# 1. Introduction

AECOM Technical Service, Inc. (AECOM), on behalf of the National Aeronautics and Space Administration (NASA), updated this supplemental field investigation (SFI) report for the Restoration Program, Operable Unit 7 (OU7), Project 15 Construction Debris Landfill (CDL) feasibility study (FS) at the Wallops Flight Facility (WFF) Formerly Used Defense Site (FUDS), Wallops Island, Virginia (**Figure 1-1)**. The National Aeronautics and Space Administration (NASA) Goddard Space Flight Center WFF qualifies as a USACE FUDS property pursuant to the Environmental Restoration Defense Account and the Defense Environmental Restoration Program, Chapter 160 of the Superfund Amendments and Reauthorization Act of 1986. As part of the USACE FUDS program, USACE-Baltimore District (CENAB) is responsible for oversight of USACE FUDS activities at the former WFF-FUDS.

This work is being performed under contract number 80KSC019D0010, delivery order 80GSFC20F0047with NASA, under the ongoing authorized Environmental Contract.

## 1.1 Objective

USACE investigated four areas of concern (AOCs) at the Project 15 CDL (the Site) in a remedial investigation (RI) and reported results of the investigation, including a human health risk assessment (HHRA) and an ecological risk assessment (ERA), in the *Final Remedial Investigation Report, Remedial Investigation of the Construction Debris Landfill, NASA Wallops Flight Facility, Accomack County, Virginia* (Versar, Inc. [Versar] 2013). The findings of the RI were used to develop remedial alternatives presented in the *Draft Final Feasibility Study Report for the Construction Debris Landfill, NASA Wallops Flight Facility, Accomack County, Virginia* (Versar 2012). Following submission of the draft final feasibility study report, USACE determined that additional information was required to refine the remedial alternatives.

The purpose of the SFI was to collect data to further define the extent of the debris in the CDL and determine if there is contamination in the deep surficial aquifer groundwater. If contamination was found in the deep surficial aquifer, the potential for contamination of the underlying upper Yorktown aquifer would be assessed. This information and the data from the RI were used to refine the alternatives developed for the Revised Draft FS (CDM Smith 2018).

After the initial scoping of the SFI, additional data collection activities were conducted to provide data required to update the HHRA and ERA and report the changes in HHRA and ERA addenda.

## 1.2 Report Organization

This SFI report has been prepared to present and describe the results of the supplemental field investigation and risk assessments performed after the draft final FS. The remainder of the report is organized as follows:

- Section 2 –Site Background. The physical site characteristics, a history of facility operations, and a summary of the RI findings are presented in this section.
- Section 3 – Supplemental Field Investigation. This section provides a description of the supplemental field investigation work.

- Section 4 – Analytical Results and Distribution of Contamination. This section provides tabular summaries of analytical data and observations as well as graphical depictions of the extent of debris and groundwater contamination. The nature and extent of contamination in soil, groundwater, pore water, and sediment are presented.
- Section 5 – Fate and Transport and Conceptual Site Model. This section provides a brief description of the fate and transport characteristics of the significant contaminants of concern (those contaminants that drove risk in the HHRA and ERA). The section also provides a conceptual site model (CSM) of contaminant migration through the site environment.
- Section 6 – Summary of Risk Assessment Addenda. The results of the HHRA and SLERA Addenda (presented in full in Appendices F and G, respectively) are summarized in this section.
- Section 7 – Conclusions. The significant conclusions of the SFI are presented in this section.
- Section 8 – References. Provides a list of sources cited in the preparation of this report.
- Appendix A – Trench and Direct Push Technology Logs. Trench and boring logs are presented in this appendix.
- Appendix B – Temporary Well Construction Diagrams. Shallow and deep surficial aquifer temporary well diagrams are compiled in this appendix.
- Appendix C – Supplemental Field Investigation Analytical Data. Full analytical data tables, with detection limits, are compiled in this appendix.
- Appendix D – Data Validation Reports. Data validation reports produced by third party validators are presented in this appendix.
- Appendix E – Duplicate Pair Analytical Data. Duplicate pair analytical data are presented in this Appendix.
- Appendix F – Human Health Risk Assessment Addendum. The results of additional human health risk evaluation are presented.
- Appendix G – Ecological Risk Assessment Addendum. Results of the screening of additional ecological risk evaluation are presented.

# 2. Site Background

The site background information presented includes information most relevant to the presentation and interpretation of the supplemental data collected during the SFI and the refinement of the site-specific CSM. This includes the site location, operational and environmental investigation history, geology, hydrogeology, drainage, and groundwater use. Information on the topography, demography, climate and ecological setting can be found in the final RI report (Versar 2013).

## 2.1 Site Location

WFF is in Accomack County, Virginia, on the Atlantic Coast of the Delmarva Peninsula (**Figure 2-1**), approximately 5 miles south of the Maryland/Virginia state boundary, and immediately west of Chincoteague Island. Bounded on the north and east by Little Mosquito Creek, Simoneaston Bay to the east, and Wattsville Branch to the west, WFF sits just above mean sea level (amsl) at 20 to 30 feet amsl. WFF consists of three separate land areas: Wallops Main Base, Wallops Mainland, and Wallops Island (**Figure 2-1**). The Project 15 CDL is located northeast of the runways on the approximately 2,230-acre Main Base.

## 2.2 Site History

The site ownership and use, as summarized from the final RI (Versar 2013), is presented in this section.

Prior to development of the Site by the U.S. government, the current WFF property was farmland and marshland. The Department of Navy acquired the property in 1942 and established a World War II training facility, the Naval Auxiliary Air Station, for naval aviators. The original runways and buildings have been modified and extended, as needed, to accommodate the evolving mission of the facility. Accordingly, the WFF property has experienced periods of construction and demolition of runways, buildings, and roadways.

The Navy discontinued naval training operations at the facility in 1959 when NASA took custody of the Main Base as well as the northern portion of Wallops Island and the Mainland; the property transfer was finalized in 1961. From 1959 to 1974, the three areas were known as Wallops Station and were used for support of the Civilian Space Program.

NASA excised approximately 397 acres of the Main Base to the U.S. Fish and Wildlife Service in 1975. The official facility name was changed to Wallops Flight Center that same year. In 1981, Wallops Flight Center was consolidated with Goddard Space Flight Center, and the name of the facility changed again to Wallops Flight Facility. WFF is currently used as a suborbital and orbital rocket launch site to support NASA and other state and federal missions.

### 2.2.1 Site Operational History

Analysis of historical aerial photographs, as reported in the RI, document a series of ground scars indicative of waste disposal between 1949 and 1963. Most indications of excavation and fill were not apparent on photographs taken in 1974. Investigations, described in Section 2.2.2, confirmed that the area had been used for disposal of construction debris and ash.

### 2.2.2 Site Investigation History

As described in the final RI report (Versar 2013), the Project 15 CDL site was discovered in 2000, when the United States Army Topographic Engineering Center (USATEC) produced a historical analysis report of area ground scars, disturbances, channels, and other activities at WFF dating back to pre-United States (U.S.) involvement in WWII (USATEC 2000). The analysis of aerial photographs revealed several ground disturbances in the northeast corner of WFF that are clearly visible in 1949, 1954, 1959, and 1963 aerial photographs. By 1963, some of these features were no longer visible, and by 1974, none of them remained visible (USATEC 2000). Based on the aerial photographic analysis, four AOCs within the CDL, shown on **Figure 2-2,** were defined and named with respect to their geographic position to each other: Northern, Central, Southern, and Western AOCs**.** In previous investigations, these AOCs have also been described by the nature of their apparent historical site use:

- Northern AOC – Disturbed Ground – This AOC was an area of disturbed ground in 1949 that was an excavation in 1954.
- Central AOC – Mounds of Material – This AOC was an area with several mounds of unidentified material in 1954 and was an excavation by 1959.
- Southern AOC – Burning Dump – This AOC was an area of disturbed ground with two man-made channels; the AOC's use as a burning ground was confirmed on a 1950 site map.
- Western AOC – Shallow Excavation – This AOC is interpreted to be a shallow excavation that is now located inside the runway area fence.

In 2001, the Department of Defense and USACE assumed responsibility for various sites, including the CDL, under the FUDS program. Since then, the AOCs have been the subject of four prior investigations:

- a limited site investigation (LSI) in 2002 conducted by Science Applications International Corporation (SAIC 2003)
- a forensic soil sampling and analysis event
- a soil gas investigation in March and April 2004
- an RI conducted in 2007

Data from the RI were used to develop the draft FS. Data from the RI also informed the planning of the SFI field activities and are used with the SFI data presented in this report to refine the CSM.

In addition, NASA conducted a site background soil and groundwater investigation for the Main Base in 2004 to provide data to represent background conditions at WFF. The background data sets are used for comparison in site-specific studies such as the Project 15 CDL RI and SFI.

#### 2.2.2.1 Limited Site Investigation – 2002

In 2002, SAIC conducted an LSI and collected soil and groundwater samples from the areas southeast of the Central and Southern AOCs. Information about the LSI presented here is summarized from the final RI report (Versar 2013).

The objective of the investigation was to determine if past activities had contaminated soil and groundwater near the AOCs. Samples were collected from three direct push technology (DPT) borings (SB-CDL-01, SB-CDL-02, and SB-CDL-03). SB-CDL-01 was located east of the southern end of the Central AOC; SB-CDL-02 and SB-CDL-03 were located east of the Southern AOC. The RI report noted that the exact locations of SB-CDL-02 and SB-CDL-03 are not known. Significant findings from the LSI include:

- In SB-CDL-02, a black sheen with associated volatile organic vapors was found from 7.5 to 16 feet below ground surface (bgs) (the bottom of the borehole). Soil samples were collected from immediately above and below the water table and analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), target analyte list (TAL) metals, and mercury. A groundwater sample was also collected (the depth of the sample is not known).
- A variety of polynuclear aromatic hydrocarbons (PAHs) (a subset of SVOCs) were detected in the SB-CDL-01 soil sample collected above the water table. No VOCs were detected in that sample. Fewer SVOCs were detected in a sample from a depth of 9 feet (below the water table). VOCs in the deeper sample include1,2-dochloropropane (2,000 microgram per kilogram [µg/kg]), ethylbenzene 12,000 µg/kg), m-and/or p-xylene at 9,600 µg/kg, and tetrachloroethene (PCE) at 1,100 µg/kg.
- The groundwater sample from SB-CDL-01 (identified as sample HP-CDL-01) contained several VOCs, including relatively low levels of chlorinated solvents (1.1 micrograms per liter [µg/l] of trichloroethylene [TCE], 0.7 µg/l chloromethane, 12 µg/l cis-1,2-dichloroethene (DCE), and 12 µg/l of PCE) and higher concentrations of petroleum hydrocarbons (920 µg/l ethylbenzene, 3,700 µg/l m-and p-xylenes, and 12,000 µg/l toluene). Concentrations of PCE and xylenes exceeded risk-based criteria.
- Concentrations of metals in SB-CDL-02 and SB-CDL-03 were higher than in SB-CDL-01. Soil from all three borings contained concentrations of arsenic that exceeded soil screening criteria. Groundwater from SB-CDL-01contained concentrations of iron and manganese that exceeded the U.S. Environmental Protection Agency (EPA) Regional Screening Levels (RSLs).

#### 2.2.2.2 Forensic Soil Investigation – 2004

In 2004, USACE collected a single soil sample from the contaminated soil layer found at approximately 7.5 feet in boring SB-CDL-01. The sample was analyzed for volatile petroleum hydrocarbons and extractable hydrocarbons using the Massachusetts Department of Environmental Protection (MADEP) method and EPA Method 8015 gas chromatograph fingerprinting analysis. The chromatograph produced by the analysis appeared to be weathered JP-5 aviation fuel with a significant number of the lower boiling point hydrocarbons missing. The results of the MADEP method also suggest that the contamination is a distillate fuel.

#### 2.2.2.3 Soil Gas Investigation – 2004

In 2004, soil gas samples were collected via a passive soil gas survey (Gore-Sorber® technique) conducted across the Site and including all or part of each AOC. The survey measured elevated levels of benzene, toluene, ethylbenzene, and xylene (BTEX) as well as chlorinated solvents (defined in the survey as PCE, TCE and dichloroethylene [DCE]). BTEX

compounds were found in heaviest concentrations east of the southern end of the Central AOC and, to a lesser degree, in the northeast part of the Central AOC, the northern end of the Western AOC and the southern end of the Southern AOC. Chlorinated solvents were detected in soil gas in the northeastern end of the Southern AOC and the southeastern end of the Central AOC.

#### 2.2.2.4 Background Soil and Groundwater Investigation – 2004

NASA completed a background soil and groundwater investigation in 2004 (Tetra Tech 2004) (the Background Study) to provide data sets that evaluate the background conditions (concentrations of analytes) in soil and groundwater at the Main Base. The data used in the study included samples collected in prior studies and samples collected specifically for the Background Study. Only samples that were located away from and/or upgradient of suspected contaminant source areas were used in the study.

Data from the two types of soils found at the Main Base—Molena and Bojac Series—were evaluated and found to be statistically distinct from each other. Background concentrations were evaluated for each soil type. The Molena soils are found on the Project 15 CDL. The constituent concentrations in surface and subsurface soil within each series were also found to be statistically distinct.

Groundwater samples were collected from only the shallowest water-bearing zone, the surficial aquifer. The Background Study also found that groundwater samples collected via low-flow sampling techniques provide a better representation of groundwater conditions.

#### 2.2.2.5 Remedial Investigation – 2007

An RI was conducted in 2007, and the data were used for a baseline HHRA and ERA. The RI, HHRA, and ERA results were reported in the final remedial investigation report (Versar 2013). The results of the RI and risk assessment were used to develop a draft FS (Versar 2012).

Remedial investigation activities included:

- Conducting electromagnetic and ground penetrating radar geophysical surveys to find buried metal and non-metal debris.
- Conducting a membrane interface probe (MIP) survey. The MIP is a direct push instrument that contains photoionization, flame ionization, and electron capture detectors. VOCs in soil will migrate through the probe membrane and are analyzed by the detectors.
- Excavating, logging, and soil sampling of 10 test pits. At least two soil samples (a surface soil from 0 to 6 inches bgs and a subsurface sample from 6 to 24 inches bgs) were collected from each test pit and analyzed for target compound list (TCL) VOCs, SVOC, pesticides and TAL metals. Ten test pits (TP1 through TP10) were excavated: two test pits were excavated in each of the Northern, Western and Central AOCs, and four test pits were excavated in the Southern AOC. At a minimum, soil samples from 0 to 0.5 and 0.5 to 2.0 feet bgs were collected for risk assessment purposes. Additional samples were collected if waste was encountered.
- Installing and sampling six shallow monitoring wells to depths about 7 feet below the water table. Soil samples were collected from the boring during drilling. One monitoring

well, MW-1, was installed upgradient of the AOCs and served as a location for background data. MW-6 and MW-2 were installed downgradient of the Northern and Western AOCs, respectively, where no evidence of debris was found during the test pit investigations. MW-5 and MW-4 were installed downgradient of the Central AOC, and, as mentioned previously, MW-3 was installed downgradient of the Southern AOC. Two rounds of groundwater samples were collected and analyzed for TCL VOCs, SVOCs, and TAL metals.

- Collecting 10 sediment samples and analyzing them for TCL VOCs, SVOCs, pesticides, and TAL metals, and total organic carbon.
- Collecting 10 surface water samples and analyzing them for TCL VOCs, SVOCs, and TAL metals.
- Measuring water levels, hydraulic gradients, and hydraulic conductivity of the shallow surficial aquifer.

Significant findings of the RI are summarized here; full evaluation of data collected in the RI is provided in the final RI report (Versar 2013).

- The geophysical investigation identified five anomalies located in either the Central or Southern AOCs. Geophysical investigation anomalies are locations where conductivity readings are either above or below zero millimhols per meter and/or magnetic susceptibility readings are either above or below zero ppt. Four of the five anomalies (Anomalies A through D) were located along the eastern edges of the AOCs; near the edge of the marsh. The fifth anomaly (Anomaly E) was located in the northwest part of the Central AOC.
- Elevated detector values were found in one of the eight MIP borings, MIP-5, located in the north-central part of the Central AOC. When the MIP probe was pulled from the ground, the probe drill rods were covered in gray paint.
- No waste was encountered in the test pits located in the Northern or Western AOCs.
- Surface soil (0 to 0.5 feet bgs) from the Northern AOC did not contain any organic compounds; only bis(2-ethylhexyl)phthalate (BEHP), at a concentration below site background levels, was detected in subsurface soils. Concentrations of detected metals did not exceed site background levels.
- The only organic compound detected in shallow soil (0 to 0.5 feet bgs) from the Western AOC was the pesticide, 4,4-dichlorodiphenyldichloroethylene (4,4-DDE). The concentration is less than the mean concentration of DDE found in site background soil samples.
- Waste drums were found at depths up to 13 feet in a test pit located near MIP-5 in the Central AOC. Waste was also found at the surface over the eastern third of the Central AOC.
- Waste (cinders and burned debris) was encountered at the surface and at depths up to 8 feet in the Southern AOC.
- During drilling of the monitoring wells, petroleum staining was noted in SB-4 (completed as MW-4), located on the southeastern edge of the Central AOC. Staining

was found in this boring from about 9 feet to about 14 feet, decreasing with depth. Monitoring well MW-3, located within the Southern AOC, is screened within waste material.

Results of the groundwater sampling included:

- VOCs, including chlorinated solvents (PCE, TCE, cis-1,2-dichloroethene [cis-1,2-DCE], and 1,2-dichloroethene), aromatic hydrocarbons (ethylbenzene, toluene, and xylenes), and ispropylbenzene were found downgradient of the waste material in the Central AOC (in MW-4). Two SVOCs, naphthalene and 2-methylnapthalene, were also detected in MW-4. Concentrations of several of these contaminants exceeded the EPA RSLs for tap water. Concentrations of three contaminants (toluene, PCE, and 1,2-dichloroethene) also exceeded EPA drinking water Maximum Contaminant Levels (MCLs).
- Iron, manganese, and mercury were detected in groundwater from monitoring wells at concentrations exceeding the EPA RSLs. Mercury concentrations were highest in the background well (MW-1); mercury was found in the method blank associated with all groundwater analyses.

Results of the surface water and sediment sampling included:

- In surface water, concentrations of aluminum, antimony, arsenic, copper, chromium, magnesium, manganese, mercury, selenium, vanadium, and sodium in surface water exceeded background concentrations; however, only mercury and copper concentrations exceeded the EPA Biological Technical Assistance Group (BTAG) screening values. Low levels of VOCs (benzene and carbon disulfide) and SVOCs (naphthalene and 2-methyl naphthalene) were also detected.
- VOCs (acetone, 2-butanone, carbon disulfide, cyclohexane and methylene chloride) and pesticides (4,4-dichlorodiphenyldichloroethane [4,4-DDD] and 4,4-DDE) were found in sediment samples. Two SVOCs (di-n-octylphthalate) and BEHP were also detected. Concentrations of BEHP, 4,4-DDD and 4,4-DDE, and several metals (arsenic, copper, lead, mercury, nickel, silver, and zinc) exceeded BTAG screening values.

The results of the RI hydrogeologic investigations are included in the discussion of site hydrogeology in Section 2.3.3.

## 2.3 Regional and Site Physical Characteristics

Site soils have been classified as Molena loamy sand. Molena loamy sand is characterized by 0 to 6 percent slopes, with rapid permeability and is somewhat excessively drained. The background study (Tetra Tech 2004) found that Molena loamy sand had concentrations of naturally occurring metals that are statistically distinct from concentrations of these metals in the other soil type found on Wallops Island Main Base, the Bojac soils. Therefore, the concentrations of metals in soil will be evaluated with respect to the concentration of metals in the Molena loamy sand.

### 2.3.1 Site Topography and Drainage

Elevations on the WFF range from mean seal level to 42 feet amsl, with slopes of 1 to 2 percent (Versar 2013). Ground elevations in the CDL, were measured at the SFI sampling locations shown on the map referenced in Section 3 of this report. In general, the land surface at the CDL slopes from north to south and west to east. Elevations ranged from just over 1-foot amsl on the southeastern edge of the Southern AOC to just under 21 feet amsl west of the access road, across from the Central AOC. In the northern portion of the CDL, elevations decrease from about 19 feet west of the access road in the Northern AOC to about 10 feet, near the edge of the marsh east of the Northern AOC. In the southern part of the Site, elevations just west of the access road are about 12 to 13 feet amsl; near the edge of the marsh, elevations are 3 to 4 feet amsl.

The Site is bound on the east by a narrow tidal channel of Mosquito Creek; water flows north to south in the immediate vicinity of the CDL. The tidal channel turns eastward south of the Site and rejoins Mosquito Creek.

Drainage on and adjacent to the CDL is controlled by ditches on the west side of the access road as well as two concrete culverts that connect the drainage ditch to west-to-east drainage features: one located north of the Central AOC and the other located south of the Southern AOC. Another, smaller man-made drainage ditch receives surface water flow off the Southern AOC **(Figure 2-2).**

### 2.3.2 Regional and Site Geology

#### 2.3.2.1 Regional Geology

The regional geologic framework, particularly the stratigraphy and hydrostratigraphy, used in this investigation is consistent with information presented in USGS Scientific Investigations Report 2009-5066, *Simulation of Groundwater-Level and Salinity Changes in the Eastern Shore, Virginia* (2009). Previous investigations of the Project 15 CDL used different terminology to describe the shallow stratigraphy. Previously the Pleistocene deposits were attributed to the Columbia Group, and the shallowest water-bearing unit was designated as the “Columbia Aquifer.” In the SFI, these deposits are referred to as the Pleistocene deposits, and the uppermost (unconfined) aquifer is referred to as the “surficial” aquifer.

WFF is located in the Atlantic Coastal Plain Physiographic Province, a seaward sloping stratified body of sediments bounded on the west by the Atlantic Seaboard Fall Line and on the east by the Atlantic Ocean. On the Eastern Shore of Virginia, these sediments thicken and dip toward the northeast. The facility is underlain by approximately 7,000 feet of unconsolidated sediments dating back to the Cretaceous Period. Below this group of sediments are crystalline basement rocks of igneous and metamorphic origins that also dip to the northeast (USGS 2009). Above the Cretaceous-age formations are the Miocene-age Calvert and St. Marys Formations that together average about 1,000 feet thick on the Eastern Shore. The overlying Yorktown Formation is a sequence of interbedded clays and sands of Pliocene age. The Yorktown Formation thickens to the east and would be expected to be close to 300 feet thick near the Project 15 CDL. Sands of the Yorktown Formation can be distinctively shelly and bluish gray to greenish gray in color.

During the sea level changes of the Pleistocene, drainage channels eroded the top of the Yorktown. Although these now in-filled paleochannels can be significant, there are no known paleochannels in the area of the Project 15 CDL. Generally, on the Eastern Shore, these Quaternary-age sediments are 40 to 150 feet thick and consist of sand, silt, and clay deposited in marginal marine and estuarine environments. Holocene deposits (back bay, salt marsh, and barrier island deposits) are found on the edges of the Eastern Shore (including Wallops Island).

#### 2.3.2.2 Site Geology

The site geology is defined based on information collected during the RI completed by Versar (2013) as well as the boring logs completed during the SFI. Generalized stratigraphy and hydrostratigraphy for the Site is presented on **Figure 2-3**. From the surface downward, the materials present at the Site and investigated during the RI and SFI include fill (including waste); Pleistocene-age sands, silts, and clays; and the Yorktown Formation.

Fill and Waste

Fill is present in the Central and Southern AOCs and consists of both natural materials (predominantly sand) and man-made materials disposed of in the AOCs (waste). Natural material (sand) appears to have been used to grade the topography as well as to cover disposed waste material. The extent of the man-made fill is described in more detail in Section 4 of this SFI report, but a typical distribution of waste is shown in Cross-Section A-A' **(Figure 2-4**). Note that on the cross section, the unit labeled "Fill" is natural material placed above the disposed waste and/or placed and graded. The eastern extent of the waste is the western edge of the marsh in the Central AOC and the Southern AOC.

Within the Central AOC waste is found at the surface but is also buried beneath as much as 11 feet of sand fill. The waste includes empty metal drums, paint, scrap metal, rebar, glass bottles, bricks, cable, springs, tires, and broken concrete. During the SFI, waste was found at depths of up to 12 feet bgs; during the RI the maximum depth of waste in the Central AOC was about 13 feet bgs.

As at the Central AOC, waste in the Southern AOC is found both at the surface and buried beneath a layer of sand fill (up to 4 feet deep). Waste in the Southern AOC consists of cinders and burned rubbish (glass, cans, wires) (Versar 2013) as well as plastic, plates, scrap metal, bathroom fixtures, railroad ties, and metal pipes. The maximum thickness of cover material (fill) was 4 feet of fine silty sand, but in most locations, only about 1 foot of cover sand was present. The maximum thickness of waste found during the SFI was 5 feet.

Pleistocene Deposits

Deep temporary wells were constructed during the SFI to sample the lower part of the surficial aquifer (see Section 3.2). The borings for these wells terminated at the top of the Yorktown Formation clay. Based on the logs from these four borings, the Pleistocene deposits are as much as 68 feet thick at the Site. The unit consists predominantly of fine to coarse quartz sands, coarsening downward and containing trace gravel in the lower part of the unit. Sands and minor organic clay layers consistent with the sandy estuarine and beach deposits are found in the upper part of the Pleistocene deposits near the marsh.

