| Theta hat (MLE) | 0.111 | Theta star (bias corrected MLE) | 0.16 |
| nu hat (MLE) | 10.63 | nu star (bias corrected) | 7.407 |
| Mean (detects) | 0.0846 | | |

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | | | |
|---|---|---|---|
| Minimum | 0.0013 | Mean | 0.0622 |

Nonparametric Distribution Free UCL Statistics

Detected Data appear Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.105

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Chebyshev (Mean, Sd) UCL 20277

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Warning: Data set has only 2 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Warning: Data set has only 2 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Conc (so | c/s | surface soil | include | nickel | tmet)

## General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 9 | Number of Distinct Observations | 9 |
| | | Number of Missing Observations | 0 |

| | | | |
|---|---|---|---|
| Minimum | 2.9 | Mean | 60.99 |
| Maximum | 502 | Median | 5.1 |
| SD | 165.4 | Std. Error of Mean | 55.13 |
| Coefficient of Variation | 2.712 | Skewness | 2.999 |

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Suggested UCL to Use

95% Hall's Bootstrap UCL 3786

Recommended UCL exceeds the maximum observation

In Case Bootstrap t and/or Hall's Bootstrap yields an unreasonably large UCL value, use 97.5% or 99% Chebyshev (Mean, Sd) UCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.0863

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Conc (so | c/s | surface soil | include | total teq (who 2005) nd = 0.5 | diox/fur)

Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 8 | Number of Distinct Observations | 8 |
| | | Number of Missing Observations | 0 |
| Minimum | 3460 | Mean | 6889 |
| Maximum | 10600 | Median | 7565 |
| SD | 2702 | Std. Error of Mean | 955.3 |
| Coefficient of Variation | 0.392 | Skewness | -0.0969 |

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | | | |

Suggested UCL to Use

95% H-UCL 16584

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Lognormal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (Chebyshev) UCL 6.69

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

| | |
|---|---|
| 95% H-UCL | 563.3 |

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | | | |

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 2.91

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Conc (so | c/s | total soil | include | nickel | tmet)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 9 | Number of Distinct Observations | 9 |
| | | Number of Missing Observations | 0 |
| Minimum | 2.9 | Mean | 60.99 |
| Maximum | 502 | Median | 5.1 |
| SD | 165.4 | Std. Error of Mean | 55.13 |
| Coefficient of Variation | 2.712 | Skewness | 2.999 |

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 20.54

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Student's-t UCL 10.67

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Suggested UCL to Use

95% Student's-t UCL 8699

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

| 95% Student's-t UCL | 12.4 | or 95% Modified-t UCL | 12.45 |
| or 95% H-UCL | 12.88 | | |

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

| | |
|---|---|
| 95% Student's-t UCL | 10.73 |

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Suggested UCL to Use

95% Student's-t UCL 653.7

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% H-UCL 52.91

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Approximate Gamma UCL 7.281

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% H-UCL 52.91

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

95% KM (Chebyshev) UCL 0.134

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

95% KM (Chebyshev) UCL 12.46

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Approximate Gamma UCL 7.193

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

95% KM (Chebyshev) UCL 37.78

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

## Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | | | |

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Approximate Gamma UCL 10.82

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | 4,4'-ddt | pest) was not processed!

Conc (sw | downgradient estuarine | all | include | 4,6-dinitro-o-cresol | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | 4,6-dinitro-o-cresol | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | aldrin | pest)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | aldrin | pest) was not processed!

Conc (sw | downgradient estuarine | all | include | alpha-bhc | pest)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | alpha-bhc | pest) was not processed!

Conc (sw | downgradient estuarine | all | include | aroclor 1221 | pcb)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |

| | | | |
|---|---|---|---|
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | aroclor 1221 | pcb) was not processed!

Conc (sw | downgradient estuarine | all | include | benzo(a)anthracene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | benzo(a)anthracene | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | benzo(a)pyrene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | benzo(a)pyrene | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | benzo(b)fluoranthene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | benzo(b)fluoranthene | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | benzo(k)fluoranthene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | benzo(k)fluoranthene | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | bis(2-chloroethyl)ether | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | bis(2-chloroethyl)ether | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | bis(2-ethylhexyl)phthalate | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | bis(2-ethylhexyl)phthalate | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | butyl benzyl phthalate | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 4 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 4 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | butyl benzyl phthalate | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | chrysene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 4 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 4 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | chrysene | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | cyanide | cyanide)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | cyanide | cyanide) was not processed!

Conc (sw | downgradient estuarine | all | include | dibenzo(a,h)anthracene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | dibenzo(a,h)anthracene | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | dieldrin | pest)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 4 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 4 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | dieldrin | pest) was not processed!

Conc (sw | downgradient estuarine | all | include | heptachlor | pest)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 4 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 4 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | heptachlor | pest) was not processed!

Conc (sw | downgradient estuarine | all | include | heptachlor epoxide | pest)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 3 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 3 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | heptachlor epoxide | pest) was not processed!

Conc (sw | downgradient estuarine | all | include | hexachlorobenzene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 5 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | hexachlorobenzene | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | hexachlorobutadiene | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 4 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 4 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | hexachlorobutadiene | voc) was not processed!

Conc (sw | downgradient estuarine | all | include | hexachloroethane | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 4 |
| Number of Detects | 0 | Number of Non-Detects | 7 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 4 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (sw | downgradient estuarine | all | include | hexachloroethane | svoc) was not processed!

Conc (sw | downgradient estuarine | all | include | indeno(1,2,3-cd)pyrene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 7 | Number of Distinct Observations | 5 |
| Number of Detects | 0 | Number of Non-Detects | 7 |

| 5% K-S Critical Value | 0.332 | Detected data appear Gamma Distributed at 5% Significance Level |

Detected data appear Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

| | | | |
|---|---|---|---|
| k hat (MLE) | 11.32 | k star (bias corrected MLE) | 5.77 |
| Theta hat (MLE) | 0.283 | Theta star (bias corrected MLE) | 0.555 |
| nu hat (MLE) | 135.8 | nu star (bias corrected) | 69.24 |
| Mean (detects) | 3.2 | | |

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | | | |
|---|---|---|---|
| Minimum | 1.073 | Mean | 3.229 |
| Maximum | 6.163 | Median | 3.134 |
| SD | 1.14 | CV | 0.353 |

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics
Detected Data appear Normal Distributed at 5% Significance Level

Suggested UCL to Use
95% KM (t) UCL 3.91

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Conc (wg | surficial aquifer | site-wide | include | silver | tmet)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 51 | Number of Distinct Observations | 5 |
| Number of Detects | 1 | Number of Non-Detects | 50 |
| Number of Distinct Detects | 1 | Number of Distinct Non-Detects | 4 |

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
uggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC,

The data set for variable Conc (wg | surficial aquifer | site-wide | include | silver | tmet) was not processed!

