated
mg/kg = milligrams per kilogram
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/g = picograms per gram
R = result or limit of detection was rejected
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/kg = micrograms per kilogram

| Vanadium | mg/kg | 18 | | 16 | | 11.8% | 15 | J | 14 | | 6.9% |
| Zinc | mg/kg | 70 | | 58 | | 18.8% | 430 | J | 160 | J | 91.5% |

**Notes:**
NC = not calculated
J = analyte was positively identified, but value is estimated
mg/kg = milligrams per kilogram
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/g = picograms per gram
R = result or limit of detection was rejected
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/kg = micrograms per kilogram

**Notes:**
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
NA = not analyzed
NC = not calculated
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

# 0. Executive Summary

AECOM Technical Services, Inc. (AECOM), on behalf of the National Aeronautics and Space Administration (NASA), updated the supplemental field investigation (SFI) report and human health risk assessment (HHRA) for the Restoration Program, Operable Unit 7, Project 15 Construction Debris Landfill (CDL) at the NASA Goddard Space Flight Center's Wallops Flight Facility (WFF) Formerly Used Defense Site (FUDS), Wallops Island, Virginia (the Site). WFF qualifies as a U.S. Army Corps of Engineers (USACE) FUDS property pursuant to the Environmental Restoration Defense Account and the Defense Environmental Restoration Program, Chapter 160 of the Superfund Amendments and Reauthorization Act of 1986. As part of the USACE FUDS program, USACE-Baltimore District (CENAB) is responsible for oversight of USACE FUDS activities at the former WFF-FUDS. This work is being performed under contract number 80KSC019D0010, delivery order 80GSFC20F0047 with NASA, under the ongoing authorized Environmental Contract.

This Revised HHRA presents a site-specific, quantitative analysis of the Site under current and future land use scenarios based on the nature of the chemicals of potential concern (COPC) detected in environmental media, potential exposure pathways to human receptors, and the degree to which these exposures may pose adverse health effects. The Revised HHRA uses all historical data (collected in 2007 for the Remedial Investigation [RI]) and recently collected Site data (collected in between May 2015 and November 2017 for the SFI), which includes soil, sediment, surface water, and groundwater data. Results of the Revised HHRA will be used to assess potential risk to site receptors.

A quantitative HHRA was completed at the Site to evaluate risks to human health potentially posed by COPCs in the affected media beneath and within the vicinity of the Site that cannot be eliminated using screening criteria. The Revised HHRA is compliant with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) process, as amended by the Superfund Amendments and Reauthorization Act of 1986, and the Virginia Department of Environmental Quality (VDEQ) risk assessment guidance. The HHRA also follows the U.S. Environmental Protection Agency (EPA) "Risk Assessment Guidance for Superfund (RAGS)" Part A (1989) and subsequent RAGS guidance, which stipulates that a risk assessment addresses the following major steps:

- Data Evaluation: A description of the data handling of each exposure medium and the exposure areas evaluated in the HHRA.
- Identification of COPCs: An identification of the COPCs for each exposure medium regarding human health effects.
- Exposure Assessment: An identification of the human receptors and the potential extent of their exposure to site-related COPCs in affected media.
- Toxicity Assessment: A description of the relationship between the magnitude of exposure (intake, dermally absorbed dose [DAD], or exposure concentration [EC]) and the incidence of adverse health effects associated with the identified COPCs.
- Risk Characterization: A description of the nature and magnitude of potential human health risks, comparison to state and federal target risk levels, and discussion of the uncertainties associated with the risk evaluation.

The Revised HHRA addressed the following exposure media: surface soil (0 to 2 feet below ground surface [bgs]), subsurface soil (2 feet bgs and greater), groundwater (from wells located downgradient of the CDL Site and from upgradient potable well TOC well 06), sediment, and surface water from the adjacent Little Mosquito Creek. Future excavation activities could result in the subsurface soil being brought to the surface and "mixed" together. Therefore, a total soil data set (surface and subsurface data combined) was derived for the surface soil and/or subsurface soil COPCs, assuming future land re-development occurs. Based on the historical aerial photographic analysis (U.S. Army Topographic Engineering Center 2000), four areas of concern (AOCs) within the CDL Site were defined and named with respect to their geographic position to each other: Northern, Central, Southern, and Western AOCs**.** For the Revised HHRA, soil media was divided into two different exposure areas: Central/Southern (C/S) and Northern/Western (N/W). The Western and Northern AOCs were evaluated together because site investigations did not indicate the presence of buried waste. The Central and Southern AOCs were evaluated together because the buried waste was present as observed during site investigations.

The following potential current and future land use scenarios and exposure pathways were addressed in the Revised HHRA:

Current/future outdoor maintenance worker: direct contact with the surface soil (current) and total soil (future) media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors), inhalation of vapors migrating from groundwater to outdoor air, and incidental ingestion and dermal contact with sediment in the upgradient drainage area.

Current/future teen trespasser: direct contact with the surface soil (current) and total soil (future) media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors), incidental ingestion and dermal contact with surface water, and incidental ingestion and dermal contact with sediment. Even though the teen trespasser may go fishing or crabbing, the consumption of fish or crab tissue is likely to be infrequent and is not evaluated in this revised HHRA. The consumption of fish and crab tissue exposure pathway is evaluated under the outdoor recreator (child/adult) scenario and is considered protective of the teen trespasser.

Current/future outdoor recreator (child/adult): direct contact with the surface soil (current) and total soil (future) media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors), incidental ingestion and dermal contact with surface water, ingestion of fish in surface water, incidental ingestion and dermal contact with sediment, and ingestion of Blue Crab in sediment.

Future indoor/outdoor commercial worker: direct contact with the total soil media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors), and inhalation of vapors migrating from groundwater to outdoor air, and vapor intrusion (VI) to indoor air.

Future construction worker: direct contact with the total soil media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors) and direct contact with the groundwater media (i.e., incidental ingestion, dermal contact and inhalation of vapors in a trench).

Future hypothetical resident (child/adult): for the soil exposure areas, the following exposure pathways are evaluated - direct contact with the surface soil (current) and total soil (future) media (i.e., incidental ingestion, dermal contact, and inhalation of wind-

blown dust and vapors), and inhalation of vapors migrating from groundwater to outdoor air. For the site-wide exposure area, the following surficial groundwater aquifer exposure pathways are evaluated - direct contact with the groundwater media (i.e., incidental ingestion, dermal contact and inhalation of vapors while showering or bathing), inhalation of vapors migrating from groundwater to outdoor air, and VI to indoor air.

Off-site current/future resident (child/adult): direct contact with the groundwater media from the Yorktown Aquifer (i.e., incidental ingestion, dermal contact and inhalation of vapors while showering or bathing). The VI exposure pathway is not evaluated for the Yorktown Aquifer due to its deep depth (roughly 154 feet bgs).

Various state and federal regulatory agencies mandate target or “acceptable” carcinogenic risk and noncarcinogenic hazard levels. The VDEQ regulations establish a target cumulative risk level (i.e., from all pathways for a single receptor group) of $1\times10^{-4}$ (1E-04) for potential excess lifetime cancer risk (ELCR). The EPA identifies the acceptable cancer risk range to be $1\times10^{-4}$ to $1\times10^{-6}$ (1E-04 to 1E-06). In effect, estimated ELCR that are less than $1\times10^{-6}$ (1E-06) are generally considered negligible. Potential ELCR in the intermediate range between $1\times10^{-4}$ to $1\times10^{-6}$ (1E-04 to 1E-06) can be considered acceptable on a case-by-case basis. The cancer risk of $1\times10^{-6}$ is used as the risk goal for individual carcinogens, with a not-to-exceed ELCR of $1\times10^{-4}$ for all carcinogens. Both the VDEQ and EPA accept a cumulative noncarcinogenic hazard target level, or Hazard Index (HI), of 1. When an HI is above 1 for a receptor, the chemical non-hazard hazard quotients (HQs) are segregated based on the target organ endpoint, and separate target organ-specific HIs are calculated. Only chemicals that act upon the same target organ are expected to be additive.

For each exposure scenario (i.e., receptor and exposure area) with a potential ELCR/HI above the EPA target levels, chemicals of concern (COCs) were identified as COPCs that contributed to the cumulative ELCR to exceed 1E-04 and/or the target organ endpoint HI to exceed 1, at one significant figure.

The Revised HHRA evaluated reasonable maximum exposure (RME) and central tendency exposure (CTE) for each receptor. The RME scenario is intended to assess the highest exposure that is reasonably expected to occur at a site. The CTE scenario refers to individuals who have average or typical intake of exposure media.

**Tables ES-1 and ES-2** summarize the RME and CTE cancer and non-cancer hazard results, respectively. **Table ES-3** presents the carcinogenic COCs that are contributing to unacceptable ELCR results for each receptor and exposure area. **Table ES-4** presents the noncarcinogenic COCs that are contributing to unacceptable target organ-specific HI results for each receptor and exposure area. The RME and CTE results for the Upgradient Drainage, and Downgradient/Estuarine exposure areas are below the EPA cumulative ELCR and HI target levels and are eliminated from further evaluation in the Revised HHRA. The carcinogenic and/or noncarcinogenic results for some receptors at the Central/Southern and Northern/Western exposure areas either equaled or were above EPA target cumulative levels and are discussed further below.

**Central/Southern Exposure Area Cancer Risk Results:**

As shown in **Table ES-3**, the Central/Southern exposure area RME carcinogenic COCs for the current and future lifetime outdoor recreator, future indoor/outdoor commercial worker, and

future hypothetical resident scenarios are primarily metals (arsenic and chromium); PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and naphthalene); dioxins and furans (i.e., 2,3,7,8-TCDD TEQ); and VOCs (1,1,2-trichloroethane, 1,2-dichloroethane, benzene, chloroform, ethylbenzene, and trichloroethene) in groundwater and surface and total soil. These results assume that groundwater is used for potable purposes even though the surficial aquifer is not used as an on-site water supply. An Environmental Covenant is not in place to prohibit future potable use of the on-site groundwater.

The Central/Southern exposure area RME and CTE evaluation indicates that the cumulative ELCR results drop from 6E-04 to 1E-04, respectively, for the current lifetime outdoor recreator scenario (**Tables ES-1 and ES-2**). As shown in **Table ES-3**, the RME evaluation identified metals (arsenic and chromium), PAHs (benzo(a)pyrene and dibenz(a,h)anthracene), and dioxins and furans (2,3,7,8-TCDD TEQ) as soil COCs. However, only chromium in surface soil remains as a COC in the CTE evaluation.

The future lifetime outdoor recreator scenario cumulative RME ELCR results are 3E-04 with the addition of VOC 1,1,2-trichloroethane and PAHs (benzo(a)anthracene, benzo(b)fluoranthene, and indeno(1,2,3-cd)pyrene) as soil COCs, but the ELCR drops below the EPA cumulative target ELCR of 1E-04 in the CTE evaluation.

For the future indoor/outdoor commercial worker scenario, the RME evaluation identified metals (arsenic and chromium); PAHs (benzo(a)pyrene and naphthalene); and VOC 1,1,2-trichloroethane as soil COCs. For groundwater, VOCs (1,2-dichloroethane, benzene, and ethylbenzene) were identified as VI COCs. The cumulative RME ELCR results drop from 4E-04 to below the EPA cumulative target ELCR of 1E-04 with 6E-05 in the CTE evaluation (i.e., no soil or groundwater COCs).

For the future lifetime resident scenario, the RME evaluation identified metals (arsenic and chromium); PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and naphthalene); dioxins and furans (2,3,7,8-TCDD TEQ); and VOCs (benzene,1,2-dichloroethane, ethylbenzene, 1,1,2-trichloroethane, and trichloroethene) as soil and/or groundwater COCs. The cumulative RME ELCR results drop from 3E-03 to CTE ELCR of 2E-03; the VOCs 1,1,2-trichloroethane and trichloroethene, and PAH dibenz(a,h)anthracene are no longer identified as carcinogenic COCs for soil in the CTE evaluation.

**Central/Southern Exposure Area Non-Cancer Hazard Results:**

As shown in **Table ES-4**, the Central/Southern exposure area RME noncarcinogenic COCs for the future outdoor worker, child outdoor recreator, indoor/outdoor commercial worker, and child and adult resident are primarily metals (aluminum, antimony, arsenic, beryllium, copper, cobalt, iron, manganese, mercury, nickel, thallium, and vanadium); PAHs (benzo(a)pyrene, 2-methylnaphthalene, and naphthalene); and VOCs (benzene, 1,1'-biphenyl, 1,1,2-trichloroethane, 1,2-dichloroethane, 2-hexanone, cis-1,2-dichloroethene, cyclohexane, ethylbenzene, isopropylbenzene, tetrachloroethene, trichloroethene, toluene, and xylenes).

The future outdoor worker cumulative HI is 3 for both the RME and CTE results (**Tables ES-1** and **ES-2**) due to inhalation of 1,1,2-trichloroethane vapors in total soil.

The current and future child outdoor recreator RME cumulative HI results were above the target HI of 1 due to direct contact with antimony, copper, iron, and nickel in soils. The CTE cumulative

HI results for the child outdoor recreator drop below the EPA cumulative target HI of 1 and metals are no longer identified as noncarcinogenic soil COCs.

The future indoor/outdoor commercial worker RME cumulative HI of 11 drops to 5 for the CTE cumulative HI; however, both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified benzene, naphthalene, toluene, trichloroethene, and xylenes as groundwater VI COCs and 1,1,2-trichloroethane was identified as an inhalation of vapors from soil COC. Trichloroethene and toluene drop out as groundwater COCs for the CTE evaluation.

The future construction worker RME cumulative HI of 16 drops to 7 for the CTE cumulative HI; however, both results remain above the EPA cumulative target HI of 1. The RME evaluation identified benzene, isopropylbenzene, mercury, naphthalene, toluene, and xylenes as groundwater COCs; 1,1,2-trichloroethane was identified as an inhalation of vapors from soil COC. However, 1,1,2-trichloroethane, toluene, manganese, mercury, and xylenes drop out as COCs for the CTE evaluation.

The future child resident RME cumulative HI of 75 drops to 42 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified the following COCs in soil and/or groundwater (**Table ES-4**): metals (aluminum, arsenic, cadmium, cobalt, copper, iron, manganese, mercury, thallium, and vanadium); PAHs (2-methylnaphthalene, benzo(a)pyrene, and naphthalene); dioxins and furans (2,3,7,8-TCDD TEQ); and VOCs (1,1,2-trichloroethane, 1,1'-biphenyl,1,2-dichloroethane, cis-1,2-dichloroethene, cyclohexane, ethylbenzene, isopropylbenzene, tetrachloroethene, toluene, trichloroethene, and xylenes). However, 1,1'-biphenyl, cis-1,2-dichloroethene, cadmium, cobalt, isopropylbenzene, 2,3,7,8-TCDD TEQ, and vanadium drop out as COCs for the CTE evaluation.

The future adult resident RME cumulative HI of 57 drops to 43 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified similar COCs as the child resident (**Table ES-4**). However, 1,1'-biphenyl, 2-methylnaphthalene, cis-1,2-dichloroethene drop out as groundwater COCs for the CTE evaluation. Even though the future child resident tends to be the more sensitive non-cancer receptor for the residential scenario, the inhalation of indoor air via VI and showering exposure pathways are contributing to the higher future adult resident RME and CTE cumulative HI results. The future child resident is not evaluated for the showering exposure pathway. As shown in **Table ES-4**, benzene and xylenes have high chemical-specific hazard quotients for the future adult resident inhalation indoor air (VI and showering) exposure pathways.

The lead evaluation using EPA's Integrated Exposure Uptake Biokinetic (IEUBK) and Adult Lead Methodology (ALM) models identified lead as a COC for surface soil and total soil for the Central/Southern exposure area. The future outdoor maintenance worker, teen trespasser, construction worker results were above the 5% probability percent threshold for total soil indicating these receptors have greater than 5% chance of having PbB levels over 5 µg/dL. The future child resident results were also above the 5% probability thresholds for surface and total soil. Therefore, potential soil cleanup options need to be explored to prevent potential adverse effects to human health from exposure to lead in soil.

**Northern/Western Exposure Area Cancer Risk Results**:

As shown in **Table ES-3**, the Northern/Western exposure area RME carcinogenic COCs for lifetime resident are primarily metals (arsenic and chromium), PAHs (benzo(a)anthracene, benzo(a)pyrene, and naphthalene), VOCs (1,2-dichloroethane, benzene, chloroform, ethylbenzene, and trichloroethene), and dioxins and furans (2,3,7,8-TCDD TEQ). These results

assume that groundwater is used for potable purposes even though the surficial aquifer is not used as an on-site water supply. An Environmental Covenant is not in place to prohibit future potable use of the on-site groundwater.

For the future indoor/outdoor commercial worker scenario, the RME evaluation identified PAH naphthalene and VOCs (1,2-dichloroethane, benzene, ethylbenzene) as groundwater VI COCs. Also, chromium was identified as a direct contact with total soil COC. The cumulative RME ELCR results drop from 4E-04 to below the EPA cumulative target ELCR of 1E-04 with 6E-05 in the CTE evaluation (i.e., no soil or groundwater COCs).

For the future lifetime resident scenario, the RME evaluation identified the metal (arsenic); PAHs (benzo(a)pyrene and naphthalene); dioxins and furans (2,3,7,8-TCDD TEQ); and VOCs (benzene,1,2-dichloroethane, and trichloroethene) as groundwater COCs. Chromium was identified as a RME total soil COC. The cumulative RME ELCR results drop from 3E-03 to a CTE ELCR of 2E-03 which is still above the EPA cumulative target ELCR of 1E-04. The CTE evaluation identified the same carcinogenic COCs as the RME evaluation.

**Northern/Western Exposure Area Non-Cancer Hazard Results**:

As shown in **Table ES-4**, the Northern/Western exposure area RME noncarcinogenic COCs for the indoor/outdoor commercial worker, construction worker, and child and adult resident are metals (aluminum, arsenic, beryllium, cobalt, iron, manganese, mercury, thallium, and vanadium); PAHs (2-methylnaphthalene and naphthalene); VOCs (benzene, 1,1'-biphenyl, 1,2-dichloroethane, cis-1,2-dichloroethene, cyclohexane, ethylbenzene, isopropylbenzene, tetrachloroethene, trichloroethene, toluene, and xylenes); and dioxins and furans (2,3,7,8-TCDD TEQ).

The future indoor/outdoor commercial worker RME cumulative HI of 7 drops to 4 for the CTE cumulative HI; however, both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified VOCs benzene, naphthalene, toluene, trichloroethene, and xylenes as groundwater VI COCs. However, trichloroethene, naphthalene and toluene drop out as groundwater COCs for the CTE evaluation.

The future construction worker RME cumulative HI of 11 drops to 6 for the CTE cumulative HI; however, both results remain above the EPA cumulative target HI of 1. The RME evaluation identified the metal mercury, PAH naphthalene, and VOCs (benzene, isopropylbenzene, toluene, and xylenes) as groundwater COCs. However, isopropylbenzene, toluene, mercury, and xylenes drop out as groundwater COCs for the CTE evaluation.

The future child resident RME cumulative HI of 54 drops to 38 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified the following groundwater COCs (**Table ES-4**): metals (aluminum, arsenic, beryllium, cobalt, iron, manganese, mercury, thallium, and vanadium); PAHs (2-methylnaphthalene, benzo(a)pyrene, and naphthalene); dioxins and furans (2,3,7,8-TCDD TEQ); and VOCs (1,1'-biphenyl,1,2-dichloroethane, cis-1,2-dichloroethene, cyclohexane, ethylbenzene, isopropylbenzene, tetrachloroethene, toluene, trichloroethene, and xylenes). However, beryllium, 1,1'-biphenyl, cis-1,2-dichloroethene, cobalt, iron, isopropylbenzene, 2,3,7,8-TCDD TEQ, and vanadium drop out as groundwater COCs for the CTE evaluation.

The future adult resident RME cumulative HI of 45 drops to 42 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified similar COCs as the future child resident (**Table ES-4**). However, 1,1'-biphenyl, 2-

methylnaphthalene, cis-1,2-dichloroethene drop out as groundwater COCs for the CTE evaluation. Even though the child resident tends to be the more sensitive non-cancer receptor for the residential scenario, the inhalation of indoor air via VI and showering exposure pathways are contributing to the higher adult resident cumulative HI results. The future child resident is not evaluated for the showering exposure pathway. As shown in **Table ES-4**, benzene and xylenes have high chemical-specific hazard quotients for the future adult resident inhalation indoor air (VI and showering) exposure pathways.

In conclusion, the HHRA results indicated that the receptors evaluated for the Upgradient Drainage and Downgradient/Estuarine exposure areas have cumulative ELCR and HI results below the EPA target levels and are eliminated from further evaluation.

The HHRA results indicate that unacceptable risk is possible for the following exposure areas and human receptors:

- Central/Southern exposure area – Future outdoor worker, current/future outdoor recreator (adult/child) exposure to surface and total soil; indoor/outdoor commercial worker exposure to surface and total soil and indoor vapors (VI) from surficial groundwater; future construction worker exposure to total soil, and outdoor vapors (trench) from surficial groundwater; and future hypothetical resident (child/adult) exposure to total soil and surficial groundwater (potable use, VI, and showering/bathing).
- Northern/Western – indoor/outdoor commercial worker exposure to indoor vapors (VI) from surficial groundwater; construction worker exposure to outdoor vapors (trench) from surficial groundwater; future hypothetical resident (child/adult) exposure to surficial groundwater (potable use, VI, and showering/bathing)
- Lead modeling results for the southern portion the Central/Southern exposure area indicate that the future outdoor maintenance worker, teen trespasser, and construction worker results were above the 5% probability percent threshold for total soil indicating these receptors have a greater than 5% chance of having PbB levels over 5 µg/dL. The hypothetical child resident results were also above the 5% probability thresholds for surface and total soil. Adverse health effects from exposure to lead in soil are possible.

The Revised HHRA conservatively assumed that total chromium concentrations were hexavalent chromium because chromium speciation data were not available. Hexavalent chromium is the more toxic form of chromium to human receptors. Chromium is a polyvalent element and can exist in several distinct oxidation states, but only trivalent chromium and hexavalent chromium occur with any frequency in the natural environment. Therefore, chromium cancer risk results may be overestimated.

As noted in **Tables ES-3 and ES-4**, the results of the Background Threshold Values Report (BTV Report) evaluation were incorporated in this Revised HHRA and indicate that after COCs below BTVs are excluded it would not cause the risk results to drop below the cumulative target cancer risk level of 1E-04 or target HI of 1 for receptors that are already exceeding.