In the southern part of the Project 15 CDL site, a significant clay unit—the Columbia Clay—is found within the Pleistocene deposits. At the Town of Chincoteague supply well TOC-06 (see the well log in the RI report attachments [Versar 2013]), this orange-brown and gray clay is present from 21 to 42 feet bgs. At DTW-4, located 140 feet east-northeast of TOC-06, the olive grey clay and silt are present from 24.6 to 39.6 feet bgs. As shown on north-south oriented Cross Section B-B' (**Figure 2-5**) this clay does not extend to the northern part of the Site.

Yorktown Formation

The Yorktown Formation clays and sands underlie the Pleistocene deposits. The top of the Yorktown Formation is a clay, distinguished by a distinctive greenish color, present at a depth of about 60 to 68 feet; the Yorktown clay was found in each of the deep temporary borings drilled in the SFI. The deep borings completed during SFI did not penetrate more than approximately 5 feet into the Yorktown clay. At TOC-06, the Yorktown clay is 33 feet thick (from 84 to 117 feet bgs). A second clay is found from 127 to 156 feet bgs. The well is screened from 154 to 225 feet bgs in fine to coarse sand, shell, and clay. A third significant clay within the Yorktown formation is found from 228 to 238 feet bgs (the maximum depth of the well boring).

## 2.3.3 Regional and Site Hydrogeology

### 2.3.3.1 Regional Hydrogeology

The two uppermost water-bearing formations within the WFF area are the Pleistocene-age surficial aquifer and the Miocene- and Pliocene-age Yorktown-Eastover Aquifer (Yorktown Aquifer). These two aquifers are the most important water supply formations for agricultural, domestic, public, and industrial uses (NASA 1994).

Surficial Aquifer

The Pleistocene deposits of the surficial aquifer consist of sand, sandy clay, and minor amounts of gravel deposited during sea level fluctuations in the Pleistocene epoch (USGS 2009). Regionally, the surficial aquifer is recharged by surface waters or by infiltration of precipitation.

At WFF, the surficial aquifer is unconfined and typically overlain by beach sands, silts, and gravel. In upland areas, the surficial aquifer occurs between depths of 5 and 60 feet bgs. Where the Columbia Clay is found, the water in the surficial aquifer may be partially confined. In marshy areas, such as those found on the eastern fringe of the Project 15 CDL site, the water table is near the land surface where the high marsh transitions to upland. Groundwater flow is generally northeast toward the marsh area that separates Chincoteague Island from the mainland (NASA 1994).

Yorktown Aquifer

On Virginia's Eastern Shore, the upper aquitard of the Yorktown Formation is comprised of a thick series of coalescing layers consisting of fine to coarse, greenish gray, glauconitic quartz sand, which is clayey, silty, and in part, contains shell fragments. The formation occurs at depths of 60 to 140 feet in Accomack County (NASA 1994), is at least 63 feet thick at WFF, and reaches its maximum thickness of 109 feet across the bay in Chincoteague (Meng and Harsh 1988).

The conceptual model of groundwater flow indicates that the Yorktown Aquifer is recharged through the upper Yorktown aquitard in the Eastern Shore. Groundwater in the Yorktown Aquifer flows laterally from the recharge area and discharges into the Chesapeake Bay or Atlantic Ocean or migrates vertically back upward across the confining unit along the coastal areas. Additionally, water from both aquifers can be withdrawn via wells for water supply (USGS 2009).

The Town of Chincoteague potable water supply well TOC-06 is located within the southern boundary of the CDL and pumps from the Middle Yorktown-Eastover aquifer (Chincoteague, 2010). It is cased to 154 feet depth and screened (draws water) from 154-225 feet depth (Chincoteague, 2010). TOC-06 is separated from the surficial aquifer by two confining units; the Upper Yorktown-Eastover confining unit and the middle Yorktown-Eastover confining unit (USGS, 2009). The zone of influence of well TOC-06 is not provided in the *Town of Chincoteague Water Supply Plan* (Chincoteague, 2010) nor in *Simulation of Groundwater-Level and Salinity Changes in the Eastern Shore, Virginia* (USGS, 2009). However, based on the presence of two confining units, an assumption can be made that the pumping of well TOC-06 will most likely affect deeper groundwater flow but there is minor influence on the flow of groundwater in the surficial aquifer from the pumping of well TOC-06.

Water Supply Aquifers

Generally, potable water supply wells for both the Town of Chincoteague and WFF are screened at the upper portion of the Yorktown aquifers, from depths less than 150 feet bgs (NASA 1994), but Chincoteague also has water supply wells that draw from the surficial aquifer.

#### 2.3.3.2 Site Hydrogeology

At the Project 15 CDL site, the surficial aquifer is approximately 50 feet thick (water table to top of Yorktown Clay). As shown on boring logs from the RI, the aquifer consists of very fine to very coarse-grained sand and silty sand at the CDL site (Versar 2013). As mentioned in Section 2.3.2.2, a discontinuous clay is found within the surficial aquifer of the southern part of the Site.

Locally, studies conducted in correlative environmental settings elsewhere on the Main Base (Versar 2001a, 2001b) indicated that tidal fluctuations occur in on-site monitoring wells, but these fluctuations do not materially affect groundwater flow direction (Versar 2013). Additionally, aquifer tests estimated hydraulic conductivity values ranging from approximately 80 to 200 feet per day and specific yield values from 0.01 to 0.13 for the unconfined aquifer. These values are typical of unconfined aquifers with mainly sand units and demonstrate the ease of recharge from surface water and/or precipitation (Versar 2013). Contrary to the regional evaluations, the local tests also indicate there is no significant hydraulic connection through the aquitard below the unconfined aquifer. Aquifer tests performed on the upper and middle Yorktown aquifers estimated a transmissivity range of 8,500 to 14,500 gallons per day per foot (gpd/ft), a storativity of approximately 0.003, and a vertical leakage rate of 0.0352 feet per day for the upper aquifer. Aquifer tests conducted at WFF demonstrate there is no significant vertical leakage through the aquitard below the unconfined surficial aquifer (Metcalf & Eddy 1992) though these tests were not conducted in the immediate vicinity of the Town of Chincoteague's water supply well TOC-06.

At the Project 15 CDL site, the Yorktown Aquifer is separated from the overlying surficial aquifer by a 63-foot thick confining layer (aquitard) of clay and silt as was detailed in the geologic log for the Town of Chincoteague water supply well TOC-06. The top of the shallowest confined aquifer of the Yorktown Formation at WFF is found at depths of approximately 100 feet bgs. Note that well TOC-06 is located within the site boundary.

Two rounds of water level monitoring at the six site monitoring wells were conducted immediately prior to each groundwater sampling event**.** The water levels recorded during these sampling events are shown in **Table 2-1. Figure 2-6** is a water level contour map for the shallow surficial aquifer drawn based on data collected during the May 2016 event. Water levels collected in November 2016 are similar although the water levels in all wells, except MW-5, are higher than those measured in May 2016. In comparing May 2007 and November 2007 water level data (Table 2-1), water levels measured in May were higher, except for those at MW-3. The RI concluded that the clay and stiff silt found at the bottom of the waste encountered in MW-3 may be locally perching the groundwater. At MW-3, this results in water collecting in the permeable waste and is unable to drain easily through the fine-grained materials. However, the water levels that do not appear to conform to a trend (such as seen in MW-5 in 2016 and MW-3 in 2007) may be the result of local response to tides, which would be expected to impact water levels in wells located closer to the marsh more strongly than those that are farther from the marsh (e.g., MW-1 and MW-2). As noted in the Field Sampling and Analysis Plan (Versar, 2007), data from the Waste Oil Dump at WFF (Site 16) which is located in a similar geologic setting at the northern end of Runway 17-35, demonstrated that tidal effects are not significant in this setting.

As shown on **Figure 2-6** groundwater flow is toward the northeast. Based on the water levels observed in May 2016, the horizontal hydraulic gradient at the CDL is about 0.15 foot per foot.

Page Intentionally Left Blank

# 3. Supplemental Field Investigation

The SFI consisted of several events conducted between May 2015 and November 2017. Field activities included trenching, collecting soil samples from trenches and from DPT borings, sampling shallow and deep temporary wells, collecting two rounds of surficial aquifer groundwater samples from monitoring wells, collecting a Yorktown Aquifer groundwater sample from water supply well TOC-06, and collecting pore water and sediment samples from Little Mosquito Creek. The trenching and temporary well activities were phased to allow evaluation of preliminary analytical results and field observations to inform the locations of subsequent data collection.

The date of sample collection events, the samples collected, and the data gaps identified, if any, are listed on **Table 3-1**. Data gaps were filled with subsequent data collection.

The location of all the trenches and temporary monitoring wells (shallow and deep) are shown on **Figure 3-1.** Note that **Figure 3-1** also shows the location of test pits excavated during the RI. The location of SFI sediment and pore water sampling locations are shown on **Figure 3-2.** Locations of RI sediment sampling are also shown on **Figure 3-2**. The objectives and rationale of the investigation activities are described below. The procedures used to collect samples and perform other fieldwork are described in the *Feasibility Study Work Plan, Construction Debris Landfill, Wallops Flight Facility Formerly Used Defense Site* (CDM Smith 2015) (the Work Plan) (including the field sampling plan [FSP] and quality assurance project plan [QAPP]), the *Field Sampling Plan Addendum #1, Construction Debris Landfill, Feasibility Study, Wallops Island Flight Facility Formerly Used Defense Site* (CDM Smith 2016) (Field Sampling Plan Addendum #1), and the *Work Plan Addendum #2, Project 15 Construction Debris Landfill, Wallops Flight Facility* (CDM Smith 2017).

Sample information, including the sample depth, sampling date, and analyses performed on the samples from various media are shown in **Tables 3-2** through **3-5**.

## 3.1 Trenching and Shallow Temporary Wells

Trenching was conducted to identify the most contaminated waste material and delineate the extent of the debris in the Southern and Central AOCs of the Project 15 CDL. Soil samples were collected from areas of highest contamination (as determined by elevated photoionization detector (PID) readings, staining, other visual evidence, and direction from the USACE technical lead). For logging purposes, each trench was divided into three 10-foot-long sections designated A, B, or C. All trench logs are compiled in **Appendix A**. Soil samples were collected from 10 trenches (in two cases, two samples were collected from different segments of the same trench) and analyzed for TCL VOCs, TCL SVOCs, and TAL metals. In addition, when ash was encountered, samples (TP-20B-00-010 and TP-27-00-004 and their duplicates) were collected and analyzed for dioxins/furans. **Table 3-2** lists the soil samples collected from all trenches.

Soil samples were also collected from the initial 11 DPT borings; sample identifiers for these soil samples include the identifier “DPS.” Soil sampling information is shown on **Table 3-2**. Shallow temporary wells were installed in these borings as well as nine subsequently drilled borings. All temporary wells were abandoned immediately following sampling. Groundwater

samples from shallow temporary wells include the identifier “DPW;” sampling information for the groundwater samples from temporary wells is shown in **Table 3-3**.

### 3.1.1 May and June 2015 Event – Trenching

Initially, thirteen 30-foot-long trenches were installed at locations TP-11 through TP-23 (see **Figure 3-1**). Note that 10 test pits, TP-1 through TP-10 on **Figure 3-1**, were excavated during the RI (Versar 2013). During the SFI, the USACE Technical Lead added a fourteenth trench, TP-24. The rationale for selecting the initial and additional trench locations include:

- TP-11: North of TP-1 to identify the transition from the waste found in TP-1 to non-waste.
- TP-12: East of TP-1 to determine the lateral extent of waste toward the margin of the marsh.
- TP-13: Southeast of TP-1 to identify the transition from waste to non-waste between TP-1 and TP-6 (both excavated in the RI), near the margin of the marsh.
- TP-14: Midway between TP-1 and TP-6 to determine the southern extent of waste.
- TP-15: East of TP-6 to determine the eastern extent of waste in the petroleum-impacted soil area.
- TP-16: Between TP-3 (waste) and TP-2 (no waste) (both excavated during the RI) to identify the transition from waste to non-waste.
- TP-17: Southwest of TP-3 to determine the extent of TP-3 waste toward the road.
- TP-18: East of TP-3 to determine the extent of waste toward the marsh.
- TP-19: Between TP-3 and TP-7 (excavated during the RI), southeast of TP-3, to determine the eastern extent of waste.
- TP-20: South of TP-7 to identify possible area of non-waste to the east.
- TP-21: South of TP-4 (excavated during the RI) and TP-7 to identify the transition between waste and non-waste.
- TP-22: South of TP-21 to determine the southern extent of waste when waste was encountered in TP-21 (per the approved FSP, the selection of this location was a USACE field decision).
- TP-23: In the western portion of the Southern AOC to determine the presence or absence of waste on the west side of the service road.
- TP-24: Extended TP-11 to the west to define the westward extent of waste found in TP-11 (per the approved FSP, the selection of this location was a USACE field decision).

Ash encountered in TP-20 was sampled and analyzed for dioxin/furans.

The preliminary laboratory analytical data and observations were used to finalize locations for the first round of shallow temporary wells (see Section 3.1.2).

### 3.1.2 July 2015 Event – Shallow Temporary Wells

Eight planned shallow borings (DPT-1 through DPT-8) were located to collect soil and groundwater samples near or downgradient of, the most contaminated material encountered in the trench soil samples. Based on information collected in the May and June 2015 trench investigation, three additional borings (DPT-9 through DPT-11) were added to the investigation. In addition, the location of two originally planned borings, DPT-3 and DPT-6, were revised from those shown in the approved FSP to be closer to waste material (based on trench observations). The locations DPT-1 through DPT-11 are shown on **Figure 3-2**. Soil and groundwater samples were collected from borings DPT-1 through DPT-8. Only groundwater samples were collected from DPT-9 through DPT-11 As mentioned previously, soil samples from shallow DPT borings have the identifier DPS, and groundwater samples have a DPW identifier.

The rationale for the DPT boring locations sampled in July 2015 is as follows:

- DPT-1: Cross-gradient (northwest) and slightly upgradient of MW-5 to assess the lateral extent of groundwater contamination emanating from the area of test pit TP-1 that may not have been intercepted by MW-5.
- DPT-2: Downgradient of TP-1 and south of MW-5 to assess the impact of waste in TP-1 on the lateral extent of groundwater contamination. Groundwater contouring indicates that MW-5 may be located too far north to best monitor any groundwater contamination contributed by the source material around TP-1.
- DPT-3: Adjacent to the center of the west edge of trench TP-13 to be close to the location of the sample (TP-13B) that contained elevated concentrations of 1,1,2-trichloroethane (TCA).
- DPT-4: Downgradient of TP-8 to detect any groundwater contamination sourced to the moderate hit on the electron capture detector recorded at TP-8 (MIP-1) at 25 to 30 feet bgs. DPT-4 is also adjacent to the location of RI TP-4 where waste was noted.
- DPT-5: Upgradient of the waste found in TP-11 and TP-24.
- DPT-6: Adjacent to the center of the edge of TP-18 where elevated concentrations of lead were detected in the trench soil sample.
- DPT-7: Downgradient of TP-22 to evaluate any groundwater impacts from waste found on the east side of the Southern AOC.
- DPT-8: Downgradient of TP-7 to assess impacts from waste in TP-4 and TP-7 on groundwater. Adjacent to TP-20 where burned waste was found.
- DPT-9: Within the Northern AOC, west of the access road to look for potential contaminant sources.
- DPT-10: North of the Central AOC to delineate the northern extent of the groundwater contamination found in trenches in the northern part of the Central AOC.
- DPT-11: Located between the waste found in the Southern AOC and the Town of Chincoteague well TOC-6 to see if contaminants found in groundwater in the Southern AOC are present west of the access road.

All logs of DPT borings are compiled in **Appendix A**.

### 3.1.3 May 2016 Event – Trenches and Shallow Temporary Wells

In May 2016, second phases of trenching and shallow borings were performed to further delineate the waste and groundwater contamination. Locations for three trenches (TP-25 through TP-27) and six shallow temporary wells (DPT-12 through DPT-17) were selected by USACE based on information collected in the prior SFI field events. Soil samples from the trenches were analyzed for VOCs, SVOCs, and metals. One soil sample, from TP-27, was analyzed for dioxins/furans. Groundwater samples were analyzed for VOCs, SVOCs, and metals; groundwater from DPT-15, DPT-16, and DPT-17, all located near the Southern AOC, were also analyzed for dioxins/furans.

The rationale for each trench and temporary well is listed below:

- DPT-12: northwest of (upgradient of) the contamination found in TP-11 and TP-24
- DPT-13: west (upgradient) of the stained soil and waste found in TP-11 and TP-24; west of the access road
- DPT-14: west side of the access road and upgradient of waste found in the Central AOC to delineate extent of impacted groundwater
- DPT-15: upgradient of TOC-06 to characterize groundwater in the surficial aquifer flowing toward the water supply well
- DPT-16: between ash in southern AOC and TOC-6 to characterize shallow surficial aquifer groundwater
- DPT-17: south of the Southern AOC to delineate the southern extent of waste-impacted groundwater
- TP-25: adjacent to DPT-13 to look for the source of contamination (stained soil and sheen) found in DPT-13
- TP-26: north of waste found in TP-11 to delineate the northern extent of waste in the Central AOC
- TP-27: south of TP-22 to delineate the extent of waste found in TP-22

Well construction logs for all temporary wells are compiled in **Appendix B.**

## 3.2 Deep Temporary Wells

Four deep temporary wells were installed with screens in the bottom of the surficial aquifer, i.e., just above the top of the Yorktown clay. The deep temporary wells were installed as described in the approved FSP and Work Plan Addendum #1 (CDM Smith 2016). The DPT drilling rig used for the effort was capable of retrieving continuous soil samples and placing temporary casing into the Columbia clay via a dual tube sampling system if the clay was encountered.

The objective of the deep temporary wells was to characterize deep surficial aquifer groundwater in areas where the soil and shallow surficial aquifer groundwater was thought to be most contaminated. The locations for these borings were selected based on preliminary (not validated) soil and groundwater data from the trenches and borings sampled in the earlier

sampling events. Per discussions with the stakeholders, the planned location of DTW-4 was not based on areas of heaviest contamination; instead, the location was selected to be between water supply well TOC-06 and the closest AOC. The rationale for each location is as follows:

- DTW-1: adjacent to TP-26 where the highest concentrations PAHs were found in soil
- DTW-2: near DPT-2 where elevated concentrations of benzene (2,100 µg/l in water) were found and about 30 feet north of TP-13 where the highest concentrations of VOCs were found in soil
- DTW-3: adjacent to TP-20 where dioxin congeners were detected in soil and MW-3 where the highest dioxin concentrations were found in shallow surficial aquifer groundwater during the May 2016 monitoring well sampling
- DTW-4: between the Southern AOC and the TOC-06 water supply well

Sampling information for groundwater samples collected from deep temporary wells is shown on **Table 3-3**. Note that the identifier “DTW” is used for groundwater samples from the deep temporary wells.

## 3.3 Monitoring and Water Supply Well Sampling

Existing monitoring wells, MW-1 through MW-6, were sampled in May 2016 and November 2016 per the procedures described in the approved FSP (CDM Smith 2015). All monitoring wells were sampled for VOCS, SVOCs, and metals. During the May 2016 sampling event, samples from MW-3, MW-4, and MW-5 were also analyzed for dioxins/furans. In November 2016, samples from all monitoring wells, except MW-6, were analyzed for dioxins/furans.

TOC-06 was sampled from an existing tap at the wellhead per procedures in Work Plan Addendum #2 (CDM Smith 2017). Samples collected in November 2016 from TOC-6 were analyzed for VOCs and dioxins/furans. In November 2017, additional samples were collected from this well and analyzed for SVOCs and metals.

Sampling information for monitoring well groundwater samples (“MW” identifier) and drinking water supply well samples (“TOC” identifier) are shown on **Table 3-3**.

## 3.4 Pore water and Sediment Sampling

Pore water and sediment sampling of the marsh adjacent to the CDL was added to the SFI to supplement the sediment analytical data obtained during the RI (Versar 2013). During the RI, sediment was not analyzed for dioxin; when dioxin and furan congeners were detected in earlier phases of the SFI, the lack of data in adjacent site sediments presented a data gap. Contaminants from the Site may migrate to the sediment via runoff and tidal action, and shallow groundwater likely discharges to the marsh. Therefore, analytes associated with the waste in the CDL (VOCs, SVOCs, and metals) were considered to be potentially present in the sediment and pore water.

In August 2016, 13 sediment samples and 13 pore water samples, co-located with the sediment samples, were collected and analyzed for VOCs, SVOCs, metals, and dioxins/furans. Sediment and pore water samples were collected during the SFI from locations SD/PW-11 through SD/PW-21 shown on **Figure 3-2**. Sediment samples collected from

locations SD-1 though SD-10 (also shown on **Figure 3-2**) were collected during the RI (Versar 2013). Water in the creek is tidally influenced but flows north to south past the Site. Locations SD/PW-12, SD/PW-20, and SD/PW-11 were selected as background locations.

Sediment and pore water samples were collected per procedures in the approved Work Plan Addendum #1 (CDM Smith 2016). Sediment samples were collected from a depth of 0 to 6 inches with a stainless-steel spoon. Pore water was collected using the stainless steel MHE Products PushPoint™ sampler. At each pore water sample location, the tip of the push point sampler was pushed to a depth of 1 foot into the sediment. Water was purged and sampled with a peristaltic pump.

Pore water sampling information is shown on **Table 3-4**, and sediment sample information is shown on **Table 3-5**. The identifiers for pore water and sediment are “PW” and “SD,” respectively.

# 4. Analytical Results and Distribution of Contamination

The objectives of the SFI included identifying the depth of groundwater contamination and delineating the extent of waste in the CDL. The analytical data presented in Section 4.2 are used to assess risk in the HHRA and ERA addenda and to inform the development of the CSM. To characterize the contamination, soil samples and initial temporary well groundwater samples were collected from material suspected to be the most contaminated based on field observations (e.g., visual and PID evidence).

All groundwater and soil chemical data were used, along with available geologic data and observations from test pits and borings, to develop a three-dimensional (3-D) model of contamination at the Site. This model was used to estimate the extent of waste material, stained soil, and groundwater contamination as described in Section 4.1.

## 4.1 Waste and Stained Soil Delineation

Delineation of waste material is a primary objective of the SFI. Field observations documented on trench and boring logs (**Appendix A**) and the boring logs in the RI (Versar 2013) noted both waste material (man-made material and objects) and zones of dark-stained soil. In the field, the stained soil can be identified as a dark-stained native material at or near the water table (in most places where it was observed), with elevated PID readings. Both the waste and stained soil are considered to be indicative of potential sources of contamination to site media (soil, groundwater, sediment, surface water, and pore water).

The presence and thickness of the waste, and the intervals of stained soil, were inputs to the Leapfrog® 3-D model, which was used to depict wastes and calculate the volume of waste for use in the FS. The 3-D model incorporates geologic, hydrogeologic, and chemical analytical data to describe the materials and contamination in three-dimensional space. Additionally, model outputs were adjusted based on the USACE project team's knowledge of the Site. The stakeholders providing the project team knowledge of the site include NASA, EPA, VDEQ, and USACE. The model is not a contaminant transport model or groundwater flow model; rather, the model uses a form of Kriging to extrapolate the data from known locations to areas where data were not collected. The model has been used to develop cross sections and other figures presented in this section.

The lateral boundary of the waste and stained soil, as extrapolated by the model and projected to land surface, is shown on **Figure 4-1**. Note that the model extrapolates waste material at depths lower than some sampling points; therefore, waste may not have been found in some test pits, trenches, or borings that on **Figure 4-1** appear to have waste. A more detailed description of field observations used to delineate the extent of waste and stained soil is provided below.

### 4.1.1 Central AOC Waste and Stained Soil

As shown on **Figure 4-1**, the boundaries of waste material in the Central AOC were investigated with SFI trenches TP-11, TP-12, TP-13, TP-14, TP-15, TP-24, TP-25, and TP-26.

Trench TP-25 (17- to 18-ft. deep by 30-ft. long), located west of the access road, was excavated to depths of 17 to 18 feet; groundwater was encountered at about 17 feet. Only

clean fill (to a depth of 0.5 feet) and native soils were found in TP-25. No debris, waste, or stained soil was observed in this trench, and no organic vapors were detected in soil screened with a PID.

The northern boundary of Central AOC waste was investigated with TP-24 (12-ft. deep by 20-ft. long) and TP-26 (14- to 16-ft. deep by 30-ft. long). The boundary of waste was found at the northern 10-foot section of TP-26 (TP-26A), where sand fill was found to a depth of 4 feet. The southern 20 feet of TP-26 contained debris (drums, cable, glass bottles, and tires) from depths of about 4.5 to 8 feet. Water was found at a depth of about 13.5 to 15 feet. Soil above and below the waste and debris in TP-26 was not stained, and no organic vapors were detected in this soil.

Trench TP-11 (12-ft. deep by 30-ft. long), an extension of TP-26 to the south, was free of debris and stained soil in the northernmost 10 feet (immediately south of TP-26), containing only topsoil and ground cover to a depth of 1.5 feet, and native soils below the topsoil. The southern 20 feet of trench TP-11, contained scrap metal, bottles, and other debris from depths of 6 to 8 feet and stained soil with a strong odor at about 12 feet. Slightly elevated PID readings from the stained soil was noted.