Conc (wg | surficial aquifer | site-wide | include | toxaphene | pest)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 12 | Number of Distinct Observations | 2 |
| Number of Detects | 0 | Number of Non-Detects | 12 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 2 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | surficial aquifer | site-wide | include | toxaphene | pest) was not processed!

Conc (wg | surficial aquifer | site-wide | include | trans-1,3-dichloropropene | voc)

General Statistics

| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | 1,1,2,2-tetrachloroethane | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | 1,1,2-trichloroethane | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | 1,1,2-trichloroethane | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | 1,1'-biphenyl | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | 1,1'-biphenyl | svoc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | 1,2,4-trichlorobenzene | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | 1,2,4-trichlorobenzene | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | 1,2-dibromo-3-chloropropane | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | 1,2-dibromo-3-chloropropane | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | 1,2-dibromoethane | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | 1,2-dibromoethane | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | 1,2-dichloroethane | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | 1,2-dichloroethane | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | 1,4-dichlorobenzene | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | 1,4-dichlorobenzene | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | 2,4-dinitrotoluene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | 2,4-dinitrotoluene | svoc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | 2,6-dinitrotoluene | svoc)

General Statistics

| | | | |

| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | bromomethane | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | cadmium | tmet)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | cadmium | tmet) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | carbon tetrachloride | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | carbon tetrachloride | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | chloroform | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | chloroform | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!

If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | chromium | tmet)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | chromium | tmet) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | cis-1,3-dichloropropene | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | cis-1,3-dichloropropene | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | cobalt | tmet)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | cobalt | tmet) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | dibenzo(a,h)anthracene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | dibenzo(a,h)anthracene | svoc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | hexachlorobenzene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | hexachlorobenzene | svoc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | hexachlorobutadiene | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | hexachlorobutadiene | voc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | hexachlorocyclopentadiene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | hexachlorocyclopentadiene | svoc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | hexachloroethane | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | hexachloroethane | svoc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | mercury | tmet)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | mercury | tmet) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | naphthalene | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | naphthalene | voc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | nitrobenzene | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | nitrobenzene | svoc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | n-nitroso-di-n-propylamine | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | n-nitroso-di-n-propylamine | svoc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | pentachlorophenol | svoc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | pentachlorophenol | svoc) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | selenium | tmet)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | selenium | tmet) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | thallium | tmet)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | thallium | tmet) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | trans-1,3-dichloropropene | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | trans-1,3-dichloropropene | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | trichloroethene | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | trichloroethene | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Conc (wg | yorktown aquifer | site-wide | include | vanadium | tmet)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 3 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 3 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Conc (wg | yorktown aquifer | site-wide | include | vanadium | tmet) was not processed!

Conc (wg | yorktown aquifer | site-wide | include | vinyl chloride | voc)

General Statistics

| | | | |
|---|---|---|---|
| Total Number of Observations | 2 | Number of Distinct Observations | 1 |
| Number of Detects | 0 | Number of Non-Detects | 2 |
| Number of Distinct Detects | 0 | Number of Distinct Non-Detects | 1 |

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Conc (wg | yorktown aquifer | site-wide | include | vinyl chloride | voc) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Table A3-15
Exposure Point Concentration Summary (Central/Southern AOC, Surface Soil)
Reasonable Maximum Exposure
Human Health Risk Assessment
Construction Debris Landfill, Wallops Island, Virginia

| Vanadium | mg/kg | 14/14 | 16.5 | 21.27 | (N) | 51 | 21.27 | mg/kg | UCL | (6) |
| Zinc | mg/kg | 14/14 | 701.5 | 1695 | (G) | 4280 | 1695 | mg/kg | UCL | (9) |

Notes:
-- = Not Evaluated
COPC = Chemical of Potential Concern
ft = feet
KM = Kaplan Meier
mg/kg = milligram per kilogram
UCL = Upper Confidence Limit

Distribution Key:
Normal (N)
Gamma (G)
Lognormal (L)
Non-Parametric (NP)

(1) A minimum of five (5) samples with two (2) distinct detects are needed to calculate summary statistics and UCLs but may not be adequate to compute meaningful and reliable results. Therefore, summary statistics and UCLs are only shown if total samples are eight (8) or more.
(2) If the dataset contains nondetects, summary statistics and UCLs are estimated by the KM method.
(3) Data set too small to calculate meaningful statistics. Therefore, maximum concentration used for exposure point concentration.
(4) UCL exceeds maximum detected concentration. Therefore, maximum concentration used for exposure point concentration.
(5) Probabilistic modeling for lead recommends using the mean concentration.
(6) Goodness-of-Fit test indicates data are normally distributed.
(7) Goodness-of-Fit test indicates data have no discernible distribution.
(8) Goodness-of-Fit test indicates data are lognormally distributed.
(9) Goodness-of-Fit test indicates data are gamma distributed.

Gamma (G)
Lognormal (L)
Non-Parametric (NP)

(1) A minimum of five (5) samples with two (2) distinct detects are needed to calculate summary statistics and UCLs but may not be adequate to compute meaningful and reliable results. Therefore, summary statistics and UCLs are only shown if total samples are eight (8) or more.
(2) If the dataset contains nondetects, summary statistics and UCLs are estimated by the KM method.
(3) Data set too small to calculate meaningful statistics. Therefore, maximum concentration used for exposure point concentration.
(4) UCL exceeds maximum detected concentration. Therefore, maximum concentration used for exposure point concentration.
(5) Probabilistic modeling for lead recommends using the mean concentration.
(6) Goodness-of-Fit test indicates data are normally distributed.
(7) Goodness-of-Fit test indicates data have no discernible distribution.
(8) Goodness-of-Fit test indicates data are lognormally distributed.
(9) Goodness-of-Fit test indicates data are gamma distributed.

MDL = Method Detection Limit
mg/kg = milligram per kilogram

(1) A minimum of five (5) samples with two (2) distinct detects are needed to calculate summary statistics and UCLs but may not be adequate to compute meaningful and reliable results. Therefore, summary statistics and UCLs are only shown if total samples are eight (8) or more.
(2) If the dataset contains nondetects, summary statistics and UCLs are estimated by the KM (Kaplan Meier) method.
(3) Only detection limits exceeded screening levels. Therefore, 1/2 the MDL was used for exposure point concentrations within Data Sensitivity Analysis.

| Thallium | µg/L | 0/7 | -- | -- | -- | All ND | 2.4 | 1.2 | µg/L | 1/2 MDL | (3) |

Notes:
-- = Not Evaluated
COPC = Chemical of Potential Concern
ft = feet
ND = Non-Detect
MDL = Method Detection Limit
mg/kg = milligram per kilogram

(1) A minimum of five (5) samples with two (2) distinct detects are needed to calculate summary statistics and UCLs but may not be adequate to compute meaningful and reliable results. Therefore, summary statistics and UCLs are only shown if total samples are eight (8) or more.
(2) If the dataset contains nondetects, summary statistics and UCLs are estimated by the KM (Kaplan Meier) method.
(3) Only detection limits exceeded screening levels. Therefore, 1/2 the MDL was used for exposure point concentrations within Data Sensitivity Analysis.