# 1. Introduction

AECOM Technical Services, Inc. (AECOM), on behalf of the National Aeronautics and Space Administration (NASA), updated the supplemental field investigation (SFI) report and human health risk assessment (HHRA) for the Restoration Program, Project 15 Construction Debris Landfill (CDL) feasibility study (FS) at the NASA Goddard Space Flight Center's Wallops Flight Facility (WFF) Formerly Used Defense Site (FUDS), Wallops Island, Virginia. WFF qualifies as a U.S. Army Corps of Engineers (USACE) FUDS property pursuant to the Environmental Restoration Defense Account and the Defense Environmental Restoration Program, Chapter 160 of the Superfund Amendments and Reauthorization Act of 1986. As part of the USACE FUDS program, USACE-Baltimore District (CENAB) is responsible for oversight of USACE FUDS activities at the former WFF-FUDS. This work is being performed under contract number 80KSC019D0010, delivery order 80GSFC20F0047with NASA, under the ongoing authorized Environmental Contract.

The Revised HHRA uses soil data, sediment data, surface water data, and groundwater data from six on-site monitoring wells and shallow and deep temporary wells. Data were collected between 2007 and 2017. Pore water data were also collected for the SFI but were not used for the revised HHRA.

WFF is in Accomack County, Virginia, on the Atlantic Coast of the Delmarva Peninsula (**Figure 1-1**), approximately 5 miles south of the Maryland/Virginia state border and immediately west of Chincoteague Island. Bounded on the north and east by Little Mosquito Creek, Simoneaston Bay to the east, and Wattsville Branch to the west, WFF sits at 20 to 30 feet above mean sea level. WFF consists of three separate land areas: Wallops Main Base, Wallops Mainland, and Wallops Island (**Figure 1-2)**. The Project 15 CDL (the CDL Site) is located northeast of the runways on the approximately 2,230-acre main base.

## 1.1 Purpose and Scope of Plan

This Revised HHRA presents a site-specific, quantitative analysis of the site under current and future land use scenarios based on the nature of the human health chemicals of potential concern (COPC) detected in environmental media samples collected from 2007 through 2017, potential exposure pathways to human receptors, and the degree to which these exposures may pose adverse health effects. Compared to the previous risk assessments, the Revised HHRA identified additional contaminants above screening levels and addressed potential exposure pathways that were not previously included. Results of the HHRA will be used to assess risk management options for the CDL Site, including possible further actions to address impacted media.

A quantitative HHRA was completed for the CDL Site to evaluate risks to human health potentially posed by COPC in the affected media beneath and within the vicinity of the site that cannot be eliminated using screening criteria.

## 1.2 Report Organization

This Revised HHRA has been organized into the following sections:

**Section 1** Introduction provides an overview of the objective and organization, identifies the governing risk assessment guidance documents, and summarizes the steps in performing an HHRA.

**Section 2** Data Evaluation describes the data management of each exposure medium and the exposure areas evaluated in the HHRA.

**Section 3** Identification of Chemicals of Potential Concern discusses the screening criteria and presents the COPCs identified in the media of concern.

**Section 4** Exposure Assessment identifies the objectives of the exposure assessment and summarizes the exposure scenarios. It also includes calculation of exposure point concentrations (EPCs) for the COPCs identified in the media of concern for use in the risk calculations.

**Section 5** Human Toxicity Assessment describes the purpose of the assessment and presents health criteria (cancer and noncancer toxicity values) used for COPCs.

**Section 6** Human Health Risk Characterization evaluates potential risks due to exposures to COPCs in soil, groundwater, surface water, and sediment from the CDL Site by integrating toxicity and exposure assessments into quantitative expressions of cancer risk and noncancer health hazards.

**Section 7** Human Health Risk Uncertainty Analysis discusses uncertainties associated with the risk estimates.

**Section 8** Conclusions summarizes the results of the revised HHRA.

**Section 9** References provides a list of sources cited in the preparation of this Revised HHRA.

The following attachments are included with this Revised HHRA:

**Attachment 1** contains the sample identification tables for each exposure area and exposure medium evaluated in the HHRA.

**Attachment 2** presents the risk-based screening results for the detected chemicals in each exposure medium as well as a risk-based screening of the detection limits.

**Attachment 3** provides the intake, dermally absorbed dose (DAD), and exposure concentration (EC) equations used for each receptor as well as the EPCs.

**Attachment 4** describes the fate and transport models and the modeled EPC results.

**Attachment 5** provides the cancer risk and non-cancer hazard calculations.

Attachment tables are denoted with the letter “A” before the Attachment number (e.g., Table A2-1).

## 1.3 Regulatory Framework and Scope

The Revised HHRA is compliant with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) process, as amended by the Superfund Amendments and Reauthorization Act of 1986 and the Virginia Department of Environmental Quality (VDEQ) risk assessment guidance. The HHRA also follows the U.S. Environmental Protection Agency (EPA) “Risk Assessment Guidance for Superfund (RAGS)” Part A (1989) and subsequent RAGS guidance, which stipulates that a risk assessment addresses the following major steps: Data Evaluation (**Section 2**), Identification of COPCs (**Section 3**), Exposure Assessment (**Section 4**), Toxicity Assessment (**Section 5**), and Risk Characterization (**Section 6**). Each phase of the Revised HHRA were reexamined in an Uncertainty Assessment (**Section 7**) to identify key assumptions, site history, and any lines of evidence that may affect, change or

support the estimates of potential cancer risk and/or non-cancer hazards. The Conclusions (**Section 8**) summarize the results of the Revised HHRA.

# 2. Data Evaluation

This section describes the data management of each exposure medium and the exposure areas evaluated in the HHRA. The Revised HHRA includes all data collected at the CDL Site; this includes data included in the 2013 RI and collected during the SFI. The SFI consisted of several events conducted between May 2015 and November 2017. Field activities included trenching, collecting soil samples from trenches and from direct push technologies (DPT) borings, sampling shallow and deep temporary wells, collecting two rounds of surficial aquifer groundwater samples from monitoring wells, collecting a Yorktown Aquifer groundwater sample from water supply well TOC-06, and collecting pore water and sediment samples from Little Mosquito Creek.

## 2.1 Site Media

The Revised HHRA addresses exposure to the following on-site media:

- Soil - surface soil (0 to 2 feet below ground surface [bgs]) and subsurface soil (2 feet bgs and greater) from four designated areas of concerns (AOCs)
- Groundwater collected from impacted wells located downgradient of the CDL Site and from upgradient potable well TOC well 06
- Sediment collected from the adjacent Little Mosquito Creek
- Surface water collected from the adjacent Little Mosquito Creek

Sample locations are presented on **Figures 3-1** and **3-2** of the SFI Report. **Table A1-2** in **Attachment 1** identifies the sample locations for each medium that are evaluated in the HHRA.

## 2.2 Soil

Based on the historical aerial photographic analysis (U.S. Army Topographic Engineering Center 2000), four AOCs within the CDL Site, shown on **Figure 3-1** of the SFI Report**,** were defined and named with respect to their geographic position to each other: Northern, Central, Southern, and Western AOCs**.** In previous investigations, these AOCs have also been described by the nature of their apparent historical site use:

- Northern AOC – Disturbed Ground – This AOC was an area of disturbed ground in 1949 that was an excavation in 1954.
- Central AOC – Mounds of Material – This AOC was an area with several mounds of unidentified material in 1954 that was an excavation by 1959.
- Southern AOC – Burning Dump – This AOC was an area of disturbed ground with two man-made channels; the AOC's use as a burning ground was confirmed on a 1950 site map.
- Western AOC – Shallow Excavation – This AOC is interpreted to be a shallow excavation that is now located inside the runway area fence.

For the Revised HHRA, soil media were divided into two different exposure areas: Central/Southern and Northern/Western. The Western and Northern AOCs were evaluated together because site investigations did not indicate the presence of buried waste. The

Central and Southern AOCs were evaluated together because the buried waste was present as observed during site investigations.

For the future scenario, a total soil data set was derived by combining surface soil and subsurface soil COPCs. The total soil data set includes all soil samples collected. This consists of samples collected from 0 feet bgs to 17.5 feet bgs in the Northern AOC, 17 feet bgs in the Central AOC, and 9.5 feet bgs in the Southern AOC. No subsurface soil samples were collected in the Western AOC. Future redevelopment activities are considered unlikely, however if they were to occur, they are anticipated to result in the subsurface soil being brought to the surface and “mixed” together.

## 2.3 Groundwater

Groundwater samples were collected from 17 shallow and 4 deep temporary wells and 6 monitoring wells during two rounds of sampling. Samples were collected and analyzed for Target Compound List (TCL) volatile organic compounds (VOCs), TCL semivolatile organic compounds (SVOCs), and Target Analyte List (TAL) metals (total metals from the monitoring wells and dissolved metals from the temporary wells). A subset of samples was analyzed for dioxins and furans. Sample identifiers for the monitoring well, shallow temporary wells, and deep temporary wells include the identifiers MW, DPW, and DTW, respectively. Additionally, two rounds of surficial aquifer groundwater samples were collected from monitoring wells in May and November 2016 and a Yorktown Aquifer groundwater sample was collected from water supply well TOC-06.

## 2.4 Sediment

Sediment samples were collected from the adjacent Little Mosquito Creek. Eleven sediment samples (SD-11 through SD-21) were collected and analyzed for TCL VOCs, TCL SVOCs, TAL metals, and dioxins/furans. Locations SD-11, SD-12, and SD-20 were selected as background locations. Sample identifiers for these sediment samples include the identifier SD. Crabs from Little Mosquito Creek were evaluated as media of potential concern. Concentrations of COPCs in crab tissue were modeled using sediment data and biota sediment accumulation factors (BSAFs) because no direct sampling of crab tissue was performed.

## 2.5 Surface Water

Groundwater at the site flows to the northeast and east towards Little Mosquito Creek; therefore, migration of groundwater to the Creek is a potentially completed pathway. Surface water samples were collected from the adjacent Little Mosquito Creek. Fish from Little Mosquito Creek were evaluated as media of potential concern. Concentrations of COPCs in fish tissue were modeled from surface water data and bioconcentration factors (BCFs) or bioaccumulation factors (BAFs) because no direct sampling of fish tissue was performed.

## 2.6 Data Treatment

The following data treatment was used in the Revised HHRA:

- A duplicate sample is treated as a sample result and is carried forward into the HHRA.

- Per VDEQ guidance (VDEQ, 2020a), non-detect (ND) chemicals (indicated by a “U” or a “UJ” qualifier), will be included in the risk-based screening at one half the method detection limit (MDL) to ensure that the laboratory analyses are protective of risk-based screening levels for measuring potential chemical concentrations at a site. In cases where one half an analyte’s MDL exceeded the VDEQ screening values, the analyte was included in the data sensitivity analysis presented in **Section 7.5**.
- If a result was rejected (indicated by an “R” qualifier), the result was eliminated for that medium.
- Total xylenes were used in place of separate congeners of m,p-xylene and o-xylene.
- Data with “J” qualifiers were assumed to be positive identifications for those media. J indicated that the numerical value is an estimated concentration (i.e., it is reported below the minimum confident sample quantitation limit). The J-flagged results are treated as detected concentrations and addressed qualitatively in the uncertainty assessment (EPA, 1989).
- If a chemical is ND and one half the MDL is lower than the screening level, then it is eliminated from further evaluation.
- The laboratory used toxicity equivalence factors (TEFs) to adjust measured concentrations and one half the MDL for ND dioxin and furan congeners to produce weighted concentrations for each congener in relation to its level of toxicity to 2,3,7,8-tetrachlorodibenzo-p-dioxin (2,3,7,8-TCDD). The adjusted concentrations were summed for each sample to provide a toxicity equivalence (TEQ) concentration for 2,3,7,8-tetrachlorodibenzo-p-dioxin. The 2,3,7,8-TCDD TEQ (ND=0.5) concentrations were carried forward into the HHRA and are considered representative of dioxins and furans at the site (EPA, 2013).

This Page Intentionally Blank

# 3. Identification of Chemicals of Potential Concern

Identifying the COPCs at the CDL Site is an important step in the risk assessment process. Screening criteria, such as those used in this HHRA, serve to focus the HHRA on COPCs that have the potential to significantly contribute to the calculated risks. According to the VDEQ Guidance Manual (VDEQ, 2020), a chemical with a maximum concentration exceeding the selected screening level is carried forward as a COPC and then quantitatively evaluated in a site-specific HHRA.

## 3.1 Selection of Risk-Based Screening Levels

The maximum concentrations for a detected chemical or one half the MDL for NDs were compared against the corresponding medium-specific screening level. Those chemicals above the corresponding screening level were retained. Chemicals with concentrations below the corresponding screening level were eliminated from further evaluation. The selected screening level criteria for the HHRA are presented in **Table 3-1**. The following screening levels were used for each media:

- Soil (both surface and subsurface) was screened using the May 2021 EPA residential soil regional screening levels (RSLs) (target risk [TR]=1E-06, target hazard quotient [THQ]=0.1). Although the Site is currently industrial, residential RSLs were used to account for the potential teen trespasser and hypothetical future resident.
- Groundwater was screened using the May 2021 EPA Tap water RSLs (TR=1E-06, THQ=0.1) and for vapor intrusion (VI) using the target groundwater concentrations generated in the Vapor Intrusion Screening Level (VISL) calculator (EPA, May 2021 version).
- Sediment was screened using May 2021 residential soil RSLs (TR=1E-06, THQ=0.1) times a multiplication factor of 10 to account for decrease in exposure to sediment.
- Surface water was screened using May 2021 EPA Tap water RSLs (TR=1E-06, THQ=0.1) times a multiplication factor of 10 to account for decrease in exposure to surface water.
- Fish and crabs from Little Mosquito Creek were evaluated as media of potential concern. Concentrations of analytes in fish and crab tissue were modeled from surface water and sediment data because no direct sampling of fish and crabs was performed. Modeled fish and crab tissue concentrations are presented in **Tables A2-15** and **A2-16 Attachment 2**.
    - Crab tissue concentrations were calculated for the downgradient estuarine sediment samples and compared to May 2021 EPA Fish RSLs (TR=1E-06, THQ=0.1).
    - Fish tissue concentrations were calculated for the downgradient estuarine surface water samples and compared to May 2021 EPA Fish RSLs (TR=1E-06, THQ=0.1).
- Surrogates are chemicals with similar molecular structures that were selected to represent chemicals without readily available toxicity information to derive risk-based screening levels. Surrogates are documented in **Table A2-14 Attachment 2**.

- A chemical with no screening level (i.e., no toxicity data) and no appropriate surrogate toxicity value was not further evaluated if no appropriate surrogate chemical were available. If no screening level or no appropriate surrogate toxicity value were available for a chemical, it was noted in the final column of the screening tables titled, “Rationale for Selection/Deletion” (**Tables A2-1** through **A2-13 of Attachment 2**.).
- Metals considered to be essential nutrients (i.e., calcium, magnesium, potassium, and sodium) were eliminated from further evaluation.

The risk-based screening results are provided in **Tables A2-1** through **A2-13 of Attachment 2**. **Table 3-2** summarizes the COPCs for each exposure medium.

RSLs are not available for total chromium. For this risk assessment, total chromium was assumed to be hexavalent chromium because chromium speciation data were not available. Chromium is a polyvalent element and can exist in several distinct oxidation states, but only trivalent chromium and hexavalent chromium occur with any frequency in the natural environment. Without speciated chromium data, it was assumed that only hexavalent chromium, which is the more toxic form to human receptors, was present at the Site. This assumption likely greatly overestimates the risk for this receptor and is discussed further in **Section 7**.

# 4. Exposure Assessment

The site-specific conceptual site exposure model (CSEM) is presented on **Figure 4-1** and on **Table 4-1**, which identifies the potential human receptors and the potentially complete exposure pathways that are addressed in the HHRA. The objectives are to:

- Identify populations that may be potentially exposed to COPCs
- Identify pathways by which such exposures may occur
- Quantify chemical intakes or potential doses based on the magnitudes, frequencies, and durations of these potential exposures

The HHRA evaluates reasonable maximum exposure (RME) and central tendency exposure (CTE) for each receptor. The RME scenario is intended to assess the highest exposure that is reasonably expected to occur at a site. The CTE scenario refers to individuals who have average or typical intake of exposure media (EPA 1989).

The RME exposure assumptions used in the HHRA are presented in **Attachment 3 Tables A3.1.RME** through **A3.12.RME**, and CTE exposure assumptions are presented in **Tables A3.1.CTE** through **A3.12.CTE**.

## 4.1 Environmental Setting and Land Use

The site is bounded on the north and east by Little Mosquito Creek, directly west is the runway for the main base, and south is an open field. Current site features include the Town of Chincoteague Yorktown Well (TOC-6) and a road that runs through the site. The majority of the site is a grassy field, except for the north and eastern edges, which include a wooded and marshy area bordering Little Mosquito Creek. The CDL Site does not have residential or commercial buildings on the site or nearby, and there is a fence surrounding the entirety of the WFF to restrict access. The upland drainage area in the southeast corner of the site is where an outdoor maintenance worker is most likely to spend time maintaining the drainage ways. Little Mosquito Creek runs along the north and east boundaries of the CDL Site; the water is brackish, flows year-round, and supports edible fish and Blue Crab communities. Surface water bodies nearby include Simoneaston Bay to the east and Wattsville Branch to the west.

The HHRA addresses two theoretical scenario timeframes for potential CDL Site receptors (current/future and future only). The current/future scenarios represent exposure to current site conditions; these conditions are assumed to not change in the future (i.e., no land re-development). The current and future exposure scenarios include the outdoor maintenance worker, teen trespasser, and outdoor recreator (child/adult). The future exposure scenarios include the indoor/outdoor commercial worker, construction worker, and hypothetical resident (child/adult). The Site-wide exposure area evaluation for the future on-site hypothetical resident includes potable use of groundwater even though groundwater from the surficial aquifer is not used as an on-site water supply. An Environmental Covenant is not in place to prohibit future potable use of the on-site groundwater.

No chemicals were detected above screening values in the Town of Chincoteague Yorktown Well (TOC-6), however some ND analytes had MDLs that exceeded screening levels and were therefore included in the data sensitivity analysis presented in **Section 7.5** An off-site current/future resident is addressed for exposure to on-site groundwater

(potable use) in the Yorktown Aquifer. The depth to the aquifer, which is over 100 feet bgs, eliminates VI exposure as a potential pathway of concern.

Direct contact with soil is evaluated for the outdoor maintenance worker, outdoor recreator (child/adult), and teen trespasser. Soil excavation activities with possible land re-development could bring subsurface soil to the surface, and the soils would be "mixed" together. Potential future re-development receptors could be exposed to total soil (surface and subsurface soil combined). The main difference between the current and future scenarios is the soil exposure medium; the current potential receptors are exposed to surface soil, while the future potential receptors are exposed to total soil.

The outdoor recreator (child/adult) could be exposed to surface water and sediment along the boundary of the site and may ingest aquatic organisms (i.e., fish and crabs) caught in the surface water or marsh areas. For the teen trespasser, direct contact with surface water and sediment is evaluated; however, the consumption of crab and fish tissue is not evaluated. The outdoor recreator scenario is considered protective of the teen trespasser scenario for the food consumption exposure pathways.

Potable use of groundwater in the surficial aquifer is addressed using the hypothetical resident scenario because the Site does not prohibit use of groundwater through an environmental covenant. The outdoor maintenance worker is expected to be exposed to groundwater only through inhalation of vapors in outdoor air. Even though there are no commercial or residential buildings on the site or nearby, potential future VI exposure from volatiles identified in groundwater was assessed for the indoor/outdoor commercial worker and hypothetical resident (child/adult).

## 4.2 Current and Future On-Site Land Use Scenarios

The current and future on-site land use scenarios consist of the outdoor maintenance worker, outdoor recreator (child/adult), and teen trespasser. Exposure factors for the RME and CTE scenarios are presented in **Attachment 3 Tables A3-1** through **A3-12. Attachment 3 Tables A3-9** and **A3-10** present the calculated skin surface areas and the teen trespasser body weight that were derived using the EPA (2011) *Exposure Factors Handbook*. **Attachment 3 Table A3-11** presents the derived incidental surface water ingestion rates (EPA, 2019). **Attachment 3 Table A3-12** presents the conversion from wet weight to dry weight for the consumption rates for crab.

### 4.2.1 Outdoor Maintenance Worker

The outdoor maintenance worker periodically visits the Site to inspect the property, patrol for security purposes, and conduct outdoor maintenance activities. The outdoor worker is assumed to be exposed to surface soil (current) and total soil (future), groundwater, surface water, and sediment.

Soil-related exposure pathways include incidental ingestion, dermal contact, and inhalation of wind-blown particulates and/or vapors from soil. EPA standard default exposure parameters for an outdoor worker scenario were used to estimate the RME cancer risk and non-cancer hazards (EPA, 2014). For the CTE evaluation, the exposure frequency (EF) was changed from 225 days per year (days/year) to 200 days/year (professional judgment) to account for inclement or cold weather preventing outdoor work. The RME EPA (2014) soil-to-skin adherence factor (AF) of 0.12 milligrams per centimeter squared per event (mg/cm$^2$-event) was changed to a CTE AF of 0.04 mg/cm$^2$-event which is a geometric mean value for landscaping activities (EPA, 2004). The EPA

standard default soil skin surface area (SA) of 3,527 centimeters squared ($cm^2$) was not changed for the CTE evaluation because the SA was derived using weighted averages of mean values for head, hands, and forearms for males and females, 21 years old and older (EPA, 2014).

A particulate emission factor (PEF) of 1.36 $\times 10^9$ cubic meters per kilogram ($m^3/kg$) and chemical-specific volatilization factors (VFs) were derived for evaluating the inhalation of wind-blown particulates and vapors exposure pathways, respectively, (EPA, 1996 and 2002). **Attachment 4** presents the equations and parameters used to derive the soil-to-outdoor air PEF and chemical-specific VFs used in the Revised HHRA.

Since volatile groundwater COPCs were identified, the outdoor worker may inhale vapors migrating from groundwater to outdoor air during the 8-hour workday. The American Society for Testing and Materials (ASTM) has developed a box model that derives a VF, groundwater-ambient air ($VF_{gw,amb}$) for estimating outdoor air concentrations using groundwater data. **Attachment 4** presents the ASTM (2015) box model, chemical-specific $VF_{gw,amb}$ and modeled outdoor concentrations.