Trench TP-24 extended 20 feet west from the southern end of TP-11 (this was the only 20-foot trench). The western 10-foot section contained paint cans and a cream-colored paste-like material from 11 to 12 feet. Soil from about 4 feet to the waste had a strong odor and elevated organic vapor readings. To the east, there was no waste, but stained soil with a strong odor was observed from depths of 6 to 12 feet.

From north to south, trenches TP-12, TP-13, and TP-15 were excavated to define the eastern edge of waste material within the central AOC. The vertical extent of these west-to-east oriented trenches was limited by the western edge of the marsh. In TP-12 (5- to 11-ft. deep by 30-ft. long), waste debris was found from the surface to depths of 8 to 9.5 feet in the western two thirds of the trench. Excavation of the eastern end of the trench was limited by the presence of shallow (5 feet bgs) groundwater; however, waste was found from ground surface to a depth of  5 feet on the edge of the marsh Neither the vertical nor eastern extent of the waste could be observed in TP-12 (i.e., the waste extended into the marsh and could be deeper than 5 feet). The western end of TP-13 (5- to 10-ft. deep by 30-ft. long) was free of debris, but soil from 6 to 10 feet bgs was stained and had elevated PID readings. The eastern 20 feet of TP-13 encountered shallow (5 feet bgs) groundwater and stained soil with elevated PID readings. Debris was found in the eastern end of the trench and observed extending into the marsh. The western 20 feet of TP-15 (5- to 9-ft. deep by 25-ft. long)  was free of debris and stained sand to depths between 5 and 9 feet. The top 1 to 2 feet of TP-15 was topsoil and a concrete-like material was noted at about 1 foot in the center 20-foot section. The easternmost part of the trench contained scrap metals and other debris in the upper 2 feet of soil. No elevated PID readings were noted in TP-15.

Trench TP-14 (12-ft. deep by 30-ft. long) is located in the south-central part of the Central AOC but contained no debris or stained soil to a depth of 12 feet. The top foot of soil in TP-14 was topsoil (fill) and the remaining soils were native. This location helps to define the extent of stained soil and debris to the south in the Central AOC.

### 4.1.2 Southern AOC Waste

As shown on **Figure 4-1**, the boundaries of waste material in the Southern AOC were investigated with SFI trenches TP-16, TP-17, TP-18, TP-19, TP-20, TP-21, TP-22, TP-23, and TP-27.

TP-16 (10- to 11-ft. deep by 30-ft. long), located in the north-central part of the Southern AOC, did not contain any debris or evidence of contamination to a depth of about 11 feet; the top foot was topsoil and ground cover. Similarly, the waste in TP-17 (10- to 12-ft. deep by 30-ft. long), located in the center of the Southern AOC was limited to scrap metal and plastic debris in the eastern two-thirds of the trench at the surface or between 1 to 2 feet bgs. TP-23 (10-ft. deep by 30-ft. long) was located on the western side of the access road and excavated to 10 feet; no waste or other evidence of contamination was found. Material in TP-23 consisted of ground cover and topsoil to a depth of about 1 foot and native soils below the topsoil.

Trenches TP-18, TP-19, TP-20, TP-21, TP-22, and TP-27 were excavated along the southeastern edge of the southern AOC to find the extent of waste along the edge of the marsh. At TP-18 (4.5- to 12-ft. deep by 30-ft. long) and TP-19 (3.5- to 6-ft. deep by 30-ft. long), a foot of top-soil covers debris (e.g., glass bottles, scrap metals, bricks, plates). At TP-18, the waste was generally found at depths between 1 and 6 feet. The depth of the TP-19 excavation was limited to less than 6 feet by shallow groundwater. The southeastern extent of waste was the edge of the marsh. Less than 50 feet south of TP-19, at TP-20 (1.5- to 5.5-ft. deep by 30-ft. long), the waste was slightly deeper (3.5 feet) and consisted of burned material (including charred wood) and an unidentified material with a bluish hue. The southeastern extent of the waste was not identified because shallow water (1.5 feet bgs) prevented deeper excavation. Trenches TP-21 (4- to 4.5-ft. deep by 30-ft. long), TP-22 (2- to 4-ft. deep by 30-ft. long), and TP-27 (3- to 4-ft. deep by 30-ft. long) were excavated in an approximate north-south orientation. All were largely outside of the previously defined boundary of the AOC. Due to the shallow water table, these three trenches could not be excavated beyond 2 to 4.5 feet bgs. The southern 20 feet of TP-22 could only be excavated to 1 to 2 feet due to water. At TP-21, the southernmost end of the trench contained a large amount of glass, wood, and metal debris below the water table (below 4 feet). Only topsoil and native soil (no waste) was found in the 20 southernmost feet of TP-27. In the northernmost section of TP-27, debris, found in a 1- to 2-foot layer below a foot of topsoil consisted of pipes, glass, and bluish-corroded material.

### 4.1.3 Summary of Stained Soil and Waste Delineation

#### 4.1.3.1 Waste

As shown on **Figure 4-1**, waste is present from the northeastern portion of the central AOC to the southeastern portion of the southern AOC and extends to the east of these AOCs. Generally, there are two areas of waste, one in the Central AOC and one in the Southern AOC. Between the Central and Southern AOCs, the continuity of the debris is less certain as the debris in TP-15 was only observed in the easternmost 10 feet of the trench in the top 2 feet (see **Figure 4-2**, Cross Section C-C'). The extent of waste to the east has not been defined but waste is assumed to extend to the edge of the marsh because of the landscape change from a slope to the flat area of the marsh. In many areas where waste is found (see **Figure 4-1**), it is buried under natural fill material. Along the edge of the marsh, debris is

visible at the ground surface. At inland portions of the Central AOC, the debris is buried to depths of up to at least 12 feet (at TP-24) but is shallower along the marsh. In the Southern AOC, the debris is generally shallower with less natural fill cover.

The volume of waste, as calculated by the 3-D model is 7,450 cubic yards.

#### 4.1.3.2 Stained Soil

Two areas of stained soil, both in and around the Central AOC, are present at the CDL (**Figure 4-1**). The northern area of staining appears to originate at TP-24 where staining extends from 4 feet bgs (i.e., several feet above the water table) to about 12 feet bgs. The zone of staining is several feet above the debris found at 11 to 12 feet in that trench, indicating a source other than the debris (see **Figure 4-3**, Cross Section D-D').

The northern lobe of staining extends southwest from TP-24; the top of the stained zone is about the elevation of the water table (Cross Section C-C'). At DPT-14, located along the western edge of the access road, across from the Central AOC wastes, stained soil was observed at depths of about 13 to 20 feet (the ending depth of the boring). The northern edge of the lobe is defined by a relatively thin (1 foot) interval of staining and elevated PID readings at depths of 14 to 15 feet bgs in DPT-5. Similarly, 2 feet of staining were found from 17 to 19 feet bgs at DPT-13 located about 60 feet northwest of DPT 14. No waste was found in the trench (TP-25) co-located with DPT-13. On the east side of the access road, the southern extent of the northern lobe of staining is between TP-1 where about 4.5 feet (from 8.5 to 13 feet bgs) of material with a petroleum odor was noted and TP-14 where no indication of soil contamination was observed. The western and southwestern extents of the northern lobe are not defined. The northern lobe of staining originates at TP-24 and extends to the southwest (upgradient) at a depth which is at or below the water table. Because the staining extends upgradient, either the groundwater gradient was different in the past, tidal influence reverses the groundwater gradient, or there is another source located to the southwest of the plume.

The southern lobe is defined by staining at the water table in trench TP-13 (a depth of 3 to 5 feet), at DPT-3 from 7 to 10 feet bgs (the depth of the boring), and at the water table (about 9 feet bgs) in

MW-4. There is uncertainty in the extent of the lobe to the southwest in particular. The southern lobe is not defined by test pits or soil borings to the west, south, or east.

The volume of stained soil (not intermixed with waste), as calculated by the 3-D model, is 8,065cubic yards.

## 4.2 Analytical Results

The analytical data from samples collected in the SFI are presented in this section. Tables presented in this section are "hits" only tables, i.e., only detected concentrations of analytes are reported. If an analyte was not detected in any sample shown on the table, it is not included in the table. Data flagged during data validation as "Rejected" are not listed in the summary tables. Data qualified as "J" (indicating an estimated value between the analytical detection limit and the quantitation limit) are listed. Full analytical data, including detection limits, are reported in **Appendix C.**

VOC, SVOC, and metals analyses were performed by Shealy Environmental Laboratory, and dioxins/furans analyses were performed by their subcontractor laboratory, Cape Environmental. All analytical work was performed in accordance with the approved QAPP and QAPP addenda (CDM Smith 2015, 2016, and 2017). A data validation subcontractor, Synectics, validated all analytical data; data validation reports are compiled in **Appendix D.**

### 4.2.1 Data Usability

The analytical data set was assessed for usability (in accordance with the Site-Wide QAPP (Weston 2011), Worksheet #37). The assessment involves the quantitative evaluation of the data set against completeness and precision. Both sampling completeness and analytical completeness were evaluated. Sampling completeness for the SFI was 100 percent, i.e., all planned samples were collected. The sampling completeness goal of 95 percent was achieved.

Analytical completeness was calculated as the number of usable (non-rejected) analytical results as a percentage of all possible analytical results. This was calculated for the entire analytical set, by media, and by analyte. The analytical completeness goal for all collected data is 95 percent and for each individual target analyte is 80 percent.

The overall analytical completeness is 99.1 percent; the analytical completeness goal for all collected data was met. The analytical completeness for groundwater from TOC-06 is 100 percent, and the analytical completeness for all other groundwater (monitoring wells and temporary wells) is 99.9 percent. The pore water analytical completeness is also 99.9 percent. Sediment analytical completeness is 99.5 percent, and soil analytical completeness is 97.3 percent.

The analytical completeness for all dioxin and furan congeners and most of the metals is 100 percent. Completeness for antimony is 96.3 percent and for selenium is 98.8 percent. The percent completeness for all other target analytes ranges between 96.3 and 100 percent.

Precision is measured by calculating the relative percent difference (RPD) of duplicate pair analytical results in cases where two results (one in each sample) for the analyte are available. The RPD goals are <20 percent for monitoring well groundwater (and is also used for water supply well TOC-06 because it is a permanent well) and <35 percent RPD for DPT groundwater samples (including both shallow and deep temporary wells). Goals for the pore water are the same as the temporary wells because pore water collection points are not permanent. The RPD goal for soil and sediment is <50 percent The RPD data are summarized by media in **Table 4-1**.

All RPD goals were achieved, except for dioxin/furan results in temporary well groundwater and sediment. Dioxins were detected in two temporary well samples, DPW-8 and DTW-1, and the RPD goal was achieved in DPW-8. Only one dioxin congener, octachorodibenzodioxin (OCDD), was detected in the parent and duplicate samples from DTW-1, and the RPD was 129 percent. The higher value in each duplicate pair will be used for risk assessment and in describing the extent of contamination.

At least one dioxin congener was detected in each of the three sediment duplicate pairs. Higher RPDs are expected in soil and sediment due to the difficulty in homogenizing samples (hence, the higher RPD goal compared to aqueous samples). Higher RPDs can also result

when the analytical results are relatively low. The higher of the values will be used in the risk assessment documents and in describing the extent of contamination.

All duplicate pair analytical data are collected in the tables in **Appendix E**.

The data quality objectives (DQOs) stated in Worksheet #11 of the Site-specific QAPP were based on the need to delineate waste and determine areas of heaviest contamination to plan subsequent sampling. Visual evidence of debris, ash, and stained soil was the DQO for delineation of waste. Preliminary analytical (unvalidated) analytical data were considered sufficient to make decisions because the goal was to identify the areas of highest contamination. The preliminary data were compared against each other and used with other (e.g., PID and visual) data to determine the areas of heaviest contamination. The overall success of the sampling and analytical program, as measured by meeting the completeness and precision goals, contributed to meeting this DQO.

The DQO for geographic data used to delineate the waste was 30 centimeters. The ends of the trenches were surveyed to within 0.1 foot (3.0 centimeters) by a licensed surveyor.

### 4.2.2 Analytical Data Screening Criteria

The analytical data presented in Section 4.2.3 are compared to various criteria to provide context. The screening criteria are similar to the criteria used in the 2013 RI although updated criteria have been used in some cases. For example, the EPA RSLs are routinely updated, and screening levels listed on the May 2018 RSL Summary Tables are used in this report.

Soil analytical data generated in the SFI are screened against the EPA residential and industrial RSLs (EPA 2018) and the site-specific soil background values (Versar 2013). In the screening tables, values exceeding the residential RSLs are bolded, and those exceeding industrial RSLs are in shaded cells. Concentrations exceeding site-specific background are italicized and underlined.

Groundwater data from permanent and temporary monitoring wells were screened against EPA tap water RSLs (exceedances bolded), Wallops Groundwater Background mean concentrations (exceedances italicized and underlined) (Tetra Tech 2004), and the Virginia Groundwater Quality Criteria (VWQC) (Virginia Department of Environmental Quality 2004) (exceedances in shaded cells).

The Town of Chincoteague municipal well (TOC-06) groundwater data, are compared to EPA tap water RSLs, EPA MCLs, EPA secondary MCLs, and VWQC. MCLs are criteria established by EPA for drinking water quality in public water systems under the Safe Drinking Water Act. Secondary MCLs are standards set to control non-health-related characteristics such as color, taste, and odor.

Monitoring well MW-1 is located upgradient of the CDL and therefore considered to be unimpacted by the disposal activities that took place in the Central and Southern AOCs. Compounds detected in MW-1 may be present due to sources of contaminants located upgradient of the CDL. Similarly, well MW-6 is located well north of the Central and Southern AOC and is not likely to be impacted by contaminants in the AOCs. Organic constituents found in groundwater, particularly the monitoring wells, are qualitatively compared to concentrations found in MW-1 and MW-6.

Pore water and sediment analytical data were screened against EPA Region 3 BTAG marine screening levels (exceedances bolded). There are no screening levels specific to pore water; therefore, BTAG aqueous estuarine screening values were used to be conservative.

Organic and inorganic contaminants can be present in the pore water and, particularly, the sediment from sources upstream of the CDL. For this reason, three sediment (SD-11, SD-12, and SD-20) and three pore water samples (PW-11, PW-12, and PW-20) were collected from an area considered to be outside the influence of the CDL. Analyses from these three samples are considered to be representative of "background" conditions. Organic and inorganic compounds detected in pore water and sediment were compared to the range of concentrations found in the background samples (exceedances of the maximum background concentrations were italicized and underlined). Those compounds found at concentrations exceeding the maximum background concentration are considered to be potentially site-related.

### 4.2.3 Dioxin and Furan Analyses

Seventeen congeners of dioxins and furans are reported. Typically, dioxin/furan congener concentrations are reported in a toxicity equivalency quotient (TEQ) that provides a "concentration" value equivalent to the concentration of the most toxic of the congeners (2,3,7,8-tetrachlorodibenzodioxin [2,3,7,8-TCDD]). TEQ is calculated by multiplying the concentrations of each congener by a toxic equivalent factor (TEF) and summing the results.

A TEF for a congener is the ratio of the toxicity of the congener to the toxicity of 2,3,7,8-TCDD. The TEF for 2,3,78-TCDD is 1. The TEQs were reported by the subcontracted laboratory using TEFs derived by the World Health Organization in 2005 (Van der Berg et al. 2006).

In calculation of TEQs, various conventions are used to deal with the situation in which a congener was not detected. The TEQs for non-detected congeners in this report are reported both as TEQ ND=0.5 (a non-detect is given a value of ½ of the detection limit) and TEQ ND=0 (a non-detect is given a value of 0).

### 4.2.4 Analytical Data

The analytical data are presented by media in **Tables 4-2** through **4-10** and discussed by AOC, below. Per the project objectives, the most contaminated soil (as determined by visual or PID evidence) encountered in the trenches was sampled. Shallow temporary wells were paired with heavily contaminated trenches and soil and water samples collected at depths within the saturated zone to determine areas where the upper surficial aquifer was most heavily contaminated.

#### 4.2.4.1 Soil Analytical Data

<u>Central AOC</u>

Soil collected from trenches and shallow temporary well borings from the Central AOC (**Table 4-2**) were analyzed for VOCs, SVOCs, and TAL metals. The samples collected from trenches (TP-11B, TP-11C, TP-12C, TP-13B, TP-13C, TP-24A, and TP-26B) characterize the chemical nature of contaminated soil. Analytical data from the DPT borings (DPT-1, DPT-2, and DPT-3) adjacent to the contaminated trenches provide information on the vertical extent of

contamination and the presence of source material in the saturated zone. Three borings, DPT-5, DPT-9, and DPT-10 were drilled at some distance to the west and north of the waste in order to provide additional bounds on the horizontal extent of contamination.

Twelve VOCs were detected in at least one of the soil samples from the Central AOC: 1,1,2-trichloroethane (1,1,2-TCA), 2-butanone, 2-hexanone, 4-methyl-2-pentanone, acetone, benzene, cyclohexane, ethylbenzene, isopropylbenzene, methylcyclohexane, toluene, and xylenes. 1,1,2-TCA, 2-hexanone, benzene, ethylbenzene, and xylenes were detected at concentrations exceeding EPA residential RSLs.

The only chlorinated solvent, 1,1,2-TCA, was detected only in the two samples from TP-13 at concentrations of 25,000 J µg/kg and 28,000 µg/kg. Although the staining at TP-13 extended into the water table, no 1,1,2-TCA was detected in the soil sample from adjacent boring DPT-3. TP-13 was also notable as the only location where significant concentrations of ketones were detected. In particular, sample TP-13C, collected from a depth of 4.5 to 5 feet, contained 86,000 J µg/kg 2-hexanone and 74,000 J 4-methyl-2-pentanone. These two compounds were not detected in the other sample from TP-13 or in any other soil sample from the Central AOC.

Soils in TP-13 also had elevated levels of cyclohexane (up to 38,000 µg/kg in TP-13C), methylcyclohexane (up to 66,000 in TP-13C), isopropylbenzene (up to 59,000 µg/kg in TP-13C), ethylbenzene (16,000 µg/kg in TP-13C), and xylenes (59,000 µg/kg in TP-13C). A similar suite of VOCs was detected in TP-24A; however, concentrations were generally lower. In addition, other aromatic hydrocarbons, benzene (550 µg/kg) and toluene (1,900 µg/kg), were also detected in TP-24A. Soil from trench TP-11, located south of TP-24, contained only three VOCs: isopropylbenzene (11,000 J µg/kg), methylcyclohexane (170,000 µg/kg), and xylenes (45,000 µg/kg). Soil from 13 to 13.5 feet bgs at DPT-1, located adjacent to TP-11 and TP-24, contained the same compounds found at TP-24 but at concentrations 1 to 2 orders of magnitude higher than at TP-24.

No VOCs were detected in soil from TP-12C (the northeast boundary of the Central AOC) and TP-26B (the northern edge of the Central AOC).

Several SVOCs, particularly the PAHs, were detected in soils in the Central AOC. Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, indeno(1,2,3-c,d)pyrene, and naphthalene were detected in at least one sample at concentrations exceeding the residential RSLs. Benzo(a)pyrene, benzo(b)fluoranthene, and benzo(k)fluoranthene were detected in one sample (from 4 to 4.5 feet in TP-26B) at concentrations exceeding industrial RSLs. Naphthalene was detected in one sample (from 13 to 13.5 feet in DPT-1DPT1) at a concentration exceeding its industrial RSL.

In TP-11, the concentration of total high molecular weight [HMW] PAHs was 1,194 µg/kg (in TP-11B), and the concentration of low molecular weight (LMW) PAHs was 6,060 µg/kg (in TP-11C). At the adjacent trench, TP-24, concentrations of HMW and LMW PAHs were 7.810 and 3,267 µg/kg, respectively. The sample from the central segment of TP-26 (the northern extension of TP-11) contained the highest concentrations of PAHs: 229,200 µg/kg HMW PAH and 62,730 µg/kg LMW PAH. The deeper (13 to 13.5 feet bgs) soil sample from the adjacent soil boring, DPT-1, also contained elevated PAHs: 8,800 µg/kg HMW PAH and 25,200 µg/kg LMW PAH.

Relatively low concentrations of PAHs (3,740 µg/kg LMW PAHs and no detected HMW PAH) were detected in TP-13. No SVOCs were detected in soil from DPT-2 (9.5 to 10 feet bgs at TP-12) or DPT -3 (4.5 to 5 feet at TP-13).

Aluminum, antimony, arsenic, chromium, cobalt, iron, and lead were present in at least one soil sample at concentrations exceeding residential RSLs. Arsenic (in soil from TP-11B, TP-12C, TP-24A, TP-26B, and DPT-2), chromium (in soil from TP-11B, TP-11C, TP-12C, TP-13B, TP-24A, DPT-2, and DPT-9), and lead (TP-26B and DPT-2) were detected at concentrations exceeding the industrial RSLs. Concentrations of each of these three metals exceeded site background concentrations at TP-26B, and chromium and lead exceeded site background in the sample from 9.5 to 10 feet at DPT-2. The soil in TP-26B had the most metals that exceeded the background concentrations and the highest detected concentrations of these metals.

Three borings were drilled outside of the suspected area of contamination to confirm the presence or absence of waste material in these locations. Boring DPT-5 was drilled on the west side of the access road, opposite the Central AOC. DPT-9 was also drilled on the west side of the access road and was located within the original suspected boundaries of the Northern AOC, and DPT-10 was drilled north of the Central AOC, about mid-way between MW-6 and the northern extent of waste in the Central AOC. Soil in DPT-5 contained 1.9 J µg/kg of toluene; DPT-9 contained similar concentrations of xylene (1.8 J µg/kg.) and 110 J µg/kg of BEHP. No organic constituents were found in the soil from DPT-10. None of the organic constituents exceeded residential RSLs. Concentrations of arsenic and chromium exceeded the residential RSL in each boring; sodium was the only metal to exceed background concentrations in samples from these three borings.

Southern AOC

Soil collected from trenches and shallow temporary well borings from the Southern AOC (**Table 4-3**) were analyzed for VOCs, SVOCs, and TAL metals; two samples were also analyzed for dioxins/furans. The samples collected from trenches (TP-18B, TP-19A, TP-20B, TP-21A, TP-22B, and TP-27A) characterize the chemical nature of contaminated soil. Analytical data from the DPT borings (DPT-4, DPT-6, DPT-7, and DPT-8) adjacent to the contaminated trenches provide information on the vertical extent of contamination and the presence of source material in the saturated zone.

Five VOCs were detected at least one time in the samples from the Southern AOC trenches: 2-butanone, acetone, benzene, methylene chloride, and toluene. As shown on **Table 4-3**, detections of these contaminants were fairly sporadic, and there is no consistent pattern to the detections. No VOCs were detected in TP-18B, TP-19A, and TP-21A. Acetone (84 µg/kg) and 2-butanone (25 µg/kg) were detected inTP-20B as well as in the adjacent DPT-8 (35 µg/kg and 7.9 J µg/kg, respectively). The sample from DPT-8 was collected at similar depth (4.5 to 5 feet bgs) as the sample from TP-20 (4 to 4.5 feet). No VOCs were detected at concentrations exceeding EPA residential RSLs.

SVOCs, particularly PAHs, were also detected sporadically in soil samples from the Southern AOC. The exception is the sample from 3 to 3.5 feet bgs from TP-21A. That sample contained 3,000 µg /kg total HMW PAHs and 516 µg/kg LMW PAHs. These HMW and LMW PAH concentrations are about an order of magnitude higher than the second highest concentrations. No staining was noted in the trench log for TP-21A although debris (glass and

metal) was noted and there was a low (1.5 ppm) detection of volatile organic vapors. One SVOC, benzo(a)pyrene, was detected at a concentration (270 µg/kg) exceeding the EPA residential soil RSL of 110 µg/kg in a sample from TP-21A; it did not exceed the industrial RSL (2,100 µg/kg) or the site background (410 µg/kg)

Two samples from TP-20B and TP-27A were analyzed for dioxins and furans. The sample from TP-27A consisted of sandy silty fill in a zone of debris. The sample from TP-27A exceeded the residential and industrial RSL for 2,3,7,8-TCDD when expressed as TEQ. All seventeen congeners of dioxin and furan were detected in the sample from TP-27A although the vast majority (12,600 J picograms per gram [pg/g]) of the sample was octachlorodibenzo-p-dioxin (OCDD). 2,3,7,8-TCDD was detected at a concentration of 1.38 pg/g. There were no non-detected congeners, thus the TEQ ND=0 and TEQ ND=0.5 are the same: 25.8 pg/g (note that the TEF for octachlorodibenzodioxin [OCCD] is 0.0003). The sample from TP-20B was collected from black burned material found at a depth of 4 to 4.5 feet. The dioxin TEQ (ND = 0.5 the DL) of the sample from TP-20B is 4.69 pg/g, less than the EPA residential RSL. Ten congeners were detected in the TP-20B sample or its field duplicate. Similar to the sample from TP-27A, the majority of dioxin in the sample was from OCCD (3,750 J pg/g).

Aluminum, antimony, arsenic, cadmium, chromium, cobalt, copper, iron, lead, manganese, and zinc were present in at least one soil sample at concentrations exceeding residential RSLs. Six metals exceeded industrial RSLs: antimony (in soil from TP-18B, TP-19A, TP-27A, DPT-4, DPT-7, and DPT-8), arsenic (in all samples except DPT-6 and DPT-11), chromium (all samples), copper (in DPT-8), iron (in TP-18B, TP-19A, TP-27A, DPT-4, and DPT-8), and lead (TP-18B and DPT-4). Fourteen metals were detected above site-specific background values (Table 4-3): aluminum, arsenic, barium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, sodium, and zinc exceeded the site background concentrations. Maximum concentrations of these metals were found at one of three locations: TP-18B, DPT-4, and DPT-8. A duplicate sample was collected at one location (DPT-8), and the highest values of some metals were found in the sample and some in the duplicate.