## Environmental Transport and Fate Models

Table A4-1
Site-Specific Particulate Emission Factor
Remedial Investigation Report
Project 15 CL, Wallops Flight Facility, Wallops Island, VA

Environmental Transport and Fate Models

Air Modeling for Generation of Dust from Soil
Non-Construction Scenario

1) General Form for Calculating Receptor and Pathway-Specific Dispersion Factors (Q/C) (USEPA, 2002)

$$Q/C_{wind} = A * \exp[ (\ln A_{site} - B)^2 / C ]$$

| Values | Parameter | Parameter Description |
|---|---|---|
| 16.2302 | A | Constant for Minneapolis, MN; Climate Zone 5 (unitless) |
| 18.7762 | B | Constant for Minneapolis, MN; Climate Zone 5 (unitless) |
| 216.108 | C | Constant for Minneapolis, MN; Climate Zone 5 (unitless) |
| 0.5 | $A_{site}$ | Areal extent of the site or contamination (acres) (1) |
| 93.77 | $Q/C_{wind}$ | Inverse of mean concentration at center of 0.5-acre-square source ($g/m^2$-s per $kg/m^3$) |

2) Derivation of the Particulate Emission Factor (PEF)

$$PEF = \frac{Q/C_{wind} * 3{,}600 s/h}{0.036 * (1-V) * (U_m/U_t)^3 * F(x)}$$

| Values | Parameter | Parameter Description |
|---|---|---|
| 93.77 | $Q/C_{wind}$ | Inverse of mean concentration at center of 0.5-acre-square source ($g/m^2$-s per $kg/m^3$) |
| 0.5 | V | Fraction of vegetative cover (unitless) |
| 4.69 | Um | Mean annual wind speed (m/s) (USEPA, 2002) |
| 11.32 | Ut | Equivalent threshold value of wind speed at 7m (m/s) |
| 0.194 | F(x) | Function dependent on Um/Ut derived from Cowherd et al. 1985 (unitless) |
| 1.36E+09 | PEF | Particulate emission factor ($m^3/kg$) |

Notes:
(1) Selected to represent most conservative scenario allowed by the model (0.5 acres).

USEPA. 2002. Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites, OSWER 9355.4-24. December 2002.

Table A4-2
Site-Specific Particulate Emission Factor from Generation of Dust from Soil from Unpaved Roads (Construction Scenario)
Remedial Investigation Report
Project 15 CL, Wallops Flight Facility, Wallops Island, VA

Environmental Transport and Fate Models

Air Modeling for Generation of Dust from Soil
Construction Scenario

1) General Form for Calculating Construction Worker Dispersion Factor (Q/Csr) (USEPA, 2002)

$$Q/C_{sr} = A \times \exp[ (\ln A_{site} - B)^2 / C ]$$

| Values | Parameters | Parameter Description |
|---|---|---|
| 12.9351 | A | Constant (unitless) |
| 5.7383 | B | Constant (unitless) |
| 71.7711 | C | Constant (unitless) |
| 0.5 | $A_{site}$ | Areal extent of the site or contamination (acres) |
| 23.02 | $Q/C_{sr}$ | Inverse of mean concentration at center of 0.5-acre-square source ($g/m^2$-s per $kg/m^3$) |

2) Calculation of Site-Specific Dispersion Correction Factor ($F_D$) (USEPA, 2002)

$$F_D = 0.1852 + (5.3537 \times 1/t_c) + (-9.6318 \times 1/t_c^2)$$

| Values | Parameters | Parameter Description |
|---|---|---|
| 6000 | $t_c$ | Duration of construction (hr) |
| 0.1861 | $F_D$ | Dispersion correction factor (unitless) |

3) Derivation of the Particulate Emission Factor Construction Scenario (USEPA, 2002)

$$PEF_{sc} = Q/C_{sr} \times 1/F_D \times \frac{T \times A_R}{556 \times (W / 3)^{0.4} \times [ (365 \text{ days/year} - p) / 365 \text{ days/year} ] \times [\text{SUM (VKT)}]}$$

| Values | Parameters | Parameter Description |
|---|---|---|
| calc, site specific | $PEF_{sc}$ | Subchronic road particulate emission factor ($m^3/kg$) |
| site specific | $Q/C_{sr}$ | Inverse of 1-h average air concentration along a straight road segment bisecting a 0.5-acre square site ($g/m^2$-s per $kg/m^3$) |
| 0.1861 | $F_D$ | Dispersion correction factor (unitless) |
| 21600000 | T | Total time over which construction occurs (s) |
| 274 | $A_R$ | Surface area of contaminated road segment ($m^2$), Equation: LR × WR × 0.092903 $m^2/ft^2$ |
| 148 | $L_R$ | Length of road segment (ft) |
| 20 | $W_R$ | Width of road segment (ft) |
| 4.7 | W | Mean vehicle weight (tons) |
| 140 | p | Number of days with at least 0.01 inches of precipitation (days/year) (Exhibit 5-2; USEPA, 2002) |
| 1.69E+02 | SUM (VKT) | Sum of fleet vehicle kilometers traveled during the exposure duration (km) |

Site-Specific Assumptions for Construction Site:

| Values | Parameters | Parameter Description |
|---|---|---|
| T = | 21600000 | Assume 6-month construction project working (5 days/week x 50 weeks/year x 1 year) |
| $A_R$ = | 274 | Assume standard road width of 6.09 m |
| W = | 4.7 | Assume 10 two-ton cars + 2 ten-ton trucks + 1 ten-ton backhoe + 1 ten-ton bulldozer + 1 ten-ton excavator |
| SUM (VKT) = | 1.69E+02 | Assume travel length of road once per day, for length of project, where: = No of fleet vehicles x length of road (km/day) x construction period (days) |
| $PEF_{sc}$ | 1.06E+07 | Subchronic road particulate emission factor ($m^3/kg$) |

References:
USEPA. 2002. Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites, OSWER 9355.4-24. December 2002.