Surface water and sediment-related exposure pathways include incidental ingestion and dermal contact in the upgradient drainage area. **Attachment 3, Table A3-11** presents an adult incidental surface water ingestion rate of 0.0985 liters per day (L/day) for the RME evaluation and 0.044 L/day for the CTE evaluation (EPA, 2019a). An RME EF of 113 days/year and a CTE EF of 100 days/year are assumed for the surface water and sediment exposure pathways, where the outdoor worker spends half of his or her time working outdoors in the drainage areas. An event duration (t-event) of 4 hours per event (hours/event) is assumed for the RME evaluation, and 2 hours/event for the CTE evaluation for the dermal contact with surface water exposure pathway. The SA of 3,527 $cm^2$ is used for the surface water and sediment exposure pathways because it is assumed that the worker is wearing long pants and boots while working in the drainage areas.

### 4.2.2 Child and Adult Outdoor Recreator

The outdoor recreator (child/adult) visits the site for 195 days/year for the RME evaluation (VDEQ, 2020) and 75 days per year (U.S. Department of Energy [DOE], 2020) for the CTE evaluation. EPA standard default residential exposure durations of 20 years (adult) and 6 years (child) were used in the RME evaluation for this scenario, assuming that the outdoor recreator family lives near the site (EPA, 2014). For the CTE evaluation, the adult exposure duration was changed to 7 years to account for the total mean residence time of 13 years (EPA, 2011); the exposure duration for the child outdoor recreator remained at 6 years (i.e., 0 to 6 years old) for the RME and CTE evaluations (EPA, 2014).

The outdoor recreator scenario is assumed to be exposed to surface soil (current) and total soil (future), surface water, and sediment. Recreational fishing is likely to occur in Mosquito Creek, so the consumption of fish and blue crab are evaluated using this receptor.

Soil-related exposure pathways include incidental ingestion, dermal contact, and inhalation of wind-blown particulates and/or vapors from soil. EPA (2014) standard default soil ingestion rates of 100 mg/day (child) and 200 mg/day (adult) were used for the RME evaluation of the incidental ingestion of soil exposure pathway. The ingestion rates were changed to 60 milligrams per day (mg/day) (child) and 30 mg/day (adult) for

the CTE evaluation (EPA, 2017a). EPA (2014) standard default soil SAs of 2,373 $cm^2$ (child) and 6,032 $cm^2$ were used (EPA, 2011) in combination with soil-to-skin AFs of 0.2 (child) and 0.07 (adult) $mg/cm^2$-event for the RME evaluation (EPA, 2014). For the CTE evaluation, the soil-to-skin AFs were changed to geometric mean values of 0.04 (child; daycare children playing outdoors) and 0.01 (adult; grounds keeping activities) $mg/cm^2$-event (EPA, 2004).

EPA default PEF of $1.36 \times 10^9$ $m^3/kg$ and chemical-specific volatilization factors (VFs) were used to derive soil-to-outdoor air concentrations for evaluating the inhalation of wind-blown particulates and vapors exposure pathways, respectively, (EPA, 1996 and 2002). **Attachment 4** presents the equations and parameters used to derive the soil-to-outdoor air PEF and chemical-specific VFs used in the Revised HHRA.

Surface water- and sediment-related exposure pathways include incidental ingestion and dermal contact. **Attachment 3, Table A3-11** presents an adult incidental surface water ingestion rate of 0.0985 L/day for the RME evaluation and 0.044 L/day for the CTE evaluation (EPA, 2019a), assuming one hour is spent in the water of Little Mosquito Creek. A surface water incidental ingestion rate of 0.119 L/day for the RME evaluation and 0.06 L/day for the CTE evaluation was derived for the child outdoor recreator, assuming one hour is spent in the water of Little Mosquito Creek (EPA, 2019a).

In **Attachment 3, Table A3-9**, a surface water and sediment adult (over 21 years old) SA of 7,325 $cm^2$ and a child (0 to 6 years old) SA 2,398 $cm^2$ was derived, assuming head, forearms, hands, lower legs, and feet are exposed (EPA, 2011). The same SA values using time-weighted averages of mean surface area data were used in the RME and CTE evaluations to estimate dermal exposure.

Modeled fish tissue and crab tissue concentrations were derived for bioaccumulative surface water and sediment COPCs, respectively, to evaluate the consumption of fish and crab exposure pathways (EPA 2005a and Oregon Department of Environmental Quality [ODEQ], 2007). A consumption rate of 17.5 grams per day (g/day) for the adult outdoor recreator and a consumption rate of 8.8 g/day for the child outdoor recreator were used for the RME evaluation (ODEQ, 2007 and EPA, 2011). For the CTE evaluation, the consumption rates changed to 5.6 g/day and 2.5 g/day for the adult and child outdoor recreators, respectively (EPA, 2011). The child and adult outdoor recreator eat fish and Blue Crab year-round, but only a quarter of the fish or Blue Crab are wild caught from the Little Mosquito Creek (professional judgment). **Attachment 4** presents the equations and chemical-specific parameters used to derive fish- and crab-tissue concentrations for potential bioaccumulative surface water and sediment COPCs (ODEQ, 2007 and EPA, 2005a).

### 4.2.3 Teen Trespasser

The site is surrounded by fencing; however, a teen trespasser may still scale the fence to gain access to the site. The teen (ages 6 to 16 years old) trespasser with a body weight of 44 kg explores and plays at the site for 24 days per year (same for the RME and CTE evaluations). The teen trespasser is exposed to surface soil (current) and total soil (future), surface water, and sediment.

Soil-related exposure pathways include direct contact with the surface soil (current) and total soil (future) media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors). In **Attachment 3, Table A3-9**, a soil SA of 3,749 $cm^2$ was derived, assuming head, forearms, hands and lower legs were exposed for 6 to 16-year old children

(EPA, 2011). A soil-to-skin adherence factor of 0.04 mg/cm$^2$-event was selected for the RME evaluation and is representative of a teen soccer player in moist conditions (EPA, 2004); for the CTE evaluation, the AF was changed to 0.01 mg/cm$^2$-event (geometric mean value for soccer players) (EPA, 2004).

Surface water- and sediment-related exposure pathways include incidental ingestion and dermal contact. In **Attachment 3, Table A3-9**, a surface water and sediment SA of 4,639 cm$^2$ was derived, assuming head, forearms, hands, lower legs, and feet are exposed for 6 to <16-year old children (EPA, 2011). **Attachment 3, Table A3-11** presents the incidental surface water ingestion rate of 0.124 L/day for the RME evaluation and 0.041 L/day for the CTE evaluation (EPA, 2019a) that were derived for the teen trespasser, assuming one hour is spent in the water of Little Mosquito Creek.

Even though the teen trespasser may go fishing or crabbing at Mosquito Creek, the consumption of fish or crab tissue is likely to be infrequent and is not evaluated in the Revised HHRA. Instead, the consumption of fish and crab tissue exposure pathway is evaluated under the outdoor recreator (child/adult) scenario which is considered protective of the teen trespasser.

## 4.3 Future Only On-Site Land Use Scenarios

The future-only exposure scenarios include the indoor/outdoor commercial worker, construction worker, and the hypothetical resident (child/adult). These scenarios are used to address site conditions that have changed due to land re-development and/or other potential excavation activities. Residential use of the site is not prohibited by a land-use covenant. Potential future re-development at the site could be construction of a residential or commercial building. **Attachment 3 Tables A3-1** through **A3-12** present the RME and CTE exposure parameters used to estimate cancer risk and non-cancer hazards for the future receptors.

### 4.3.1 Indoor/Outdoor Commercial Worker

The future indoor/outdoor commercial worker spends most of his/her time indoors. The indoor worker is assumed to be exposed to total soil (0 to 10 feet bgs), assuming the land is disturbed during potential future re-development as well as vapors from groundwater that have migrated through the subsurface into outdoor air and indoor air.

Soil-related exposure pathways include incidental ingestion and inhalation of wind-blown particulates and/or vapors from soil. Standard default worker exposure parameters (e.g., 250 days/year for 25 years) that are used to derive EPA's generic "composite worker" RSLs are also used in the RME evaluation for this scenario (EPA, 2021a). For the CTE evaluation, the incidental soil ingestion rate was changed from 100 mg/day to 50 mg/day (EPA, 2017a). Also, the exposure duration was changed from 25 years to 6.7 years (EPA, 2011). The RME EPA (2014) soil-to-skin AF of 0.12 mg/cm$^2$-event was changed to a CTE AF of 0.02 mg/cm$^2$-event which is a geometric mean value for grounds keepers (EPA, 2004). Similar to the outdoor worker scenario, the default soil SA of 3,527 cm$^2$ was not changed for the CTE evaluation since it was derived using weighted averaging of the mean values (EPA, 2011 and 2014).

EPA default PEF of 1.36 ×10$^9$ m$^3$/kg and chemical-specific VFs were used to derive soil-to-outdoor air concentrations for evaluating the inhalation of wind-blown

particulates and vapors exposure pathways, respectively, (EPA, 1996 and 2002). **Attachment 4** presents the equations and parameters used to derive the soil-to-outdoor air PEF and chemical-specific VFs used in the Revised HHRA.

Groundwater-related exposure pathways include inhalation of vapors emanating from groundwater to outdoor air and the VI exposure pathway (i.e., inhalation of indoor air vapors). Volatile groundwater COPCs were identified at the CDL Site. For the RME evaluation, it was assumed that the commercial worker spent the full 8-hour workday either working outdoors for the groundwater-to-outdoor air exposure pathway or working indoors for the VI exposure pathway. For the CTE evaluation, it was assumed that the commercial worker spent 4 hours working outdoors and 4 hours working indoors (professional judgment). The ASTM (2015) box model was used to derive chemical-specific VFgw,amb to model groundwater-to-outdoor air concentrations. EPA's on-line VISL calculator was used to model indoor air concentrations from groundwater (EPA, 2021b). EPA's Johnson and Ettinger VI model was not used for the VI evaluation so as to meet VDEQ (2020) VI requirements. **Attachment 4** presents the models, equations, and parameters used to evaluate the inhalation of vapors from groundwater exposure pathways.

### 4.3.2 Construction Worker

The future on-site construction worker is assumed to be involved in a 1-year-long construction project (i.e., 250 days/year out of a year) at the Site for the RME evaluation and a 6-month long construction project (i.e., 125 days/year out of half a year) for the CTE evaluation.

Soil-related exposure pathways include incidental ingestion, dermal contact, and inhalation of wind- blown particulates and/or vapors from total soil (0 to 10 feet bgs). The RME incidental soil ingestion rate of 330 mg/day was changed to 100 mg/day (upper percentile general population adult soil and dust value) for the CTE evaluation (EPA, 2002 and 2017a); upper percentile values were used for both evaluations since the construction worker scenario represents intensive soil exposure during excavation activities. For the dermal exposure pathway, the soil-to-skin AF of 0.3 mg/cm$^2$-event (95$^{th}$ percentile value for construction workers) was changed to a CTE AF of 0.1 mg/cm$^2$-event, which is a geometric mean value for construction workers (EPA, 2004).

A construction worker subchronic unpaved roads PEF of 1.06 ×10$^7$ m$^3$/kg was derived, and chemical-specific VFs specific to construction worker exposure were generated to derive soil-to-outdoor air concentrations for the inhalation of wind-blown particulates and vapors exposure pathways, respectively (EPA, 1996 and 2002). **Attachment 4** presents the equations and parameters used to derive the soil-to-outdoor air PEF and chemical-specific VFs used in the Revised HHRA.

Groundwater occurs above 15 feet bgs at the site; therefore, incidental ingestion, dermal contact, and inhalation of groundwater vapors with shallow groundwater seeping into an excavation trench for a building or structure were evaluated. An incidental ingestion rate for groundwater was assumed to be 0.028 L/day for the RME and CTE evaluations (EPA, 2019). VDEQ (2020) construction worker trench model was used to estimate outdoor air concentrations within the trench. For the RME evaluation, the EF was assumed to be 125 days/year, with an exposure time of 4 hours each day for time spent in the trench during the construction project; these exposure parameters are VDEQ (2020) model default

values. For the CTE evaluation, the EF and exposure time were changed to 65 days/year for 2 hours each day spent in the trench (professional judgment). **Attachment 4** describes the VDEQ construction worker trench model and the modeled results.

### 4.3.3 Hypothetical Resident

There are currently no residential receptors on the site, and the site is not zoned for residential use and is not likely to be in the future; however, a residential adult/child exposure scenario was evaluated in the HHRA as a conservative measure of hypothetical future site use to provide information for decision-making purposes. Standard default residential exposure parameters (e.g., 350 days/year for 26 years) that are used to derive EPA's generic residential RSLs are also used in the RME evaluation for this scenario (EPA, 2021a and 2014). For the CTE evaluation, the adult exposure duration was changed to 7 years to account for the total mean residence time of 13 years (EPA, 2011); the exposure duration for the child resident remained at 6 years (i.e., 0 to 6 years old) for the RME and CTE evaluations (EPA, 2014).

Soil-related exposure pathways include incidental ingestion, dermal contact, and inhalation of wind- blown particulates and/or vapors from total soil (0 to 10 feet bgs). EPA (2014) standard default incidental soil ingestion rates of 100 mg/day (child) and 200 mg/day (adult) were used for the RME evaluation. The ingestion rates were changed to 60 mg/day (child) and 30 mg/day (adult) for the CTE evaluation (EPA, 2017a). EPA (2014) standard default soil SAs of 2,373 $cm^2$ (child) and 6,032 $cm^2$ were used (EPA, 2011) in combination with soil-to-skin AFs of 0.2 (child) and 0.07 (adult) $mg/cm^2$-event for the RME evaluation (EPA, 2014). For the CTE evaluation, the soil-to-skin AFs were changed to geometric mean values of 0.04 (child; daycare children playing outdoors) and 0.01 (adult; grounds keeping activities) $mg/cm^2$-event (EPA, 2004).

Groundwater-related exposure pathways include ingestion, dermal contact, and inhalation of vapor while bathing and from vapor intrusion. EPA (2014) standard default groundwater ingestion rates (assuming potable use) of 2.5 L/day (adult) and 0.78 L/day (child) were used for the RME evaluation. These values were changed to 2 L/day (adult) and 0.21 L/day (child) for the CTE evaluation (EPA, 1991 and 2019). In addition, EPA (2014) standard default event durations (t-event) of 0.71 hours/event (adult) and 0.54 hours/event (child) for the dermal contact with groundwater while showering or bathing. For the CTE evaluation, the t-events were changed to 0.33 hours/event (adult; mean value for time spent showering) and 0.4 hours/event (child; mean value for time spent bathing) (EPA, 2011). For the VI exposure pathway, the RME evaluation uses the EPA (2014) standard default exposure parameters. The primary change for the CTE evaluation is the reduced exposure duration of 13 years for the lifetime resident (EPA, 2011).

Volatile groundwater COPCs were identified at the CDL Site. It is assumed that the adult resident is the most likely to shower, so the child resident was not evaluated for this pathway; however, the child resident bathing parameters were factored into the lifetime resident mutagenic calculations. It was assumed that the adult resident spends a total time of 1 hour in the bathroom for the RME evaluation EPA, 2011); the total time was reduced to 0.71 hours/event for the CTE evaluation (EPA, 2014).

## 4.4 Current and Future Off-Site Land Use Scenario

Town of Chincoteague well TOC-6, located on-site, pumps potable water from the Yorktown Aquifer and could be consumed by an off-site resident. Groundwater-related exposure

pathways include ingestion, dermal contact, and inhalation of vapor while showering or bathing. The depth to the aquifer, which is over 100 feet bgs, eliminates VI exposure as a potential pathway of concern. The same EPA standard default residential exposure parameters used for the RME and CTE evaluations for the Hypothetical Resident (**Section 4.3.3**) were used for this receptor. This scenario is used for the data sensitivity analysis only because no detected analytes exceeded screening values in the Town of Chincoteague well TOC-6.

No other off-site receptors were identified for the CDL Site.

## 4.5 Chemical Intake and Exposure Concentrations

**Tables A3-1** through **A3-12** of **Attachment 3** present the chemical intake, DAD, and EC equations and exposure parameters used for each of the current and future and future only scenarios. Where possible, the EPA updated standard default exposure parameters were used (EPA, 2011 and 2014). **Tables A3-13** through **A3-27** of **Attachment 3** contain the EPA ProUCL Version 5.1 input, output, and summary statistics tables for the HHRA.

## 4.6 Exposure Point Concentrations

The concentrations of COPCs that a potential receptor may come into contact with are referred to as EPCs. EPA RAGS (EPA, 1989) recommends using the lower of the maximum detected concentration and the upper confidence limit (UCL) of the mean as the EPC in cases where the exposure area is reasonably defined. For some chemicals, a UCL was not calculated because the sample data set was a small size (less than 10 results) and/or the detection frequency was low. For both the RME and CTE scenarios, EPCs are equal to the UCL or the maximum detected concentration, whichever is lower (EPA, 1989).

The EPCs were derived using approved statistical methodologies for calculating the UCL of the mean. ProUCL Version 5.1 software, which was developed for EPA, was used to test the distribution of the data sets (EPA, 2016a). After testing, the program computes a conservative UCL based on the appropriate distribution of the data. For those data sets that do not fit the normal, lognormal, or gamma distributions, several parametric and distribution-free non-parametric methods are available to calculate an appropriate UCL (e.g., bootstrap methods). The ProUCL Version 5.1 program uses several statistical methods to handle data sets with and without ND results.

**Tables A3-13** through **A3-27** of **Attachment 3** present the ProUCL input and output tables, summary statistics, and selected EPCs for each exposure medium.

For indirect exposure pathways, **Attachment 4** provides a description of the fate and transport models that were used to model the indirect EPCs in the HHRA. **Tables A4-1 through A4-14** presents the modeled EPC results. **Table 4-2** presents the transport and fate models that were used.

## 4.7 Lead Evaluation

Because most human health effects data for lead are correlated with concentrations in the blood rather than an external dose, the standard cancer risk and non-cancer hazard approach for evaluating health effects cannot be applied to lead. Lead is, therefore, assessed separately from carcinogens and noncarcinogens. The lead residential RSLs are considered action levels because they were derived using EPA's Integrated Exposure-Uptake Biokinetic (IEUBK) model (EPA, 2021a and 2010). For risk-based screening, the

maximum detected concentration in soil was compared to an action level of200 milligrams of chemical per kilogram (mg/kg), which is one half the EPA Region 3 residential soil screening level (EPA, 2021a). One half the EPA Region 3 residential soil screening level was used to account for future proposed policy changes by the EPA and to match with the lead screening methodology used at other sites at the WFF. The maximum detected concentration in groundwater was compared to the EPA tap water RSL of 15 micrograms per liter (µg/L).

The risk-based screening results presented in **Tables 4-3 and 4-4** identified lead as a COPC in total soil at the Central AOC, surface and total soil at the Southern AOC, and in groundwater. Lead sampling summary statistics are presented below. Lead was not identified as a COPC in any other media.

EPA (2010) recommends using the mean concentration as the EPC for evaluating risk from exposure to lead. The mean concentration in side-wide groundwater is below the lead action level of 15 µg/L; therefore, no further modeling was necessary for groundwater.

The mean lead concentration in the Central AOC total soil and Southern AOC surface and total soil samples is above the lead action level of 200 mg/kg; therefore, further modeling is necessary for the Central AOC total soil and Southern AOC.

### 4.7.1 Lead Model Parameters and Exposure Point Concentrations

The EPA has developed the following two models to estimate the receptor blood lead concentrations (PbB) and what percentage of the exposed population may have PbB levels above the allowable PbB threshold:

- Adult Lead Methodology (ALM) (version date 6/14/17) model

IEUBKwin version 2 (May 2021) Children are more vulnerable to lead poisoning than adults because their nervous system is still developing. Children can be exposed to lead in their environment and prior to birth from lead in their mother's body. At lower levels of exposure, lead can decrease mental development, with effects on learning, intelligence, and behavior. The EPA ALM and IEUBK models are designed to estimate PbB levels for the fetus of a female worker (i.e., body burden from exposure to lead) and a hypothetical child, respectively (EPA, 2017b and 2010). The ALM model was used to evaluate soil exposure to the current and future outdoor maintenance worker, teen trespasser, as well as the future construction worker receptors. The IEUBK model was used to evaluate soil exposure to the hypothetical future child resident receptor. The hypothetical child resident is also protective of a young child outdoor recreator.

**Table A4-15** through **A4-19** presents the exposure parameters used to evaluate lead in soil using the ALM and IEUBK models (EPA, 2017c and 2017d). The mean concentration was used as the exposure point concentration (EPC) (EPA, 2019b). Microsoft® Excel was used as the calculation tool to derive the mean concentrations. **Table 4-5** presents the mean concentrations that were used in lead modeling.

#### 4.7.1.1 Target Risk Levels

Lead exposure was evaluated by comparing the estimated PbB to EPA's target PbB threshold of 5 µg/dL for the young child resident and the fetus of a teen trespasser or female worker (i.e., body burden from exposure to lead) receptor populations. The target PbB threshold is based on potentially adverse neurological effects in children (Centers for Disease Control and Prevention [CDC], 1991 and 2012). In addition, the threshold for lead

is to limit the risk to no more than a 5% probability for the receptor's population PbB to exceed the selected target PbB threshold in the ALM and IEUBK model (EPA, 2017b and 2010). If the probability of 5% is exceeded, then adverse health effects from exposure to lead are possible.

The potential risks are only estimates and are based on intentionally conservative exposure and toxicity assumptions. Exceedance of any particular risk level does not imply that adverse health effects have already occurred or will occur. The estimates are an indication that additional evaluation or action may be warranted.

#### 4.7.1.2 Lead Modeling Results

**Table 4-5** summarizes the ALM and IEUBK lead modeling results for surface and total soil for each receptor. The current outdoor maintenance worker and teen trespasser ALM model results were below the PbB and probability percent thresholds for Central AOC total soil and Southern AOC surface soil. The future construction worker model results were below the PbB and probability percent thresholds for Central AOC total soil.

The future outdoor maintenance worker, teen trespasser, and construction worker, ALM model results for total soil at Southern AOC were above the target PbB threshold of 5 µg/dL and the probability threshold of 5% indicating that adverse health effects from exposure to lead are possible.

The hypothetical child resident IEUBK model results were above the target PbB threshold of 5 µg/dL and probability threshold of 5% for total soil at the Central AOC and all soil at Southern AOC, indicating that that adverse health effects from exposure to lead are possible.