The highest concentrations of arsenic (52 milligrams per kilogram [mg/kg]), cobalt (28 mg/kg), iron (250,000 mg/kg [25 per cent]), manganese (1,600 mg/kg), nickel (120 mg/kg), and sodium (410 J mg/kg) were found in the soil from TP-18B. This soil was collected from 3.5 to 4 feet bgs in a zone of fill waste, including scrap metal. Soil from 6.5 to 7 feet at that location was collected from DPT-6 and contained significantly lower concentrations (about an order of magnitude lower) of all of these metals.

The highest concentrations of barium (300 mg/kg), lead (22,000 mg/kg [2.2 percent]), and zinc 5,400 mg/kg) were found in soil from 7 to 7.5 feet at DPT-4. The highest concentration of antimony (510 mg/kg was also found in this sample; there is no background screening level for antimony, but the concentration in this sample is notable as it is 2 to 3 orders of magnitude above any other concentrations of antimony in Southern AOC soil. DPT-4 was located adjacent to the location of the RI investigation TP-4 where waste was observed.

The highest concentrations of aluminum (37,000 mg/kg), chromium (140 J mg/kg), copper (6,700 mg/kg, and magnesium 2,500 J mg/kg) were detected in the sample from 4.5 to 5 feet bgs at DPT-8 or its duplicate. DPT-8 was collected adjacent to, and just below, the sample from TP-20B (collected from 4 to 4.5 feet bgs). Concentrations of several metals in the sample from TP-20B (or its duplicate) also exceeded the background samples: arsenic (8.5 mg/kg),

calcium (2,500 mg.kg), chromium 58 mg.kg). copper (1,200 mg/kg), lead (310 mg/kg), nickel (50 mg/kg), sodium (80 J mg/kg), and zinc (320 J mg/kg).

Soil was collected from a depth of 9 to 9.5 feet, from one boring (DPT-11) located on the west side of the access road to investigate the presence of waste material west of the road, west of the southern end of the Southern AOC. The only organic constituent detected in that soil was acetone (42 J µg/kg). There was asphalt fill noted in soil from 2.2 to 3.2 feet bgs but no other indications of waste deposition in the soil from DPT-11. The only metal that exceeded background concentrations in that sample was calcium (1,100 mg/kg).

#### 4.2.4.2 Groundwater Water Quality and Analytical Data

Groundwater samples were collected from 17 shallow and 4 deep temporary wells as well as 6 monitoring wells. Samples were collected and analyzed in accordance with the approved FSP and QAPP (CDM Smith 2015). All samples were analyzed for VOCs, SVOCs, and metals. A subset of samples—including those from shallow temporary wells upgradient and within the Southern AOC; all four deep temporary wells; and MW-3, MW-4, and MW-5 during the May 2016 sampling event and all permanent monitoring wells, except MW-6 in November 2016—were analyzed for dioxins and furans. The Town of Chincoteague supply well TOC-06 was sampled for VOCs and dioxins (November 2016) and SVOCs and metals (November 2017). All temporary well data detections are shown on **Table 4-4**, and all monitoring well and water supply well sample analytical results are summarized on **Table 4-5** and **Table 4-6**, respectively.

Water quality data (temperature, dissolved oxygen, oxidation-reduction potential [ORP], pH, and specific conductance) were measured as part of the well purging process during sampling. The final readings prior to sampling are compiled in **Table 4-7.**

Shallow Temporary Wells

At least one VOC was detected in shallow surficial aquifer groundwater samples DPW-1, DPW-2, DPW-3, DPW-5, DPW-7, DPW-14, and DPW-17 at a concentration exceeding the EPA tap water RSL. Most of the exceedances were found in samples from the Central AOC: DPW-1, DPW-2, DPW-3, and DPW-14. Only xylene was detected above screening levels in DPW-5 (also near the Central AOC) and DPW-7 (on the southern edge of the Southern AOC). VOCs that exceeded the tap water RSLs in these samples include benzene, ethylbenzene, 1,2-dichloroethane (only in DPW-17), cis-1,2-DCE (only in DPW-2), isopropylbenzene, PCE (only in DPW-14), toluene, and xylenes.

Twenty-three SVOCs were detected in at least one shallow temporary well groundwater sample. 1,1-biphenyl, 2-methylnaphthalene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and naphthalene were detected in at least one sample at concentrations exceeding the EPA tap water RSL. Samples with an RSL exceedance included DPW-1, DPW-2, DPW-3, DPW-5, DPW-6, DPW-7, DPW-10, DPW-14, and DPW-15. Except DPW-6 and DPW-7, these locations were collected in or near the Central AOC. Naphthalene was the SVOC most frequently found at concentrations above the tap water RSL.

Shallow surficial aquifer groundwater from five shallow temporary wells (DPW-4, DPW-8, DPW-15, DPW-16, and DPW-17), all located upgradient, within, or on the downgradient edge of the Southern AOC, was analyzed for dioxin/furans. OCDD was the only congener of dioxin that was detected in any of these samples. The TEQ calculated based on ND=0 resulted in no

exceedances of the dioxin tap water RSL. All of the TEQs calculated with ND=0.5 of the detection limit exceeded the RSLs because these calculations are dominated by the analytical detection limits.

Arsenic, barium, chromium, cobalt, and manganese were detected in shallow temporary monitoring well groundwater samples at concentrations exceeding the EPA tap water RSLs. None of the samples contained arsenic or barium concentrations that exceeded site background concentrations. There are no cobalt or manganese Site-specific groundwater concentrations (Tetra Tech 2004). The concentration of zinc in samples DPW-7, DPW-9, DPW-10, and DPW-16 exceeded the VWQC; samples from DPW-7 and DPW-10 also exceeded the site-specific background concentration for zinc.

Deep Temporary Wells

Eight VOCs (benzene, carbon disulfide, chloroform, ethylbenzene, isopropylbenzene, toluene, methylcyclohexane, and xylenes) were detected in one or two deep surficial aquifer groundwater samples. Benzene (in DTW-1), chloroform (DTW-2), ethylbenzene (DTW-2), and toluene (DTW-4) were detected in concentrations that exceeded the tap water RSL. No VOCs were detected in DTW-3 (located in the Southern AOC).

Ten SVOCs were detected in one or two deep surficial aquifer groundwater samples. Only naphthalene was detected in one temporary shallow well (DTW-1) at a concentration exceeding an RSL. No SVOCs were detected in DTW-2 or DTW-3.

Groundwater from all four deep temporary wells was analyzed for dioxins/furans. Similar to the shallow temporary well results, OCCD was detected in each sample; the sample from DTW-2 (located in the Central AOC) also contained 1,2,3,4,6,7,8-heptachlorodibenzo-p-dioxin (1,2,3,4,6,7,8-HpCDD), 1,2,3,4,6,7,8-heptachlorodibenzofuran (1,2,3,4,6,7,8-HpCDF), and 2,3,7,8-TCDD. The TEQ ND=0 in DTW-1, DTW-3, and DTW-4 did not exceed the EPA tap water RSL. The TEQs calculated with one-half the detection limits all exceeded the tap water RSL. The concentration of 1,2,3,4,6,7,8-HpCDD, 71.4 picograms per liter (pg/l), exceeded the tap water RSL for that congener (13 pg/l) as did the concentration for 2,3,7,8-TCDD (4 J pg/l), and the TEQ (1.98 pg/l).

Four metals exceeded the tap water RSL in at least one deep temporary well groundwater sample: arsenic (DTW-3), barium (DTW-1), cobalt (all deep surficial aquifer groundwater), and manganese (all deep surficial aquifer samples). The concentrations of arsenic in DTW-3 and barium in DTW-1 did not exceed site-specific background concentrations. There are no site-specific background concentrations for cobalt and manganese. No metals concentrations exceeded VWQC.

Monitoring Wells

Monitoring well groundwater data are shown in **Table 4-5**. One organic constituent, naphthalene (0.083 µg/l) was detected in the November 2016 sampling event in the CDL background well MW-1. Arsenic and chromium were also detected in samples from at least one sampling round in MW-1 at concentrations exceeding EPA tap water RSLs.

Several VOCs were detected in MW-4 (see **Table 4-5**). Concentrations of cis-1,2-DCE, 1,2-dichloroethane, ethylbenzene, isopropylbenzene, toluene, and xylenes exceeded tap water RSLs.

Fifteen SVOCs, mostly PAHs were detected in at least one downgradient monitoring well. The highest concentrations were generally found in samples from both sampling events in MW-4, located downgradient of the Central AOC. Lower concentrations of several PAHs were also detected in the sample collected from MW-5 in November 2016. 1,1-biphenyl and 2-methylnaphthalene (only in MW-4) and naphthalene (MW-3 and MW-4) exceeded the tap water RSL.

Arsenic, barium, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, vanadium, and zinc exceeded EPA tap water RSLs in at least one sample. Concentrations of all these metals in the November 2016 sample from MW-5 (downgradient of the Central AOC) exceeded their respective EPA RSLs. Some of these metals (arsenic, cadmium, cobalt, copper, iron, lead, manganese, mercury, and zinc) exceeded the site-specific background (Versar 2004) and/or VWQC in that sample. Cadmium concentrations from the November 2016 samples from MW-3 and MW-4 exceeded both the VWQC and site background screening levels.

Water Supply Well TOC-6

Groundwater from TOC-06 was analyzed for VOCs, SVOCs, dioxins/furans, and metals (see **Table 4-6**). The only organic constituent detected was caprolactam, an SVOC. The aliquot for SVOC analysis was run in triplicate (a field sample and two field duplicates). Caprolactam was detected in two of the three samples at concentrations of 1.2 J and 0.92 J µg/l). The tap water RSL for caprolactam is 990 µg/l, and there is no MCL or other criteria for caprolactam.

No dioxin or furan congeners were detected in the sample. The resulting dioxin TEQ ND=0 is 0; the TEQ ND=0.5 is 20 pg/l. The MCL for dioxin is 30 pg/l. The tap water RSL is 0.12 pg/l.

The concentration of iron exceeded the secondary MCL; the concentration of manganese did not exceed the secondary MCL.

Constituents found in both the surficial aquifer wells (monitoring wells) and Yorktown aquifer (TOC-06) include common ions (calcium, potassium, and sodium) and iron, magnesium, and manganese. There are no screening criteria for calcium and potassium. There are no MCLs or RSLs for sodium or magnesium. Both sodium and magnesium were detected in surficial aquifer groundwater monitoring wells at concentrations below the Virginia Groundwater Quality Criteria. Iron and manganese were each detected in at least one monitoring well groundwater sample at concentrations exceeding the RSLs and Secondary MCLs. (Note that the monitoring well data were not screened against secondary MCLs in Table 4-5).

#### 4.2.4.3 Pore water Analytical Data

Detections of analytes in background and site pore water samples are presented in **Tables 4-8 and 4-9**, respectively. The water quality parameters measured during pore water sampling are listed in **Table 4-12**.

Background Samples

Pore water was collected from three background locations (see **Figure 3-2**): PW-11, PW-12, and PW-20. No VOCs or SVOCs were detected in any of the background pore water samples. One congener of dioxin, OCDD, was detected in the sample from PW-11 (56.4 pg/l). The TEQ with ND=0 is 0.0169 pg/l, above the BTAG estuarine screening level (0.0031 pg/l).

Three metals, arsenic, magnesium, and sodium exceeded the EPA BTAG estuarine screening levels in the samples from PW-12 and PW-20. The barium screening level was exceeded in PW-12, and the cadmium screening level was exceeded in pore water from PW-20.

Site Samples

Two VOCs, carbon disulfide and PCE, were detected in pore water samples. Carbon disulfide was detected in PW-14, PW-17, and PW-21. Concentrations of carbon disulfide exceeded the screening criterium (0.92 µg/l) in each sample where it was detected. The highest concentration (23 µg/l) of carbon disulfide was found in the downstream sample, PW-21. PCE was detected in one sample, PW-17, at a concentration of 5.3 µg/l. This concentration does not exceed the screening level of 45 µg/l.

One SVOC, BEHP, was detected in pore water from one location, PW-18, at a concentration of 0.75 µg/l. This is less than the BTAG screening level of 16 µg/l.

One congener of dioxin, OCDD, was detected in PW-13, PW-14, PW-15, PW-16, PW-18, and PW-19. In each sample, the dioxin TEQ with ND=0 exceeded the screening level of 0.0031 pg/l; in all samples except PW-13, the concentrations of OCDD and TEQ exceeded the maximum concentration and TEQ in the background samples. The highest concentrations were detected in PW-19 (TEQ of 0.045 pg/l).

Concentrations of several metals, including arsenic, barium, cadmium, magnesium, manganese, potassium, and sodium, exceeded their respective BTAG estuarine screening levels. Cadmium (0.0012 µg/l) in PW-14, PW-16, and PW-21 also exceeded the maximum cadmium concentration in a background sample. Potassium and sodium equaled or exceeded maximum background concentrations in several pore water samples, including PW-15 and PW-16 (sodium exceedance only) and PW-18, PW-19, and PW-21.

#### 4.2.4.4 Sediment Analytical Data

Detections of analytes in background and site pore water samples are presented in **Tables 4-10** and **4-11**, respectively.

Background Samples

Three VOCs, 2-butanone, acetone, and carbon disulfide were each detected in two of the background sediment samples, SD-11 and SD-20. There are no BTAG sediment screening criteria for these compounds. No SVOCs were detected in background sediment samples.

Three dioxin congeners were detected in at least one background sample: 1,2,3,4,6,7,8-HpCDD, 2,3,7,8-TCDD, and OCDD. 2,3,7,8-TCDD was only detected in SD-11, and the other two congeners were detected in each background sample. The dioxin TEQs with ND=0 range from 0.104 to 0.353 pg/g. The BTAG sediment screening level is 0.85 pg/g.

No metals concentrations in samples SD-11 and SD-20 exceeded screening levels. Concentrations of arsenic (13 J mg/kg), chromium (54 J mg/kg), copper (19 J mg/kg), iron (29,000 mg/kg), and nickel (24 J mg/kg) exceeded the BTAG estuarine screening levels (7.24, 52.3, 18.7, 20,000, and 15.9 mg/kg, respectively) in sample SD-12.

Site Samples

Four VOCs, 2-butanone, acetone, carbon disulfide, and carbon tetrachloride, were detected in at least one sediment sample. Only carbon tetrachloride has a BTAG screening value: 7,240

µg/kg. The one detection of this compound, in SD-21 at 30 J µg/kg, is well below the screening level. The concentrations of 2-butanone, and acetone are below the maximum background concentrations in all samples, except SD-13, the most upstream sediment sample. The concentration of carbon disulfide in SD-18 (180 µg/kg) exceeded the highest concentration in the background samples (82 µg/kg). All other samples had concentrations of carbon disulfide below the maximum background concentration.

One SVOC, the PAH fluoranthene, was detected in site sediment. It was detected in one sample (SD-16) at a concentration (17 µg/kg) below the screening level (113 µg/kg).

Seven dioxin or furan congeners were detected in at least one sediment sample. Dioxin TEQ with ND=0 ranged from 0.0098 pg/g in SD-17 to 3.62 pg/g in SD-16. The screening level (0.85 pg/g) was exceeded in SD-14, SD-16, SD-19, and SD-21.

Arsenic, iron, and nickel concentrations in nearly all sediment samples exceeded the screening levels, but only in SD-19 did the concentrations of these three metals exceed the maximum concentration found in a background sample. Chromium in that sample (59J mg/kg) exceeded both the screening level (52.3 mg/kg) and the maximum background concentration (54 J mg/kg).

## 4.3 Distribution of Contamination in Soil, Groundwater, Sediment and Pore water

Chemicals of potential concern (COPCs) and chemicals of potential ecological concern (COPECs) were defined in the HHRA and ERA and updated in the HHRA and ERA addenda (**Appendices F** and **G**, respectively)**.** The COPCs and COPECs, collectively called COPCs in this SFI report, are shown for each media (soil, groundwater, pore water, and sediment) in **Table 4-13**. The discussion focusses on the COPCs determined in the HHRA and ERA (Versar 2013) as well as new COPCs and COPECs identified in the HHRA and ERA addenda performed with data collected in the SFI. The full risk assessment addenda are provided in **Appendices F** and **G** of this report.

### 4.3.1 Soil

Defining the horizontal extent of the COPCs (or COPECs) in soil was not a primary objective of this SFI; however, some correlations of COPCs in soil can be made to the waste and areas of stained soil. In the RI (Versar 2013), COPCs were identified for surface soils and aggregate (0 to 10 feet bgs) soils. In this SFI, only the aggregate soil COPCs are relevant as no surface soil samples were collected.

The RI states that “Screening for 2,3,7,8-dioxin in soil samples was negative for all samples” (Versar 2013); although dioxin/furans are not mentioned as analytes in the RI report. Dioxins/Furans were not identified in any of the risk documents as COPCs for soil; therefore, sampling for these parameters in soil in the SFI was limited to two samples deemed to be the most likely to be contaminated with dioxins due to the presence of burned material. A discussion of the location and nature of dioxin/furans in soil is provided to inform the discussion of the conceptual site model in Section 4.4.

#### 4.3.1.1 Volatile Organic Compounds

VOC aggregate soil COPCs include benzene, cyclohexane, 1,2-dicloroethane, ethylbenzene, 2-hexanone, isopropylbenzene, 4-methyl-2-pentanone (MIBK), 1,1,2-trichloroethane, toluene, and xylenes (m,p-xylene, o-xylene, and total xylenes). 1,2-dichloroethane was not detected in the SFI samples. Five of these VOCs, benzene, cyclohexane, ethylbenzene, isopropylbenzene, and xylene, were detected in one or more SFI soil samples.

In the Central AOC samples from TP-11A, TP-11B, TP-13B, TP-13C, TP-24A, and DPT-1, all within the area of the northern lobe of stained soil, contained one or more of the VOC COPCs. Xylene and isopropylbenzene were the most widespread and were detected in the same six samples; only the concentration of xylene in soil from TP-13C exceeded the EPA residential RSL. That sample, as well as the sample from TP-13B, also contained ethylbenzene at concentrations exceeding the residential RSL. Two COPCs, 2-hexanone and MIBK, were only detected in one SFI soil sample, TP-13B; concentrations of 2-hexanone exceeded the EPA RSL. Samples from TP-13 (both TP-13B and TP-13C) were the only ones to contain 1,1,2-trichloroethane; concentrations in both samples exceeded the EPA residential RSL.

In the Southern AOC, the only SFI soil samples that had a detectable concentration of a VOC COPC were from TP-27 (1.4 J µg/kg benzene) and DPT-4 (2.2 J µg/kg of toluene).

#### 4.3.1.2 Semi-volatile Organic Compounds

SVOC COPCs in aggregate soil included seven PAHs: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, dibenzofuran, indeno(1,2,3-c,d)pyrene, 2-methylnaphthalene, naphthalene, phenanthrene, and pyrene. Dibenz(a,h)anthracene and phenanthrene were not detected in any SFI soil sample.

In the Central AOC, one or more SVOC COPCs was detected in all soil samples collected from trenches as well as the soil from DPT-1. SVOC COPCs at concentrations exceeding the EPA residential RSL were found in TP-11B, TP-11C, TP-12C, TP-24A, TP-26B, and DPT-1. The highest concentrations were detected in TP-26B. The sample from TP-26B also contained the most (four) COPCs with concentrations exceeding the EPA residential RSLs: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and indeno(1,2,3-c,d)pyrene. These soil samples were collected in areas of the stained soil.

The detected concentrations of SVOC COPCs in soil from the Southern AOC were generally lower than those from soil in the Central AOC. No SVOC COPCs were detected in soil from TP-18B, TP-19A, TP-22B, TP-27A, DPT-4, and DPT-6. Most of the other soil samples from the Southern AOC only contained one or two SVOC COPCs that were present at relatively low concentrations. The most SVOC COPCs, nine, were detected in the sample from TP-21A; the concentration of benzo(a)pyrene in that sample exceeded the EPA residential RSL.

#### 4.3.1.3 Dioxins/Furans

Two soil samples collected in the Southern AOC were analyzed for dioxins/furans: TP-20B and TP-27A. The sample from TP-27A contained each of the 17 dioxin/furan congeners. However, the congener detected at highest concentrations is OCDD (12,600 J pg/g). The congener with the second highest concentration is 1,2,3,4,6,7,8-HpCDD (289 pg/g); 1,2,3,4,6,7,8-HpCDF was the third highest (45.4 pg/g). The remaining congeners were

present at concentrations less than 13 pg/g. The dioxin TEQ for this sample, 25.8 pg/g, exceeded both the EPA residential RSL (4.8 pg/g) and the industrial RSL (22 pg/g).

Soil from TP-20B contained 10 of the 17 dioxin/furan congeners. The highest-concentration congeners were the same as in the sample from TP-27A: OCDD (3,750 pg/g), 1,2,3,4,6,7,8-HpCDD (59.5 J pg/g), and 1,2,3,4,6,7,8-HpCDF (14.4 pg/g). The remaining congeners were present at concentrations less than 3 pg/g. The dioxin TEQ (ND=0.5 the DL) is 4.69 pg/g, i.e., less than the EPA residential RSL.

#### 4.3.1.4 Metals

The distribution of metals contamination described here includes soils containing concentrations of COPCs that are both above the site-specific background (and therefore are site-related) and exceed an EPA RSL.

Only three Central AOC soil samples contained one or more metals at a concentration considered to be Site-related and exceeding an RSL: TP-11B (aluminum at 18,000 mg/kg and iron at 14,000 mg.kg), TP-26B (arsenic at 59 mg/kg, chromium at 63 mg.kg, cobalt at 12 mg/kg, iron at 35,000 mg/kg, and lead at 1,000 mg/kg), and DPT-2 (chromium at 22 mg/kg and lead at 4,900 mg/kg). All three soil samples were collected in intervals of waste. The sample from 11B was at a depth of 11 to 12 feet and was stained soil.

Site-related metals contamination in soil was more widespread in the Southern AOC. Samples from TP-18B, DPT-4, DPT-7, and DPT-8 contained seven or more metals at concentrations above both the site screening level and EPA residential RSLs. Typically, these four samples contained aluminum arsenic, cadmium, chromium, cobalt, copper, iron, and lead. Each sample was collected from intervals that contained waste.

Several samples from the AOC soils contained no metals exceeding both RSL and site-specific screening criteria (TP-22B) or only iron or aluminum at concentrations exceeding the residential RSL (TP-21A, TP-27A [a duplicate had residential RSL exceedances for chromium and cobalt], DPT-6, and DPT-11). Although the soil from 1.5 to 2 feet at TP-22B did not contain metals contamination, a slightly shallower sample (from 0.5 feet to 1 foot) from the adjacent boring DPT-7 contained several site-related metals at concentrations exceeding residential RSLs. Plastic debris was noted in the DPT-7 soil log at the sample interval. Debris, including metal scrap, was noted in the TP-21A trench at the sample interval (3 to 3.5 feet); only iron exceeded the residential RSL. The sample from TP-27 was collected at a depth interval, 1.5 feet, that contained several types of debris, including metals springs, pipes, and corroded material). Boring DPT-11 was located on the west side of the access road where no waste was found.

In general, the presence of debris was not a good predictor of the presence of metals contamination. However, in the areas where debris was not found, no metals exceeded both the site-specific background and an RSL.

### 4.3.2 Surficial Aquifer Groundwater

The extent of contamination in groundwater is defined in this report based on the presence of COPCs determined in the HHRA (Versar 2013) or the HHRA addendum (**Appendix F**). The derivation of COPCs for each media is explained in the RI report (Versar 2013).

Groundwater samples were collected from the shallow and deep sections of the surficial aquifer. Samples collected from the “shallow surficial aquifer” are those considered near the observed water table. Samples collected from the “deep surficial aquifer” were collected from a temporary well with the screen installed just above the Yorktown Clay confining unit. Therefore, the samples were collected from the deepest part of the surficial aquifer. The depths of the mid-points of these deep temporary well screens ranged from 49.5 feet (DTW-3) to 61.5 feet (DTW-1).

#### 4.3.2.1 Volatile Organic Compounds

The VOC COPCs for groundwater derived in the 2013 HHRA include chlorinated hydrocarbons (1,2-dichlorethane [1,2-DCA], cis-1,2-DCE, and PCE), BTEX, isopropylbenzene, and methylene chloride. Chloroform and cyclohexane were added as COPCs in the HHRA addendum (**Appendix F**).

During the RI, groundwater samples were collected in May and December 2007. Chlorinated hydrocarbons were only detected in samples from MW-4 (PCE [7.9 to 13.9 µg/l], TCE [2.6 to 3.6 µg/l], and cis-1,2-DCE [45.4 to 54.8 µg/l]) and MW-5 (1,2-DCA [8.8 to 17.5 µg/l]).

Monitoring MW-4 is located downgradient of the Central AOC. Groundwater in MW-4 did not contain any TCE in 2016, and concentrations of PCE (3.8J µg/l in May 2016) and cis-1,2-DCE (21 to 22 µg/l) were lower than previously detected in the RI. The detection limits in November 2016 samples were elevated and could have masked low levels of TCE. One shallow temporary well, DPW-14, contained 14 J µg/l of PCE and no cis-1,2-DCE. DPW-14 is located upgradient of the Central AOC and within the area of stained soil. As in 2007, the extent of PCE and cis-1,2-DCE is limited to the Central AOC. The work performed in the SFI indicated that PCE is present upgradient of the AOC at concentrations above the RSL of 4 µg/L.