Table A4-3
Calculation of the Site-Specific Volatilization Factors
Remedial Investigation Report
Project 15 CL, Wallops Flight Facility, Wallops Island, VA

Environmental Transport and Fate Models

Dispersion Factor for Chronic Volatile Emissions ($Q/C_{vol}$)
Non-Construction Scenario (Open Air)

$$Q/C_{wind} = A * \exp[ (\ln A_{site} - B)^2 / C ]$$

| Values | Parameter | Parameter Description |
|---|---|---|
| 16.2302 | A | Constant for Minneapolis, MN; Climate Zone 5 (unitless) |
| 18.7762 | B | Constant for Minneapolis, MN; Climate Zone 5 (unitless) |
| 216.108 | C | Constant for Minneapolis, MN; Climate Zone 5 (unitless) |
| 0.5 | $A_{site}$ | Areal extent of the site or contamination (acres)(1) |
| 93.77 | $Q/C_{vol}$ | Inverse of mean concentration at center of 0.5-acre-square source ($g/m^2$-s per $kg/m^3$) |

Dispersion Factor for Subchronic Volatile Emissions ($Q/C_{sa}$)
Construction Scenario (Trench Air)

$$Q/C_{sa} = A * \exp[ (\ln A_{site} - B)^2 / C ]$$

| Values | Parameter | Parameter Description |
|---|---|---|
| 2.4538 | A | Constant (unitless) |
| 17.566 | B | Constant (unitless) |
| 189.0426 | C | Constant (unitless) |
| 0.5 | $A_{site}$ | Areal extent of the site or contamination (acres) |
| 14.31 | $Q/C_{sa}$ | Inverse of mean concentration at center of 0.5-acre-square source ($g/m^2$-s per $kg/m^3$) |

Notes:
(1) Selected to represent most conservative scenario allowed by the model (0.5 acres).

Notes:
-- = Not Evaluated; only volatile chemicals evaluated
CASRN = Chemical Abstract Services Registry Number

Derivation of the Soil Saturation ($C_{sat}$)

$$C_{sat} = \frac{S}{\rho_b} \times (K_d \rho_b + \theta_w + H' \theta_a)$$

| Equation Parameter/Definitions (units) | Value | Default |
|---|---|---|
| $C_{sat}$ /soil saturation concentration (mg/kg) | Calculated | Calculated |
| S /solubility in water (mg/L – water) | See below | Constituent-specific |
| $\rho_b$ /dry soil bulk density (kg/L) | 1.5 | 1.5[a] |
| $K_d$ /soil-water partition coefficient (L/kg) | See below | Organics: $K_d = K_{oc} \times f_{oc}$ |
| | | Inorganics: Constituent-specific[b] |
| Koc /soil organic carbon partition coefficient (L/kg) | See below | Constituent-specific |
| $F_{oc}$ /fraction organic carbon in soil (g/g) | 0.006 | 0.006 (0.6%)[a] |
| $\theta_w$ /water-filled soil porosity ($L_{water}/L_{soil}$) | 0.15 | 0.15[a] |
| H' /dimensionless Henry's law constant | See below | Constituent-specific |
| $\theta_a$ /air-filled soil porosity ($L_{air}/L_{soil}$) | 0.28 | 0.28 or n-$\theta_w$ |
| n /total soil porosity ($L_{pore}/L_{soil}$) | 0.43 | 1 – ($\rho_b/\rho_s$) |
| $\rho_s$ /soil particle density (g/cm$^3$) | 2.65 | 2.65[a] |

[a] Site-specific value may be substituted if data are available.
[b] Assuming a pH of 6.8 when selecting default $K_d$ values for metals.

Parameters:
B = Dimensionless Ratio of the Permeability Coefficient of a Compound Through the Stratum Corneum Relative to its Permeability Coefficient Across the Viable Epidermis
CF3 = Conversion Factor 3, 0.001 L/cm3
FA = Fraction Absorbed Water
Kp = Dermal Permeability Coefficient of Compound in Water
T* = Time to Reach Steady-State
t-event = Event Duration (scenario-specific)
Tau-event = Lag Time per Event
DABS = Dermal Absorption Factor

References:
USEPA, 2004. Risk Assessment Guidance for Superfund, Volume 1, Human Health Evaluation Manual, Part E, Supplemental Guidance for Dermal Risk Assessment, Final, July, EPA/540/R/99/005.

For Organic Compounds:
If t-event ≤ T*, then: DA-event 1 =

$$2\ x\ FA\ x\ K_p\ x\ CF3\ x\ \sqrt{\frac{6\ x\ \tau_{event}\ x\ t_{event}}{\pi}}$$

If t-event > T*, then: DA-event 2 =

$$FA\ x\ CF3\ x\ K_p\ x\ \left[\frac{t_{event}}{1+B} + (2\ x\ \tau_{event})\ x\ \left(\frac{1+3B+3B^2}{(1+B)^2}\right)\right]$$

For Inorganic Compounds:
DA-event 1 = KP x CF3 x t-event
No DA-event 2 equation for inorganics.

Parameters:
B = Dimensionless Ratio of the Permeability Coefficient of a Compound Through the Stratum Corneum Relative to its Permeability Coefficient Across the Viable Epidermis
CF3 = Conversion Factor 3, 0.001 L/cm3
FA = Fraction Absorbed Water
Kp = Dermal Permeability Coefficient of Compound in Water
T* = Time to Reach Steady-State
t-event = Event Duration (scenario-specific)
Tau-event = Lag Time per Event
DABS = Dermal Absorption Factor

References:
USEPA, 2004. Risk Assessment Guidance for Superfund, Volume 1, Human Health Evaluation Manual, Part E, Supplemental Guidance for Dermal Risk Assessment, Final, July, EPA/540/R/99/005.

For Organic Compounds:
If t-event ≤ T*, then: DA-event 1 =

$$2\ x\ FA\ x\ K_p\ x\ CF3\ x\ \sqrt{\frac{6\ x\ \tau_{event}\ x\ t_{event}}{\pi}}$$

If t-event > T*, then: DA-event 2 =

$$FA\ x\ CF3\ x\ K_p\ x\ \left[\frac{t_{event}}{1+B} + (2\ x\ \tau_{event})\ x\ \left(\frac{1+3B+3B^2}{(1+B)^2}\right)\right]$$

For Inorganic Compounds:
DA-event 1 = KP x CF3 x t-event
No DA-event 2 equation for inorganics.

Parameters:
B = Dimensionless Ratio of the Permeability Coefficient of a Compound Through the Stratum Corneum Relative to its Permeability Coefficient Across the Viable Epidermis
CF3 = Conversion Factor 3, 0.001 L/cm3
FA = Fraction Absorbed Water
Kp = Dermal Permeability Coefficient of Compound in Water
T* = Time to Reach Steady-State
t-event = Event Duration (scenario-specific)
Tau-event = Lag Time per Event
DABS = Dermal Absorption Factor

References:
USEPA, 2004. Risk Assessment Guidance for Superfund, Volume 1, Human Health Evaluation Manual, Part E, Supplemental Guidance for Dermal Risk Assessment, Final, July, EPA/540/R/99/005.