This Page Intentionally Blank

# 5. Toxicity Assessment

Risk assessments vary for different chemicals depending on whether noncarcinogenic or carcinogenic responses are used to assess potential risks. Some COPCs may result in both noncarcinogenic and carcinogenic effects. Toxicity assessment involves determining whether exposures to a chemical can increase the incidence of a specific adverse effect (e.g., cancer, kidney damage) in humans, characterizing the nature and strength of evidence of causation and, if sufficient data are available, quantifying the relationship between the dose of the chemical and the incidence of adverse health effects in the exposed population. Toxicity assessments provide the basis for evaluating the acceptable exposure and the level of exposure that may adversely affect human health.

## 5.1 Selection of Toxicity Values

**Tables A5-1, A5-2, A6-1,** and **A6-2** of **Attachment 5** present the toxicity values used in the HHRA. The toxicity assessment was conducted in accordance with USEPA guidance and considers chronic (long-term) and subchronic (less-than-lifetime) exposures for carcinogenic and noncarcinogenic COPCs. The EPA's guidance regarding the hierarchy of sources of toxicity values in risk assessment was followed (EPA 2003, 2021a) and is presented below:

**Tier 1 – EPA's Integrated Risk Information System (IRIS) (EPA, 2021c)** – The IRIS program supports protection of human health and the environment by identifying and characterizing the health hazards of chemicals found in the environment. Each assessment can cover a chemical, a group of related chemicals, or a complex mixture. The online IRIS database is found here:

https://www.epa.gov/iris

**Tier 2 – EPA's Provisional Peer Reviewed Toxicity Values (PPRTVs)** – The Office of Superfund Remediation and Technology Innovation develops PPRTVs on a chemical-specific basis:

https://www.epa.gov/pprtv/provisional-peer-reviewed-toxicity-values-pprtvs-assessments

**Tier 3 – EPA's Office of Pesticide Programs (OPP) Human Health Benchmarks for Pesticides (HHBP) –** The OPP lists 363 pesticides in the HHBP table that are no longer updated in EPA's IRIS. The online HHBP tables are listed here: https://iaspub.epa.gov/apex/pesticides/f?p=HHBP:home

**Tier 4 – Other Toxicity Values** – Tier 4 includes additional EPA and non-EPA sources of toxicity information. Priority should be given to those sources of information that are the most current, the basis for which is transparent and publicly available, and that have been peer reviewed. Some examples of Tier 4 sources include the following:

- The California EPA (Cal EPA) toxicity values are peer reviewed and address both cancer and non-cancer effects (Cal EPA, 2021). Cal EPA toxicity values are available on the Cal EPA website at http://oehha.ca.gov/chemicals
- The Agency for Toxic Substances and Disease Registry (ATSDR) Minimal Risk Levels (MRLs) are estimates of the daily human exposure to a hazardous substance that is likely to be without appreciable risk of adverse non-cancer health effects over a specified duration of exposure. The ATSDR MRLs are peer reviewed and are available on the ATSDR website at http://www.atsdr.cdc.gov/mrls/index.asp (ATSDR, 2021).

- Health Effects Assessment Summary Tables (HEAST) dated July 1997 (EPA, 1997). HEAST is found online at https://epa-heast.ornl.gov/

Where toxicity values were not available for a chemical, toxicity values based on surrogate chemicals (i.e., chemicals with structural similarities) were identified.

## 5.2 Noncarcinogenic Health Effects

Evaluation of noncarcinogenic effects is based on the assumption that noncarcinogenic toxicological effects of chemicals occur only after a threshold dose is achieved. The reference dose (RfD) is used to evaluate ingestion and dermal exposure pathways, and the reference concentration (RfC) is used to evaluate the inhalation pathway. The RfD and RfC are estimates of the threshold dose (or concentration) at which the most sensitive human population may experience an observed adverse effect for that compound.

The EPA defines a chronic RfD/RfC as an estimate of a daily exposure level for the human population that is unlikely to result in deleterious effects during a lifetime (i.e., 70 years). A chronic RfD/RfC is used to evaluate the potential noncarcinogenic hazards associated with long-term chemical exposures. Chronic toxicity values are used to evaluate all scenarios in this HHRA except for the construction worker scenario. Subchronic toxicity values are applicable to the construction worker scenario where exposures are expected to occur over a brief (i.e., one year) duration. The chronic and subchronic RfDs and RfCs, as well as their corresponding target organ(s), are provided in **Tables A5-1, A5-2, A6-1,** and **A6-2** of **Attachment 5.**

## 5.3 Carcinogenic Health Effects

The EPA requires that potential carcinogens be evaluated as if minimum threshold doses do not exist (1989). The EPA has established a weight-of-evidence approach to evaluating whether a particular chemical is a carcinogen (EPA, 1986). This weight-of-evidence classification is as follows:

- Group A chemicals are known carcinogens for which there is sufficient evidence to support a causal association between exposure to the agents in humans and cancer.
- Group B1 chemicals are probable human carcinogens for which there is limited evidence of carcinogenicity in humans.
- Group B2 chemicals are probable human carcinogens for which there is sufficient evidence of carcinogenicity in animals but inadequate or no human data.
- Group C chemicals are possible human carcinogens for which there is limited evidence of carcinogenicity in animals and inadequate or no human data.
- Group D chemicals are not classifiable as to human carcinogenicity, as there is inadequate human and animal evidence of carcinogenicity, or no data are available.
- Group E chemicals show evidence of non-carcinogenicity in humans, as there is no evidence of carcinogenicity from either human or animal studies.

In 2005, the EPA published new guidelines for carcinogenic risk assessment (EPA, 2005b). The 2005 guidelines recognize the growing sophistication of research methods; therefore, the EPA is revising the weight of evidence classification system. Weighing of the evidence includes addressing not only the likelihood of human carcinogenic effects of the agent but also the conditions under which such effects may

be expressed to the extent that these are revealed in the toxicological and other biologically important features of the agent. There are five recommended standard hazard descriptors under the new guidance:

“Carcinogenic to Humans”

“Likely to Be Carcinogenic to Humans”

“Suggestive Evidence of Carcinogenic Potential”

“Inadequate Information to Assess Carcinogenic Potential”

“Not Likely to Be Carcinogenic to Humans”

The EPA is currently re-examining the carcinogenic classification for numerous chemicals; where available, the new classification is provided in **Table A6-1** and **A6-2** of **Attachment 5** for the COPCs evaluated in this HHRA.

The cancer slope factor (CSF) is used to estimate the incremental risk from exposure to carcinogenic COPCs. CSFs are developed based on a dose response curve for carcinogenicity of the specific chemical. In estimating risks posed by potential carcinogens, the EPA generally assumes that any exposure level is associated with a finite probability, however minute, of producing a carcinogenic response. This mechanism for carcinogenicity is referred to as “non-threshold” because there is theoretically no level of exposure for a substance that does not pose a small, though finite, probability of producing a carcinogenic response.

The CSF, expressed in units of 1/milligrams per kilogram-day (mg/kg-day)$^{-1}$, is used to convert the chronic daily intake (CDI) of a chemical from ingestion and dermal exposures, normalized over a lifetime, directly to a cancer risk. To evaluate inhalation exposure, the CSF is expressed as an inhalation unit risk (IUR) in units of 1/micrograms per cubic meter ($\mu g/m^3$)$^{-1}$ and is used to convert the adjusted EC in units of $\mu g/m^3$ directly to a cancer risk. Cancer toxicity data are derived for those chemicals in classes A, B1, and B2. The CSFs and IURs are summarized in **Table A6-1** and **A6-2** of **Attachment 5**.

Some chemicals are identified as mutagens. A mutagen adversely affects the deoxyribonucleic acid (DNA) of a receptor; the mutated DNA causes malfunctioning or loss of function for a particular gene(s), and the accumulation of mutations may lead to cancer. EPA has developed equations to address mutagenic health effects, especially for age-sensitive or developmental stages where mutagenic health effects are likely to occur (EPA 2005c). EPA recommends using age dependent adjustment factors (ADAFs) to quantify potential cancer risks for child receptors (EPA, 2005c). An ADAF of 10 is used for exposures occurring less than 2 years of age, an ADAF of 3 was used for exposures occurring between 2 and less than 16 years of age, and an ADAF of 1 is used for exposures occurring after 16 years of age (EPA, 2005c). These ADAFs are used to quantify potential cancer risks for the child/adult outdoor recreator, on-site child/adult hypothetical resident, off-site child/adult resident, and teen trespasser for all exposure pathways (i.e., ingestion, dermal contact, and inhalation). Mutagenic COPCs evaluated in the Revised HHRA include benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, hexavalent chromium, indeno(1,2,3-cd)pyrene, trichloroethylene, and vinyl chloride.

Some chemicals such as TCE and vinyl chloride require specialized intake and EC equations. For TCE, two toxicity value adjustment factors are used to account for carcinogenic adjustment factors (CAF) and mutagenic adjustment factors (MAF) health effects. Early life exposure to vinyl chloride may result in cancer during childhood as well as contribute to cancers later in life. Infants and young children tend to be more susceptible than adults in regard to vinyl chloride-induced cancer (EPA, 2021c). The mutagenic and specialized equations are documented in **Attachment 3**.

## 5.4 Absorption Factors

Dermal toxicity values are not available in the EPA's IRIS or other sources (EPA, 2021c). To evaluate risk/hazard from dermal routes of exposure, EPA dermal guidance documents (EPA, 2016b and 2004) were used. EPA (EPA, 2004) guidance recommends adjusting oral toxicity values using gastrointestinal absorption factors (GIABS) to evaluate dermal exposure routes for some chemicals. The oral-to-dermal adjustment is not required for all chemicals where 100% (GIABS of 1) absorption is assumed. For cancer toxicity data, the oral CSF is divided by the GIABS to derive the dermal CSF. For non-cancer toxicity data, the oral RfD is multiplied by the GIABS to derive the dermal RfD. The GIABS values are presented in **Attachment 4**.

For dermal contact with soil, an absorption fraction (ABS) is used to estimate desorption of a chemical from the soil and its absorption across the skin (EPA, 2016b and 2004). **Attachment 4** presents the soil ABS values used in the HHRA.

Metals can exist in a variety of chemical and physical forms in the environment, and not all forms of a given metal are absorbed to the same extent. The relative bioavailability factor (RBA) is the fraction of an ingested dose that crosses the gastrointestinal epithelium and becomes available for distribution to internal target tissues and organs (EPA, 2007). The HHRA uses an RBA of 0.6 to account for the difference in oral bioavailability of arsenic in soils (EPA, 2007). An RBA of 1 is assumed for all the other soil COPCs.

For dermal exposure to groundwater and surface water, a chemical-specific permeability coefficient (Kp) is used to estimate chemical absorption from water through the skin of the receptor. It is assumed that the absorption continues after the exposure has ended, i.e. the final absorbed dose (DAevent) is estimated to be the total dose dissolved in the skin at the end of the exposure (EPA, 2004). **Tables A4-7** and **A4-8** in **Attachment 4** present the KPs used in the DAevent calculations.

# 6. Risk Characterization

Risk characterization summarizes the nature and magnitude of the potential for occurrence of adverse health effects under a specific set of conditions. The exposure assessment and the toxicity assessment are integrated into quantitative estimates of potential health risks to potential receptors.

Potential carcinogenic and noncarcinogenic human health risks are calculated and summarized individually for each receptor exposed to COPCs in the affected site media. Estimated risks are combined across COPCs and exposure pathways, as appropriate.

## 6.1 Target Risk Levels

Various state and federal regulatory agencies mandate target or “acceptable” carcinogenic risk and noncarcinogenic hazard levels. The VDEQ regulations establish a target cumulative risk level (i.e., from all pathways for a single receptor group) of $1\times10^{-4}$ (1E-04) for potential excess lifetime cancer risk (ELCR). The EPA identifies the acceptable cancer risk range to be $1\times10^{-4}$ to $1\times10^{-6}$ (1E-04 to 1E-06). In effect, estimated ELCR that are less than $1\times10^{-6}$ (1E-06) are generally considered negligible. Potential ELCR in the intermediate range between $1\times10^{-4}$ to $1\times10^{-6}$ (1E-04 to 1E-06) can be considered acceptable on a case-by-case basis. The cancer risk of $1\times10^{-6}$ is used as the risk goal for individual carcinogens, with a not-to-exceed ELCR of $1\times10^{-4}$ for all carcinogens. Both the VDEQ and EPA accept a noncarcinogenic hazard target level, or HI, of 1.

The risk assessment process generally incorporates exposure assumptions that are based on conservative exposure scenarios (i.e., based on reasonable maximum exposure). Therefore, the risks calculated in this HHRA represent reasonable upper bound risks the receptor groups evaluated for the site may incur. The actual risks that could be incurred by these receptor groups are likely to be much lower. **Section 7.0** summarizes the uncertainties associated with the calculation of risk levels in this HHRA.

## 6.2 Carcinogenic Risks

The CSF converts estimated daily intakes to an estimate of incremental cancer risk. As noted earlier, the CSFs are generally upper-bound estimates. This means “true risk” probably does not exceed the risk estimate generated using the CSFs and is likely to be less than the risk predicted using this method. The cancer risk estimate, which is unitless, represents an estimation of an upper-bound incremental lifetime probability that an individual will develop cancer as a result of exposure to a potential carcinogen.

Carcinogenic risk is calculated for each chemical and exposure pathway (ingestion and dermal) by multiplying the estimated CDI by the CSF, as follows:

**Equation 1:**

Cancer Risk (unitless) = CDI (mg/kg-day) × oral CSF $(\text{mg/kg-day})^{-1}$

For the dermal contact pathway, the DAD is multiplied by the dermal CSF:

**Equation 2:**

Cancer Risk (unitless) = DAD (mg/kg-day) × dermal CSF $(\text{mg/kg-day})^{-1}$

For the inhalation pathway, the IUR and the adjusted EC (in units of concentration in air) are used:

**Equation 3:**

Cancer Risk (unitless) = EC ($\mu g/m_3$) × IUR $(\mu g/m^3)^{-1}$

Chemical-specific risks for all chemicals associated with a specific pathway are summed to assess exposure to multiple chemicals. The pathway-specific risks for all pathways and exposure media are then summed to determine the potential ELCR for each exposure scenario. The potential ELCR assumes that different carcinogens affect the same target organ to produce a cancer response, ignoring potential antagonistic or synergistic effects or disparate effects on different target organs.

The VDEQ regulations establish a target cumulative risk level (i.e., from all pathways for a single receptor group) of $1 \times 10^{-4}$ for carcinogenic risks. **Tables 7.1.RME/CTE** through **7.39.RME/CTE and Tables 9.1RME/CTE to 9.39RME/CTE** of **Attachment 5** present the cancer risk results calculated for each receptor in this HHRA. **Table 6-1 and 6-2** summarize the cancer risk results for RME and CTE, respectively. **Table 6-3** presents the carcinogenic COCs that are contributing to unacceptable ELCR results for each receptor and exposure area.

## 6.3 Noncarcinogenic Risks

To characterize potential noncarcinogenic effects, comparisons are made between projected intakes of substances over a specified time period and toxicity values, primarily RfDs and RfCs. The ratio of exposure to toxicity value is the Hazard Quotient (HQ). The HQ is calculated for each chemical and exposure pathway (ingestion and dermal) by dividing the CDI by the RfD as follows:

**Equation 4:**

Non-cancer HQ (unitless) = CDI (mg/kg-day)/oral RfD (mg/kg-day)

For the dermal contact pathway, the DAD is divided by the dermal RfD.

**Equation 5:**

Non-cancer HQ (unitless) = DAD (mg/kg-day)/dermal RfD (mg/kg-day)

For inhalation exposures, a similar comparison is made using the RfC, the adjusted EC, and a unit's conversion factor:

**Equation 6:**

Non-cancer HQ = EC $(\mu g/m^3)$/(RfC $[mg/m^3]$× 1000 µg/mg)

Estimated HQs for noncarcinogenic effects are generated on a chemical-by-chemical basis for each relevant pathway of exposure. The chemical-specific HQs are summed for all chemicals associated with a specific pathway to determine the pathway-specific HI. The HQs for all pathways and exposure media are then summed to determine the cumulative HI for each exposure scenario.

The HQ is not a statistical probability of a noncarcinogenic effect occurring. If the exposure level is less than the appropriate toxicity value (i.e., the HQ is less than 1), adverse health effects are not likely, even with a lifetime of exposure. Given the uncertainty factors used in deriving RfDs and RfCs, an HQ greater than 1 may not indicate a higher risk of adverse effect than an HQ of 1 or less than 1.

If the cumulative HI for an exposure scenario is greater than 1, indicating potential cause for concern, the HI is segregated by critical effect and mechanism of action (EPA, 1989). HQs only for chemicals that affect the same target organ are summed to derive target organ-specific HIs.

**Tables 7.1.RME/CTE** through **7.39.RME/CTE** and **Tables 9.1RME/CTE** through **9.39RME/CTE** of **Attachment 5** present the non-cancer hazard results calculated in this HHRA. The VDEQ regulations establish a target HI (i.e., from all pathways for a single receptor group) of 1 for non-cancer HI. **Table 6-1** and **6-2** present the current/future and future scenario non-cancer hazard results for RME and CTE, respectively. **Table 6-4** presents the noncarcinogenic COCs that are contributing to unacceptable target organ-specific HI results for each receptor and exposure area.

## 6.4 Summary of HHRA Results

The RME and CTE results for the Upgradient Drainage and Downgradient/Estuarine exposure areas are below the EPA cumulative ELCR and HI target levels and are eliminated from further evaluation in the Revised HHRA. The carcinogenic and/or noncarcinogenic results for some receptors at the Central/Southern and Northern/Western exposure areas were above EPA target cumulative levels and are discussed further below.

### 6.4.1 Central/Southern Exposure Area

**Central/Southern Exposure Area Cancer Risk Results:**

As shown in **Table 6-3**, the Central/Southern exposure area RME carcinogenic COCs for the current and future lifetime outdoor recreator, future indoor/outdoor commercial worker, and future hypothetical lifetime resident scenarios are primarily metals; semi-volatile organic compounds (SVOCs); dioxins and furans (i.e., 2,3,7,8-Tetrachlorodibenzo-p-dioxin toxicity equivalence [2,3,7,8-TCDD TEQ]); and volatile organic compounds (VOCs) in groundwater and/or soil (surface and total). These results assume that the Central/Southern groundwater is used for potable purposes even though the surficial aquifer is not used as an on-site water supply. An Environmental Covenant is not in place to prohibit future potable use of the on-site groundwater.

The Central/Southern exposure area RME and CTE evaluation indicates that the cumulative ELCR results drop from 6E-04 to 1E-04, respectively, for the current lifetime outdoor recreator scenario (**Tables 6-1 and 6-2**). As shown in **Table 6-3**, the RME evaluation for current lifetime outdoor recreator identified two metals (arsenic and total chromium) as surface soil COCs, only one (total chromium) remained a COC in the CTE evaluation.

The RME evaluation for the future lifetime outdoor recreator identified metals, SVOCs, 2,3,7,8-TCDD TEQ, and one VOC as total soil COCs. The future lifetime outdoor recreator scenario cumulative RME ELCR results are 3E-04 but the ELCR drops below the EPA cumulative target ELCR of 1E-04 in the CTE evaluation (i.e., no total soil COCs).

For the future indoor/outdoor commercial worker scenario, the RME evaluation identified metals; one SVOC; and one VOC as soil COCs. For groundwater, VOCs were identified as VI COCs. The cumulative RME ELCR results drop from 4E-04 to below the EPA cumulative target ELCR of 1E-04 in the CTE evaluation (i.e., no soil or groundwater COCs).

For the future lifetime resident scenario, the RME evaluation identified metals; SVOCs; 2,3,7,8-TCDD TEQ; and VOCs as soil and/or groundwater COCs. The cumulative RME ELCR results drop from 3E-03 to CTE ELCR of 2E-03; two VOCs and one SVOC are no longer identified as carcinogenic COCs for soil in the CTE evaluation.

**Central/Southern Exposure Area Non-Cancer Hazard Results:**

As shown in **Table 6-4**, the Central/Southern exposure area RME noncarcinogenic COCs for the future outdoor worker, child outdoor recreator, construction worker, indoor/outdoor commercial worker, and child and adult resident are primarily metals; SVOCs; 2,3,7,8-TCDD TEQ; and VOCs.

The future outdoor worker cumulative HI is 3 for both the RME and CTE results (**Tables 6-1** and **6-2**) due to inhalation of 1,1,2-trichloroethane (VOC) vapors in total soil.

The current and future child outdoor recreator RME cumulative HI results were above the target HI of 1 due to direct contact with metals in soils. The CTE cumulative HI results for the child outdoor recreator drop below the EPA cumulative target HI of 1 and metals are no longer identified as noncarcinogenic soil COCs.

The future indoor/outdoor commercial worker RME cumulative HI of 11 drops to 5 for the CTE cumulative HI; however, both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified five VOCs as groundwater VI COCs and one other VOC was identified as an inhalation of vapors from soil COC. Three of the VOCs dropped out as groundwater COCs for the CTE evaluation.

The future construction worker RME cumulative HI of 16 drops to 7 for the CTE cumulative HI; however, both results remain above the EPA cumulative target HI of 1. The RME evaluation identified VOCs and metals as groundwater and soil COCs. However, four VOCs and mercury drop out as COCs for the CTE evaluation.

The future child resident RME cumulative HI of 75 drops to 42 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified the following COCs in soil and/or groundwater (**Table 6-4**): metals; SVOCs; (2,3,7,8-TCDD TEQ; and VOCs. However, one SVOC, three VOCs, three metals, and 2,3,7,8-TCDD TEQ drop out as COCs for the CTE evaluation.

The future adult resident RME cumulative HI of 57 drops to 43 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified similar COCs as the child resident (**Table 6-4**). However, one SVOC, one VOC, and one metal drop out as groundwater COCs for the CTE evaluation. Additionally, iron (metal), which was identified as a soil and groundwater COC in the RME evaluation, was not identified as a COC for either medium in the CTE evaluation. Even though the future child resident tends to be the more sensitive non-cancer receptor for the residential scenario, the inhalation of indoor air via VI and showering exposure pathways are contributing to the higher future adult resident RME and CTE cumulative HI results. The future child resident is not evaluated for the showering exposure pathway. As shown in **Table 6-4**, benzene and xylenes (VOCs) have high chemical-specific hazard quotients for the future adult resident inhalation indoor air (VI and showering) exposure pathways.