The concentration of 1,2-DCA, 0.59 J µg/l, detected in the May 2016 sample from MW-5 (off the northeast corner of the Central AOC) was also significantly less than the 2007 concentrations. 1,2-DCA was detected in one shallow temporary well, DPW-17 (located south of the Southern AOC), at a concentration of 0.2 J µg/l. All the concentrations detected in 2016 were below the EPA RSL (2.8 µg/l).

Chloroform was only detected in one deep surficial aquifer sample, DTW-1 and therefore is not widespread. The remaining groundwater VOC COPCs (BTEX, cyclohexane, and isopropylbenzene) were found in relatively higher concentrations in shallow surficial aquifer groundwater in an area in the northern and central part of the Central AOC: DPW-1, DPW-2, DPW-3, and MW-4. Fewer of them (e.g., no benzene) and lower concentrations were found upgradient of the Central AOC but within the area of stained soil at DPT-14. DPW-5 appears to be at the northwest edge of the area of groundwater contamination as only xylene was found at concentrations exceeding an RSL.

In the deep surficial aquifer, relatively low concentrations of ethylbenzene, isopropylbenzene, and toluene were found in DTW-1. Only the concentration of ethylbenzene exceeded an RSL. Toluene (150 µg/l) was also detected in DTW-4. No toluene was detected in DTW-2 or DTW-3; the extent of elevated concentrations of toluene in the deep surficial aquifer is limited to the area around DTW-4.

#### 4.3.2.2 Semi-Volatile Organic Compounds

The SVOC COPCs identified in the RI include 2-methylnapthalene and naphthalene; 1,1-biphenyl, benzo(a)anthracene, benzo(a)pyrene, benzo(b) fluoranthene, and dibenzofuran were added as COPCs in the HHRA addendum (**Appendix F**).

The distribution of 1,1-biphenyl, 2-methylnaphthalene, and naphthalene is similar to that of the BTEX and cyclohexane COPCs: DPT-1, DPT-2, DPT-3, and MW-4 with lower concentrations found in DPW-14 and DPW-5 on the west side of the access road across from the Central AOC. Naphthalene was detected in relatively low concentrations, but above RSLs, downgradient of the Southern AOC at MW-3. Groundwater in MW-5, located on the northeast corner of the Central AOC, also had relatively low concentrations (below RSLs) of benzo(b)fluoranthene and naphthalene.

The locations where the remaining groundwater SVOC COPCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b) fluoranthene, and dibenzofuran) were detected includes points along the north and northeast of the Central AOC (DPT-1, DPT-5, DPT-10, and MW-5) and one location side-gradient of the Southern AOC (DPT-7).

The only SVOC groundwater COPCs detected in the deep surficial aquifer were found at DTW-1, located adjacent to DPT-1. Naphthalene (above the RSL) and 2-methylnaphthalene (below the RSL) were detected in DTW-1. SVOC contamination is limited to the shallow surficial aquifer, except near DTW-1.

#### 4.3.2.3 Dioxin/Furans

Dioxin TEQ is a groundwater COPC identified in the HHRA addendum (**Appendix F**). OCCD was the only congener detected in shallow surficial groundwater samples analyzed for dioxins/furans. It was detected in all samples analyzed, except the sample from the background well, MW-1. Locations where it was detected include DPT-4, DPT-8, DPT-15, DPT-16 DPT-17, MW-2, MW-3, MW-4, and MW-5. The TEQ (ND=0) ranged from 0.0112 pg/l at DPT-17, south of the Southern AOC, to 0.0619 pg/l at DPT-8, located downgradient of the Southern AOC. Dioxin TEQ did not exceed the RSL at any sampling locations in the shallow surficial aquifer.

All the deep surficial aquifer groundwater samples were analyzed for dioxins/furans, and dioxin congeners were detected in samples for DTW-1 and DTW-2, both located downgradient of the Central AOC. The highest dioxin TEQ (ND=0) was 1.98 pg/l, above the RSL of 1.2 pg/l in DTW-2.

#### 4.3.2.4 Metals

Metals were detected at concentrations above both an RSL and site-specific background concentrations in samples from MW-5 (arsenic, cadmium, cobalt, copper, iron, lead, manganese, and zinc) and MW-3 (copper). Both locations are immediately downgradient of waste material in the shallow surficial aquifer. Midpoints of the well screens are at depths of 8 feet (MW-3) and 28 feet (MW-5).

There are no metals in the deep surficial aquifer groundwater at concentrations that exceed both the RSL and Site background concentrations.

### 4.3.3 Yorktown Aquifer Groundwater

One Yorktown Aquifer well, Town of Chincoteague drinking water supply well TOC-06, was sampled. Iron and manganese were detected in the Yorktown Aquifer well. The iron concentration, 0.41 milligrams per liter (mg/l), did not exceed the EPA RSL (1.4 mg/l) using 1/10 the noncancer Hazard Index (HI); the iron concentration slightly exceeded the secondary MCL (0.30 mg/l). Secondary MCLs are set for contaminants that are not health-threatening but may impact the water color, taste, or smell. The manganese concentration in the Yorktown Aquifer sample (0.0069 J mg/l) did not exceed the EPA RSL (0.043 mg/l) using 1/10 the noncancer HI or the secondary MCL (0.05 mg/l).

There is no evidence of site-related contamination in the Yorktown Aquifer groundwater in the sample from TOC-06.

### 4.3.4 Pore Water

#### 4.3.4.1 Volatile Organic Compounds

There are no VOC human health COPCs or ecological COPECs for pore water (based on surface water screening levels; see **Appendices F** and **G**). Carbon disulfide was detected in three locations, PW-14, PW-17, and PW-21. These three locations are relatively far (about 370 feet) from each other and are not adjacent to each other, i.e., there are locations with no carbon disulfide between each of these locations. Carbon disulfide is a natural product of natural anaerobic biodegradation such as is expected to be occurring in marshlands. Due to this pattern of occurrence, carbon disulfide is not considered to be site-related. PCE was detected in PW-17, collected east of the southern AOC, at a concentration of 5.3 µg/l. The concentration is less than the BTAG screening value (45 µg/l) but is considered Site-related as PCE has been detected in Site groundwater.

#### 4.3.4.2 Semi-volatile Organic Compounds

There are no SVOC human health or ecological COPCs in pore water. The only SVOC detected was BEHP in pore water from PW-18. The concentration (0.75 µg/l) was less than the BTAG screening level.

#### 4.3.4.3 Dioxin/Furans

Dioxin TEQ is not a COPC in pore water. The only dioxin or furan congener that was detected in pore water was OCDD. The dioxin TEQ (ND=0) exceeded the maximum background concentration at PW-14, PW-16, PW-18, and PW-19.

#### 4.3.4.4 Metals

Metal COPCs in pore water include arsenic, barium, cadmium, manganese, and mercury. Arsenic, barium, and manganese were not detected in any pore water samples at concentrations exceeding background samples. Cadmium was found at PW-14, PW-16, and PW-21 at concentrations exceeding maximum background concentrations and the BTAG estuarine water screening level. PW-14 and PW-16 are upstream and downstream of the Central AOC (see **Figure 3-2**). PW-21 is the most downstream sample from the pore water data set.

Mercury was only detected in one location, PW-18; it was not detected in background pore water. The detected concentration did not exceed the BTAG estuarine water screening level. PW-18 is located in the marsh adjacent to the Southern AOC.

## 4.3.5 Sediment

### 4.3.5.1 Volatile Organic Compounds

There are no VOC human health COPCs for sediment; the COPECs are carbon disulfide. Only carbon disulfide in sediment from SD-18 and carbon tetrachloride in sediment from SD-21 exceeded concentrations of these compounds in the site background samples (see **Table 4-11**). Location SD-18 is slightly downstream (south) of the Southern AOC, and location SD-21 is the most downstream location (see **Figure 3-2**).

Carbon disulfide can be produced naturally in areas where anaerobic biodegradation is occurring, such as a marsh. Carbon disulfide is not considered to be site-related.

### 4.3.5.2 Semi-volatile Organic Compounds

There are no SVOC human health COPCs for sediment. BEHP is an ecological COPC. No BEHP was detected in sediment samples collected in the SFI. During the RI, two sediment samples, SD-5 located upstream of the Central AOC and SD-10 collected downstream of the Southern AOC, contained BEHP.

### 4.3.5.3 Dioxin/Furans

Dioxin TEQ is a COPEC in sediment. Sediment locations with a dioxin TEQ (ND=0) higher than background concentrations include SD-15, SD-16, SD-19, and SD-21. Locations SD-15 and SD-16 are in the marsh east of the Central AOC. SD-19 and SD-21 are downstream of the Southern AOC. The highest concentration of dioxin TEQ ND=0 was detected at SD-16 (3.62 pg/g).

All of the sediment samples contained the OCCD congener, and all, except the sediment from SD-17, contained 1,2,3,4,6,7,8-HpCDD. Sediment from SD-16 contained seven congeners. As with the soil samples, the congener with the highest concentration was OCDD; generally, the concentration of OCDD was 1 to 2 orders of magnitude higher than the concentration of the second highest concentration congener, 1,2,3,4,6,7,8-HpCDD.

### 4.3.5.4 Metals

Metal COPCs include aluminum, arsenic, beryllium, chromium, mercury, nickel, and vanadium. Aluminum, arsenic, chromium, nickel, and vanadium only exceeded the respective maximum background concentrations in sediment from SD-19, located immediately downstream of the discharge point of the drainage ditch that flows east to west south of the Southern AOC. Aluminum does not have a BTAG screening value. Arsenic, chromium, and nickel exceeded the BTAG screening value at that location as well.

Beryllium was detected at concentrations exceeding the maximum detected background value in all samples except SD-13, SD-14, and SD-15. All the locations where beryllium was detected were immediately east and downstream of the Southern AOC. There is no BTAG screening level for beryllium. Mercury was detected at concentrations above the background concentrations in SD-16, SD-17, and SD-18—all locations immediately east of the Southern AOC. None of the detected concentrations exceeded the BTAG screening value (0.13 mg/kg).

Notably, mercury was not detected in samples from SD-19 and SD-21, downstream of the Southern AOC.

## 4.4 Summary of Extent of Contamination

The aerial extent of waste and stained soil is shown on **Figure 4-1**. Waste is found in a broad arc that ranges from the northern boundary of the Central AOC to three quarters of the way along the southeast edge of the Southern AOC. As shown on **Figure 4-2**, Cross Section C-C,' the waste along the edge of the marsh is fairly shallow and covered with little or no fill. In the northern part of the Central AOC, the waste is found at depths up to 11 feet (see **Figure 4-3**, Cross Section D-D').

The stained soil extends in two lobes in the Central AOC. The southwestern extent has not been fully defined. In one location (Trench TP-24), the stained soil is stained fill and is found several feet above the waste (debris) found at 11 to 12 feet bgs (see **Figure 4-3**, Cross Section D-D'), In other places, the stained soil appears to be found at about the water table and extends a few feet below it.

Delineation of the extent of soil contamination was not an objective of the SFI. However, data from the SFI indicate VOC- and SVOC-contaminated soil is associated with areas of stained soil and debris in the Central AOC. Metals contaminated soil is sometimes, but not always, associated with debris in both the Central and Southern AOCs.

The areal extent of VOC-contaminated shallow surficial aquifer groundwater, shown on **Figure 4-4**, is approximately the extent of the Central AOC and extends westward to at least DPT 14. The area of groundwater contamination does not appear to extend to the marsh although the marsh is expected to be a local groundwater discharge zone. SVOC-contaminated groundwater is mostly co-located with VOC-contaminated groundwater except that naphthalene is found slightly exceeding RSLs at DPT-10 (DPW-10), just north of the VOC contamination, and DPT-6 and MW-3, south of the VOC contamination. Heavier PAHs, benzo(a)anthracene and benzo(a)pyrene, were found at concentrations exceeding RSLs at DPT-7, upgradient of MW-3 (**Figure 4-4**). The SVOC contamination at DPT-7 is not contiguous with the naphthalene contaminated groundwater at MW-3 and DPT-6 because no SVOCs were detected in DPT-8. No site-related VOCs or SVOCs have been detected in the pore water from the marsh sediments (or in surface water samples collected during the RI). Cyclohexane was detected in one sediment sample (the most downstream sediment sample collected in the RI) and may be an indication that VOCs have discharged through the sediment in the past.

Metals contamination in the shallow surficial aquifer appears limited to the locations immediately downgradient of the waste material in both the Central AOC (MW-5) and Southern AOC (MW-3).

Contaminants in the deep surficial aquifer are limited to relatively low concentrations (but exceeding tap water RSLs) in DTW-1, DTW-2, and DTW-4. The detections of organic constituents greater than RSLs in deep surficial aquifer are shown on **Figure 4-5**.

There are no organic COPCs or COPECs for pore water. No pattern of contamination is apparent in the isolated detections of carbon disulfide (which can be produced naturally in anaerobic environments). PCE were detected at concentrations below BGTAG screening

levels in pore water east of the northern end of the Southern AOC and BEHP was detected below screening values east of the Southern AOC. Similarly, no strong pattern of metals contamination is present in the pore water. Cadmium was found near the Central AOC (upstream and downstream of the AOC). Mercury was found in the most downstream pore water sample; however, it was not detected in site soil samples during the SFI. In the RI, mercury was detected in surface soil samples from the Southern AOC.

Similar to the pore water, the SFI sediment samples contained few organic COPCs. Carbon disulfide in sediment from SD-18 and carbon tetrachloride from sediment from SD-21 (the most downstream sample) exceeded concentrations of these compounds in the site background samples. Location SD-18 is slightly downstream (south) of the Southern AOC. Carbon disulfide can be produced naturally in areas where anaerobic biodegradation is occurring, such as a marsh, and is not considered to be site-related. Carbon tetrachloride is also not considered to be site-related because it has not been detected in any other media at the Site in either the RI or SFI.

Although no BEHP, a COPEC, was detected in sediment samples collected in the SFI, two RI sediment samples (one from upstream of the Central AOC and one from downstream of the Southern AOC) contained BEHP. Sediment with a dioxin TEQ (ND=0) higher than background concentrations was found in the marsh east of the Central AOC and downstream of the Southern AOC. The highest concentration of dioxin TEQ was found east of the Central AOC.

Metal COPCs include aluminum, arsenic, beryllium, chromium, mercury, nickel, and vanadium. Aluminum, arsenic, chromium, nickel, and vanadium only exceeded the respective maximum background concentrations in sediment from SD-19, located immediately downstream of the discharge point of the drainage ditch that flows east to west, south of the Southern AOC.

Beryllium was detected at concentrations exceeding the maximum detected background value at locations just east, and downstream, of the Southern AOC. There is no BTAG screening level for beryllium. Mercury was detected at concentrations above the background concentrations in locations immediately east of the Southern AOC. None of the detected concentrations exceeded the BTAG screening value. Notably, mercury was not detected in samples from SD-19 and SD-21, downstream of the Southern AOC. In RI sampling, mercury was detected above screening levels in sediment in the drainage ditch that crosses the Southern AOC.

Page Intentionally Left Blank

# 5. Contaminant Fate and Transport and Conceptual Site Model

The RI, with data collected in the SFI, has identified site contaminants and delineated the sources of contamination at the Site. This section presents a discussion of the properties of the site media and physical and chemical properties of the contaminants that influence how the contaminants migrate through the site media to potential exposure points.

## 5.1 Properties of the Site Media Influencing Contaminant Transport

The physical characteristics of the Site are described in more detail in the RI and Section 2 of this SFI report. Characteristics specific to site contaminant transport are summarized below.

### 5.1.1 Topography and Surface Water Runoff

Site topography is generally flat; however, several drainage ditches cross through or near the AOCs. Surface water drains through the ditches and into the marsh and tidal channel immediately east of the AOCs. In addition, some waste material is exposed along the edge of the marsh; surface runoff from the waste material is a potential pathway for contaminants to enter the marsh.

### 5.1.2 Soil and Sediment Chemistry

Soil and sediment chemistry most impacting the persistence and mobility of contaminants include:

- Redox potential (Eh or ORP)
- pH
- Total organic carbon content

Redox potential of the subsurface soil and sediment affects the variety of contaminants present and their mobility or persistence in the environment. Microbial activity, as would be expected in a marsh, would create reducing conditions. The strongly negative ORP readings and generally low dissolved oxygen in the sediment pore water indicate reducing conditions (see **Table 4-12**).

The pH of soils and sediment affects hydrolysis rates, contaminant solubility, and biodegradability rates. Solubility of inorganics generally increases as pH decreases. Biodegradation rates are typically maximized when soil pH is between 5.5 and 8.5 (EPA 1989). The pH of sediments was not directly measured; however, the pH of pore water was in the range of 6 to 8.

High total organic carbon (TOC) content in soil and sediment increases contaminant absorption and hinders the movement of contaminants through the soil. The TOC of sediment, measured in the RI, ranged from 21,500 to 129,000 mg/kg (2.15 to 12.9 percent).

### 5.1.3 Geology and Hydrogeology

The sands underlying the disposed waste do not contain significant clay lenses that would inhibit movement of groundwater. The Columbia clay, though present in the southern part of the Site, is absent under the Central AOC.

The Yorktown clay was found across the Site at a depth of about 70 to 75 feet. At the water supply well, there is a series of clay members (the uppermost is 44 feet thick) between the bottom of the surficial aquifer and the shallowest interval of the well screen (at a depth of 154 feet).

Groundwater flow in the Central AOC is to the northeast and in the area of the Southern AOC is to the north (**Figure 2-6**). The tidal marsh would be expected to be a discharge zone for the surficial aquifer. In the area of Wallops Island, the ocean is the ultimate discharge point for the Yorktown Aquifer. A small percentage of Yorktown Aquifer groundwater will migrate through the confining layers to lower or upper aquifers; the majority of groundwater will flow laterally through the aquifer (USGS 2009).

The groundwater is likely to be tidally influenced; some local changes in the direction of flow would be expected throughout the tidal cycle.

## 5.2 Chemical and Physical Properties of Contaminants

The principal chemical and physical properties that impact the fate and transport of contaminants in the environment include solubility (dissolution), sorption, volatilization, advection, and dispersion as well as degradation processes, such as biodegradation, photolysis, and hydrolysis. These processes are described below.

### 5.2.1 Dissolution

Dissolution is the partitioning of a chemical in the liquid phase. Water solubility is the maximum concentration of a chemical or compound that dissolves in a given amount of pure water at a specific temperature and pH. Highly soluble chemicals are more likely to leach from the soil and waste into the groundwater and from sediment into pore water and surface water and biodegrade. Inorganic contaminants may be found in various forms, such as carbonates and sulfates. These compounds may have a variety of solubilities.

### 5.2.2 Sorption

Sorption is the tendency for contaminants to adsorb to materials in the environment. The amount of sorption that will take place is a function of the chemical properties of the contaminant and the properties of the media through which the contaminant is moving. Many contaminants tend to adsorb to organic carbon; thus, the tendency of a contaminant to adsorb can be indicated by the log of the organic carbon partition coefficient, $K_{oc}$, of that chemical. $K_{oc}$ is the ratio of the adsorbed chemical per unit weight of organic carbon to the aqueous solute concentration.

A low $K_{oc}$ (e.g., 10) suggests there is a weak potential for the chemical to leach into groundwater or surface water, whereas a high $K_{oc}$ (e.g., 10,000) indicates the chemical will strongly adsorb to the available organic carbon. Generally, the stronger a chemical is adsorbed, the lower the water solubility. Log $K_{oc}$ ranges and the ability to adsorb to soil are presented below (Agency for Toxic Substances and Disease Registry 1999).

The tendency of metals to adsorb to environmental media is controlled not only by the organic carbon in the media but also by the pH, the cation exchange capacity of the soils, and other site-specific factors.

| Log $K_{oc}$ | Sorption to soil/sediment |
|---|---|
| <1 | Very weakly sorbed |
| 1 to 2 | Weakly sorbed |
| 2 to 3 | Moderately sorbed |
| 3 to 4 | Moderately to strongly sorbed |
| 4 to 5 | Strongly sorbed |
| >5 | Very strongly sorbed |

As a contaminant moves through an aquifer, it will be slowed by its tendency to sorb and the presence of organic material. The degree to which it is slowed is expressed as a retardation factor, which can be calculated if the $K_{oc}$ is known.

### 5.2.3 Volatilization

Vapor pressure is a relative measure of the volatility of the compound in its pure state and is an important factor in the rate of volatilization from contaminated soils and surface water to the atmosphere. Volatilization rates are also affected by site-specific conditions, such as temperature, wind speed, and soil conditions. Chemicals with a relatively low vapor pressure and a high affinity for soil or water are less likely to vaporize and become airborne than those with a high vapor pressure and low affinity for water and soil.

A related parameter, Henry's law constant, is sometimes referred to as the air-water partition coefficient. It is the ratio of the partial pressure of a compound in air to the concentration of the chemical in water at a given temperature under equilibrium (Montgomery and Welkom 1990). When vapor pressure is high relative to water solubility, Henry's law constant is high, and the chemical volatilizes to air. If the water solubility is high relative to the vapor pressure, Henry's law constant will be low, and the chemical will tend to remain in solution. Some ranges of Henry's law constant and associated volatility are listed below.

| Henry's Law Constant | Volatility |
|---|---|
| $<3\times10^{-7}$ | Non-volatile |
| $3\times10^{-7}$ to $1\times10^{-5}$ | low |
| $1\times10^{-5}$ to $1\times10^{-3}$ | moderate |
| $>1\times10^{-3}$ | high |

### 5.2.4 Advection, Diffusion, and Dispersion

Contaminants that have reached the water table move through an aquifer via advection, diffusion, and dispersion. Advection is the movement of the contaminants with the water as it moves downgradient, forming a contaminant plume. Diffusion is the movement of contaminants in response to concentration gradients. The size of the plume can increase as the water moves through the process of dispersion. The primary mechanism for dispersion is the mechanical mixing of the contaminant as the water flow velocity changes due to variations

in pore size and shape. The effect of dispersion is a dilution in the contaminant concentration away from the source.

### 5.2.5 Biodegradation, Photolysis, Hydrolysis, and Bioaccumulation

These degradation processes transform the contaminants to another chemical.

Biodegradation is the process by which indigenous soil or sediment organisms degrade contaminants to innocuous byproducts, such as carbon dioxide and water. The four requirements for biodegradation to occur include the presence of nutrients, moisture, an electron donor, and a terminal electron acceptor. Nutrients and moisture are generally readily available in the subsurface. Therefore, the presence of electron donors or terminal electron acceptors are generally the limiting factor in biodegradation. Although no site-specific data on these factors are available, numerous studies found in the literature document theoretical and measured half-lives in soils and surface water from which generalizations concerning the tendency of a compound to degrade can be derived.

Photolysis is the process by which chemicals degrade as a result of exposure to sunlight. This process will be insignificant in groundwater but could be more significant when contaminants are discharged to the creeks or other surface water bodies where they can be exposed to sunlight.

Hydrolysis is the reaction of a compound with water resulting in a new chemical species. Hydrolysis reactions are highly pH dependent. In groundwater, these are typically too slow to be significant.

Bioaccumulation is the process by which chemicals can accumulate in an organism when the organism absorbs a substance faster than the rate at which the substance is lost by catabolism and excretion. Through bioaccumulation, contaminants can become a part of the food chain. The log of the *n*-octanol/water coefficient ($K_{ow}$) of a substance has been shown to be related to the bioaccumulation factors (BCFs) in aquatic organisms. Log $K_{ow}$ is unitless. The higher the log $K_{ow,}$ the greater the tendency of a compound to bioaccumualate. The log $K_{ow}$ of some compounds (phenols and acids, for example) are pH dependent. A log $K_{ow}$ less than 3 indicates that the compound is not likely to bioaccumulate; log $K_{ow}$ between 3 and 4 indicates a potential to bioaccumulate and a log $K_{ow}$ greater than 4 indicates the potential to significantly bioaccumulate.

## 5.3 Environmental Fate of COPCs

The various chemical and physical processes described above impact the environmental fate and transport of COPCs to different extents. The COPCs evaluated in the SFI are VOCs, SVOCs, dioxins/furans, and metals. Within each group or class of chemicals, the COPCs are impacted similarly by their chemical and physical properties. The processes that act upon these classes of compounds are discussed below. Those chemical and physical properties that are most important in the fate and transport of organic and inorganic groundwater, soil, pore water, and sediment COPCs are discussed below.

### 5.3.1 Volatile Organic Compounds

Several VOCs are COPCs and COPECs for soil, groundwater, pore water, and sediment at the Site. VOCs are generally highly mobile in the environment and highly volatile (Henry's law

constants in the range of $1.0 \times 10^{-1}$ to $9.0 \times 10^{-3}$). They do not adsorb readily to soils and have low retardation factors in groundwater, with their flow rates approximately equal to that of groundwater. A large portion of most of the VOCs, when originally released to the soil, would be expected to rapidly evaporate due to their high vapor pressure. Then, because these VOCs are moderately to highly soluble in water and do not sorb to soils, the fraction remaining in the soil would readily infiltrate through the unsaturated zone by partitioning between the liquid phase (soil moisture) and the vapor phase and leach into the groundwater. In groundwater, they would be expected to flow downgradient with little retardation. If discharged to surface water, several of these COPCs may volatilize. Some, but not all, may undergo photolysis and biodegradation. Due to their high Henry's law constants, VOCs in soil and groundwater can move from soil surfaces and groundwater into the vapor phase. Once in the vapor phase, VOCs can move through the pore spaces in soil and discharge at the ground surface to the atmosphere. The log $K_{ow}$ of VOC COCs and COPECs are below 4 and would not be expected to bioaccumulate.