For Organic Compounds:
If t-event ≤ T*, then: DA-event 1 =

$$2\ x\ FA\ x\ K_p\ x\ CF3\ x\ \sqrt{\frac{6\ x\ \tau_{event}\ x\ t_{event}}{\pi}}$$

If t-event > T*, then: DA-event 2 =

$$FA\ x\ CF3\ x\ K_p\ x\ \left[\frac{t_{event}}{1+B} + (2\ x\ \tau_{event})\ x\ \left(\frac{1+3B+3B^2}{(1+B)^2}\right)\right]$$

For Inorganic Compounds:
DA-event 1 = KP x CF3 x t-event
No DA-event 2 equation for inorganics.

Parameters:
B = Dimensionless Ratio of the Permeability Coefficient of a Compound Through the Stratum Corneum Relative to its Permeability Coefficient Across the Viable Epidermis
CF3 = Conversion Factor 3, 0.001 L/cm3
FA = Fraction Absorbed Water
Kp = Dermal Permeability Coefficient of Compound in Water
T* = Time to Reach Steady-State
t-event = Event Duration (scenario-specific)
Tau-event = Lag Time per Event
DABS = Dermal Absorption Factor

References:
USEPA, 2004. Risk Assessment Guidance for Superfund, Volume 1, Human Health Evaluation Manual, Part E, Supplemental Guidance for Dermal Risk Assessment, Final, July, EPA/540/R/99/005.

For Organic Compounds:
If t-event ≤ T*, then: DA-event 1 =

$$2\ x\ FA\ x\ K_p\ x\ CF3\ x\ \sqrt{\frac{6\ x\ \tau_{event}\ x\ t_{event}}{\pi}}$$

If t-event > T*, then: DA-event 2 =

$$FA\ x\ CF3\ x\ K_p\ x\ \left[\frac{t_{event}}{1+B} + (2\ x\ \tau_{event})\ x\ \left(\frac{1+3B+3B^2}{(1+B)^2}\right)\right]$$

For Inorganic Compounds:
DA-event 1 = KP x CF3 x t-event
No DA-event 2 equation for inorganics.

Parameters:
B = Dimensionless Ratio of the Permeability Coefficient of a Compound Through the Stratum Corneum Relative to its Permeability Coefficient Across the Viable Epidermis
CF3 = Conversion Factor 3, 0.001 L/cm3
FA = Fraction Absorbed Water
Kp = Dermal Permeability Coefficient of Compound in Water
T* = Time to Reach Steady-State
t-event = Event Duration (scenario-specific)
Tau-event = Lag Time per Event
DABS = Dermal Absorption Factor

References:
USEPA, 2004. Risk Assessment Guidance for Superfund, Volume 1, Human Health Evaluation Manual, Part E, Supplemental Guidance for Dermal Risk Assessment, Final, July, EPA/540/R/99/005.

For Organic Compounds:
If t-event ≤ T*, then: DA-event 1 =

$$2\ x\ FA\ x\ K_p\ x\ CF3\ x\ \sqrt{\frac{6\ x\ \tau_{event}\ x\ t_{event}}{\pi}}$$

If t-event > T*, then: DA-event 2 =

$$FA\ x\ CF3\ x\ K_p\ x\ \left[\frac{t_{event}}{1+B} + (2\ x\ \tau_{event})\ x\ \left(\frac{1+3B+3B^2}{(1+B)^2}\right)\right]$$

For Inorganic Compounds:
DA-event 1 = KP x CF3 x t-event
No DA-event 2 equation for inorganics.

Parameters:

B = Dimensionless Ratio of the Permeability Coefficient of a Compound Through the Stratum Corneum Relative to its Permeability Coefficient Across the Viable Epidermis

CF3 = Conversion Factor 3, 0.001 L/cm3

FA = Fraction Absorbed Water

Kp = Dermal Permeability Coefficient of Compound in Water

T* = Time to Reach Steady-State

t-event = Event Duration (scenario-specific)

Tau-event = Lag Time per Event

DABS = Dermal Absorption Factor

References:

USEPA, 2004. Risk Assessment Guidance for Superfund, Volume 1, Human Health Evaluation Manual, Part E, Supplemental Guidance for Dermal Risk Assessment, Final, July, EPA/540/R/99/005.

For Organic Compounds:

If t-event ≤ T*, then: DA-event 1 =

$$2\ x\ FA\ x\ K_p\ x\ CF3\ x\ \sqrt{\frac{6\ x\ \tau_{event}\ x\ t_{event}}{\pi}}$$

If t-event > T*, then: DA-event 2 =

$$FA\ x\ CF3\ x\ K_p\ x\ \left[\frac{t_{event}}{1+B} + (2\ x\ \tau_{event})\ x\ \left(\frac{1+3B+3B^2}{(1+B)^2}\right)\right]$$

For Inorganic Compounds:

DA-event 1 = KP x CF3 x t-event

No DA-event 2 equation for inorganics.

Table A4-11
Calculation of Receptor-Specific Volatilization Factors for the Groundwater-to-Outdoor Air Exposure Pathway
Remedial Investigation Report
Project 15 CDL, Wallops Flight Facility, Wallops Island, VA

| Groundwater Volatile Chemical of Potential Concern (Non-Vapor Intrusion) | CASRN | Diffusivity in Air ($D_{air}$) ($cm^2/s$) | Diffusivity in Water ($D_{wat}$) ($cm^2/s$) | Henry's Law Constant at System Temperature ($H'_{TS}$) ($cm^3$-water / $cm^3$-air) | Effective Diffusivities | | | Outdoor Air $VF_{w,amb}$ ($mg/m^3$)-air / (mg/L)-water |
|---|---|---|---|---|---|---|---|---|
| | | | | | $D^{eff}_{cap}$ ($cm^2/s$) | $D^{eff}_{s}$ ($cm^2/s$) | $D^{eff}_{ws}$ ($cm^2/s$) | |

Notes:

Equation (1a) $D^{eff}_{cap} = D_{air} \times (\Theta_{acap}^{3.33} / \Theta_t^2) + (D_{wat} / H'_{TS}) \times (\Theta_{wcap}^{3.33} / \Theta_t^2)$
Equation (1b) $D^{eff}_{s} = D_{air} \times (\Theta_{as}^{3.33} / \Theta_t^2) + (D_{wat} / H'_{TS}) \times (\Theta_{ws}^{3.33} / \Theta_t^2)$
Equation (2) $D^{eff}_{ws} = (h_{cap} + h_v) \times ((h_{cap} / D^{eff}_{cap}) + (h_v / D^{eff}_{s}))^{-1}$
Equation (3) $VF_{w,amb} = H'_{TS} / (1 + (U_{air} \times \delta_{air} \times L_{gw} / (W \times D^{eff}_{ws}))) \times 10^3$ ($L/m^3$)