The lead evaluation using EPA's Integrated Exposure Uptake Biokinetic (IEUBK) and Adult Lead Methodology (ALM) models identified lead as a COC for surface soil and total soil for the southern portion of the Central/Southern exposure area. The future outdoor maintenance worker, teen trespasser, construction worker results were above the 5% probability percent

threshold for total soil indicating these receptors have greater than 5% chance of having PbB levels over 5 µg/dL. The future child resident results were also above the 5% probability thresholds for surface and total soil. Therefore, potential soil cleanup options need to be explored to prevent potential adverse effects to human health from exposure to lead in soil.

### 6.4.2 Northern/Western Exposure Area

**Northern/Western Exposure Area Cancer Risk Results**:

As shown in **Table 6-3**, the Northern/Western exposure area RME carcinogenic COCs for lifetime resident are primarily metals, one SVOC, VOCs, and 2,3,7,8-TCDD TEQ. These results assume that the Northern/Western groundwater is used for potable purposes even though the surficial aquifer is not used as an on-site water supply. An Environmental Covenant is not in place to prohibit future potable use of the on-site groundwater.

For the future indoor/outdoor commercial worker scenario, the RME evaluation identified VOCs as groundwater VI COCs. Also, total chromium (metal) was identified as a direct contact with total soil COC. The cumulative RME ELCR results drop from 4E-04 to below the EPA cumulative target ELCR of 1E-04 in the CTE evaluation (i.e., no soil or groundwater COCs).

For the future lifetime resident scenario, the RME evaluation identified one SVOC; 2,3,7,8-TCDD TEQ; and VOCs as groundwater COCs. Arsenic and chromium (metals) were both identified as total soil and groundwater COCs in the RME evaluation. The cumulative RME ELCR results drop from 3E-03 to a CTE ELCR of 2E-03 which is still above the EPA cumulative target ELCR of 1E-04. The CTE evaluation identified the same carcinogenic COCs as the RME evaluation; however, arsenic was dropped as a total soil COC and only identified as a groundwater COC in the CTE evaluation.

**Northern/Western Exposure Area Non-Cancer Hazard Results**:

As shown in **Table 6-4**, the Northern/Western exposure area RME noncarcinogenic COCs for the indoor/outdoor commercial worker, construction worker, and child and adult resident are metals; SVOCs; VOCs; and 2,3,7,8-TCDD TEQ.

The future indoor/outdoor commercial worker RME cumulative HI of 7 drops to 4 for the CTE cumulative HI; however, both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified five VOCs as groundwater VI COCs. However, three VOCs drop out as groundwater COCs for the CTE evaluation.

The future construction worker RME cumulative HI of 11 drops to 6 for the CTE cumulative HI; however, both results remain above the EPA cumulative target HI of 1. The RME evaluation identified the mercury and five VOCs as groundwater inhalation COCs. However, three VOCs and mercury drop out as groundwater COCs for the CTE evaluation.

The future child resident RME cumulative HI of 54 drops to 38 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified the following groundwater COCs (**Table 6-4**): metals; SVOCs; 2,3,7,8-TCDD TEQ; and VOCs. However, four metals, one SVOC, two VOCs, and 2,3,7,8-TCDD TEQ drop out as groundwater COCs for the CTE evaluation.

The future adult resident RME cumulative HI of 45 drops to 42 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified similar COCs as the future child resident (**Table 6-4**). However, two SVOCs and one VOC drop out as groundwater COCs for the CTE evaluation. Even though the child resident tends to be the more sensitive non-cancer receptor for the residential scenario, the inhalation of indoor air

via VI and showering exposure pathways are contributing to the higher adult resident cumulative HI results. The future child resident is not evaluated for the showering exposure pathway. As shown in **Table 6-4**, benzene and xylenes (VOCs) have high chemical-specific hazard quotients for the future adult resident inhalation indoor air (VI and showering) exposure pathways.

This Page Intentionally Blank

# 7. Uncertainty Analysis

Uncertainties are inherent in every aspect of a quantitative risk assessment. Certain assumptions are made as part of the risk assessment process, and these assumptions may lead to an over- or underestimation of the actual risks associated with the site. The assumptions made for this HHRA were conservative so that an overestimation of the actual risks posed by site conditions is more likely.

This section provides a brief summary of the key uncertainties in this assessment and qualifies the level of effect that each uncertainty has on the assessment. Almost all major assumptions used in the assessment of risk for this site are anticipated to overestimate the actual risks posed by site conditions.

## 7.1 Site Characterization Uncertainties

**Source of Uncertainty**: Biased sampling; collecting soils, groundwater, surface water, and sediment samples at locations where concentrations are likely to be highest.

**Effect on Risk/Hazard Estimates**: Overestimate.

**Potential Magnitude**: Moderate.

**Rationale for Assumptions**: Samples were not collected on a random sample grid pattern; therefore, the UCLs of the mean concentration for COPC are likely biased high, since samples were collected in potential release location(s) rather than being representative of potential exposure across the entire site.

**Source of Uncertainty**: Flagged results such as “J” flags (i.e., estimated values) were carried forward into the HHRA.

**Effect on Risk/Hazard Estimates**: Under- or overestimate.

**Potential Magnitude**: Low.

**Rationale for Assumptions**: EPA (EPA, 1989) guidance recommends treating “J”-flagged results as detected concentrations. The statistical calculations of EPCs takes into account detect and ND results to derive representative concentrations. A “J”-flagged result indicates that the analyte was positively identified, and the associated numerical value is an estimated quantity with an unknown bias. In other words, the “J”-flagged result was treated as a detected concentration even though the chemical’s true concentration was unknown (EPA, 1989). Therefore, if the J-flagged chemical were identified as a COPC, it is unknown if the estimated risk were under- or overestimated because the bias in calculating the EPC using J-flagged results is unknown.

**Source of Uncertainty**: For the identification of COPCs, there are uncertainties associated with selection of sampling locations and procedures and the number of samples collected. Maximum concentrations of chemicals detected in site media were compared with screening criteria that are protective of human health.

**Effect on Risk/Hazard Estimates**: Over- or underestimate.

**Potential Magnitude**: Moderate.

**Rationale for Assumptions**: EPA (EPA, 1989, 2021a) guidance recommends using conservative generic screening levels and maximum detected

concentrations for COPC screening. Also, conservative risk levels were selected for laboratory analysis to be protective of risk-based screening levels where possible; the laboratory was better able to detect potential concentrations of chemicals that may be COPC at the site.

**Source of Uncertainty**: Inclusion of inorganic chemicals that might not be entirely related to the site.

**Effect on Risk/Hazard Estimates**: Overestimate.

**Potential Magnitude**: Low.

**Rationale for Assumptions**: Metals occur naturally in soils, groundwater, surface water, and sediment; background data are available for soil and groundwater, so a quantitative background comparison was performed for those media which reduces the risk of overestimating.

**Source of Uncertainty**: Both total and dissolved groundwater samples were included in the risk assessment.

**Effect on Risk/Hazard Estimates**: Underestimate.

**Potential Magnitude**: Low.

**Rationale for Assumptions**: Total and dissolved metals results were both used to assess metals at the site. Because the dissolved metals results were field filtered concentrations of metals may be lower than those present in the total metals samples, therefore the combined metals results could be biased low.

**Source of Uncertainty**: Total chromium was treated as hexavalent chromium.

**Effect on Risk/Hazard Estimates**: Overestimate.

**Potential Magnitude**: High.

**Rationale for Assumptions**: Total chromium concentrations were conservatively treated as hexavalent chromium because chromium speciation data were not available. Without speciated chromium data, it was assumed that only hexavalent chromium was present at the Site, which is the more toxic form to human receptors. Hexavalent and trivalent chromium are commonly present at a ratio of 1:6 (Cr IV to Cr III) in the environment (EPA, 2021a); therefore, the total chromium concentrations at the site are likely a similar ratio. This assumption likely overestimates the risk.

**Source of Uncertainty:** If the analytical methods used do not apply to some chemicals that are present at the site, risk could be underestimated.

**Effect on Risk/Hazard Estimates**: Underestimate.

**Potential Magnitude**: Low.

**Rationale for Assumptions**: Since the analytical methods at the site were selected to address all chemicals that are known or suspected to be present on the basis of the history of the site, the potential for not identifying a COPC is reduced.

**Source of Uncertainty:** Identify whether RLs are low enough (i.e., below risk-based screening levels) to capture detected concentrations in the affected media. A detection

limit analysis was included in the screening tables (see **Tables A2-1** through **A2-13** in **Attachment 2**).

**Effect on Risk/Hazard Estimates**: Underestimate.

**Potential Magnitude**: Low.

**Rationale for Assumptions**: Per VDEQ guidance, risk from analytes with MDLs above screening values must be addressed. Analytes that were not detected were screened using the one half the maximum MDL. Those ND analytes that exceeded screening values were included in a data sensitivity analysis using one half the MDL as the EPC. The data sensitivity analysis is discussed further in **Section 7.5**.

**Source of Uncertainty**: A surrogate screening level was used if a screening level were not available for a particular chemical.

**Effect on Risk Hazard Estimates:** Over- or underestimate.

**Magnitude:** Low

**Rationale:** The footnotes of **Table A2-1** through **Table A2-13** in **Attachment 2** document what surrogates were used in the risk-based screening. Where possible, the chemicals selected as surrogates had similar molecular structure and/or toxicity information available. Since peer-reviewed toxicity data are not available, the effect upon the cancer risk and/or non-cancer hazard results for these chemicals is unknown.

## 7.2 Exposure Assessment Uncertainties

**Source of Uncertainty**: A duplicate sample is treated as a sample result and is carried forward into the HHRA.

**Effect on Risk/Hazard Estimates**: Under- or overestimate.

**Potential Magnitude**: Low.

**Rationale for Assumptions**: Duplicate samples were not biased and collected randomly during both the RI and SFI. Any effects from retaining duplicates, was expected to be minimal given the random approach for selecting duplicate locations (equal chance to under or overestimate risk). Duplicates were carried forward to provide higher sample populations for sites and media with less data. Effect on UCL calculations would be negligible for larger sample populations.

**Source of Uncertainty**: Data from groundwater were used to represent the hypothetical future indoor/outdoor commercial worker and hypothetical resident exposure to vapor intrusion emanating from groundwater.

**Effect on Risk/Hazard Estimates**: Overestimate.

**Potential Magnitude**: High.

**Rationale for Assumptions**: The vapor intrusion evaluation assumed that a building is constructed directly above the locations with the highest concentrations of VI COPCs. As these concentrations are found at different locations on the Site, any future building would not be built directly above all these locations, and subsequently the calculated indoor air concentrations are subsequently overestimated. Because of this assumption, cancer risk and non-cancer hazard

results for the future indoor/outdoor commercial worker and hypothetical resident are likely overestimated.

**Source of Uncertainty**: The EPA (EPA, 1989) recommends using the lower of the UCL of the mean concentration and the maximum detected concentration as the EPC. If the calculated UCL were used as the EPC, then the risk results would be less likely to be biased high. If the maximum detected concentration were used as the EPC, then the risk results would be likely biased high.

**Effect on Risk/Hazard Estimates**: Overestimate.

**Potential Magnitude**: Low-Moderate, EPC-dependent.

**Rationale for Assumptions**: UCLs were calculated, when possible, for all media and used in the risk/hazard calculations. Some chemicals required using the maximum detected concentration as the EPC (see **Table 4-1**) due to a small data set or low detection frequency. The cancer risk/non-cancer hazards for COPC and exposure media where maximum detected concentrations were used as EPCs may be overestimated.

**Source of Uncertainty**: Because concentrations of chemicals in media may decrease over time as chemicals migrate and/or degrade, risk estimates for the current scenarios do not necessarily represent future risk.

**Effect on Risk/Hazard Estimates**: Overestimate.

**Potential Magnitude**: Moderate.

**Rationale for Assumptions**: For many organic COPCs, recently measured concentrations represent the worst case for future exposure scenarios. Over time, estimated risks and hazards can be expected to decline.

**Source of Uncertainty**: Modeled concentrations were used to estimate concentrations in the outdoor and indoor air. Generally, a higher level of uncertainty is associated with the use of modeled concentrations rather than the use of measured concentrations.

**Effect on Risk/Hazard Estimates**: Under- or overestimate.

**Potential Magnitude**: Low.

**Rationale for Assumptions**: Conservative model assumptions used to derive the soil-to-air particulate emission factor (PEF), soil-to-air VFs, VFw,amb, groundwater-to-air (VFw,trench and VFw,amb), and vapor migration from groundwater (VISL) tend to reduce the likelihood of underestimating the cancer risk/hazards.

**Source of Uncertainty**: Conservative exposure parameters were used to estimate exposure to the potential human receptors. The default exposure factors that are incorporated for the various exposure scenarios are typically much higher than are realized in practice.

**Effect on Risk/Hazard Estimates**: Overestimate.

**Potential Magnitude**: Moderate.

**Rationale for Assumptions**: Conservative VDEQ (VDEQ, 2020) and EPA (EPA, 2014) default exposure parameters were used to estimate exposure to human receptors. The exposure parameters are documented in **Attachment 3 Tables A3-**

**1** through **A3-11**. When default parameters were not available, site knowledge, best professional judgment, and EPA (EPA, 2011) data were used to derive representative exposure parameters (**Attachment 3 Tables A3-1** through **A3-11**).

## 7.3 Toxicity Assessment Uncertainties

**Source of Uncertainty:** RfDs are frequently derived from animal studies that have little quantitative bearing on potential adverse health effects in humans.

**Effect on Risk/Hazard Estimates:** Overestimate.

**Potential Magnitude:** Moderate.

**Rationale for Assumptions:** Since the fate and mechanism of action of a chemical may differ in animals and humans, the effects observed in animals may not be observed in humans, resulting in an overestimation of potential adverse health effects.

**Source of Uncertainty**: Total chromium used hexavalent chromium toxicity data.

**Effect on Risk/Hazard Estimates**: Overestimate.

**Potential Magnitude**: High.

**Rationale for Assumptions**: Chromium is a polyvalent element and can exist in several distinct oxidation states, but only trivalent chromium and hexavalent chromium occur with any frequency in the natural environment. Hexavalent and trivalent chromium are commonly present at a ratio of 1:6 (Cr IV to Cr III) in the environment (EPA, 2021a). Total chromium was conservatively treated as hexavalent chromium in the risk calculations; therefore, hexavalent chromium toxicity data were used. Hexavalent chromium is the more toxic form to human receptors. This assumption likely overestimates the risk.

**Source of Uncertainty:** Fourth tier toxicity data (e.g., ATSDR, Cal EPA, and HEAST toxicity values) were used to estimate the cancer risk and/or non-cancer hazards for some COPCs (see **Tables A5-1, A5-2, A6-1, and A6-2** of **Attachment 5**).

**Effect on Risk/Hazard Estimates:** Under- or overestimate.

**Potential Magnitude:** Unknown.

**Rationale for Assumptions:** Third tier toxicity values are likely undergoing intensive scientific review and have not been verified by IRIS (EPA, 2021c). It is unknown if the cumulative cancer risk and/or non-cancer hazards are under- or overestimated.

## 7.4 Risk Characterization Uncertainties

**Source of Uncertainty:** Risk characterization uncertainties include possible synergistic or antagonistic effects of exposure to multiple chemicals and applicability of cancer risk estimation methodology to less than lifetime exposure durations.

**Effect on Risk/Hazard Estimates:** Under- or overestimate.

**Potential Magnitude:** Low.

**Rationale for Assumptions:** These uncertainties are generic to the risk assessment process and not specific to the site.

## 7.5 Data Sensitivity Analysis

A data sensitivity analysis (DSA) was conducted wherein one half a chemical's maximum MDL was compared to risk-based screening levels (SLs) that were used to identify COPC (See **Section 3.0**). The purpose of this screening was to ensure that the laboratory analytical methods were sensitive enough to detect potential COPC, assuming residential exposure to site media. If the chemical's laboratory MDL were higher than the SL, then the laboratory analysis could not have detected concentrations that are lower than the MDL but higher than the SL. **Tables A2-1** through **A2-13** of **Attachment 2** present the sensitivity analysis results. Tables **A3-23** through **A3-26** of **Attachment 3** present the summary statistics and selected EPCs for each exposure medium used in the DSA evaluations. Per VDEQ guidance (VDEQ, 2020a), the EPC for ND COPCs included in the DSA was one half the MDL.

To determine how much of an effect including ND chemicals would have on risk results, a second set of risk calculations that included only ND COPCs was included in **Attachment 6**. These calculations were identical to the RME calculations included in **Section 6**, except that only ND analytes were included in the calculations. Potential carcinogenic and noncarcinogenic human health risks are calculated and summarized individually for each receptor exposed to COPCs in the affected site media. Estimated risks are combined across COPCs and exposure pathways, as appropriate.

Detailed cancer risk and non-cancer hazard calculation tables for each receptor and a summary of the risks and hazards for the current/future and future only receptors are presented in **Tables 7.1.DSA** through **7.27.DSA** and **Tables 9.1.DSA** through **9.27.DSA** in **Attachment 6**.

Results of the DSA calculations were reviewed to determine if adding these results to the detection only results presented in **Section 6**, would cause the cancer risk and/or non-cancer hazard to exceed the cumulative target cancer risk level of 1E-04 and/or target HI of 1 for any receptor. The effect of the DSA results on the site receptors is discussed below:

- For the current/future outdoor maintenance worker and the current/future outdoor recreator (adult), the DSA risk results would not cause unacceptable risk in all exposure areas.
- For the current/future teen trespasser, the DSA risk results would cause the HI to exceed 1 in all exposure areas. This is caused by ingestion and dermal contact with ND cyanide in surface water.
- The addition of the DSA risk results would not change the overall conclusions for the current/future outdoor recreator (child and lifetime), future indoor/outdoor commercial worker, future construction worker, and future hypothetical resident (child) because the cumulative cancer risk and HI results are already exceeding the EPA target levels as shown in **Tables 6-3 and 6-4**.

For the current/future off-site lifetime resident the DSA risk results are above the EPA cumulative target ELCR of 1E-04 at 4E-04 and above the cumulative target HI of 1 at 68 for the child resident.

Results of the DSA cancer risk and non-cancer hazard calculations indicate that the addition of ND chemicals would not cause the risk results to exceed the cumulative target cancer risk level of 1E-04 or target HI of 1 for any receptor, except for the current/future teen trespasser, that was

not already exceeding. The current/future teen trespasser is unlikely to be exposed to cyanide below the MDL at the site. No detected analytes exceeded screening values in the Town of Chincoteague well TOC-6, however if the ND chemicals were included in the current/future off-site lifetime resident risk results it would result in unacceptable risk.

### 7.5.1 TEQ Sensitivity Analysis

A sensitivity analysis of the dioxin/furan 2,3,7,8-TCDD TEQ calculations was conducted to determine if non-detects are impacting unacceptable risk results. TEQ calculations were completed using 0 for non-detects instead of ½ the MDL. TEQ calculations are presented in table 2-17 and 2-18 of Attachment 2. EPCs were only calculated for areas with unacceptable risk. Surface soil, subsurface soil, and groundwater EPCs assuming NDs are 0 and NDs are ½ the MDL are compared below.

| Area | Media | Units | NDs = 0 | NDs = 1/2 MDL | Type |
|---|---|---|---|---|---|
| C/S and N/W | Surficial Aquifer | µg/L | 1.03E-06 | 2.09E-05 | UCL |
| C/S | Surface Soil | mg/kg | 2.60E-05 | 2.58E-05 | Max |
| C/S | Total Soil | mg/kg | 3.40E-06 | 2.58E-05 | Max |

Tables comparing the cancer risk and hazard quotients for the 2,3,7,8-TCDD TEQ using an ND of ½ the MDL and of 0 are presented in Tables 7-1 and 7-2. The effect of the two sets of 2,3,7,8-TCDD TEQ calculations on the site receptors is discussed below:

- For the Lifetime Outdoor Recreator in the Central/Southern exposure area: the cancer risk for the current scenario stayed the same (3E-06) and the cancer risk for the future scenario decreased from 3E-06 to 4E-07.
- For the future Lifetime Resident in the Central/Southern exposure area: the cancer risk from ingestion and dermal contact with groundwater decreased from 3E-05 to 2E-06, and the cancer risk from incidental ingestion and dermal contact with total soil decreased from 5E-06 to 7E-07.
- For the future Lifetime Resident in the Northern/Western exposure area: the cancer risk from ingestion and dermal contact with groundwater decreased from 3E-05 to 2E-06.
- For the future Child Resident in the Central/Southern exposure area: the non-cancer risk from ingestion and dermal contact with groundwater decreased from 1 to 0.07, and the non-cancer risk from incidental ingestion and dermal contact with total soil decreased from 0.5 to 0.07.
- For the future Child Resident in the Northern/Western exposure area: the non-cancer risk from ingestion and dermal contact with groundwater decreased from 1 to 0.07.

While some 2,3,7,8-TCDD TEQ risk results decreased to below target risk levels, cumulative risk results still exceed the cumulative target cancer risk level of 1E-04 or target HI of 1 for the Lifetime Outdoor Recreator, future Lifetime Resident, and Child Resident in the Central/ Southern exposure area, as well as the future Lifetime Resident and Child Resident in the Northern/Western exposure area.

## 7.6 Background Threshold Value Evaluation

A Background Threshold Values Report (BTVs Report) was prepared for the WFF (Tetra Tech, 2021). The purpose of the BTVs Report was to provide new background threshold values (BTVs) for analytes-of-interest (analytes) in surface/subsurface soils and groundwater. BTVs are incorporated into this Revised HHRA to determine whether the concentrations of COCs at the site are attributed to background/anthropogenic conditions or from site-related activities. COCs at the site in soil and groundwater were compared to the BTVs for the Molena soil series (**Tables A2-1.BTV through A2-8.BTV of Attachment 2**). COCs that were below BTVs are summarized in **Table 7-3**.

For the RME carcinogenic COCs, the results are summarized on **Table 7-4** and COCs below BTVs are highlighted in green. The following COCs are below BTVs for these receptors:

- Lifetime Outdoor Recreator in the Central/Southern exposure area: Arsenic in surface soil.
- Indoor/Outdoor Commercial Worker in the Northern/Western exposure area: Total Chromium in total soil.
- Onsite Lifetime Resident in the Northern/Western exposure area: Arsenic and total chromium in total soil.

# 8. HHRA Conclusions

The HHRA has fulfilled the objective discussed in **Section 1.0**, which was to conduct a Site-specific, quantitative analysis of the Site under current and future land use scenarios and determine the degree to which exposure may cause adverse human health effects. The evaluation is based on the nature of the COCs detected in environmental media and on the potential exposure pathways to potential human receptors.