The chlorinated solvent COPCs are moderately persistent in the environment. They are resistant to chemical degradation but moderately susceptible to biodegradation under anaerobic conditions. A comparison of the concentration of PCE and cis-1,2-DCE in groundwater from MW-4 in 2007 to the concentration in 2016 is shown in **Table 5-1**. All samples and duplicates are shown on this table. Generally, concentrations of PCE in 2007 (7.9 to 13.9 µg/l) decreased to a range of non-detect to 3.8 J µg/l in 2016. Concentrations of cis-1,2-DCE (a daughter product of dichlorination of PCE and TCE) decreased from 45.4 to 54.5 µg/l in 2007 to a range of non-detect to 22 J µg/l in 2016. Cis-1,2-DCE can be used as a solvent although it has not been used extensively in industry. It is also used as an intermediary in the manufacture of other chemicals. However, the presence of cis-1,2-DCE at concentrations greater than PCE in 2007 may indicate that biodegradation of PCE (a more commonly used solvent and therefore more likely to have been disposed in the waste) had already been occurring for some time prior to 2007. The decrease in cis-1,2-DCE concentrations from 2007 to 2016 indicates that biodegradation continued through that time. Vinyl chloride, a breakdown product of cis-1,2-DCE through anaerobic biodegradation, has not been detected in MW-4.

Petroleum hydrocarbons, such as BTEX components, can be degraded under both aerobic and anaerobic conditions. The rate of degradation for the individual components of BTEX is site-dependent. Although benzene is present in high concentrations in the waste and stained soil areas of the Central AOC, it was only detected at relatively low concentrations (3.7 µg/l) once in MW-5 (May 2007); it was not detected in MW-5 in either 2016 sample. Therefore, a comparison of benzene concentrations through time is not possible. Ethylbenzene, toluene, and total xylene were detected in both 2007 and 2016 in MW-4. Concentrations of ethylbenzene (389 to 548 µg/l in 2007 and 430 to 600 µg/l in 2016) and xylene (1,900 to 3,040 µg/l in 2007 and 2,500 to 3,500 µg/l in 2016) do not indicate a decrease and may be indicative of a slight increase. Concentrations of toluene in MW-4, however, decreased markedly from 1,220 to 1,680 µg/l in 2007 to 540 J to 670 J µg/l in 2016.

Cycloalkanes (cyclohexane and methylcyclohexane) are not easily biodegraded. Concentrations of these compounds in MW-4 stayed the same or increased. Cyclohexane ranged from 128 to 216 µg/l in 2007 and from 180 to 330 µg/l in 2016); methylcyclohexane was found at concentrations of 105 to 180 µg/l in 2007 and from 99 to 210 µg/l in 2016.

The site-related VOC detected in the porewater, PCE, has a log $K_{ow}$ of 3.4 but was detected below the BTAG screening value. The only site-related VOC detected in SFI sediment samples, carbon tetrachloride, has a log $K_{ow}$ of 2.8 and is unlikely to bio accumulate.

### 5.3.2 Semi-volatile Organic Compounds

Several PAHs are site COPCs for soil and groundwater. Typically, PAHs adsorb readily to organic material and fine particles in soil, and most have very low solubility. When released to soil, these compounds will adhere to the soil particles and may be transported through surface runoff to sediment in water bodies. A small percentage may dissolve and percolate to groundwater.

Naphthalene and 2-methylnaphthalene are significantly more soluble than the other PAHs. While most of the PAHs are moderately to strongly adsorbed to organic carbon, naphthalene is moderately adsorbed (Log $K_{oc}$ of 2.74). Similarly, while most of the PAHs have a log $K_{ow}$ greater than 4, indicating a likely tendency to bioaccumulate, naphthalene and 2-methylnaphthalene have log $K_{ow}$s between 3 and 4.

At the Site, high levels of SVOCs, particularly PAHs, were found in soil samples (See TP-11C, TP-12C, TP-24A, and TP-26B). Relatively low levels of dissolved PAHs were found in groundwater samples in some adjacent temporary wells (e.g., DPW-1). In other close-by temporary wells, only the most soluble of PAHs, naphthalene, was found at concentrations above RSLs (e.g., DPW-2, DPW-3, and DPW-4). As would be expected based on their relatively higher solubilities compared to the other SVOCs, naphthalene, 2-methylpahthalene, and 1,1-biphenyl were the only SVOCs that were found in MW-4, downgradient of the Central AOC shallow surficial aquifer groundwater contamination.

The only SVOC detected in SFI sediment samples, the PAH fluoranthene, was found at the SD-16 location, at the discharge point of the drainage feature that runs northeast from the Southern AOC. PAHs were found in surface soil in the Southern AOC during the RI (no surface soil samples were collected in the SFI). Although PAHs are common in soil and sediment in the environment due to industrialization, the presence of a PAH at the surface drainage discharge point (and no other locations) suggests that PAHs adsorbed to soil particles or organic matter in the surface soil of the Southern AOC may have migrated via overland flow of surface runoff during periods of heavy precipitation to the drainage ditch and, subsequently, to the tidal creek.

### 5.3.3 Dioxins/Furans

Dioxin congeners are a COPC for groundwater and a COPEC for sediment. EPA's exposure and human health reassessment of 2,3,7,8-TCDD and related compounds (2003) summarizes important fate and transport properties for dioxins and furans. These properties include water solubility, vapor pressure, octanol/water partition coefficient, organic carbon partition coefficient, and photochemical quantum yield. The values identified by EPA were based on a thorough search of the literature for dioxins and furans.

Dioxins and furans are nearly insoluble in water. The solubilities of individual congeners range from $7.4\times10^{-8}$ mg/l (low end of the range for OCDD) to $4.2\times10^{-4}$ mg/l (tetrachlorodibenzofuran [TCDF]). Because of their non- to low-soluble characteristics, these chemicals bind to soil and do not leach significantly into underlying groundwater.

Dioxins and furans have low vapor pressures, indicating they are not volatile. Average Henry's law constants for dioxin and furan congener groups range from $1.88\times10^{-6}$ (OCDF) to $1.7\times10^{-5}$ (TCDD) atm-$m^3$/mol, which indicates they are unlikely to volatilize from water.

Although average $K_{oc}$ values are not provided by EPA (2003) for all congener groups, the $K_{oc}$ values for dioxins and furans are high, with log ($K_{oc}$) values for OCDD (the congener most frequently detected in site media and detected at the highest concentrations) and OCDF, ranging from 5.92 to 7.90. These high $K_{oc}$ values indicate that dioxins and furans will very strongly adsorb to soil. Dioxin/Furan congeners that are adsorbed to soil particles can be transported via surface runoff and on particles suspended in moving surface water.

Dioxins and furans are extremely stable under most environmental conditions. The only significant transformation processes for dioxins and furans are atmospheric photooxidation and photolysis of species that are not adsorbed to soil. Once adsorbed to soil, dioxins and furans demonstrate no significant leaching or volatilization.

Although no shallow soils were collected and analyzed for dioxins/furans in the RI or SFI, the highest concentrations of dioxin TEQ (ND=0) were found near the discharge of the drainage feature that runs northeast from the Southern AOC (at SD-16). Other elevated dioxin TEQ concentrations were found downgradient of the discharge point of the southern drainage (SD-19 and SD-21). If dioxins/furans were present in the surface soils at the Southern AOC, similar to the migration of SVOCs, dioxins/furans adsorbed to fine soil particles or organic matter could have been washed via overland flow during periods of heavy precipitation to the drainage ditch and into the tidal creek.

The log $K_{ow}$ of both of the most frequently detected congeners of dioxin/furan (OCCD and 1,2,3,4,6,7,8-HpCDD) is greater than 4 and would be expected to bioaccumulate.

### 5.3.4 Metals

Except for total mercury, the metal COPCs and COPECs will not volatilize or biodegrade. Generally, the metals can form hydroxides and oxides of various solubilities, but most also strongly adsorb to clays, iron or other metals, and organic matter. Due to their tendency to adsorb to soil and sediment, these compounds may be transported via surface runoff to sediment and surface water on particles to which they have adsorbed. The transport of these contaminants in sediment will largely be dependent on the movement of the sediment particles to which they are adsorbed.

A variety of factors affects the mobility of metals in the subsurface, including:

- the presence of water (soil moisture content)
- the presence of other complexing chemicals in solution
- the pH and ORP, which affect the speciation of all inorganics and complexing agents
- the temperature
- soil properties, such as cation exchange, the presence of hydrous oxides of iron and magnesium, and the presence of organic matter

Dissolved metals will be transported in groundwater; however, the solubility of inorganics is variable because their solubility is highly dependent upon redox conditions and pH. If these conditions change along a flow path, dissolved metals can transform chemically and precipitate out of solution.

Because of the wide range of soil conditions in the environment and the resulting high variability of certain physical parameters, it is difficult to predict the mobility of inorganics. Soil

sorption constants may vary over several orders of magnitude for a given inorganic in different soils and/or under different environmental conditions. Thus, there is no single sorption constant describing the binding of inorganics in solution to soils, and no one mobility prediction holds for all environmental conditions.

The persistence of metals will depend on the rates of leaching, amount of rainfall, and individual metal properties. Inorganic persistence is complicated by processes, such as precipitation and dissolution, which are dependent upon pH, the presence of certain ions or complexing agents, and concentrations of the inorganics in solution.

The highest concentrations of all the metal COPECs identified in the ERA addendum (Appendix G) were detected in SD-19. It is likely that elevated concentrations of metals at this location are due to adsorption of the metals to soil particles that travel, like SVOCs and dioxins/furans, from the surface soil via overland flow during heavy precipitation to the drainage ditch. Once in the drainage ditch, metals would flow to the tidal creek. Mercury found in surface soil in the Southern AOC in the RI may also have migrated via surface runoff to the sediments of the marsh downgradient of the drainage channel. . Some forms of metals can bioaccumulate.

## 5.4 Conceptual Site Model

The CSM is intended to integrate the different types of information collected during the RI and SFI in order to present a coherent theory of contaminant migration through the various site media. Information includes site history, geology, hydrogeology, fate and transport characteristics of site-related contamination, and natural fate and transport properties that are present and active at the Site.

The CSM is represented graphically on **Figure 5-1.** The CSM figure is not a scale representation of the Site; rather, it depicts the conditions present at the Site and highlights the processes that control migration of COPCs and COPECs.

The site-related sources of the COPCs and COPECs include various waste materials (metal, plastic, glass, and paint and other undetermined pastes); a petroleum fuel, likely JP-5 (based on petroleum fingerprinting analyses done during previous studies); and other petroleum wastes. JP-5 is a kerosene-based jet fuel consisting of a mixture of hydrocarbons. The presence of two or even three source materials for the stained soil is evidenced by the presence of the two, seemingly unconnected, areas of stained soil and different observed patterns of contamination within the areas of stained soil. VOC and SVOC COPCs were both found in TP-11C and TP-11B, TP-24A, and DPT-1 (the northern lobe of staining). Only VOC COPCs (no SVOC COPCs) were detected in TP-13B and TP-13C (the southern lobe of staining), and only SVOCs COPCs (no VOC COPCs) were detected in soil from TP-26 (also in the northern lobe).

The wastes were disposed in low areas along the marsh edge, excavations, or both. Subsequently, the waste was covered with natural materials (sand) and the surface graded. In at least one location, petroleum fuel was disposed or spilled onto the sand fill. Fuel released into the soil (sand fill) will infiltrate downward through the underlying sand fill, waste (if present), and natural sands.

The density of JP-5 is less than water; therefore, when pure fuel encountered the water table, most of the mass would have floated. However, a small percentage would dissolve, releasing BTEX, cyclohexane methylcyclohexane, and other constituents into the shallow surficial aquifer. At the water table, floating fuel would spread laterally. The area of stained soil (fuel contamination) extends and thins to the southwest from the area of apparent discharge (TP-24).

Some of the mass would adsorb to soil particles or fill pore spaces in the unsaturated zone as the water table moved up or down in response to tides, seasonal fluctuations, and longer-term sea level rise.

Contaminants can also enter the groundwater as precipitation infiltrates through the debris waste and petroleum wastes and leach constituents from the waste material or from fuel that is filling pore spaces or adhering to soil particles in the unsaturated zone. Dissolved contaminants may travel with the precipitation to the water table.

In the groundwater, dissolved contaminants would travel through advection, diffusion, and dispersion. Contaminants moving with advection (with groundwater flow) would be expected to move northeast and discharge to the sediment pore water or the tidal channel. However, significant detections of the most mobile of the contaminants, the VOCs, have not been found in the pore water or the surface water, indicating that the contamination is not moving significantly. In addition, concentrations of the least biodegradable of the VOC contaminants, cyclohexane, have remained nearly the same for about 9 years although a slight increase in the concentrations in MW-4 may indicate that an area of higher concentration is migrating toward MW-4.

The low levels of contaminants found in the deep surficial aquifer are most likely present because of diffusion (concentration gradients) or dispersion. Based on the text and figure in Simulation of Groundwater Level and Salinity Changes in the Eastern Shore, Virginia. (USGS 2009), in the area immediately adjacent to the marsh, hydraulic vertical gradients would be expected to be upward; therefore, contaminants in the deep surficial aquifer are not likely to be present due to advection. The presence of toluene in DTW-4 is anomalous as it is not associated with shallow surficial aquifer contamination in the area of DTW-4.

The presence of active biodegradation in the aquifer is indicated by the decrease in cis-1,2-DCE from 2007 to 2016 and the negative ORP, indicating a reducing environment favorable to reductive dichlorination. The concentration of toluene in MW-4 has also decreased significantly, whereas ethylbenzene and xylene concentrations remain the same or slightly increase. In a study of attenuation rates of BTEX components under anaerobic conditions, Bruce et. al (2010) found that attenuation rates for the different components of BTEX varied, but ratios of attenuation rates of the various components to each other remained constant across different sites. Consistent with observations at the CDL, the study found that toluene concentrations attenuate the fastest. The study concluded that attenuation of benzene, ethylbenzene, and xylene were occurring but at slower rates than for toluene. At the Project 15 CDL Site, this means that concentrations of benzene, ethylbenzene, and xylenes that appear stable or increasing likely are indicative of higher concentrations approaching the measuring point (MW-4) and undergoing degradation (i.e., attenuation of benzene,

ethylbenzene, and xylene is occurring at the same rate or slightly slower than the increase in concentrations arriving at MW-4).

The relatively high Henry's law constants of site VOC COPCs indicate that they may volatilize from the groundwater into the soil pore space in the unsaturated zone. Once in the soil pore space, VOCs can migrate upward through the soil and discharge to the atmosphere at the ground surface.

SVOCs do not biodegrade as easily as VOCs and generally have lower solubility and higher $K_{ow}$ than VOCs. SVOCs released to the environment will be less likely to dissolve and will tend to adsorb to organic material and soil particles. Generally, the high levels of SVOCs, particularly PAHs found in soil samples in the Central AOC, were only found in groundwater immediately adjacent to the contaminated soils. Only the most soluble (naphthalene, 2-methylpahthalene, and 1,1-biphenyl) were detected in the downgradient monitoring well (MW-4). SVOCs dissolved in groundwater and discharged to the marsh would be expected to adsorb to the high TOC content marsh sediments. The three SVOCs detected in elevated concentrations in MW-4 were not detected in SFI marsh sediment or pore water samples. It is likely that SVOCs in dissolved groundwater are adsorbed to organic material or fine soil particles in the marsh sediments before they reach the shallow pore water.

SVOCs, dioxins/furans, and metals tend to adsorb to fine-grained soil and organic material. Contaminants adsorbed to soil particles on the ground surface can mobilize via surface water runoff from contaminated areas to low lying areas. Thus, contaminants can move from exposed waste and contaminated soil via surface runoff to the marsh. This mechanism for the migration of contaminants is present at the Site as evidenced by the highest concentrations of dioxins/furans and COPEC metals in sediment at, or downgradient of, the discharge points of site drainage ditches. The only PAH found in sediment (fluoranthene) was also found at the discharge point of a drainage ditch (SD-16). Some of these organic and inorganic contaminants have the potential to bioaccumulate.

If contaminated soil particles reach the surface water of the tidal channel, they would move with the direction of flow in the channel until settling through the water column. The water flow in the channel adjacent to the Site is tidal; thus, it reverses direction twice per day.

The Site is located in a low-lying coastal area immediately adjacent to tidal surface water. The waste, in some areas is visible at the water's edge. These wastes, as well as contaminated soil, are susceptible to erosion from storm events, wind, and tides. Waste and contaminated soil particles eroded from the eastern edge of wastes can be expected to flow suspended in ebbing tides and receding storm water. These particles can become entrained in the marsh vegetation and settle out in the marsh sediment.

In addition, future sea level rise will potentially increase the amount of waste that is submerged, as well as the height of waves impacting the shoreline. Flooding and storm runoff could also erode and mobilize petroleum-contaminated soil from areas where petroleum products were discharged at the surface. Contaminated soil particles suspended during flooding may be deposited in the marsh or could travel, suspended, along the drainage channels to the creek channel.

# 6. Summary of Risk Assessment Addenda

## 6.1 Human Health Risk Assessment Addendum Summary

The Revised HHRA presents a site-specific, quantitative analysis of the Site under current and future land use scenarios based on the nature of the chemicals of potential concern (COPC) detected in environmental media, potential exposure pathways to human receptors, and the degree to which these exposures may pose adverse health effects. The Revised HHRA uses all historical data (collected in 2007 for the Remedial Investigation [RI]) and recently collected Site data (collected in between May 2015 and November 2017 for the SFI), which includes soil, sediment, surface water, and groundwater data. Results of the Revised HHRA will be used to assess potential risk to site receptors.

A quantitative HHRA was completed at the Site to evaluate risks to human health potentially posed by COPCs in the affected media beneath and within the vicinity of the Site that cannot be eliminated using screening criteria. The Revised HHRA is compliant with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) process, as amended by the Superfund Amendments and Reauthorization Act of 1986, and the Virginia Department of Environmental Quality (VDEQ) risk assessment guidance. The HHRA also follows the U.S. Environmental Protection Agency (EPA) “Risk Assessment Guidance for Superfund (RAGS)” Part A (1989) and subsequent RAGS guidance, which stipulates that a risk assessment addresses the following major steps:

- Data Evaluation: A description of the data handling of each exposure medium and the exposure areas evaluated in the HHRA.
- Identification of COPCs: An identification of the COPCs for each exposure medium regarding human health effects.
- Exposure Assessment: An identification of the human receptors and the potential extent of their exposure to site-related COPCs in affected media.
- Toxicity Assessment: A description of the relationship between the magnitude of exposure (intake, dermally absorbed dose [DAD], or exposure concentration [EC]) and the incidence of adverse health effects associated with the identified COPCs.
- Risk Characterization: A description of the nature and magnitude of potential human health risks, comparison to state and federal target risk levels, and discussion of the uncertainties associated with the risk evaluation.

The Revised HHRA addressed the following exposure media: surface soil (0 to 2 feet below ground surface [bgs]), subsurface soil (2  feet bgs and greater), groundwater (from wells located downgradient of the CDL Site and from upgradient potable well TOC well 06), sediment, and surface water from the adjacent Little Mosquito Creek. Future excavation activities could result in the subsurface soil being brought to the surface and “mixed” together. Therefore, a total soil data set (surface and subsurface data combined) was derived for the surface soil and/or subsurface soil COPCs, assuming future land re-development occurs. Based on the historical aerial photographic analysis (U.S. Army Topographic Engineering Center 2000), four areas of concern (AOCs) within the CDL Site were defined and named with respect to their geographic position to each other: Northern, Central, Southern, and Western AOCs. For the Revised HHRA, soil media was divided

into two different exposure areas: Central/Southern (C/S) and Northern/ Western (N/W). The Western and Northern AOCs were evaluated together because site investigations did not indicate the presence of buried waste. The Central and Southern AOCs were evaluated together because the buried waste was present as observed during site investigations.

The following potential current and future land use scenarios and exposure pathways were addressed in the Revised HHRA:

Current/future outdoor maintenance worker: direct contact with the surface soil (current) and total soil (future) media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors), inhalation of vapors migrating from groundwater to outdoor air, and incidental ingestion and dermal contact with sediment in the upgradient drainage area.

Current/future teen trespasser: direct contact with the surface soil (current) and total soil (future) media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors), incidental ingestion and dermal contact with surface water, and incidental ingestion and dermal contact with sediment. Even though the teen trespasser may go fishing or crabbing, the consumption of fish or crab tissue is likely to be infrequent and is not evaluated in this revised HHRA. The consumption of fish and crab tissue exposure pathway is evaluated under the outdoor recreator (child/adult) scenario and is considered protective of the teen trespasser.

Current/future outdoor recreator (child/adult): direct contact with the surface soil (current) and total soil (future) media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors), incidental ingestion and dermal contact with surface water, ingestion of fish in surface water, incidental ingestion and dermal contact with sediment, and ingestion of Blue Crab in sediment.

Future indoor/outdoor commercial worker: direct contact with the total soil media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors), and inhalation of vapors migrating from groundwater to outdoor air, and vapor intrusion (VI) to indoor air.

Future construction worker: direct contact with the total soil media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors) and direct contact with the groundwater media (i.e., incidental ingestion, dermal contact and inhalation of vapors in a trench).

Future hypothetical resident (child/adult): for the soil exposure areas, the following exposure pathways are evaluated - direct contact with the surface soil (current) and total soil (future) media (i.e., incidental ingestion, dermal contact, and inhalation of wind-blown dust and vapors), and inhalation of vapors migrating from groundwater to outdoor air. For the site-wide exposure area, the following surficial groundwater aquifer exposure pathways are evaluated - direct contact with the groundwater media (i.e., incidental ingestion, dermal contact and inhalation of vapors while showering or bathing), inhalation of vapors migrating from groundwater to outdoor air, and VI to indoor air.

Off-site current/future resident (child/adult): direct contact with the groundwater media from the Yorktown Aquifer (i.e., incidental ingestion, dermal contact and inhalation of vapors while showering or bathing). The VI exposure pathway is not evaluated for the Yorktown Aquifer due to its deep depth (roughly 154 feet bgs).

Various state and federal regulatory agencies mandate target or "acceptable" carcinogenic risk and noncarcinogenic hazard levels. The VDEQ regulations establish a target cumulative risk level (i.e., from all pathways for a single receptor group) of $1\times10^{-4}$ (1E-04) for potential excess lifetime cancer risk (ELCR). The EPA identifies the acceptable cancer risk range to be $1\times10^{-4}$ to $1\times10^{-6}$ (1E-04 to 1E-06). In effect, estimated ELCR that are less than $1\times10^{-6}$ (1E-06) are generally considered negligible. Potential ELCR in the intermediate range between $1\times10^{-4}$ to $1\times10^{-6}$ (1E-04 to 1E-06) can be considered acceptable on a case-by-case basis. The cancer risk of $1\times10^{-6}$ is used as the risk goal for individual carcinogens, with a not-to-exceed ELCR of $1\times10^{-4}$ for all carcinogens. Both the VDEQ and EPA accept a cumulative noncarcinogenic hazard target level, or Hazard Index (HI), of 1. When an HI is above 1 for a receptor, the chemical non-hazard hazard quotients (HQs) are segregated based on the target organ endpoint, and separate target organ-specific HIs are calculated. Only chemicals that act upon the same target organ are expected to be additive.

For each exposure scenario (i.e., receptor and exposure area) with a potential ELCR/HI above the EPA target levels, chemicals of concern (COCs) were identified as COPCs that contributed to the cumulative ELCR to exceed 1E-04 and/or the target organ endpoint HI to exceed 1, at one significant figure.

The Revised HHRA evaluated reasonable maximum exposure (RME) and central tendency exposure (CTE) for each receptor. The RME scenario is intended to assess the highest exposure that is reasonably expected to occur at a site. The CTE scenario refers to individuals who have average or typical intake of exposure media.

**Tables 6-1 and 6-2** summarize the RME and CTE cancer and non-cancer hazard results, respectively. **Table 6-3** presents the carcinogenic COCs that are contributing to unacceptable ELCR results for each receptor and exposure area. **Table 6-4** presents the noncarcinogenic COCs that are contributing to unacceptable target organ-specific HI results for each receptor and exposure area. The RME and CTE results for the Upgradient Drainage and Downgradient/Estuarine exposure areas are below the EPA cumulative ELCR and HI target levels and are eliminated from further evaluation in the Revised HHRA. The carcinogenic and/or noncarcinogenic results for some receptors at the Central/Southern, and Northern/Western exposure areas either equaled or were above EPA target cumulative levels and are discussed further below.

**Central/Southern Exposure Area Cancer Risk Results:**

As shown in **Table 6-3**, the Central/Southern exposure area RME carcinogenic COCs for the current and future lifetime outdoor recreator, future indoor/outdoor commercial worker, and future hypothetical resident scenarios are primarily metals (arsenic and chromium); PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and naphthalene); dioxins and furans (i.e., 2,3,7,8-TCDD TEQ); and VOCs (1,1,2-trichloroethane, 1,2-dichloroethane, benzene, chloroform, ethylbenzene, and

trichloroethene) in groundwater and surface and total soil. These results assume that groundwater is used for potable purposes even though the surficial aquifer is not used as an on-site water supply. An Environmental Covenant is not in place to prohibit future potable use of the on-site groundwater.