| Input Parameter | Variable | Value | Units | Notes |
|---|---|---|---|---|
| Effective diffusivity - capillary fringe zone | $D^{eff}_{cap}$ | Calculated | $cm^2/s$ | ASTM (2015ab) |
| Molecular diffusion coefficient in air | $D_{air}$ | Calculated | $cm^2/s$ | ASTM (2015ab) |
| Volumetric air content in capillary fringe | $\Theta_{acap}$ | 0.038 | $cm^3$-air / $cm^3$-soil | Default value (ASTM, 2015ab) |
| Total soil porosity | $\Theta_t$ | 0.38 | $cm^3$-pore space / $cm^3$-soil | Default value (ASTM, 2015ab) |
| Molecular diffusion coefficient in water | $D_{wat}$ | Calculated | $cm^2/s$ | ASTM (2015ab) |
| Henry's law constant at system temperature | $H'_{TS}$ | Calculated | $cm^3$-water / $cm^3$-air | See Table A4-5, Henry's Law at Constant System Temperature |
| Volumetric water content in capillary fringe | $\Theta_{wcap}$ | 0.342 | $cm^3$-$H_2O$ / $cm^3$-soil | Default value (ASTM, 2015ab) |
| Effective diffusivity - soil (vadose zone) | $D^{eff}_{s}$ | Calculated | $cm^2/s$ | ASTM (2015ab) |
| Volumetric air content in vadose zone | $\Theta_{as}$ | 0.26 | $cm^3$-air / $cm^3$-soil | Default value (ASTM, 2015ab) |
| Volumetric water content in vadose zone | $\Theta_{ws}$ | 0.12 | $cm^3$-$H_2O$ / $cm^3$-soil | Default value (ASTM, 2015ab) |
| Effective diffusivity - water table to soil surface | $D^{eff}_{ws}$ | Calculated | $cm^2/s$ | ASTM (2015ab) |
| Thickness of capillary fringe | $h_{cap}$ | 5 | cm | Default value (ASTM, 2015ab) |
| Thickness of vadose zone | $h_v$ | 147 | cm | $L_{gw}$ - $h_{cap}$ (ASTM, 2015) |
| Volatilization factor - groundwater to ambient (outdoor) air | $VF_{w,amb}$ | Calculated | ($mg/m^3$)-air / (mg/L)-water | ASTM (2015ab) |
| Volatilization factor - groundwater to trench air | $VF_{w,trench}$ | Calculated | ($mg/m^3$)-air / (mg/L)-water | VDEQ trench model (VDEQ, 2020) |
| Wind speed | $U_{air}$ | 225 | cm/s | Professional judgment: ambient (outdoor) air (5 miles/hr) |
| Wind speed - trench | $U_{air}$ | 22.5 | cm/s | Professional judgment: trench (0.5 miles/hr) |
| Ambient air mixing zone height | $\delta_{air}$ | 200 | cm | Default value (ASTM, 2015ab) |
| Depth to groundwater | $L_{gw}$ | 152 | cm | Site-specific; 4.99 feet bgs (minimum depth to groundwater used during |
| Width of source area | W | 1500 | cm | Default value (ASTM, 2015ab) |
| Length of source area - trench | L VDEQ | 2.44 | m | VDEQ trench model default (VDEQ, 2020) |
| Width of source area - trench | W VDEQ | 0.91 | m | VDEQ trench model default (VDEQ, 2020) |
| Depth of source area - trench | D VDEQ | 2.44 | m | VDEQ trench model default (VDEQ, 2020) |

Notes:
(1) A value of 1 ug/L is used to calculate a shower concentration for all possible COPCs. The Site/COPC specific groundwater EPC will be multiplied by the generic air concentration value to model shower air.
-- = Not Evaluated; only volatile chemicals evaluated
CASRN = Chemical Abstract Services Registry Number

Equations used for Foster-Chrostowski (1987) model

1) Derivation of Liquid-Film Mass Transfer Coefficient for the Shower Model

$$k_l = 20 * (44 / MW)^{0.5}$$

| Values | | |
|---|---|---|
| calc | $k_l$ | Liquid-film mass transfer coefficient (cm/hour) |
| 20 | | Liquid-film mass transfer coefficient for carbon dioxide (cm/hour) |
| 44 | | Conversion factor (molecular weight of carbon dioxide) |
| chem-specific | MW | Molecular Weight |

2) Derivation of Gas-Film Mass Transfer Coefficient for the Shower Model

$$k_g = 3000 * (18 / MW)^{0.5}$$

| Values | | |
|---|---|---|
| calc | $k_g$ | Gas-film mass transfer coefficient (cm/hour) |
| 3000 | | Gas-film mass transfer coefficient for water (cm/hour) |
| 18 | | Conversion factor (molecular weight of water) |
| chem-specific | MW | Molecular Weight |

3) Derivation of Overall Mass Transfer Coefficient Shower Model

$$K_L = [ 1/k_l + (R * T / (H * k_g)) ]^{-1}$$

| Values | | |
|---|---|---|
| calc | $K_L$ | Overall mass transfer coefficient (cm/hour) |
| calc | $k_l$ | Liquid-film mass transfer coefficient (cm/hour) |
| 8.2E-05 | R | Gas constant (atm-$m^3$/mol-K) |
| 293 | T | Room temperature (K) |
| chem-specific | H' | Henry's Law Constant (atm-$m^3$/mol) |
| calc | $k_g$ | Gas-film mass transfer coefficient (cm/hour) |

4) Derivation of Adjusted Overall Mass Transfer Coefficient Shower Model

$$K_{aL} = K_L * [ (T_1 * \mu_s) / (T_s * \mu_1) ]^{-0.5}$$

Values

5) Derivation of Concentration Leaving Shower Droplet Shower Model

$$C_{wd} = C_0 * ( 1 - \exp [ (-K_{aL} * t_s) / (60 * d) ] )$$

| Values | | |
|---|---|---|
| calc | $C_{wd}$ | Concentration leaving shower droplet after time $t_s$ (µg/L) |
| chem-specific | $C_0$ | Initial concentration in tap water (µg/L) |
| calc | $K_{aL}$ | Adjusted overall mass transfer coefficient (cm/hour) |
| 2 | $t_s$ | Shower droplet drop time (sec) |
| 60 | | Interficial area for droplet multiplied by conversion factors |
| 1 | d | Shower droplet diameter (mm) |

6) Derivation of VOC in Air Generation Rate Shower Model

$$S = ( C_{wd} * FR ) / SV$$

| Values | | |
|---|---|---|
| calc | S | VOC in air generation rate (µg/$m^3$-min) |
| calc | $C_{wd}$ | Concentration leaving shower droplet after time $t_s$ (µg/L) |
| 20 | FR | Shower water flow rate (L/min) |
| 6 | SV | Shower room air volume ($m^3$) |

7) Derivation of VOC Concentration in Shower Room Shower Model

$$C_a = ( S / Ra )$$

| Values | | |
|---|---|---|
| calc | $C_a$ | VOC concentration in shower room air (µg/$m^3$) |
| calc | S | VOC in air generation rate (µg/$m^3$-min) |
| 0.016666667 | Ra | Air exchange rate (1/min) |
| 0.001 L/$m^3$ | CF | Conversion factor |