The HHRA results indicate that the receptors evaluated for the Upgradient Drainage and Downgradient/Estuarine exposure areas have cumulative ELCR and HI results below the EPA target levels and are eliminated from further evaluation.

The HHRA results indicate that unacceptable risk is possible for the following exposure areas and human receptors:

- Central/Southern exposure area – Future outdoor worker, current/future outdoor recreator (adult/child) exposure to surface and total soil; indoor/outdoor commercial worker exposure to total soil and indoor vapors (VI) from surficial groundwater; future construction worker exposure to total soil, and outdoor vapors (trench) from surficial groundwater; and future hypothetical resident (child/adult) exposure to total soil and surficial groundwater (potable use, VI, and showering/bathing).
    - Lead modeling results for the southern portion the Central/Southern exposure area indicate that the future outdoor maintenance worker, teen trespasser, and construction worker results were above the 5% probability percent threshold for total soil indicating these receptors have above a 5% chance of having PbB levels over 5 µg/dL. The hypothetical child resident results were also above the 5% probability thresholds for surface and total soil. Adverse health effects from exposure to lead in soil are possible.
    - Adverse health effects could be possible from exposure to the following soil and groundwater COCs at the Central/Southern exposure area:

| Soil | Groundwater |
|---|---|
| **VOCs** | **VOCs** |
| 1,1,2-Trichloroethane | 1,2-Dichloroethane |
| 2-Hexanone | Benzene |
| **SVOCs** | cis-1,2-Dichloroethene |
| Benzo(a)anthracene | Cyclohexane |
| Benzo(a)pyrene | Ethylbenzene |
| Benzo(b)fluoranthene | Isopropylbenzene |
| Dibenz(a,h)anthracene | Naphthalene |
| Indeno(1,2,3-cd)pyrene | Tetrachloroethene |
| **Dioxins and Furans** | Toluene |
| 2,3,7,8-TCDD TEQ | Trichloroethene |
| **Metals** | Xylenes, Total |
| Aluminum | **SVOCs** |
| Arsenic | 1,1'-Biphenyl |
| Cadmium (Diet) | 2-Methylnaphthalene |

| Soil | Groundwater |
|---|---|
| Chromium, Total | Benzo(a)pyrene |
| Cobalt | **Dioxins and Furans** |
| Copper | 2,3,7,8-TCDD TEQ |
| Iron | **Metals** |
| Lead | Aluminum |
| Manganese | Arsenic |
| Thallium | Beryllium |
| Vanadium | Chromium, Total |
| | Cobalt |
| | Iron |
| | Manganese |
| | Mercury |
| | Thallium |
| | Vanadium |

- Northern/Western exposure area – Future indoor/outdoor commercial worker exposure to indoor vapors (VI) from surficial groundwater; future construction worker exposure to outdoor vapors (trench) from surficial groundwater; future hypothetical resident (child/adult) exposure to surficial groundwater (potable use, VI, and showering/bathing)
    - Adverse health effects could be possible from exposure to the following groundwater COCs at the Northern/Western exposure area:

| Groundwater | | |
|---|---|---|
| **VOCs** | **SVOCs** | **Metals** |
| 1,2-Dichloroethane | 1,1'-Biphenyl | Aluminum |
| Benzene | 2-Methylnaphthalene | Arsenic |
| cis-1,2-Dichloroethene | Benzo(a)pyrene | Beryllium |
| Cyclohexane | **Dioxins and Furans** | Chromium, Total |
| Ethylbenzene | 2,3,7,8-TCDD TEQ | Cobalt |
| Isopropylbenzene | | Iron |
| Naphthalene | | Manganese |
| Tetrachloroethene | | Mercury |
| Toluene | | Thallium |
| Trichloroethene | | Vanadium |
| Xylenes, Total | | |

Results of the DSA cancer risk and non-cancer hazard calculations indicate that the addition of ND chemicals would not cause the risk results to exceed the cumulative target cancer risk level of 1E-04 or target HI of 1 for any receptor, except for the current/future teen trespasser, that was not already exceeding. No detected analytes in the off-site groundwater exceeded screening values in the Town of Chincoteague well TOC-6, however if the ND chemicals were included in the current/future off-site lifetime resident risk results it would result in unacceptable risk. The

MDLs of the off-site groundwater may not have been protective enough to identify all chemicals of potential concern; therefore, the off-site groundwater results may be underestimated.

Results of the BTV evaluation were incorporated in this Revised HHRA and indicate that the following COCs would be eliminated from future removal action due to being below BTVs for the following receptors:

- Lifetime Outdoor Recreator in the Central/Southern exposure area: Arsenic in surface soil.
- Indoor/Outdoor Commercial Worker in the Northern/Western exposure area: Total Chromium in total soil.
- Onsite Lifetime Resident in the Northern/Western exposure area: Arsenic and total chromium in total soil.

The Revised HHRA conservatively assumed that total chromium concentrations were hexavalent chromium because chromium speciation data were not available. Hexavalent chromium is the more toxic form of chromium to human receptors. Chromium is a polyvalent element and can exist in several distinct oxidation states, but only trivalent chromium and hexavalent chromium occur with any frequency in the natural environment. Chromium cancer risk results may be overestimated.

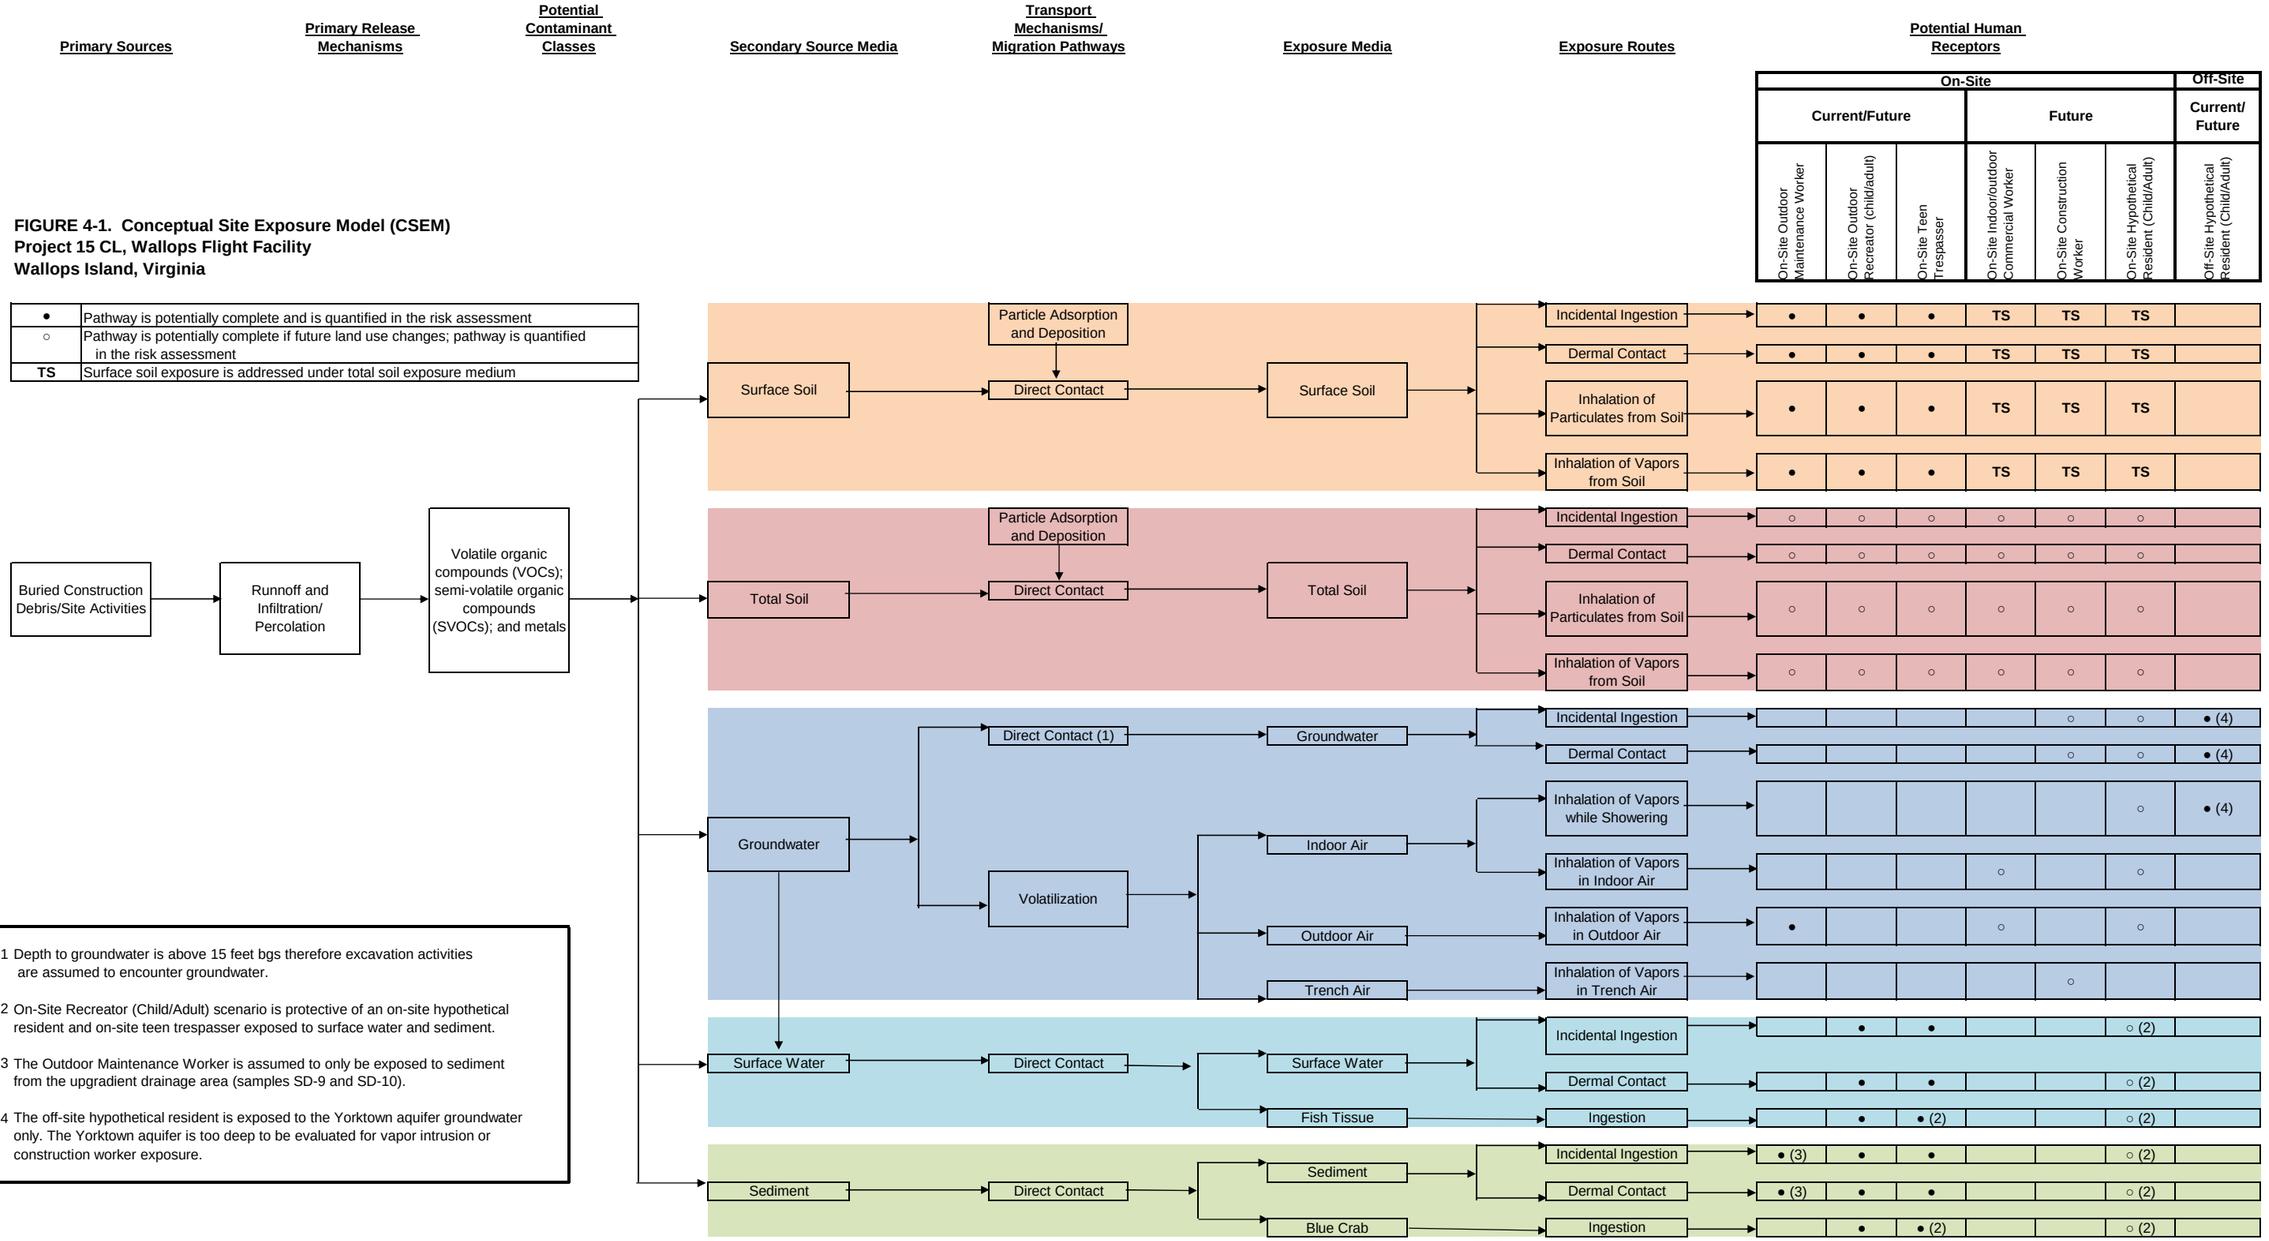
|---|---|
| ● | Pathway is potentially complete and is quantified in the risk assessment |
| ○ | Pathway is potentially complete if future land use changes; pathway is quantified in the risk assessment |
| **TS** | Surface soil exposure is addressed under total soil exposure medium |



**Notes:**

1 Depth to groundwater is above 15 feet bgs therefore excavation activities are assumed to encounter groundwater.

2 On-Site Recreator (Child/Adult) scenario is protective of an on-site hypothetical resident and on-site teen trespasser exposed to surface water and sediment.

3 The Outdoor Maintenance Worker is assumed to only be exposed to sediment from the upgradient drainage area (samples SD-9 and SD-10).

4 The off-site hypothetical resident is exposed to the Yorktown aquifer groundwater only. The Yorktown aquifer is too deep to be evaluated for vapor intrusion or construction worker exposure.

| Adult Outdoor Recreator, D/E | -- | 0.008 | NA | NA |
| Lifetime Outdoor Recreator, D/E | 1E-05 | -- | NA | NA |

**Notes:**

-- = COPCs do not exhibit toxicological health effects to calculate either cancer risks or hazards for this pathway.

COPC = chemical of potential concern; C/S = Central/Southern; D/E = Downgradient/Estuarine;

NA = Not Applicable; N/W = Northern/Western; UD = Upgradient Drainage

*Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

** Risk-based screen results did not identify any detected groundwater COPCs in the deeper Yorktown Aquifer; offsite residential exposure to groundwater was not evaluated.

**EPA Target Thresholds (Exceedances are Shaded):**

**Table ES-2**
**Summary of Cancer Risk and Non-Cancer Hazards - Central Tendency Exposure (CTE)**
**Human Health Risk Assessment**
**Project 15 CDL, Wallops Flight Facility, Wallops Island, Virginia**

| Receptor | Current/Future ** | | Future Only ** | |
|---|---|---|---|---|
| | Cancer Risk * | Non-Cancer Hazard | Cancer Risk * | Non-Cancer Hazard |

- Target Cumulative Cancer Risk Threshold of 1×10-4 (1E-04).
- Target Non-Cancer Hazard Threshold, or Hazard Index (HI), of 1.

**Table ES-3**

**Notes:**

2,3,7,8-TCDD TEQ = 2,3,7,8- Tetrachlorodibenzo-p-dioxin Toxicity Equivalence; AOC = Area of Concern; C/S = Central/Southern AOC; CTE = Central Tendency Exposure; DIOX/FUR = Dioxins and Furans; MET = Metals; NA = Not Applicable; N/W = Northern/Western AOC; RME = Reasonable Maximum Exposure; SVOC = Semi-Volatile Organic Compound; VI = Vapor Intrusion; VOC = Volatile Organic Compound

(a) The main difference between the current and future scenarios is soil exposure medium; the current receptors are exposed to surface soil while the future receptors are exposed to total soil.
(b) All groundwater pathways involve the Surficial Aquifer.

**Notes:**

2,3,7,8-TCDD TEQ = 2,3,7,8- Tetrachlorodibenzo-p-dioxin Toxicity Equivalence; AOC = Area of Concern; C/S = Central/Southern AOC; CTE = Central Tendency Exposure; DIOX/FUR = Dioxins and Furans; MET = Metals; NA = Not Applicable; N/W = Northern/Western AOC; RME = Reasonable Maximum Exposure; SVOC = Semi-Volatile Organic Compound; VI = Vapor Intrusion; VOC = Volatile Organic Compound

(a) The main difference between the current and future scenarios is soil exposure medium; the current receptors are exposed to surface soil while the future receptors are exposed to total soil.

(b) All groundwater pathways involve the Surficial Aquifer.

# Table 3-1
# Selected Screening Criteria for the HHRA
# Human Health Risk Assessment
# Project 15 CDL, Wallops Flight Facility, Wallops Island, Virginia

| Selected Screening Criteria | Notes |
|---|---|
| **Soil and Sediment Screening Criteria** | |
| Residential Soil RSLs | Residential Soil RSLs are multiplied by a factor of 10 for sediment. |
| **Groundwater Screening Criteria** | |
| Tapwater RSLs | |
| **Surface Water Screening Criteria** | |
| National Recommended Water Quality Criteria (NRWQC) for Human Health (HH) and Aquatic Life (Federal HH-Water + Organism) | For RCRA Corrective Action, the lower of Federal HH-Water + Organism and VAWQS-HH-PWS was used for the screening value. If neither was available, the Federal MCL was used unless that too was not available in which case the Tapwater RSL multiplied by a factor of 10 was used. |
| Virginia Water Quality Standards Criteria for Surface Water Table - Public Water System (VAWQS-HH-PWS) | |
| USEPA Drinking Water Standards (Federal MCL) | |
| Tapwater RSLs (x10) | |
| **Vapor Intrusion Screening Criteria** | |
| Default Resident Vapor Intrusion Screening Levels (VISL) | |
| **Fish and Crab Tissue Concentration Screening Criteria** | |
| Regional Fish RSLs | Modeled concentrations of crab and fish tissue derived from sediment and surface water concentrations were screened against USEPA Regional Fish RSLs. |

**References:**

USEPA's Regional Screening Levels (RSLs) (May 2021) protective of a target hazard quotient of 0.1 and a target cancer risk of 1E-06.

USEPA's Regional Fish RSLs (Spring 2021) protective of a target hazard quotient of 0.1 and a target cancer risk of 1E-06.

**Notes:**
CASRN = chemical abstract service registry number; COI = constituent of interest; HH COI = human health constituent of interest; HHRA = human health risk assessment; NA = not applicable;
GW = groundwater; SVOC = semi-volatile organic compound; VI = vapor intrusion; VOC = volatile organic compound
X = indicates chemical is a medium-specific HH COI and is quantified in the HHRA
Empty cell indicates that it is not a HH COI
*Analytes* = non-detect, but the laboratory reporting limit exceeded the screening value.
X (ND) = indicates chemical is non-detect (ND) but the detection limit analysis identified it as a HH COI (i.e., quantified separately in the HHRA).