The Central/Southern exposure area RME and CTE evaluation indicates that the cumulative ELCR results drop from 6E-04 to 1E-04, respectively, for the current lifetime outdoor recreator scenario (**Tables 6-1 and 6-2**). As shown in **Table 6-3**, the RME evaluation identified metals (arsenic and chromium), PAHs (benzo(a)pyrene and dibenz(a,h)anthracene), and dioxins and furans (2,3,7,8-TCDD TEQ) as soil COCs. However, only chromium in surface soil remains as a COC in the CTE evaluation.

The future lifetime outdoor recreator scenario cumulative RME ELCR results are 3E-04 with the addition of VOC 1,1,2-trichloroethane and PAHs (benzo(a)anthracene, benzo(b)fluoranthene, and indeno(1,2,3-cd)pyrene) as soil COCs, but the ELCR drops below the EPA cumulative target ELCR of 1E-04 in the CTE evaluation.

For the future indoor/outdoor commercial worker scenario, the RME evaluation identified metals (arsenic and chromium); PAHs (benzo(a)pyrene and naphthalene); and VOC 1,1,2-trichloroethane as soil COCs. For groundwater, VOCs (1,2-dichloroethane, benzene, and ethylbenzene) were identified as VI COCs. The cumulative RME ELCR results drop from 4E-04 to below the EPA cumulative target ELCR of 1E-04 with 6E-05 in the CTE evaluation (i.e., no soil or groundwater COCs).

For the future lifetime resident scenario, the RME evaluation identified metals (arsenic and chromium); PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and naphthalene); dioxins and furans (2,3,7,8-TCDD TEQ); and VOCs (benzene,1,2-dichloroethane, ethylbenzene, 1,1,2-trichloroethane, and trichloroethene) as soil and/or groundwater COCs. The cumulative RME ELCR results drop from 3E-03 to CTE ELCR of 2E-03; the VOCs 1,1,2-trichloroethane and trichloroethene, and PAH dibenz(a,h)anthracene are no longer identified as carcinogenic COCs for soil in the CTE evaluation.

**Central/Southern Exposure Area Non-Cancer Hazard Results:**

As shown in **Table 6-4**, the Central/Southern exposure area RME noncarcinogenic COCs for the future outdoor worker, child outdoor recreator, indoor/outdoor commercial worker, and child and adult resident are primarily metals (aluminum, antimony, arsenic, beryllium, copper, cobalt, iron, manganese, mercury, nickel, thallium, and vanadium); PAHs (benzo(a)pyrene, 2-methylnaphthalene, and naphthalene); and VOCs (benzene, 1,1'-biphenyl, 1,1,2-trichloroethane, 1,2-dichloroethane, 2-hexanone, cis-1,2-dichloroethene, cyclohexane, ethylbenzene, isopropylbenzene, tetrachloroethene, trichloroethene, toluene, and xylenes).

The future outdoor worker cumulative HI is 3 for both the RME and CTE results (**Tables 6-1 and 6-2**) due to inhalation of 1,1,2-trichloroethane vapors in total soil.

The current and future child outdoor recreator RME cumulative HI results were above the target HI of 1 due to direct contact with antimony, copper, iron, and nickel in soils. The CTE cumulative HI results for the child outdoor recreator drop below the EPA cumulative target HI of 1 and metals are no longer identified as noncarcinogenic soil COCs.

The future indoor/outdoor commercial worker RME cumulative HI of 11 drops to 5 for the CTE cumulative HI; however, both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified benzene, naphthalene, toluene, trichloroethene, and xylenes as groundwater VI COCs and 1,1,2-trichloroethane was identified as an inhalation of vapors from soil COC. Trichloroethene and toluene drop out as groundwater COCs for the CTE evaluation.

The future construction worker RME cumulative HI of 16 drops to 7 for the CTE cumulative HI; however, both results remain above the EPA cumulative target HI of 1. The RME evaluation identified benzene, isopropylbenzene, mercury, naphthalene, toluene, and xylenes as groundwater COCs; 1,1,2-trichloroethane was identified as an inhalation of vapors from soil COC. However, 1,1,2-trichloroethane, toluene, manganese, mercury, and xylenes drop out as COCs for the CTE evaluation.

The future child resident RME cumulative HI of 75 drops to 42 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified the following COCs in soil and/or groundwater (**Table 6-4**): metals (aluminum, arsenic, cadmium, cobalt, copper, iron, manganese, mercury, thallium, and vanadium); PAHs (2-methylnaphthalene, benzo(a)pyrene, and naphthalene); dioxins and furans (2,3,7,8-TCDD TEQ); and VOCs (1,1,2-trichloroethane, 1,1'-biphenyl,1,2-dichloroethane, cis-1,2-dichloroethene, cyclohexane, ethylbenzene, isopropylbenzene, tetrachloroethene, toluene, trichloroethene, and xylenes). However, 1,1'-biphenyl, cis-1,2-dichloroethene, cadmium, cobalt, isopropylbenzene, 2,3,7,8-TCDD TEQ, and vanadium drop out as COCs for the CTE evaluation.

The future adult resident RME cumulative HI of 57 drops to 43 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified similar COCs as the child resident (**Table 6-4**). However, 1,1'-biphenyl, 2-methylnaphthalene, cis-1,2-dichloroethene drop out as groundwater COCs for the CTE evaluation. Even though the future child resident tends to be the more sensitive non-cancer receptor for the residential scenario, the inhalation of indoor air via VI and showering exposure pathways are contributing to the higher future adult resident RME and CTE cumulative HI results. The future child resident is not evaluated for the showering exposure pathway. As shown in **Table 6-4**, benzene and xylenes have high chemical-specific hazard quotients for the future adult resident inhalation indoor air (VI and showering) exposure pathways.

The lead evaluation using EPA's Integrated Exposure Uptake Biokinetic (IEUBK) and Adult Lead Methodology (ALM) models identified lead as a COC for surface soil and total soil for the Central/Southern exposure area. The future outdoor maintenance worker, teen trespasser, construction worker results were above the 5% probability percent threshold for total soil indicating these receptors have greater than 5% chance of having PbB levels over 5 µg/dL. The future child resident results were also above the 5% probability thresholds for surface and total soil. Therefore, potential soil cleanup options need to be explored to prevent potential adverse effects to human health from exposure to lead in soil.

**Northern/Western Exposure Area Cancer Risk Results:**

As shown in **Table 6-3**, the Northern/Western exposure area RME carcinogenic COCs for lifetime resident are primarily metals (arsenic and chromium), PAHs (benzo(a)anthracene,

benzo(a)pyrene, and naphthalene), VOCs (1,2-dichloroethane, benzene, chloroform, ethylbenzene, and trichloroethene), and dioxins and furans (2,3,7,8-TCDD TEQ). These results assume that groundwater is used for potable purposes even though the surficial aquifer is not used as an on-site water supply. An Environmental Covenant is not in place to prohibit future potable use of the on-site groundwater.

For the future indoor/outdoor commercial worker scenario, the RME evaluation identified PAH naphthalene and VOCs (1,2-dichloroethane, benzene, ethylbenzene) as groundwater VI COCs. Also, chromium was identified as a direct contact with total soil COC. The cumulative RME ELCR results drop from 4E-04 to below the EPA cumulative target ELCR of 1E-04 with 6E-05 in the CTE evaluation (i.e., no soil or groundwater COCs).

For the future lifetime resident scenario, the RME evaluation identified the metal (arsenic); PAHs (benzo(a)pyrene and naphthalene); dioxins and furans (2,3,7,8-TCDD TEQ); and VOCs (benzene,1,2-dichloroethane, and trichloroethene) as groundwater COCs. Chromium was identified as a RME total soil COC. The cumulative RME ELCR results drop from 3E-03 to a CTE ELCR of 2E-03 which is still above the EPA cumulative target ELCR of 1E-04. The CTE evaluation identified the same carcinogenic COCs as the RME evaluation.

**Northern/Western Exposure Area Non-Cancer Hazard Results:**

As shown in **Table 6-4**, the Northern/Western exposure area RME noncarcinogenic COCs for the indoor/outdoor commercial worker, construction worker, and child and adult resident are metals (aluminum, arsenic, beryllium, cobalt, iron, manganese, mercury, thallium, and vanadium); PAHs (2-methylnaphthalene and naphthalene); VOCs (benzene, 1,1'-biphenyl, 1,2-dichloroethane, cis-1,2-dichloroethene, cyclohexane, ethylbenzene, isopropylbenzene, tetrachloroethene, trichloroethene, toluene, and xylenes); and dioxins and furans (2,3,7,8-TCDD TEQ).

The future indoor/outdoor commercial worker RME cumulative HI of 7 drops to 4 for the CTE cumulative HI; however, both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified VOCs benzene, naphthalene, toluene, trichloroethene, and xylenes as groundwater VI COCs. However, trichloroethene, naphthalene and toluene drop out as groundwater COCs for the CTE evaluation.

The future construction worker RME cumulative HI of 11 drops to 6 for the CTE cumulative HI; however, both results remain above the EPA cumulative target HI of 1. The RME evaluation identified the metal mercury, PAH naphthalene, and VOCs (benzene, isopropylbenzene, toluene, and xylenes) as groundwater COCs. However, isopropylbenzene, toluene, mercury, and xylenes drop out as groundwater COCs for the CTE evaluation.

The future child resident RME cumulative HI of 54 drops to 38 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified the following groundwater COCs (**Table 6-4**): metals (aluminum, arsenic, beryllium, cobalt, iron, manganese, mercury, thallium, and vanadium); PAHs (2-methylnaphthalene, benzo(a)pyrene, and naphthalene); dioxins and furans (2,3,7,8-TCDD TEQ); and VOCs (1,1'-biphenyl,1,2-dichloroethane, cis-1,2-dichloroethene, cyclohexane, ethylbenzene, isopropylbenzene, tetrachloroethene, toluene, trichloroethene, and xylenes). However, beryllium, 1,1'-biphenyl, cis-1,2-dichloroethene, cobalt, iron, isopropylbenzene, 2,3,7,8-TCDD TEQ, and vanadium drop out as groundwater COCs for the CTE evaluation.

The future adult resident RME cumulative HI of 45 drops to 42 for the CTE cumulative HI; both sets of results remain above the EPA cumulative target HI of 1. The RME evaluation identified similar COCs as the future child resident (**Table 6-4**). However, 1,1'-biphenyl, 2-methylnaphthalene, cis-1,2-dichloroethene drop out as groundwater COCs for the CTE evaluation. Even though the child resident tends to be the more sensitive non-cancer receptor for the residential scenario, the inhalation of indoor air via VI and showering exposure pathways are contributing to the higher adult resident cumulative HI results. The future child resident is not evaluated for the showering exposure pathway. As shown in **Table 6-4**, benzene and xylenes have high chemical-specific hazard quotients for the future adult resident inhalation indoor air (VI and showering) exposure pathways.

In conclusion, the HHRA results indicated that the receptors evaluated for the Upgradient Drainage and Downgradient/Estuarine exposure areas have cumulative ELCR and HI results below the EPA target levels and are eliminated from further evaluation.

The HHRA results indicate that unacceptable risk is possible for the following exposure areas and human receptors:

- Central/Southern exposure area – Future outdoor worker, current/future outdoor recreator (adult/child) exposure to surface and total soil; indoor/outdoor commercial worker exposure to surface and total soil and indoor vapors (VI) from surficial groundwater; future construction worker exposure to total soil, and outdoor vapors (trench) from surficial groundwater; and future hypothetical resident (child/adult) exposure to total soil and surficial groundwater (potable use, VI, and showering/bathing).
- Northern/Western – indoor/outdoor commercial worker exposure to indoor vapors (VI) from surficial groundwater; construction worker exposure to outdoor vapors (trench) from surficial groundwater; future hypothetical resident (child/adult) exposure to surficial groundwater (potable use, VI, and showering/bathing)
- Lead modeling results for the southern portion the Central/Southern exposure area indicate that the future outdoor maintenance worker, teen trespasser, and construction worker results were above the 5% probability percent threshold for total soil indicating these receptors have a greater than 5% chance of having PbB levels over 5 µg/dL. The hypothetical child resident results were also above the 5% probability thresholds for surface and total soil. Adverse health effects from exposure to lead in soil are possible.

The Revised HHRA conservatively assumed that total chromium concentrations were hexavalent chromium because chromium speciation data were not available. Hexavalent chromium is the more toxic form of chromium to human receptors. Chromium is a polyvalent element and can exist in several distinct oxidation states, but only trivalent chromium and hexavalent chromium occur with any frequency in the natural environment. Therefore, chromium cancer risk results may be overestimated.

As noted in **Tables 6-3 and 6-4**, the results of the Background Threshold Values Report (BTV Report) evaluation were incorporated in the HHRA and indicate that after COCs below BTVs are excluded it would not cause the risk results to drop below the cumulative target cancer risk level of 1E-04 or target HI of 1 for receptors that are already exceeding.

## 6.2 Ecological Risk Assessment Addendum Summary

The primary purpose of the ERA is to identify constituents of potential ecological concern (COPECs) and assess the need and the level of effort necessary to perform further evaluation of the current and future Site risk. The ERA fulfills this purpose by: (1) identifying potential ecological receptors and habitats at the Site; (2) determining which pathways are potentially complete; (3) evaluating if constituents of interest (COIs) present within complete exposure pathways have the potential to pose significant environmental risk; and (4) to determine if this potential for risk warrants additional ecological risk characterization.

The ERA was conducted in accordance with the following federal guidance:

- United States Environmental Protection Agency (USEPA). 1997. *Ecological Risk Assessment Guidance for Superfund* (ERAGS).
- USEPA. 2001. *The Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments.*
- USEPA. 2015a. *EPA Region 3 BTAG – Frequently Asked Questions.* September.
- USEPA. 2018. *Region 4 Ecological Risk Assessment Supplemental Guidance*.

Potential ecological exposure was evaluated under current conditions using recent analytical data collected in relevant exposure media (i.e., surface soil, sediment, surface water, and pore water). Exposures were evaluated for four source areas of concern (AOCs) and several nearby wetland areas potentially impacted by overland flow and groundwater to surface discharge.

The scope of this ERA report includes Steps 1 and 2 of the 8-step ERAGS process (also referred to as a Screening Level Ecological Risk Assessment [SLERA]). Steps 1 and 2 were used to identify COPECs in potentially affected environmental media to support a scientific management decision point (SMDP) regarding the need for further risk characterization and/or remediation. The list of COPECs was refined consistent with the initial stage of a Baseline Ecological Risk Assessment (BERA) Step 3 (referred to as Step 3a COPEC Refinement) to reduce uncertainty in the SLERA Step 1 and 2 conclusions and to refine the recommendations presented in the report by applying more realistic exposure assumptions.

Guided by an ecological conceptual site model (ECSM), a conservative screening evaluation was conducted to assess potential risks related in surface soil (soil macroinvertebrates and terrestrial wildlife) and sediment/surface water/pore water (benthic macroinvertebrates and aquatic/semi-aquatic wildlife). If COIs were detected above wildlife-specific benchmarks, dose rate models (DRMs) were prepared to assess potential adverse effects to selected ecological receptors from incidental and dietary ingestion.

After Step 2 of the SLERA, the results of the risk characterization determined the following SMDPs:

- The information is not adequate to a make a decision at this point and the ecological risk assessment continued to Step 3.
    - All Soil AOCs

        - Surface Soil – results of the direct contact evaluation and wildlife DRMs have indicated potential adverse effects for soil macroinvertebrates and wildlife.
    - Upgradient Drainage
        - Sediment – results of the direct contact evaluation and wildlife DRMs have indicated potential adverse effects for benthic macroinvertebrates and wildlife.
    - Downgradient Estuarine
        - Sediment/Surface Water/Pore Water – results of the direct contact evaluation and wildlife DRMs have indicated potential adverse effects for benthic macroinvertebrates and wildlife.
    - **Table 6-5** includes a summary of COPECs retained for the Step 3a COPEC Refinement within the BERA.

During BERA Step 3a, refinements were made to reduce uncertainty in both the direct contact evaluation and wildlife DRMs. The results for the refined direct contact evaluation (**Table 6-6 and 6-7)** and wildlife DRMs (**Table 6-8**) are summarized below. The results of the SLERA, BERA Step 3a COPEC refinement, and consideration of the uncertainties present in the evaluation support the following SMDPs for WFF:

- "There is adequate information to conclude that ecological risks are negligible and therefore no need for remediation on the basis of ecological risk" (USEPA, 1997)
    - Northern AOC: soil macroinvertebrates and terrestrial wildlife
    - Western AOC: soil macroinvertebrates and terrestrial wildlife
    - Upgradient Drainage: benthic macroinvertebrates and aquatic/semi-aquatic wildlife
- The information indicates a potential for adverse ecological effects
    - Central AOC: soil macroinvertebrates and terrestrial wildlife
    - Southern AOC: soil macroinvertebrates and terrestrial wildlife
    - Downgradient Estuarine: benthic macroinvertebrates and aquatic/semi-aquatic wildlife
        - Impacts to sediment greatest within exposure area – adverse population-level effects to ecological receptors via surface water and pore water are unlikely.

Page Intentionally Left Blank

# 7. Conclusions

The SFI was performed to collect information and analytical data to allow a refinement of the remedial alternatives presented in the draft FS (Versar 2012). The primary objectives of the field investigation were:

- To determine if the lower part of the surficial aquifer was contaminated and, if so, determine if the upper Yorktown Aquifer was contaminated
- Refine the extent of the waste material at the CDL

The initial field investigation determined that dioxin congeners were present in site soil and groundwater. EPA, VDEQ, NASA and USACE determined that additional sediment samples, as well as pore water samples, should be collected to further refine the areas of sediment contamination and update the ERA to determine if additional COPECs were present. Similarly, an HHRA addendum was developed to evaluate the presence of additional COPCs and the additional risk posed to future receptors based on the additional COPCs or recent toxicity values.

The objectives of the SFI have been achieved, and the data collected will be used to complete the FS.

Although not a specific objective of the SFI, the extensive information and analytical data collected allows a refinement of the CSM.

**Vertical Extent of Groundwater Contamination**

To identify the areas of the lower surficial aquifer most likely to be contaminated, trenches were excavated, and soil from the trenches was sampled and analyzed to identify areas of heavy soil contamination. Shallow surficial aquifer temporary wells were installed and sampled in areas of heaviest soil contamination. Deep temporary wells were installed in areas where heaviest contamination was found in the shallow surficial aquifer as well as between those areas and the upper Yorktown Aquifer water supply well TOC-06.

The contamination found in the shallow parts of the surficial aquifer extends to greater depths, but is contained within the surficial aquifer. Analyses of deep surficial aquifer groundwater identified relatively low contaminant concentrations (but exceeding tap water RSLs) in DTW-1 (naphthalene), DTW-2 (dioxin TEQ and carbon disulfide), and DTW-4 (toluene). Nickel in DTW-1 was the only metal to exceed site-specific background concentrations. No detected constituents in the upper Yorktown Aquifer groundwater (TOC-06) were present at concentrations exceeding EPA RSLs or MCLs. Dioxin TEQ, based solely on detection limits (i.e., there were no dioxin or furan congeners detected; therefore, a concentration of 0.5 times the detection limit was used to calculate TEQ), exceeded the RSL.

The relatively low-concentration contamination in the deeper part of the surficial aquifer is not reaching the Yorktown Aquifer. The upper Yorktown clay that separates the surficial aquifer from the Yorktown Aquifer, and likely the upward vertical hydraulic gradients, are retarding or preventing the migration of contaminants from the surficial aquifer to the Yorktown Aquifer.

## Extent of Waste

Delineation of waste was not a primary objective of the SFI, however, in addition to identifying the areas of heaviest soil contamination, trenching and soil borings were used to delineate the edge of observed waste and document the types of debris and sources of contaminants present at the Site. There are two areas of waste: one in the Central AOC and one in the Southern AOC. In these areas, debris is generally buried under clean fill. However, along the edge of the marsh, including the area between the AOCs, waste is observed near the surface. In the Southern AOC the southern extent of waste was delineated in trench TP-27 and DPT-7 and the western extent by TP-16 TP-17.

In addition to waste, observations and soil analytical data allow the delineation of areas of petroleum-stained sand that are sources of groundwater contamination. The location, depth, and thickness of waste and zones of stained sand were used as inputs to a 3-D model. The model extrapolated the extent of both the waste and stained sand, although the western extent of stained sand is not well-defined with field observations. The 3-D model was used to calculate the volume of waste debris (7,450 cubic yards) and the volume of stained sand (8,065 cubic yards).

Generally, the stained sand was found in a zone near the water table, indicating that the disposed liquid was a light nonaqueous phase liquid that may have floated near the water table when first disposed. Previous work at the Site has identified the source of some staining as jet fuel JP-5; JP-5 has a density lighter than water. However, there are likely multiple fuels disposed at the Site as some areas of staining contain VOCs, some contain predominantly SVOCs, and some contain both VOCs and SVOCs. In addition, there are two separate areas of stained sand. No pure nonaqueous phase liquid was observed in the field. At one location, the zone of staining extended several feet above the water table, almost to ground surface, indicating that the liquid had been disposed at the ground surface. The ground surface was later graded with fill.

## HHRA Addendum

The HHRA Addendum (Appendix F of this SFI report) indicates that the receptors evaluated for the Northern/Western, Upgradient Drainage, and Downgradient/Estuarine exposure areas have cumulative ELCR and HI results below the EPA target levels and are eliminated from further evaluation.

The HHRA results indicate that unacceptable risk is possible for the following exposure areas and human receptors:

- Central/Southern exposure area - Future outdoor worker, current/future outdoor recreator (adult/child) exposure to surface and total soil; indoor/outdoor commercial worker exposure to surface and total soil and indoor vapors (VI) from surficial groundwater; construction worker exposure to surface and total soil, and outdoor vapors (trench) from surficial groundwater; and future hypothetical resident (child/adult) exposure to surface and total soil and surficial groundwater (potable use, VI, and showering/bathing).

- Northern/Western - indoor/outdoor commercial worker exposure to indoor vapors (VI) from surficial groundwater; construction worker exposure to outdoor vapors (trench) from surficial groundwater; future hypothetical resident (child/adult) exposure to surficial groundwater (potable use, VI, and showering/bathing)
- Lead modeling results for the southern portion the Central/Southern exposure area indicate that the future outdoor maintenance worker, teen trespasser, and construction worker results were above the 5% probability percent threshold for total soil indicating these receptors have a greater than 5% chance of having PbB levels over 5 µg/dL. The hypothetical child resident results were also above the 5% probability thresholds for surface and total soil. Adverse health effects from exposure to lead in soil are possible.

Once the background study for WFF is completed, the metals and PAHs will be re-evaluated to determine whether the concentrations are attributed to background/anthropogenic conditions or from site-related activities. Also, the Revised HHRA conservatively assumed that total chromium concentrations were hexavalent chromium because chromium speciation data were not available. Hexavalent chromium is the more toxic form of chromium to human receptors. Chromium is a polyvalent element and can exist in several distinct oxidation states, but only trivalent chromium and hexavalent chromium occur with any frequency in the natural environment. Chromium cancer risk results may be overestimated.

The COCs identified in the Revised HHRA will remain preliminary until the background study for WFF is completed and stakeholders have reviewed the risk assessment reports for the Site and are in agreement with the human health COCs.

**ERA Addendum**

The overall objective of this ERA is to determine whether potentially adverse ecological effects are occurring, or may occur, due to Site-related constituents in relevant media. Potential for risks were evaluated by screening in a SLERA framework that identified a limited number of COPECs. The evaluations for these COPECs were further refined in the context of BERA Step 3a of the ERAGS.

The results of the SLERA, BERA Step 3a COPEC refinement, and the consideration of the uncertainties present in the evaluation support the following conclusions:

- “There is adequate information to conclude that ecological risks are negligible and therefore no need for remediation on the basis of ecological risk” (USEPA, 1997)
    - Northern AOC: soil macroinvertebrates and terrestrial wildlife
    - Western AOC: soil macroinvertebrates and terrestrial wildlife
    - Upgradient Drainage: benthic macroinvertebrates and aquatic/semi-aquatic wildlife
- The information indicates a potential for adverse ecological effects
    - Central AOC: soil macroinvertebrates and terrestrial wildlife
    - Southern AOC: soil macroinvertebrates and terrestrial wildlife

- Downgradient Estuarine: benthic macroinvertebrates and aquatic/semi-aquatic wildlife
    - Impacts to sediment greatest within exposure area – adverse population-level effects to ecological receptors via surface water and pore water are unlikely.