Table A4-13

**Table A4-15**
**Adult Lead Methodology Model Parameters**
**Human Health Risk Assessment**
**Construction Debris Landfill, Wallops Island, Virginia**

| Variable | Description of Variable | Units | Model Input Values | Notes |
|---|---|---|---|---|
| **General Parameters** | | | | |
| PbS | Lead exposure point concentration (mean) | mg/kg | Central AOC<br>TS = 394.6<br>Southern AOC<br>SS = 524.7<br>TS = 1437 | a |
| $R_{fetal/maternal}$ | Fetal/maternal lead blood (PbB) ratio | unitless | 0.9 | b |
| BKSF | Biokinetic Slope Factor | µg/dL per µg/day | 0.4 | |
| $GSD_i$ | Geometric standard deviation PbB | unitless | 1.8 | |
| $PbB_0$ | Baseline PbB concentration | µg/dL | 0.6 | |
| $AF_{S, D}$ | Absorption fraction (same for soil and dust) | unitless | 0.12 | |
| PbBt | Target PbB level of concern | µg/dL | 5 | CDC, 2012 |
| **Receptor-Specific Parameters** | | | | |
| $IR_{S, D}$ | **Soil ingestion rate (including soil-derived indoor dust)** | | | |
| | Current/Future Outdoor Worker | grams/day | 0.05 | c |
| | Future Construction Worker | grams/day | 0.1 | d |
| | Current/Future Teen Trespasser | grams/day | 0.1 | d |
| $EF_{S, D}$ | **Exposure frequency (same for soil and dust)** | | | |
| | Current/Future Outdoor Worker | days/year | 219 | b |
| | Future Construction Worker | days/year | 219 | b |
| | Current/Future Teen Trespasser | days/year | 24 | e |
| $AT_{S, D}$ | **Averaging time (same for soil and dust)** | | | |
| | Current/Future Outdoor Worker | days/year | 365 | b |
| | Future Construction Worker | days/year | 365 | b |
| | Current/Future Teen Trespasser | days/year | 90 | f |

**Notes:**

[a] See Attachment 3 for mean EPC calculations
[b] EPA (2017) ALM default
[c] EPA (2017) recommends 50 mg/day as a plausible central tendency value for non-contact-intensive activities.
[d] EPA (2018) recommends 100 mg/day as a soil ingestion rate for the contact-intense worker and young adult exposure.
[e] Teen Trespasser visits the site 24 days/year.
[f] EPA (2003): Minimum exposure period of 90 days/year for intermittent and variable exposure.

ALM = Adult Lead Methodology
B = blood
DU = decision unit
Pb = lead
PbB = blood-lead concentration
EPA = U.S. Environmental Protection Agency
µg/dL = micrograms per deciliter
µg/day = micrograms per day
mg/kg = milligrams per kilogram

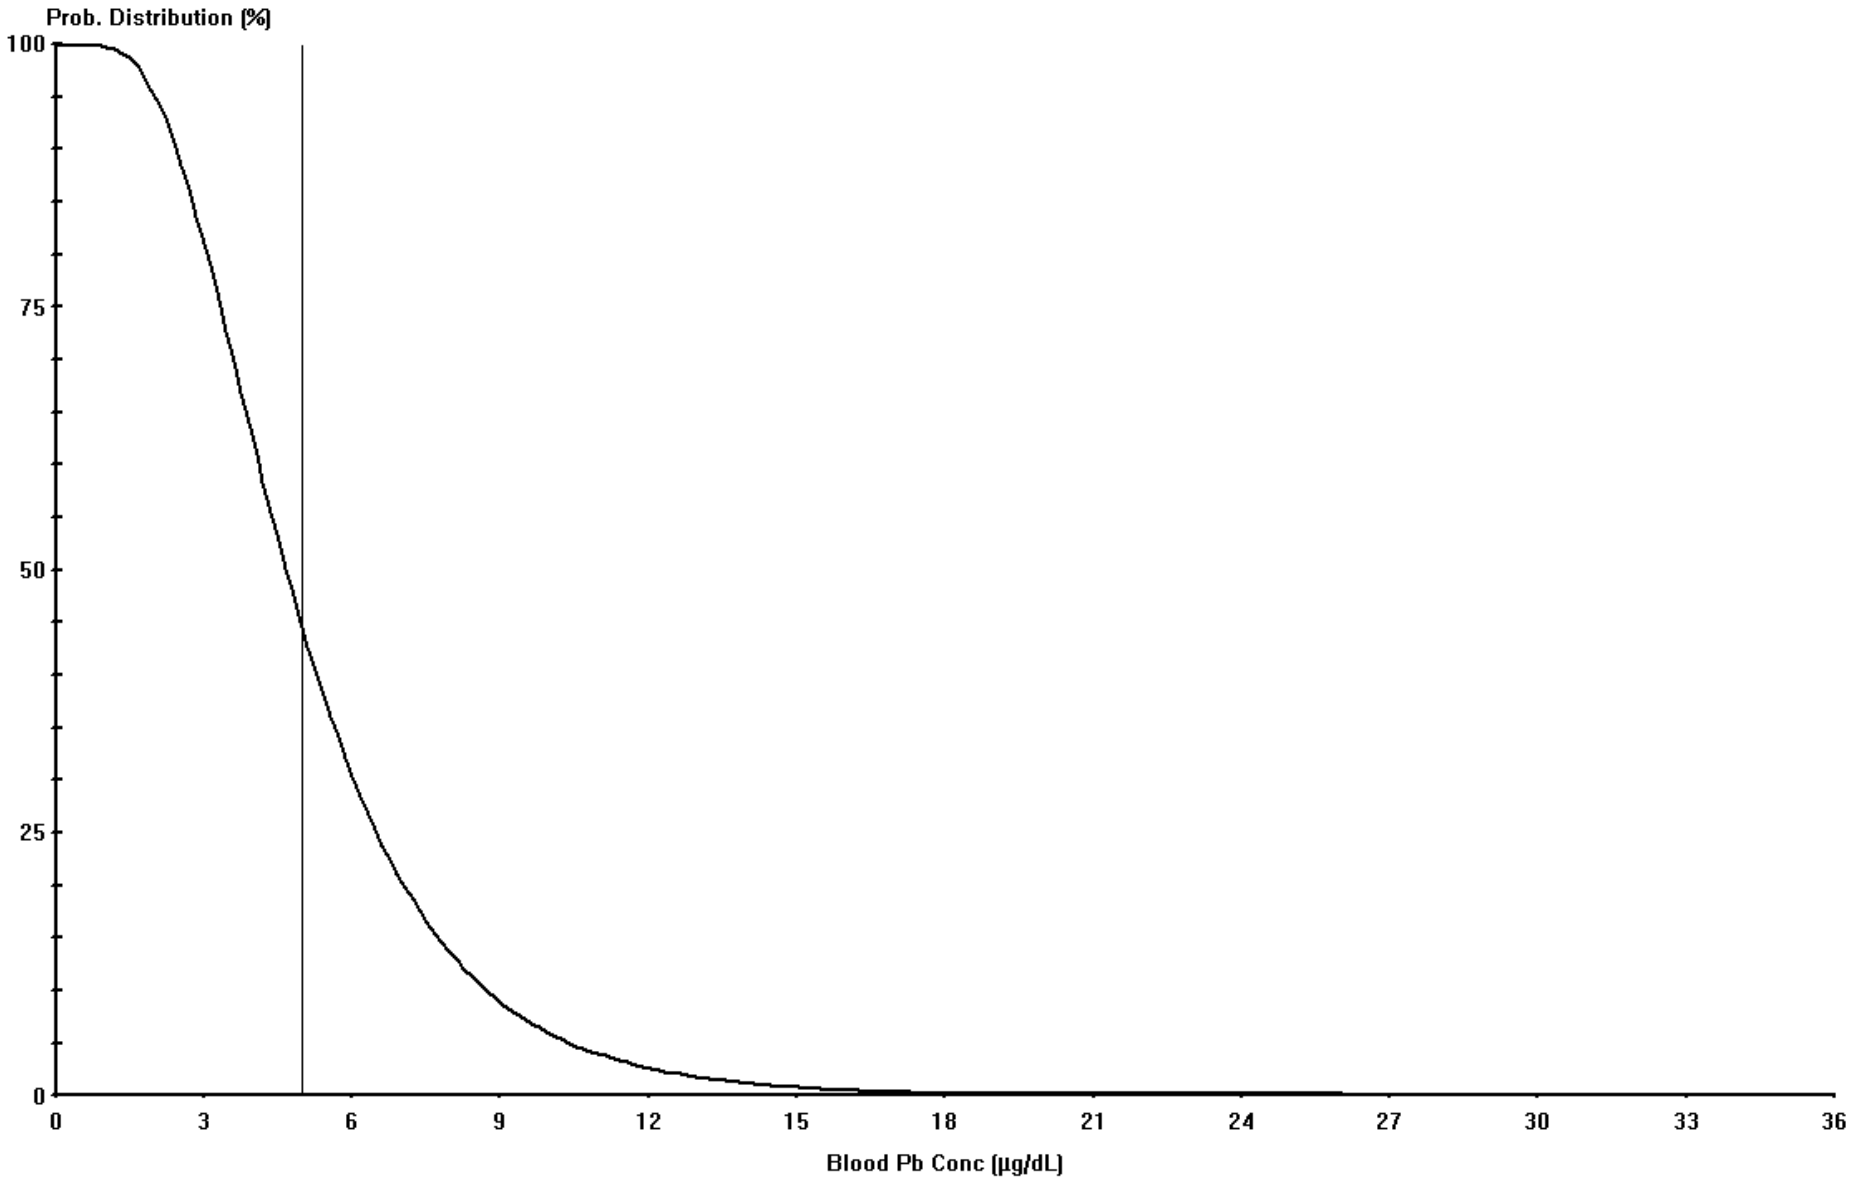
EPA 2021b. User's Guide for the Integrated Exposure Uptake Biokinetic Model for Lead in Children (IEUBK) Windows® version 2 (Updated May 2021). The Technical Review Workgroup (TRW) Lead Committee.