**Chemical Abbreviations:**
DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethylene
2,3,7,8-TCDD = 2,3,7,8- Tetrachlorodibenzo-p-dioxin
TEQ = Toxicity Equivalence

**Table 4-1**
**Selection of Exposure Pathways**
**Remedial Investigation Report**
**Project 15 CL, Wallops Flight Facility**
**Wallops Island, Virginia**

| Scenario Timeframe | Medium | Exposure Medium | Exposure Point | Receptor Population [2] | Receptor Age | Exposure Route | Type of Analysis | Rationale for Selection or Exclusion of Exposure Pathway |
|---|---|---|---|---|---|---|---|---|
| Current/Future | Surface Soil | Surface Soil | Surface Soil | Outdoor Maintenance Worker | Adult | Ingestion Dermal Absorption | Quant | Receptor could ingest/contact surface soil from the site while conducting routine maintenance activities (i.e., mowing lawns). |
| | | | | Outdoor Recreator | Child | Ingestion Dermal Absorption | Quant | Receptor could ingest/contact surface soil while engaging in recreational activities at the site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult Outdoor Recreator (24 years) and child Outdoor Recreator (6 years) are added together (30 years) to address lifetime exposure to surface soil. The non-cancer hazard evaluations are treated separately for child and adult Outdoor Recreator. |
| | | | | Trespasser | Teenager | Ingestion Dermal Absorption | Quant | Receptor could ingest/contact surface soil while trespassing at the site. |
| | | Air | Outdoor Ambient Air Above Surface Soil (Vapors and Particulates) | Outdoor Maintenance Worker | Adult | Inhalation | Quant | Receptor could inhale vapors/particulates from ambient air above the surface soil. |
| | | | | Outdoor Recreator | Child | Inhalation | Quant | Receptor could inhale vapors/particulates from ambient air above the surface soil. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Trespasser | Teenager | Inhalation | Quant | Receptor could inhale vapors/particulates from ambient air above the surface soil. |
| | | | Upward Migration of Vapors from Surface Soil (Indoors) | Outdoor Maintenance Worker | Adult | Inhalation | None | Receptor is assumed to spend most of his/her time outdoors. |
| | | | | Outdoor Recreator | Child | Inhalation | None | Receptor is assumed to spend his/her time outdoors. Receptor is not likely to inhale vapors/particulates from indoor air in any significant quantities. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Trespasser | Teenager | Inhalation | None | Receptor is assumed to spend his/her time outdoors. Receptor is not likely to inhale vapors/particulates from indoor air in any significant quantities. |
| Current/Future | Subsurface Soil | Subsurface Soil | Subsurface Soil | Outdoor Maintenance Worker | Adult | Ingestion Dermal Absorption | Quant | Receptor could ingest/contact subsurface soil when mixed with surface soil following land redevelopment activities. |
| | | | | Outdoor Recreator | Child | Ingestion Dermal Absorption | Quant | Receptor could ingest/contact subsurface soil when mixed with surface soil following land redevelopment activities. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult Outdoor Recreator (24 years) and child Outdoor Recreator (6 years) are added together (30 years) to address lifetime exposure to subsurface soil following land redevelopment activities. The non-cancer hazard evaluations are treated separately for child and adult Outdoor Recreator. |
| | | | | Trespasser | Teenager | Ingestion Dermal Absorption | Quant | Receptor could ingest/contact subsurface soil when mixed with surface soil following land redevelopment activities. |
| | | Air | Outdoor Ambient Air Above Subsurface Soil (Vapors and Particulates) | Outdoor Maintenance Worker | Adult | Inhalation | Quant | Receptor could inhale vapors/particulates from ambient air above the subsurface when mixed with surface soil following land redevelopment activities. |
| | | | | Outdoor Recreator | Child | Inhalation | None | Receptor is not likely to inhale vapors/particulates from ambient air above the subsurface when mixed with surface soil following land redevelopment activities in any significant quantities. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Trespasser | Teenager | Inhalation | Quant | Receptor is not likely to inhale vapors/particulates from ambient air above the subsurface when mixed with surface soil following land redevelopment activities in any significant quantities. |
| | | | Upward Migration of Vapors from Subsurface Soil (Indoors) | Outdoor Maintenance Worker | Adult | Inhalation | None | Receptor is assumed to spend most of their time outdoors. |
| | | | | Outdoor Recreator | Child | Inhalation | None | Receptor is assumed to spend time outdoors. Receptor is not likely to inhale vapors/particulates from ambient air above the subsurface when mixed with surface soil following land redevelopment activities in any significant quantities. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Trespasser | Teenager | Inhalation | None | Receptor is assumed to spend time outdoors. Receptor is not likely to inhale vapors/particulates from ambient air above the subsurface when mixed with surface soil following land redevelopment activities in any significant quantities. |

**Wallops Island, Virginia**

| Scenario Timeframe | Medium | Exposure Medium | Exposure Point | Receptor Population [2] | Receptor Age | Exposure Route | Type of Analysis | Rationale for Selection or Exclusion of Exposure Pathway |
|---|---|---|---|---|---|---|---|---|
| Current/Future | Sediment | Sediment | Sediment | Outdoor Maintenance Worker | Adult | Ingestion<br>Dermal Absorption | Quant | Receptor could ingest/contact sediment from the site while conducting routine maintenance activities (i.e., mowing lawns). |
| | | | | Outdoor Recreator | Child | Ingestion<br>Dermal Absorption | Quant | Receptor could ingest/contact sediment while engaging in recreational activities at the site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult Outdoor Recreator (24 years) and child Outdoor Recreator (6 years) are added together (30 years) to address lifetime exposure to sediment. The non-cancer hazard evaluations are treated separately for child and adult Outdoor Recreator. |
| | | | | Trespasser | Teenager | Ingestion<br>Dermal Absorption | Quant | Receptor could ingest/contact sediment while trespassing at the site. |
| | | | Sediment to Blue Crab | Outdoor Maintenance Worker | Adult | Ingestion | None | Receptor is not likely to ingest/contact blue crab. |
| | | | | Outdoor Recreator | Child | Ingestion | Quant | Receptor could ingest/contact blue crab while engaging in recreational activities at the site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult Outdoor Recreator (24 years) and child Outdoor Recreator (6 years) are added together (30 years) to address lifetime exposure to sediment via blue crab. The non-cancer hazard evaluations are treated separately for child and adult Outdoor Recreator. |
| | | | | Trespasser | Teenager | Ingestion | Quant | Receptor could ingest/contact blue crab while trespassing at the site. |
| Current/Future | Groundwater | Groundwater | Groundwater | Outdoor Maintenance Worker | Adult | Ingestion<br>Dermal Absorption | None | Receptor is not likely to ingest/contact groundwater from the site during maintenance activities. |
| | | | | Outdoor Recreator | Child | Ingestion<br>Dermal Absorption | None | Receptor is not likely to ingest/contact groundwater while engaging in recreational activities at the site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Off-site Resident [1] | Child | Ingestion<br>Dermal Absorption | None | Receptor ingests/contacts groundwater in the Yorktown Aquifer only. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Trespasser | Teenager | Ingestion<br>Dermal Absorption | None | Receptor is not likely to ingest/contact groundwater while trespassing on site. |
| | | Air | Upward Migration of Vapors from Groundwater (Outdoors) | Outdoor Maintenance Worker | Adult | Inhalation | Quant | Receptor could inhale VOCs that migrated upward from groundwater to ambient air. |
| | | | | Outdoor Recreator | Child | Inhalation | None | Receptor is not likely to inhale VOCs that migrated upward from groundwater to ambient air. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Trespasser | Teenager | Inhalation | None | Receptor is not likely to inhale VOCs that migrated upward from groundwater to ambient air. |
| | | | Upward Migration of Vapors from Groundwater (Indoors) | Outdoor Maintenance Worker | Adult | Inhalation | None | Receptor is assumed to spend most of his/her time outdoors. |
| | | | | Outdoor Recreator | Child | Inhalation | None | Receptor is assumed to spend his/her time outdoors. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Trespasser | Teenager | Inhalation | None | Receptor is assumed to spend most of their time outdoors. |
| | | Air | Vapors while Showering | Outdoor Maintenance Worker | Adult | Inhalation | None | Receptor is unlikely to shower using groundwater due to groundwater use deed restriction at the site and receptor is assumed to be outdoors. |
| | | | | Outdoor Recreator | Child | Inhalation | None | Receptor is unlikely to shower using groundwater due to groundwater use deed restriction at the site and receptor is assumed to be outdoors. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Off-site Resident [1] | Child | Ingestion<br>Dermal Absorption | None | Receptor is exposed to groundwater in the Yorktown Aquifer only. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | |
| | | | | Trespasser | Teenager | Inhalation | None | Receptor is unlikely to shower using groundwater due to groundwater use deed restriction at the site and receptor is assumed to be outdoors. |

**Wallops Island, Virginia**

| Scenario Timeframe | Medium | Exposure Medium | Exposure Point | Receptor Population [(2)] | Receptor Age | Exposure Route | Type of Analysis | Rationale for Selection or Exclusion of Exposure Pathway |
|---|---|---|---|---|---|---|---|---|
| Current/Future | Surface Water | Surface Water | Surface Water | Outdoor Maintenance Worker | Adult | Ingestion<br>Dermal Absorption | Quant | Receptor may come into contact surface water from the site during maintenance activities. |
| | | | | Outdoor Recreator | Child | Ingestion<br>Dermal Absorption | Quant | Receptor may come into contact with surface water while engaging in recreational activities at the site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult Outdoor Recreator (24 years) and child Outdoor Recreator (6 years) are added together (30 years) to address lifetime exposure to surface water. The non-cancer hazard evaluations are treated separately for child and adult Outdoor Recreator. |
| | | | | Trespasser | Teenager | Ingestion<br>Dermal Absorption | Quant | Receptor may come into contact with surface water while trespassing on site. |
| Current/Future | Surface Water | Surface Water | Surface Water to Fish Tissue | Outdoor Maintenance Worker | Adult | Ingestion | Quant | Receptor is not likely to ingest/contact fish tissue. |
| | | | | Outdoor Recreator | Child | Ingestion | Quant | Receptor could ingest/contact fish tissue while engaging in recreational activities at the site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult Outdoor Recreator (24 years) and child Outdoor Recreator (6 years) are added together (30 years) to address lifetime exposure to surface water via fish tissue. The non-cancer hazard evaluations are treated separately for child and adult Outdoor Recreator. |
| | | | | Trespasser | Teenager | Ingestion | Quant | Receptor could ingest/contact fish tissue while trespassing at the site. |
| Future | Surface Soil | Surface Soil | Surface Soil | Indoor/outdoor Commercial Worker | Adult | Ingestion<br>Dermal Absorption | Quant | Receptor could ingest/contact surface soil while working at the site. |
| | | | | Construction Worker | Adult | Ingestion<br>Dermal Absorption | Quant | Receptor could ingest/contact surface soil from the site during construction activities. |
| | | | | Hypothetical Resident | Child | Ingestion<br>Dermal Absorption | Quant | Receptor could ingest/contact surface soil while living on site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to surface soil. The non-cancer hazard evaluations are treated separately for child and adult resident. |
| | | Air | Ambient Air Above Surface Soil (Vapors and Particulates) | Indoor/outdoor Commercial Worker | Adult | Inhalation | Quant | Receptor could inhale vapors/particulates from ambient air above the surface soil. |
| | | | | Construction Worker | Adult | Inhalation | Quant | Receptor could inhale vapors/particulates from ambient air above the surface soil. |
| Future | Surface Soil | Air | Ambient Air Above Surface Soil (Vapors and Particulates) | Hypothetical Resident | Child | Inhalation | Quant | Receptor could inhale vapors/particulates from ambient air above the surface soil while living on site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to surface soil. The non-cancer hazard evaluations are treated separately for child and adult resident. |
| | | | Upward Migration of Vapors from Soil (Indoors) | Indoor/outdoor Commercial Worker | Adult | Inhalation | Qual | Receptor could inhale VOCs from soil via vapor intrusion into building while working indoors. EPA (2015) guidance recommends using groundwater data for evaluating this exposure pathway. |
| | | | | Construction Worker | Adult | Inhalation | Qual | Receptor is assumed to spend most of his/her time outdoors. |
| | | | | Hypothetical Resident | Child | Inhalation | Qual | Receptor could inhale VOCs from soil via vapor intrusion into residence. EPA (2015) guidance recommends using groundwater data for evaluating this exposure pathway. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to surface soil. The non-cancer hazard evaluations are treated separately for child and adult resident. |

| | | | | | Child/Adult | | | The cancer risk estimates for the adult Outdoor Recreator (24 years) and child Outdoor Recreator (6 years) are added together (30 years) to address lifetime exposure to sediment via blue crab. The non-cancer hazard evaluations are treated separately for child and adult Outdoor Recreator. |

**Table 4-1**
**Selection of Exposure Pathways**
**Remedial Investigation Report**
**Project 15 CL, Wallops Flight Facility**
**Wallops Island, Virginia**

| Scenario Timeframe | Medium | Exposure Medium | Exposure Point | Receptor Population [2] | Receptor Age | Exposure Route | Type of Analysis | Rationale for Selection or Exclusion of Exposure Pathway |
|---|---|---|---|---|---|---|---|---|
| Future | Groundwater | Groundwater | Groundwater | Indoor/outdoor Commercial Worker | Adult | Ingestion Dermal Absorption | None | Receptor could possibly ingest/contact groundwater since groundwater use is not deed restricted. The risk encountered by the resident is assumed to be protective. |
| | | | | Construction Worker | Adult | Ingestion Dermal Absorption | Quant | Due to the depth to groundwater (above 15 ft bgs), the receptor could ingest/contact groundwater during excavation activities. |
| | | | | Hypothetical Resident | Child | Ingestion Dermal Absorption | Quant | Receptor could possibly ingest/contact groundwater since groundwater use is not deed restricted. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident. |
| | | | | Off-site Resident [1] | Child | Ingestion Dermal Absorption | Quant | Receptor ingests/contacts groundwater in the Yorktown Aquifer only. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident. |
| | | Air | Upward Migration of Vapors from Groundwater (Outdoors) | Indoor/outdoor Commercial Worker | Adult | Inhalation | Quant | Receptor could inhale VOCs that migrated upward from groundwater to ambient air. |
| | | | | Construction Worker | Adult | Inhalation | Quant | Receptor could inhale VOCs that migrated upward from groundwater to ambient air during excavation activities. |
| | | | | Hypothetical Resident | Child | Inhalation | Quant | Receptor could inhale VOCs that migrated upward from groundwater to ambient air. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident. |
| | | | Upward Migration of Vapors from Groundwater (Indoors) | Indoor/outdoor Commercial Worker | Adult | Inhalation | Quant | Receptor could inhale VOCs from groundwater via vapor intrusion into commercial building. |
| | | | | Construction Worker | Adult | Inhalation | None | Receptor is assumed to spend most of his/her time outdoors. |
| | | | | Hypothetical Resident | Child | Inhalation | Quant | Receptor could inhale VOCs from groundwater via vapor intrusion into residence. |
| | | | | | Adult | | | |
| Future | Groundwater | Air | Upward Migration of Vapors from Groundwater (Indoors) | Hypothetical Resident | Child/Adult | Inhalation | Quant | The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident. |
| | | | Vapors while Showering | Indoor/outdoor Commercial Worker | Adult | Inhalation | None | Receptor could possibly inhale vapors while showering since groundwater use is not deed restricted. The risk encountered by the resident is assumed to be protective. |
| | | | | Construction Worker | Adult | Inhalation | None | Receptor is assumed to spend most of his/her time outdoors. |
| | | | | Hypothetical Resident | Child | Inhalation | Quant | Receptor could possibly inhale vapors while showering assuming that groundwater is used as a tap water source since the site does not have groundwater use deed restrictions in place. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident. |

**Table 4-1**
**Selection of Exposure Pathways**
**Remedial Investigation Report**
**Project 15 CL, Wallops Flight Facility**
**Wallops Island, Virginia**

| Scenario Timeframe | Medium | Exposure Medium | Exposure Point | Receptor Population [2] | Receptor Age | Exposure Route | Type of Analysis | Rationale for Selection or Exclusion of Exposure Pathway |
|---|---|---|---|---|---|---|---|---|
| Future | Groundwater | Air | Vapors while Showering | Off-site Resident [1] | Child | Inhalation | Quant | Receptor could inhale vapors while showering from Yorktown Aquifer groundwater only. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident. |
| | Surface Water | Surface Water | Surface Water | Indoor/outdoor Commercial Worker | Adult | Ingestion Dermal Absorption | None | Receptor is not anticipated to ingest/contact surface water while working at the site. |
| | | | | Construction Worker | Adult | Ingestion Dermal Absorption | None | Receptor is not anticipated to ingest/contact surface water while working at the site. |
| | | | | Hypothetical Resident | Child | Ingestion Dermal Absorption | Quant | Receptor could possibly come into contact with surface water while residing at the site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult Outdoor Recreator (24 years) and child Outdoor Recreator (6 years) are added together (30 years) to address lifetime exposure to surface water. The non-cancer hazard evaluations are treated separately for child and adult Resident. |
| | | Surface Water | Surface Water to Fish Tissue | Indoor/outdoor Commercial Worker | Adult | Ingestion Dermal Absorption | None | Receptor is not likely to ingest/contact fish tissue. |
| | | | | Construction Worker | Adult | Ingestion Dermal Absorption | None | Receptor is not likely to ingest/contact fish tissue. |
| | | | | Hypothetical Resident | Child | Ingestion | Quant | Receptor could possibly come into contact with surface water while residing at the site. |
| | | | | | Adult | | | |
| | | | | | Child/Adult | | | The cancer risk estimates for the adult Outdoor Recreator (24 years) and child Outdoor Recreator (6 years) are added together (30 years) to address lifetime exposure to surface water via fish tissue. The non-cancer hazard evaluations are treated separately for child and adult Resident. |

Notes:
(1) The off-site hypothetical resident is exposed to the Yorktown aquifer groundwater only. The Yorktown aquifer is too deep to be evaluated for vapor intrusion or construction worker exposure.

**Table 4-2**
**Summary of Transport/Fate Models Used in HHRA**
**Human Health Risk Assessment**
**Project 15 CDL, Wallops Flight Facility, Wallops Island, Virginia**

| Exposure Medium / Exposure Pathway | Potential Receptor | Fate and Transport Model |
|---|---|---|
| Soil – inhalation of fugitive dust in outdoor air | Outdoor maintenance worker, outdoor recreator (child/adult), teen trespasser, indoor/outdoor commercial worker, construction worker, and hypothetical resident (child/adult) | Minneapolis, MN constants were used for the site-specific PEF in the soil-to-outdoor air calculations.<br>(EPA, 2002) |
| Soil – inhalation of vapor in outdoor air | Outdoor maintenance worker, outdoor recreator (child/adult), teen trespasser, indoor/outdoor commercial worker, construction worker, and hypothetical resident (child/adult) | Minneapolis, MN constants were used for the chemical-specific volatilization factors (VFs) in the soil-to-outdoor air calculations.<br>(EPA, 2002) |
| Groundwater – inhalation of vapor in outdoor air or trench air | Outdoor maintenance worker, indoor/outdoor commercial worker, construction worker, and hypothetical resident (child/adult) | Chemical-specific $VF_{w, amb}$ (ASTM, 2015) and groundwater vapors in trench air ($VF_{w, trench}$) (VDEQ, 2021) |
| Groundwater – inhalation of vapor in indoor air | Indoor/outdoor commercial worker and hypothetical resident (child/adult) | EPA's VISL (May 2021) was used to derive indoor air concentrations.<br>Foster and Chrostowski shower model was used to derive shower air concentrations (Foster and Chrostowski, 1987) |
| Sediment – ingestion of Blue Crab | Outdoor recreator (child/adult), teen trespasser, and hypothetical resident (child/adult) | Crab tissue concentrations were modeled using sediment concentrations (EPA, 2005a and ODEQ, 2007) |
| Surface Water – ingestion of fish | Outdoor recreator (child/adult), teen trespasser, and hypothetical resident (child/adult) | Fish tissue concentrations were modeled using surface water concentrations (EPA, 2005a). |

COPC = chemical of potential concern; C/S = Central/Southern; D/E = Downgradient/Estuarine;

NA = Not Applicable; N/W = Northern/Western; UD = Upgradient Drainage

## Table 6-1
## Summary of Cancer Risk and Non-Cancer Hazards - Reasonable Maximum Exposure
## Human Health Risk Assessment
## Project 15 CDL, Wallops Flight Facility, Wallops Island, Virginia

| Receptor and Exposure Area | Current/Future ** | | Future Only ** | |
|---|---|---|---|---|
| | Cancer Risk * | Non-Cancer Hazard | Cancer Risk * | Non-Cancer Hazard |

*Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

** Risk-based screen results did not identify any detected groundwater COPCs in the deeper Yorktown Aquifer; offsite residential exposure to groundwater was not evaluated.

**EPA Target Thresholds (Exceedances are Shaded):**

- Target Cumulative Cancer Risk Threshold of 1×10-4 (1E-04).
- Target Non-Cancer Hazard Threshold, or Hazard Index (HI), of 1.

**Table 6-2**

**Notes:**

-- = COPCs do not exhibit toxicological health effects to calculate either cancer risks or hazards for this pathway.

COPC = chemical of potential concern; C/S = Central/Southern; D/E = Downgradient/Estuarine;

NA = Not Applicable; N/W = Northern/Western; UD = Upgradient Drainage

## Table 6-2
## Summary of Cancer Risk and Non-Cancer Hazards - Central Tendency Exposure (CTE)
## Human Health Risk Assessment
## Project 15 CDL, Wallops Flight Facility, Wallops Island, Virginia

| Receptor | Current/Future ** | | Future Only ** | |
|---|---|---|---|---|
| | Cancer Risk * | Non-Cancer Hazard | Cancer Risk * | Non-Cancer Hazard |

*Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

** Risk-based screen results did not identify any detected groundwater COPCs in the deeper Yorktown Aquifer; offsite residential exposure to groundwater was not evaluated.

**EPA Target Thresholds (Exceedances are Shaded):**

- Target Cumulative Cancer Risk Threshold of 1×10-4 (1E-04).
- Target Non-Cancer Hazard Threshold, or Hazard Index (HI), of 1.

**Table 6-3**

**Notes:**

2,3,7,8-TCDD TEQ = 2,3,7,8- Tetrachlorodibenzo-p-dioxin Toxicity Equivalence; AOC = Area of Concern; C/S = Central/Southern AOC; CTE = Central Tendency Exposure; DIOX/FUR = Dioxins and Furans; MET = Metals; NA = Not Applicable; N/W = Northern/Western AOC; RME = Reasonable Maximum Exposure; SVOC = Semi-Volatile Organic Compound; VI = Vapor Intrusion; VOC = Volatile Organic Compound

(a) The main difference between the current and future scenarios is soil exposure medium; the current receptors are exposed to surface soil while the future receptors are exposed to total soil.

(b) All groundwater pathways involve the Surficial Aquifer.

| Iron | 7439-89-6 | X | Below BTV | X | Below BTV | X | -- | X | X |
| Manganese | 7439-96-5 | Below BTV | -- | X | -- | -- | -- | X | X |
| Thallium | 7440-28-0 | Below BTV | Below BTV | Below BTV | Below BTV | X (ND) | X (ND) | X (ND) | X |

**Notes:**

CASRN = chemical abstract service registry number; NA = not applicable; GW = groundwater; SVOC = semi-volatile organic compound; COPC = Chemical of Potential Concern; BTV = Background Threshold Value; '-- = Chemical is not a COPC; 'X = chemical is a medium-specific COPC and is quantified in the HHRA

X (ND) = indicates chemical is non-detect (ND) but the detection limit analysis identified it as a COPC.

Below BTV = COPC with concentrations below BTVs, COPC was excluded.

- BTVs and COPC concentrations are presented in the BTV screening tables (Table 2-1.BTV through 2-8.BTV in Attachment 2)

Notes:

(1) Depth interval for groundwater samples represents the screened interval from where the sample was collected.