Cutoff = 5.000 µg/dl
Geo Mean = 4.901
GSD = 1.600
% Above = 48.301

Age Range = 12 to 72 months

Run Mode = Research
Comment = 524.7 mg/kg

These IEUBK Model results are valid as long as they were produced with an official, unmodified version of the IEUBK Model with a software certificate.
While IEUBK Model output is generally written with three digits to the right of the decimal point, the true precision of the output is strongly influenced by least precise input values.

Notes:

-- = No Value; mg/kg-day = milligrams per kilogram -day; RfD = Reference Dose

(1) Source: U.S. Environmental Protection Agency (EPA) July 2004. Risk Assessment Guidance for Superfund. Volume 1: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) Final. Office of Emergency and Remedial Response. Washington D.C. EPA/540/R/99/005.

(2) To derive the Absorbed RfD for Dermal, the oral RfD is multiplied by the oral absorption efficiency.

(3) if no subchronic toxicity value is available, then the chronic value is used in the calculations.

RfD: Target Organ Source Information:

ATSDR = Agency for Toxic Substance & Disease Registry (https://www.atsdr.cdc.gov)

HEAST = Health Effects Assessment Summary Table (https://www.epa-heast.ornl.gov/)

IRIS = Integrated Risk Information System (https://www.epa.gov/iris)

PPRTV = Provisional Peer-Reviewed Toxicity Values (https://www.hhpprtv.ornl.gov/)

Target Organ Codes:

CV = Cardiovascular HM = Hematological OC = Ocular
DM = Dermal HP = Hepatic OT = Other

Notes:
-- = No Value
N/A = Not Available
RfC = Reference Concentration
µg/m³ = micrograms per cubic meter

Target Organ Source Information:
ATSDR = Agency for Toxic Substance & Disease Registry (https://www.atsdr.cdc.gov)
Cal EPA = California Environmental Protection Agency (https://calepa.ca.gov/)
HEAST = Health Effects Assessment Summary Table (https://www.epa-heast.ornl.gov/)
IRIS = Integrated Risk Information System (https://www.epa.gov/iris)
PPRTV = Provisional Peer-Reviewed Toxicity Values (https://www.hhpprtv.ornl.gov/)

Target Organ Codes:
CV = Cardiovascular
DM = Dermal
IM = Immune
NV = Nervous
RS = Respiratory
UR = Urinary

| | | | | | | | | | Total of Receptor Risks Across All Media | | -- | | | Total of Receptor Hazards Across All Media | | 0.3 |

Notes:

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

Notes:

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

Notes:

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

Table 7-11.RME
Calculation of Chemical Cancer Risks and Non-Cancer Hazards
Reasonable Maximum Exposure (Central/Southern)
Future On-Site Indoor/Outdoor Commercial Worker - Total Soil, Soil (Outdoor Air), Groundwater (Trench) or (Outdoor Air), Groundwater (Vapor Intrusion)

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

Notes:

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

| | | | | | | | | | | Total of Receptor Risks Across All Media | -- | | | | Total of Receptor Hazards Across All Media | 54 |

Notes:

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

| Notes: | | | | | | | | | | | Total of Receptor Risks Across All Media | | | | | Total of Receptor Hazards Across All Media |

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

Notes:

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

Notes:
(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.
(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.

(1) CR and HQs are rounded to one non-zero digit; cumulative totals may be slightly higher or lower depending on degree of rounding.

(2) Cancer risk is only presented for the lifetime receptor, whereas non-cancer hazard is calculated separately for the child and adult receptor.