AOC = Area of Concern

FD = Field Duplicate Sample

ft. bgs = feet below ground surface

N = Primary Sample

N/A = Not applicable

TOT MET = Total Metals

VOC = Volatile Organic Compounds

PEST = Pesticides

PCB = Polychlorinated Biphenyls

DIOX/FUR = Dioxins/Furans

SVOC = Semi-Volatile Organic Compounds

SD = Sediment

SS = Surface Soil

SB = Subsurface Soil

SW = Surface Water

WG = Groundwater

# Attachment 2

## Human Health Risk-Based Screening Results

Table 2-1
Occurrence, Distribution, and Selection of Constituents of Interest (Direct Contact – Northern AOC; Surface Soil, 0 - 2 feet)
Reasonable Maximum Exposure
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

Notes:
% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
ft bgs = feet below gound surface
J = Estimated Concentration
MDL = Method Detection Limit
MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA Residential Soil RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
DSA = Data Sensitivity Analysis
ft bgs = feet below gound surface
J = Estimated Concentration
MDL = Method Detection Limit
MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA Residential Soil RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:
% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
ft bgs = feet below gound surface
MDL = Method Detection Limit
MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA Residential Soil RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
ft bgs = feet below gound surface
J = Estimated Concentration
MDL = Method Detection Limit
MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA Residential Soil RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
DSA = Data Sensitivity Analysis
ft bgs = feet below gound surface
J = Estimated Concentration
MDL = Method Detection Limit
MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA Residential Soil RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
ft bgs = feet below gound surface
J = Estimated Concentration
MDL = Method Detection Limit
MDC = Maximum Detected Concentration

Table 2-6
Occurrence, Distribution, and Selection of Constituents of Interest (Direct Contact – Southern AOC; Surface Soil, 0 - 2 feet)
Reasonable Maximum Exposure
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

| | |
|---|---|
| Scenario Timeframe: | Current and Future |
| Medium: | Soil |
| Exposure Medium: | Soil |
| Exposure Point: | Soil (0 – 2 ft) |

| Chemical | CASRN | Minimum Detected Concentration | Maximum Detected Concentration | Units | Location of Maximum | Depth (ft bgs) | Detection Frequency | Range of Detection Limits (1) | Screening Concentration | Screening Level (2, 3) | Source | COPC Flag (Yes/No) | Rationale for Selection/Deletion |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA Residential Soil RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
DSA = Data Sensitivity Analysis
ft bgs = feet below gound surface
J = Estimated Concentration
MDL = Method Detection Limit

Table 2-7
Occurrence, Distribution, and Selection of Constituents of Interest (Direct Contact – Southern AOC; Subsurface Soil, 2 - 9.5 feet)
Reasonable Maximum Exposure
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

| | |
|---|---|
| Scenario Timeframe: | Current and Future |
| Medium: | Soil |
| Exposure Medium: | Soil |
| Exposure Point: | Soil (> 2 ft) |

| Chemical | CASRN | Minimum Detected Concentration | Maximum Detected Concentration | Units | Location of Maximum | Depth (ft bgs) | Detection Frequency | Range of Detection Limits (1) | Screening Concentration | Screening Level (2, 3) | Source | COPC Flag (Yes/No) | Rationale for Selection/Deletion |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA Residential Soil RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:
% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
ft bgs = feet below gound surface
J = Estimated Concentration
MDL = Method Detection Limit
MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against 10 x USEPA Residential Soil RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
DSA = Data Sensitivity Analysis
ft bgs = feet below gound surface
J = Estimated Concentration
MDL = Method Detection Limit

Table 2-9
Occurrence, Distribution, and Selection of Constituents of Interest (Direct Contact – Downgradient Estuarine; Sediment)
Reasonable Maximum Exposure
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

| | |
|---|---|
| Scenario Timeframe: | Current and Future |
| Medium: | Sediment |
| Exposure Medium: | Sediment |
| Exposure Point: | Sediment |

| Chemical | CASRN | Minimum Detected Concentration | Maximum Detected Concentration | Units | Location of Maximum | Depth (ft bgs) | Detection Frequency | Range of Detection Limits (1) | Screening Concentration | Screening Level (2, 3) | Source | COPC Flag (Yes/No) | Rationale for Selection/Deletion |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against 10 x USEPA Residential Soil RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:
% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
DSA = Data Sensitivity Analysis
J = Estimated Concentration
MDL = Method Detection Limit
MDC = Maximum Detected Concentration
N/A = Not Applicable
ND = Non-Detect or Not Detected
NRWQC = National Recommended Water Quality Criteria
RSL = Regional Screening Level
SL = Screening Level
µg/L = micrograms per liter
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA's NRWQC (Organism + Water) ; if unavailable, 10 x USEPA Tap Water RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
DSA = Data Sensitivity Analysis
J = Estimated Concentration
MDL = Method Detection Limit
MDC = Maximum Detected Concentration

Table 2-11
Occurrence, Distribution, and Selection of Constituents of Interest (Direct Contact – Site-Wide; Groundwater, Surficial Aquifer)
Reasonable Maximum Exposure
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

| | |
|---|---|
| Scenario Timeframe: | Current and Future |
| Medium: | Groundwater |
| Exposure Medium: | Groundwater |
| Exposure Point: | Groundwater (Surficial Aquifer) |

| Chemical | CASRN | Minimum Detected Concentration | Maximum Detected Concentration | Units | Location of Maximum | Depth (ft bgs) | Detection Frequency | Range of Detection Limits (1) | Screening Concentration | Screening Level (2, 3) | Source | COPC Flag (Yes/No) | Rationale for Selection/Deletion |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
µg/L = micrograms per liter
USEPA = United States Environmental Protection Agency

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA Tap Water RSLs, last updated May 2021 (TR = 1E-6, THQ = 0.1).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
COPC = Chemical of Potential Concern
DSA = Data Sensitivity Analysis
J = Estimated Concentration
MDL = Method Detection Limit
MDC = Maximum Detected Concentration

Table 2-12
Occurrence, Distribution, and Selection of Constituents of Interest (Vapor Intrusion – Site-Wide; Groundwater, Surficial Aquifer)
Reasonable Maximum Exposure
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

| | |
|---|---|
| Scenario Timeframe: | Current and Future |

| Chemical | CASRN | Minimum Detected Concentration | Maximum Detected Concentration | Units | Location of Maximum | Depth (ft bgs) | Detection Frequency | Range of Detection Limits [1] | Screening Concentration | Screening Level [2, 3] | Source | COPC Flag (Yes/No) | Rationale for Selection/Deletion |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

N/A = Not Applicable
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
µg/L = micrograms per liter
USEPA = United States Environmental Protection Agency
VISL = Vapor Intrusion Screening Level

(1) Detection limits are the MDLs.
(2) Site data screened against USEPA Residential Groundwater VISLs, last updated May 2021 (TR = 1E-6, THQ = 0.1). Site-specific, system temperature was set to 16.1 Celsius (Virginia default; USEPA, 2004).
(3) An asterisk,"*", indicates surrogate toxicity information was used to derive a Screening Level (see Table 2-14).

(3) Calculations were only done for analytes that are bioaccumulative. Table 4-2 of USEPA's "Bioaccumulation Testing and Interpretation for the Purpose of Sediment Quality Assessment" (February 2000) was used to identify bioaccumulative chemicals.

(4) USACE's Biota-Sediment Accumulation Factor database was used to find BSAF values. https://www.erdc.usace.army.mil/Media/Fact-Sheets/Fact-Sheet-Article-View/Article/832015/biota-sediment-accumulation-factor-bsaf-database/

(5) Table 2 median values from Bechtel 1998. Biota Sediment Accumulation Factors for Invertebrates: Review and Recommendations for the Oak Ridge Reservation. August 1998. 1 is assumed for analytes with no BSAFs.

(6) USEPA Regional Fish Regional Screening Levels (RSLs) (Spring 2021) were used for screening the modeled crab and fish tissue concentrations. The lower of the 2 RSLs was used as the selected RSL criteria:

a) ingestion screening level protective of target risk of 1E-06

b) ingestion screening level protective of target hazard quotient of 0.1

Table 2-16
Modeled Fish Tissue Concentrations Using Surface Water
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

C-fish (mg/kg) = Conc in Surface Water (CSW) x CF1 × BCF-Fish (chemical's log Kow is < 4.0)
C-fish (mg/kg) = CSW × CF1 × BAF-Fish (chemical's log Kow is > 4.0)
Where: (1)

| Parameter | Units | Parameter Definition | Value |
|---|---|---|---|
| C-fish | mg/kg | Concentration in Fish | Calculated |
| CSW | µg/L | Concentration in surface water | Site-Specific |
| CF1 | mg/µg | Conversion factor 1 | 0.001 |
| BCFish | Unitless | Bioconcentration factor for fish | Chemical-specific |
| BAFish | Unitless | Bioaccumulation factor for fish | Chemical-specific |
| Log Kow | unitless | log octanol-water partition coefficient | Chemical-specific |

| Analyte | CASRN | Class | CSW (µg/L) | Bioaccumulative? (Y/N) (2) | BCF-Fish (3) | BAF-Fish (3) | Log Kow (3) | C-Fish (mg/kg) | Lower of RSL Values (4) | Fish Tisue Value Exceeds RSL? |
|---|---|---|---|---|---|---|---|---|---|---|
| Arsenic | 7440-38-2 | TMET | 11.7 | Y | 300 | -- | -- | 3.510 | 0.003 | Yes |
| Chromium | 7440-47-3 | TMET | 2 | Y | 200 | -- | -- | 0.400 | 0.0083 | Yes |
| Copper | 7440-50-8 | TMET | 4.9 | Y | 200 | No BAF | -- | 0.9800 | 6.2 | No |
| Lead | 7439-92-1 | TMET | 4 | Y | 300 | -- | -- | 1.2 | NA | No SL |
| Nickel | 7440-02-0 | TMET | 2.9 | Y | 100 | -- | -- | 0.29 | 0.0046 | Yes |
| Selenium | 7782-49-2 | TMET | 11.8 | Y | 200 | -- | -- | 2.36 | 0.770 | Yes |

Notes and References:
(1) USEPA, 2005. Human Health Risk Assessment Protocol for Hazardous Waste Combustion Facilities, Final. EPA530-R-05-006. September 2005.
(2) Calculations were only done for analytes that are bioaccumulative. Table 4-2 of USEPA's "Bioaccumulation Testing and Interpretation for the Purpose of Sediment Quality Assessment" (February 2000) was used to identify bioaccumulative chemicals.
(3) ORNL's Risk Assessment Information System (RAIS) toxicity values and physical parameters database was used to identify Log Kow, BAFs, and BCFs. In this dataset, Log Kow and BAF values could not be found for the bioaccumulative detected chemicals. Therefore, C-Fish was calculated by multiplying BCF, CF1, and CSW.
(4) USEPA Regional Fish Regional Screening Levels (RSLs) (Spring 2021) were used for screening the modeled crab and fish tissue concentrations. The lower of the 2 RSLs was used as the selected RSL criteria:
a) ingestion screening level protective of target risk of 1E-06
b) ingestion screening level protective of target hazard quotient of 0.1

CASRN = Chemical Abstracts Service Registry Number; ug/l = micrograms per liter; ND = Non-detect; pg/l = picograms per liter; TEF = Toxicity Equivalence Factor; TEQ = Toxicity Equivalence

(1) The adjusted result (pg/l) is derived by mulitplying the detected result (ug/l) by the dioxin/furan TEF (unitless).

(2) The adjusted result (ug/L) is derived by mulitplying the adjusted result (pg/L) by a conversion factor (CF) of 0.000001.

Lab Qualifiers (LQ): U = Undetected at the laboratory reporting limit; J = Estimated Concentration;

Table 2-18
Detections of Dioxin-Like Compounds and the Derivation of 2,3,7,8-TCDD Toxicity Equivalence (TEQ) Mixtures for Groundwater
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

| CASRN | Groundwater Parameter | | Dioxin/Furan TEF (unitless) | Units | CDL-MW6-00-023042-02 Groundwater 11/15/2016 Result | LQ | Adj Result (1) pg/l | Adj Result (2) ug/l |

- = not applicable; $cm^2$ = square centimeters; SA = skin surface area; USEPA = U.S. Environmental Protection Agency

**Sources:** USEPA, 2011. Exposure Factors Handbook: 2011 Edition. EPA/ 600/ R-090/052F, September 2011.

Boniol, M; Verriest, JP; Perdeux, R: Dore JF. (2007) Proportion of skin surface area of children and young adults from 2 to 18 years old. J Investig Dermatol 128(2): 461-464.

Surface area values from USEPA (2011) were converted into $cm^2$ by multiplying the skin surface areas ($m^2$) by a conversion factor of 10,000 $cm^2/m^2$.

(1) Time-weight factor is derived by dividing the age group timeframe (years) by the receptor age range (years; yellow-highlighted cell).

(2) For soil exposure, the weighted mean values for head, forearms, hands and lower legs are used.

(3) For surface water and sediment exposure, the weighted mean values for head, forearms, hands, lower legs, and feet are used.

(4) For the adult recreator, the average of the male and female skin surface area was selected.

| **Central Tendency Exposure (CTE) Scenario** | | | | |
| Adult Recreator and Resident | 74 | 5.6 | USEPA, 2011 (Table 10-3, mean value for recreational marine fish intake for Atlantic, ages > 18 years | 1.46 |
| Child Recreator and Resident | 74 | 2.5 | USEPA, 2011 (Table 10-3, mean value for recreational marine fish intake for Atlantic, ages 3 to <6 years | 0.65 |

General Notes:
CRC - Consumption Rate of Crab
dw - Dry Weight.
g - grams
W - percent water content
ww - wet weight

Equation 1 USEPA 2011
CRCdw (g/g-day dw) = CRCww x [(100 - W)/100]

Where:
CRCdw Consumption Rate of Crab, dry-weightt (g/g-day dw)
CRCww Consumption Rate of Crab, wet-weightt (g/g-day ww)
W percent water content (%)

| | | | | CA | Exposure Point Concentration, air | Modeled | µg/m³ | - | $\frac{CA \times ET \times EF \times FH\text{-}GW \times ED}{ATc \times CF1}$ |
| | | | | ET | Exposure Time | 4 | hours/day | VURAM, 2020; trench model default | |
| | | | | EF | Exposure Frequency | 65 | days/year | Site-specific assumption (3-month construction project (3 months/year x 4.3 weeks/month x 5 days/week)) | Exposure concentration (µg/m³) for non-carcinogens (adult) = |
| | | | | FH-GW | Fraction Inhaled from Source, groundwater | 1 | unitless | USEPA, 1989 (Default of 1 (100%) is assumed) | $\frac{CA \times ET \times EF \times FH\text{-}GW \times ED}{ATnc \times CF1}$ |
| | | | | ED | Exposure Duration | 0.5 | years | Site-specific assumption (6 month construction project (25 weeks x 5 days/week x 0.5 year)) | |
| | | | | ATc | Averaging Time, carcinogens | 25550 | days | USEPA, 1989 (ED (70 years) x 365 days/year) | Where: |
| | | | | ATnc | Averaging Time, noncarcinogens | 182.5 | days | USEPA, 2011 (ED x 365 days/year) | CA (µg/m³) = (CGW x VFw,trench) x CF2 |
| | | | | CF1 | Conversion Factor 1 | 24 | hours/day | - | |
| | | | | CGW | Exposure Point Concentration, groundwater | Site-Specific | mg/L | - | |
| | | | | CF2 | Conversion Factor 2 | 1000 | µg/mg | - | |
| | | | | VFw,trench | Volatilization Factor, water-to-trench air | Calculated | L/m³ | VURAM, 2020 | |
| Inhalation | Outdoor Worker (Current/Future) | Adult | Inhalation of Groundwater Vapors in Outdoor Air | | | | | | Mutagenic and Non-Mutagenic Constituents |
| | | | | EC | Exposure concentration | Calculated | µg/m³ | See equations | Exposure concentration (µg/m³) = |
| | | | | CA | Exposure Point Concentration, air | Modeled | µg/m³ | - | $\frac{CA \times ET \times EF \times FH\text{-}GW \times ED}{ATc \times CF1}$ |
| | | | | CF1 | Conversion Factor 1 | 24 | hours/day | - | |
| | | | | ET | Exposure Time | 8 | hours/day | USEPA, 2014 (8-hour work day) | |
| | | | | EF | Exposure Frequency | 200 | days/year | Site-specific assumption, assume inclement or cold weather prevents work time outdoors; 40 weeks/year x 5 days/week | Exposure Point Concentration, air (µg/m³) = |
| | | | | FH-GW | Fraction Inhaled from Source, groundwater | 1 | unitless | USEPA, 1989 (Default of 1 (100%) is assumed) | $\frac{CA \times ET \times EF \times FH\text{-}GW \times ED}{ATnc \times CF1}$ |
| | | | | ED | Exposure Duration | 6.7 | years | USEPA, 2011 (Table 16-2, average of men and women occupational mobility, all ages > 16 years) | Where: |
| | | | | ATc | Averaging Time, carcinogens | 25550 | days | USEPA, 1989 (ED (70 years) x 365 days/year) | CA (µg/m³) = (CGW x VFw,amb) x CF2 |
| | | | | ATnc | Averaging Time, noncarcinogens | 2445.5 | days | USEPA, 2011 (ED x 365 days/year) | |
| | | | | CGW | Exposure Point Concentration, groundwater | Site-Specific | mg/L | - | |
| | | | | CF2 | Conversion Factor 2 | 1000 | µg/mg | - | |
| | | | | VFw,amb | Volatilization Factor, water-to-ambient air | Calculated | (mg/m³)-air/(mg/L)-water | ASTM, 2015 (Equations in Attachment A4) | |
| Inhalation | On-Site Hypothetical Resident (Future) and Off-Site Resident (Current/Future) | Adult | Inhalation of Groundwater Vapors in Indoor Air (Showering) | | | | | | Non-Mutagenic Constituents |
| | | | | EC | Exposure concentration | Calculated | µg/m³ | See equations | Exposure concentration (µg/m³) for carcinogens (lifetime) = |
| | | | | CA | Exposure Point Concentration, shower air | Modeled | µg/m³ | Calculated (See Attachment A4) | $\frac{CA \times ETs \times EV \times EF \times FH\text{-}GW \times EDa}{ATc \times CF1}$ |
| | | | | ETs | Exposure Time, shower | 0.14 | hours/event | See equations | |
| | | | | EV | Event Frequency | 1 | event/day | | |
| | | | | Ds | Shower Duration | 0.33 | hour/event | USEPA, 2011 (Tables 16-29 ; adult (16 to <21 years mean value of 20 min spent showering, assuming 1 shower/day) | |
| | | | | Ra | Air Exchange Rate | 0.0167 | 1/hr | Foster and Chrostowski, 1987 | Exposure concentration (µg/m³) for non-carcinogens (lifetime) = |
| | | | | ts,a | Total Time in Shower Room | 0.71 | hour | USEPA, 2014 | $\frac{CA \times ETs \times EV \times EF \times FH\text{-}GW \times EDa}{ATnc,a \times CF1}$ |
| | | | | EF | Exposure Frequency | 350 | days/year | USEPA, 2014 (USEPA, 1991; pg 15) | Where: |
| | | | | FH-GW | Fraction Inhaled from Source, groundwater | 1 | unitless | USEPA, 1989 (Default of 1 (100%) is assumed) | Exposure Time, shower (hr/event) = |
| | | | | EDa | Exposure Duration, adult | 7 | years | USEPA, 2011 (EDr (13 years) - EDc (6 years)) | |
| | | | | ATc | Averaging Time, carcinogens | 25550 | days | USEPA, 1989 (ED (70 years) x 365 days/year) | $\left[Ds + \frac{e^{(-Ra \times ts)}}{Ra} - \frac{e^{(Ra \times (Ds - ts))}}{Ra}\right]$ |
| | | | | ATnc,a | Averaging Time, noncarcinogens - adult | 2555 | days | USEPA, 2011 (ED x 365 days/year) | |
| | | | | CF1 | Conversion Factor 1 | 24 | hours/day | - | Note: It is assumed that the child resident does not take showers; however, early life exposure via bathing is taken into account with the mutagenic calculations. |
| | | | | | | | | | |

**Notes**

- = not applicable; $cm^2$ = square centimeters; SA = skin surface area; USEPA = U.S. Environmental Protection Agency

**Sources:** USEPA, 2011. Exposure Factors Handbook: 2011 Edition. EPA/ 600/ R-090/052F, September 2011.

Boniol, M; Verriest, JP; Perdeux, R: Dore JF. (2007) Proportion of skin surface area of children and young adults from 2 to 18 years old. J Investig Dermatol 128(2): 461-464.

Surface area values from USEPA (2011) were converted into $cm^2$ by multiplying the skin surface areas ($m^2$) by a conversion factor of 10,000 $cm^2/m^2$.

(1) Time-weight factor is derived by dividing the age group timeframe (years) by the receptor age range (years; yellow-highlighted cell).

(2) For soil exposure, the weighted mean values for head, forearms, hands and lower legs are used.

(3) For surface water and sediment exposure, the weighted mean values for head, forearms, hands, lower legs, and feet are used.

(4) For the adult recreational user, the average of the male and female skin surface area was selected.

**Notes:**

(1) Time-weight factor is derived by dividing the age group timeframe (years) by the receptor age range. For the adult receptors, 20 total years of exposure is split between the 16 to <21 years and 21+ years age groups.

CTE = Central Tendency Exposure; L/hour = liter per hour; L/day = liter per day; RME = Reasonable Maximum Exposure

USEPA, 2019. Exposure Factors Handbook, Chapter 3 Update, Ingesito nof Water and Other Select Liquids, February 2019.

Table A3-12.CTE
Conversion from Wet Weight to Dry Weight, Consumption Rates for Crab
Reasonable Maximum Exposure and Central Tendency Exposure
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

| Receptor | Percent Water Content (W) for Crab (Invertebrates) (USEPA 1993) | Consumption Rate of Crab (CRC) in Wet Weight Units (g/g-day ww) | | Consumption Rate of Crab (CRC) Converted to Dry Weight (g/g-day dw) (Equation 1) |
|---|---|---|---|---|
| | | Value | Reference | |
| Reasonable Maximum Exposure (RME) Scenario | | | | |
| Adult Recreator and Resident | 74 | 17.5 | USEPA, 2011 (Table 10-3, 95th percentile value for recreational marine fish intake for Atlantic, ages > 18 years | 4.55 |
| Child Recreator and Resident | 74 | 8.8 | USEPA, 2011 (Table 10-3, 95th percentile value for recreational marine fish intake for Atlantic, ages 3 to <6 years | 2.29 |
| Central Tendency Exposure (CTE) Scenario | | | | |
| Adult Recreator and Resident | 74 | 5.6 | USEPA, 2011 (Table 10-3, mean value for recreational marine fish intake for Atlantic, ages > 18 years | 1.46 |
| Child Recreator and Resident | 74 | 2.5 | USEPA, 2011 (Table 10-3, mean value for recreational marine fish intake for Atlantic, ages 3 to <6 years | 0.65 |

General Notes:
CRC - Consumption Rate of Crab
dw - Dry Weight.
g - grams
W - percent water content
ww - wet weight

Equation 1 USEPA 2011
CRCdw (g/g-day dw) = CRCww x [(100 - W)/100]

Where:
CRCdw Consumption Rate of Crab, dry-weightt (g/g-day dw)
CRCww Consumption Rate of Crab, wet-weightt (g/g-day ww)
W percent water content (%)