## Conceptual Site Model

The analytical data and field observations from trenches and borings allow the development of a CSM of the migration of COPCs and COPECs through the environment. **Figure 5-1** depicts the CSM graphically. Key elements of the CSM include:

- Waste and fuel are sources of contamination. When disposed on the ground surface liquid fuels infiltrated through the sand to the water table and then moved laterally, floating on the water table.
- Tidal fluctuations create a “smear zone” of fuel-stained sand at the water table.
- Contaminants leach from waste and stained sand via infiltrating precipitation and migrate to the groundwater.
- Groundwater flow is northeast and east, toward the marsh and tidal channel. The adjacent marsh and tidal waters are a regional groundwater discharge zone for the surficial aquifer.
- Contaminants in the VOC and SVOC shallow groundwater found in the Central AOC were not detected in the pore water of the marsh sediment, indicating that contaminant concentrations are attenuating before they reach the marsh sediments. Attenuation processes likely include aerobic and anaerobic degradation of VOCs, adsorption of SVOC, dioxin and metal contaminants on sediment and organic matter, and dilution via advection, diffusion, and dispersion.
- Based on the text and figure in Simulation of Groundwater Level and Salinity Changes in the Eastern Shore, Virginia. (USGS 2009), in groundwater discharge zones, there is an expected upward hydraulic gradient from the deeper upper Yorktown Aquifer to the surficial aquifer (USGS, 2009).
- The regionally extensive Yorktown clay confines the upper Yorktown Aquifer where the water supply well is screened, protecting the aquifer from the low levels of contamination found in the deep surficial aquifer.
- Volatile components of the fuel volatilize from the groundwater to air in soil pore spaces, migrate upward, and are released to the atmosphere.
- In the groundwater, anaerobic, and possibly aerobic, degradation of some contaminants has occurred as seen in the marked decrease in concentrations of cis-1,2-dichloroethene and toluene in groundwater in MW-4 between 2007 and 2016.

- Contaminants adsorbed to fine soil particles and organic material, such as metals, dioxin congeners, and SVOCs, are washed into drainage ditches via overland flow. Once in the drainage ditches, the contaminants travel with surface water flow to the ditch discharge point in the tidal channel. The highest concentrations of some metals and dioxin TEQ at, or immediately downstream from, the discharge ditches indicate that this has been an active contaminant migration pathway.
- Tidal flow will distribute contaminants that are adsorbed to fine soil particles and organic matter until they settle into the sediments. Note that wave action and flooding during severe storm events can re-mobilize contaminants adsorbed to soil and organic matter.

Conclusion

The data collected in the SFI met the objectives of the study and will provide the information required to finalize the FS.

Key Elements of CSM
1. Waste and fuel is disposed
2. Contaminants leach from waste to shallow surficial aquifer
3. Tidal fluctuation “smears” fuel at water table
4. Contaminants absorbed to sediment particles migrate through site drainage pathways to the tidal marsh
5. VOCs volatilize from contaminantion in groundwater, through soil pore space, to atmosphere
6. Anaerobic and possible aerobic degradation of groundwater contamination
7. Upward hydraulic gradient
8. TOC06 is screened below the upper Yorktown Clay
9. Eastward groundwater flow and discharge to marsh
10. Surface runoff from waste disposal areas to site drainage
11. Ecological Receptors feeding on benthic invertebrates.

# Tables

**Table 2-1**
**Supplemental Field Investigation and Remedial Investigation Groundwater Elevations**
**Project 15 CDL, Wallops Island, Virginia**

| Well | TOC Elevation (feet amsl) | DTW (5/12/16) (Feet) | GW Elevation (5/12/16) (Feet amsl) | DTW (11/15/16) (Feet) | GW Elevation (11/15/16) (Feet amsl) | GW Elevation (05/07) (Feet amsl) | GW Elevation (12/07) (Feet amsl) |
|---|---|---|---|---|---|---|---|
| MW-1 | 32.00 | 24.74 | 7.26 | 23.72 | 8.28 | 7.24 | 5.8 |
| MW-2 | 22.55 | 15.38 | 7.17 | 15.25 | 7.30 | 7.16 | 5.7 |
| MW-3 | 13.10 | 6.72 | 6.38 | 6.45 | 6.65 | 5.9 | 6.48 |
| MW-4 | 11.87 | 9.53 | 2.34 | 9.1 | 2.77 | 2.04 | 1.25 |
| MW-5 | 10.06 | 8.84 | 1.22 | 9.58 | 0.48 | 0.31 | -0.54 |
| MW-6 | 18.18 | 16.45 | 1.73 | 15.93 | 2.25 | 2.64 | 0.57 |

DTW = depth to water
GW = groundwater
TOC = top of inner casing
Note that groundwater elevations recorded in 2007 are reported in the Remedial Investigation Report (Versar 2013)

Table 3-1 Project 15 CDL Supplemental Field Investigation Event Activities, Wallops Flight Facility, Virginia

| Event Date | Sampling Activity | Data Gaps/Stakeholder Decisions |
|---|---|---|
| May 2015 | Excavation and logging of 14 trenches (TP-11 through TP-24). Collection of 10 soil samples. | Trench data were used to select locations for DPT borings and shallow temporary wells. |
| July 2015 | Installation and logging of 11 DPT borings (DPT-1 through DPT-11). Installation of 11 shallow temporary wells. Collection of 8 soil samples and 11 groundwater samples. | Identified data gaps in waste and groundwater contamination delineation. Additional trenches and DPT shallow wells were planned and executed in May 2016. |
| May 2016 | Excavation and logging of three trenches (TP-25 through TP-27). Collection of three soil samples.<br>Installation and soil logging of six shallow temporary wells (DPT-12 through DPT-17). Collection of six groundwater samples<br>Collection of Round 1 monitoring well groundwater samples and water level measurements. | Data from all trenches and DPT shallow temporary wells were used to select locations of deep temporary wells.<br>Concern over potential groundwater impacts on pore water and sediment in adjacent marsh prompted planning of pore water and sediment sampling. |
| August 2016 | Drilling, logging, and sampling of four deep temporary wells (DTW-1 through DTW-4).<br>Collection of 13 pore water and 13 co-located sediment samples. Three locations were selected for collection of background samples. | Minor contamination in deep temporary wells indicates need to sample water supply well TOC-06 (Yorktown Aquifer well). |
| November 2016 | Collection of Round 2 monitoring well groundwater samples.<br>Collection of TOC-06 groundwater with analysis for VOCs and dioxins/furans. | |
| November 2017 | Collection of TOC-06 groundwater sample with analysis for SVOCs and metals. | |

**Notes:**
- Groundwater samples from temporary wells analyzed for metals were filtered in the field per the approved work plan.
- Screening levels include the EPA Regional Screeening Levels (RSL) for Tapwater (for non-carcinogens 0.1 times the RSL is listed) (EPA May 2021); Wallops Groundwater Maximum Background Detection (Tetra Tech 2021); Virginia Groundwater Quality Standards (Virginia Administartive Code 9VAC25-280-40).
- Bolded values exceed EPA RSLs, underlined and italicized values exceed Site Background screening levels and shaded cells indicated exceedance of Virginia Groundwater Criteria.

FD = field duplicate
ft btic = feet below top of inner casing
HMW = high molecular weight
J = analyte was positively identified, but value is estimated
LMW = low molecular weight
mg/l = milligrams per liter
N = normal field samples
NA = not analyzed
OCCD = Octachlorodibenzodioxin
OCDF = Octachlorodibnezofuran
"-" = Not detected
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
TEQ = toxic equivalency
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**
- Groundwater samples from temporary wells analyzed for metals were filtered in the field per the approved work plan.
- Screening levels include the EPA Regional Screeening Levels (RSL) for Tapwater (for non-carcinogens 0.1 times the RSL is listed) (EPA May 2021); Wallops Groundwater Maximum Background Detection (Tetra Tech 2021); Virginia Groundwater Quality Standards (Virginia Administartive Code 9VAC25-280-40).
- Bolded values exceed EPA RSLs, underlined and italicized values exceed Site Background screening levels and shaded cells indicated exceedance of Virginia Groundwater Criteria.

**Notes:**
- Groundwater samples from monitoring and water supply wells wells analyzed for metals were not filtered in the field (i.e., total metals concentrations are reported).
- Screening levels include the EPA Regional Screeening Levels (RSL) for Tapwater (for non-carcinogens 0.1 times the RSL is listed) (EPA May 2021); Wallops Groundwater Maximum Background Detection (Tetra Tech 2021); Virginia Groundwater Quality Standards (Virginia Administrative Code 9VAC25-280-40).
- Bolded values exceed EPA RSLs, underlined and italicized values exceed Site Background screening levels and shadec cells indicated exceedance of Virginia Groundwater Criteria.

**Notes:**

NA - Water quality data not available.

* - Unable to collect water quality data due to temporary well purging dry.

** - Turbidity sensor did not work properly while purging; sample was clear to the naked eye.

DPT- Shallow Temporary Well; DTW - Deep Temporary Well; MW- Monitoring Well

DO - dissolved oxygen

mg/l = milgrams per liter

$mS/cm^3$ mili-Siemens per cubic centimeter

mv - milivolts

°C - degrees celsius; mV - milivolts; NTU - Nephelometric Turbidity Unit; mg/l - miligrams per liter

> greater than

**Notes:**

2,3,7,8-TCDD TEQ = 2,3,7,8- Tetrachlorodibenzo-p-dioxin Toxicity Equivalence; AOC = Area of Concern; C/S = Central/Southern AOC; CTE = Central Tendency Exposure; DIOX/FUR = Dioxins and Furans; MET = Metals; NA = Not Applicable; N/W = Northern/Western AOC; RME = Reasonable Maximum Exposure; SVOC = Semi-Volatile Organic Compound; VI = Vapor Intrusion; VOC = Volatile Organic Compound

(a) The main difference between the current and future scenarios is soil exposure medium; the current receptors are exposed to surface soil while the future receptors are exposed to total soil.

(b) All groundwater pathways involve the Surficial Aquifer.

**Notes:**

2,3,7,8-TCDD TEQ = 2,3,7,8- Tetrachlorodibenzo-p-dioxin Toxicity Equivalence; AOC = Area of Concern; C/S = Central/Southern AOC; CTE = Central Tendency Exposure; DIOX/FUR = Dioxins and Furans; MET = Metals; NA = Not Applicable; N/W = Northern/Western AOC; RME = Reasonable Maximum Exposure; SVOC = Semi-Volatile Organic Compound; VI = Vapor Intrusion; VOC = Volatile Organic Compound

(a) The main difference between the current and future scenarios is soil exposure medium; the current receptors are exposed to surface soil while the future receptors are exposed to total soil.

(b) All groundwater pathways involve the Surficial Aquifer.

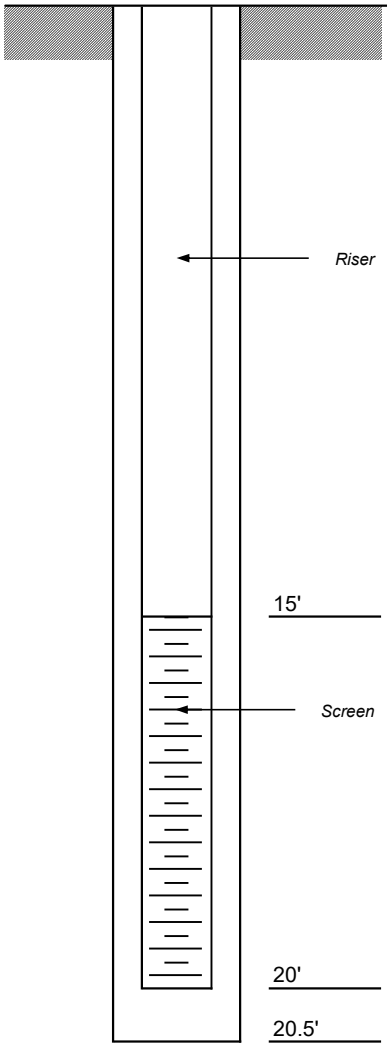
Project: Project 15 CDL  Location: Wallops Island, VA  Well No.: DPT-15

Surf elev.: 19.3'  Type: Temporary Well



## DRILLING SUMMARY

| | | | |
|---|---|---|---|
| Drilling Company: | Eichelberger's | Drillers: | G. Garland |
| Drill Rig/Model: | 6622 DT Geoprobe | | |
| Borehole Diameters: | 2" | | |
| Total Depth: | 20.5' bgs | Depth To Water: | 15' bgs |
| Supervisor Geologist: | S. Cleaver | | |

## WELL DESIGN

| | | | |
|---|---|---|---|
| Casing Material: | SCH-40 PVC | Diameter: | 1" |
| Screen Material: | SCH-40 PVC | Diameter: | 1" |
| Slot Size: | 0.010" | Setting: | 15'-20' bgs |
| Filter Material: | NA | Setting: | NA |
| Seals Material: | NA | Setting: | NA |
| Grout: | NA | Setting: | NA |
| Surface Completion | Abandoned | | |

## TIME LOG

| | Started | Completed |
|---|---|---|
| Drilling: | 5/5/2016 | 5/5/2016 |
| Installation: | 5/5/2016 | 5/5/2016 |
| Abandonment: | 5/5/2016 | 5/5/2016 |

**Notes:**
FD = field duplicate
ft btic = feet below top of inner casing
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**
FD = field duplicate
ft bgs = feet below ground surface
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**
FD = field duplicate
ft bgs = feet below ground surface
J = analyte was positively identified, but value is estimated
mg/kg = milligrams per kilogram
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/g = picograms per gram
R = result or limit of detection was rejected
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/kg = micrograms per kilogram

**Notes:**
FD = field duplicate
ft bgs = feet below ground surface
J = analyte was positively identified, but value is estimated
mg/kg = milligrams per kilogram
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/g = picograms per gram
R = result or limit of detection was rejected
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/kg = micrograms per kilogram

**Notes:**
FD = field duplicate
ft bgs = feet below ground surface
J = analyte was positively identified, but value is estimated
mg/kg = milligrams per kilogram
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/g = picograms per gram
R = result or limit of detection was rejected
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/kg = micrograms per kilogram

**Notes:**
FD = field duplicate
ft bgs = feet below ground surface
J = analyte was positively identified, but value is estimated
mg/kg = milligrams per kilogram
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/g = picograms per gram
R = result or limit of detection was rejected
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/kg = micrograms per kilogram

**Notes:**
FD = field duplicate
ft btic = feet below top of inner casing
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**
FD = field duplicate
ft btic = feet below top of inner casing
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**
FD = field duplicate
ft btic = feet below top of inner casing
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**
FD = field duplicate
ft btic = feet below top of inner casing
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
N = normal field samples
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
RB = rinsate blank
TB = trip blank
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

**Notes:**
J = analyte was positively identified, but value is estimated
mg/l = milligrams per liter
NA = not analyzed
ND = non-detect
PAHs = polycyclic aromatic hydrocarbons
pg/l = picograms per liter
RB = rinsate blank
TB = trip blank
TEQ = toxic equivalency
U = analyte not detected above the limit of detection
UJ = analyte not detected above the limit of detection; however, the limit of detection is estimated
WHO = World Health Organization
µg/l = micrograms per liter

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) QF04017. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 90 results (16.92%) out of the 532 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | The laboratory noted that MS/MSD recoveries were outside control limits. |
| SW7471B | No additional comments; see Checklist for detail. |
| SW8260B | No additional comments; see Checklist for detail. |
| SW8270D | The laboratory noted that ICV/CCV recoveries were outside control limits |

November 08, 2017

Reviewed by Mark Lund, Project Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 09, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

| QQ76828-001 (LB)/ QQ76828-001 | Aluminum | 18.00 | < 6.7 | < 50 | mg/kg | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW6010C, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Continuing Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| VSTD050EP (CV) | Chloromethane | 48.50 | 80 - 120 | 40 - 160 | % | J/UJ | V2 | |
| VSTD050EP (CV) | Dichlorodifluoromethane | 49.80 | 80 - 120 | 40 - 160 | % | J/UJ | V2 | |
| VSTD050EP (CV) | Vinyl chloride | 54.30 | 80 - 120 | 40 - 160 | % | J/UJ | V2 | |
| VSTD050EP (CV) | Bromomethane | 56.50 | 80 - 120 | 40 - 160 | % | J/UJ | V2 | |
| VSTD050EP (CV) | Chloroethane | 59.90 | 80 - 120 | 40 - 160 | % | J/UJ | V2 | |
| VSTD050EP (CV) | Trichlorofluoromethane | 68.30 | 80 - 120 | 40 - 160 | % | J/UJ | V2 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ76864-002 (BS)/ QQ76864-002 | Bromomethane | 26.80 | 30 - 160 | 30 - 160 | percent | J/UJ | C | |
| QQ76864-003 (BD)/ QQ76864-003 | Bromomethane | 26.40 | 30 - 160 | 30 - 160 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP13B-00-010 | N | Bromomethane | 2600 | 2100 QL U | 2100 UJ | - | ug/kg | C/I |
| CDL-TP13C-00-006 | N | Bromomethane | 4400 | 3500 L U | 3500 UJ | - | ug/kg | C |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP13B-00-010 (N)/ QF04017-003 | Dibromofluoromethane | 76.09 | 78 - 119 | 10 - 119 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Surrogate for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ76666-002 (BS)/ QQ76666-002 | 2,4-Dimethylphenol | 108.0 | 30 - 105 | 30 - 105 | percent | J/None | C | |
| QQ77004-002 (BS)/ QQ77004-002 | Acenaphthylene | 108.0 | 50 - 105 | 50 - 105 | percent | J/None | C | |
| QQ77004-002 (BS)/ QQ77004-002 | 2,4-Dimethylphenol | 114.0 | 30 - 105 | 30 - 105 | percent | J/None | C | |
| QQ77004-002 (BS)/ QQ77004-002 | 4-Chloroaniline | 96.01 | 10 - 95 | 10 - 95 | percent | J/None | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Table of Results with Modified Qualifiers**

| Modified Qualifiers for test method SW8270D | | | | | | | |
|---|---|---|---|---|---|---|---|
| FieldSample ID | Type | Analyte | LOQ | Lab Result | ADR Result | Modified Result | Reason |
| CDL-TP22B-00-004 | N | n-Nitrosodiphenylamine | 400 | 160 U | 160 U | 160 | |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| G2 | Initial Calibration RSD/r^2/r |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| TR | Trace Level Detect |
| V2 | CCV |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) QE29016. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 128 results (44.44%) out of the 288 results (sample and field QC samples) reported are qualified based on review and 92 results (31.94%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | No additional comments; see Checklist for detail. |
| SW7470A | No additional comments; see Checklist for detail. |
| SW7471B | No additional comments; see Checklist for detail. |
| SW8260B | The laboratory noted that CCV/LCS/Surrogate recoveries and Hold Times were outside control limits. |
| SW8270D | The laboratory noted that ICV/MS/MSD recoveries and Hold Times were outside control limits. |

Reviewed by Mark Lund, Project Scientist, Synectics,
Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 17, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics,

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ76828-001 (LB)/ QQ76828-001 | Aluminum | 18.00 | < 6.7 | < 50 | mg/kg | U/None | L | |
| QQ77434-001 (LB)/ QQ77434-001 | Copper | 0.2400 | < 0.19 | < 0.5 | mg/kg | U/None | L | |
| QQ77434-001 (LB)/ QQ77434-001 | Aluminum | 20.00 | < 6.7 | < 50 | mg/kg | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW6010C, Total, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Blank for SW6010C, Total**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-RB1-02 | EB | Arsenic | 0.0150 | 0.00240 BJ | 0.0150 U | + | mg/l | L |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, Total, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-RB1-02 (EB)/ QE29016-004 | Arsenic | 0.002400 | < 0.0022 | < 0.015 | mg/l | U/None | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ76864-002 (BS)/ QQ76864-002 | Bromomethane | 26.80 | 30 - 160 | 30 - 160 | percent | J/UJ | C | |
| QQ76864-003 (BD)/ QQ76864-003 | Bromomethane | 26.40 | 30 - 160 | 30 - 160 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP11C-00-12 | N | Bromomethane | 27000 | 22000 QL U | 22000 UJ | | ug/kg | C |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP11C-00-12 (N)/ QE29016-002 | Dibromofluoromethane | 126.4 | 78 - 119 | 10 - 119 | percent | J/None | I | |
| CDL-TP11C-00-12 (N)/ QE29016-002 | Toluene-d8 | 157.4 | 85 - 116 | 10 - 116 | percent | J/None | I | |
| CDL-TP11C-00-12 (N)/ QE29016-002 | 1-Bromo-4-fluorobenzene (4-Bromofluorobenzene) | 180.6 | 79 - 119 | 10 - 119 | percent | J/None | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Surrogate for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP11C-00-12 | N | Isopropylbenzene (Cumene) | 27000 | 11000 JQ | 11000 J | + | ug/kg | I/TR |
| CDL-TP11C-00-12 | N | Methylcyclohexane | 27000 | 170000 Q | 170000 J | + | ug/kg | I |
| CDL-TP11C-00-12 | N | Xylenes, Total | 27000 | 45000 Q | 45000 J | + | ug/kg | I |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Test Hold Time**

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP11B-00-12 (N)/ QE29016-001 | | 15.26 | < 14 | | days | J/R | H1 | Test Exceeds UWL |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, Initial Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 6-16-2015 16:24 (IV) | Acenaphthylene | 122.0 | 80 - 120 | 80 - 120 | % | J/None | V1 | |
| TCLICVCC (IV) | Caprolactam | 0.000 | 80 - 120 | 80 - 120 | % | J/UJ | V1 | |
| TCLICVCC (IV) | Pentachlorophenol | 73.10 | 80 - 120 | 80 - 120 | % | J/UJ | V1 | |
| TCLICVCC (IV) | 4-Nitrophenol | 77.90 | 80 - 120 | 80 - 120 | % | J/UJ | V1 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Initial Calibration Verification for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP11C-00-12 | N | 4-Nitrophenol | 980 | 800 U | 800 UJ | - | ug/kg | V1 |
| CDL-TP11C-00-12 | N | Pentachlorophenol | 980 | 320 U | 320 UJ | - | ug/kg | V1 |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ76581-002 (BS)/ QQ76581-002 | Caprolactam | 115.0 | 20 - 100 | 20 - 100 | percent | J/None | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Prep Hold Time**

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP11B-00-12 (N)/ QE29016-001 | | 15.24 | < 14 | < 14 | days | J/R | H2 | Prep Exceeds UCL |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| D | MS RPD |
| G1 | Initial Calibration RRF |
| G2 | Initial Calibration RSD/r^2/r |
| H1 | Test Hold Time |
| H2 | Prep Hold Time |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| TR | Trace Level Detect |
| V | Equipment Blank |
| V1 | ICV |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) QF10017. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Field Duplicate RPD
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 70 results (7.52%) out of the 931 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | The laboratory noted that MS/MSD recoveries were outside control limits. |
| SW7471B | No additional comments; see Checklist for detail. |
| SW8260B | The laboratory noted that MS/MSD recoveries were outside control limits. |
| SW8270D | The laboratory noted that ICV/MS/MSD recoveries were outside control limits. |

November 08, 2017

Reviewed by Mark Lund, Project Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 20, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ77434-001 (LB)/ QQ77434-001 | Copper | 0.2400 | < 0.19 | < 0.5 | mg/kg | U/None | L | |
| QQ77434-001 (LB)/ QQ77434-001 | Aluminum | 20.00 | < 6.7 | < 50 | mg/kg | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW6010C, Field Duplicate RPD**

Field duplicate analyses are performed in order to assess sample collection/laboratory precision for each sample matrix. Summary forms were evaluated and compared to electronic data deliverables. Field duplicate results that were outside of the acceptance criteria are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP20B-00-010 (SD)/ QF10017-001MD | Copper | 185.7 | 75 - 125 | 30 - 125 | percent | J/None | M | Spike amount Insignificant |

| CDL-TP24A-01-012 | FD | Xylenes, Total | 240 | 16000 | 16000 J | | ug/kg | D3 |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ77066-002 (BS)/ QQ77066-002 | Dichlorodifluoromethane | 140.0 | 35 - 135 | 35 - 135 | percent | J/None | C | |
| QQ77148-002 (BS)/ QQ77148-002 | Dichlorodifluoromethane | 140.0 | 35 - 135 | 35 - 135 | percent | J/None | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QF10017-007MD (SD)/ QF10017-007MD | Methyl acetate | 38.10 | < 30 | < 30 | rpd | J/None | D | |
| QF10017-007MD (SD)/ QF10017-007MD | Acetone | 66.67 | < 30 | < 30 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS RPD for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP24A-00-012 | N | Acetone | 19.0 | 44.0 | 44.0 J | | ug/kg | D3/D |
| CDL-TP24A-01-012 | FD | Acetone | 19.0 | 83.0 | 83.0 J | | ug/kg | D3/D |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP24A-00-012 (SD)/ QF10017-007MD | 1-Bromo-4-fluorobenzene (4-Bromofluorobenzene) | 76.13 | 79 - 119 | 10 - 119 | percent | J/UJ | I | |
| CDL-TP24A-00-012 (SD)/ QF10017-007MD | Toluene-d8 | 82.10 | 85 - 116 | 10 - 116 | percent | J/UJ | I | |
| CDL-TP24A-00-012 (MS)/ QF10017-007MS | 1-Bromo-4-fluorobenzene (4-Bromofluorobenzene) | 78.36 | 79 - 119 | 10 - 119 | percent | J/UJ | I | |
| CDL-TP24A-00-012 (MS)/ QF10017-007MS | Toluene-d8 | 82.22 | 85 - 116 | 10 - 116 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Initial Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| ICV SVMS 1152 (IV) | Acenaphthylene | 122.2 | 80 - 120 | 80 - 120 | percent | J/None | V1 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Initial Calibration Verification for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP21B-00-007 | N | Acenaphthylene | 380 | 66.0 J | 66.0 J | + | ug/kg | C/TR/V1 |
| CDL-TP24A-00-012 | N | Acenaphthylene | 380 | 38.0 J | 38.0 J | + | ug/kg | C/TR/V1 |
| CDL-TP24A-01-012 | FD | Acenaphthylene | 370 | 77.0 J | 77.0 J | + | ug/kg | C/TR/V1 |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ77004-002 (BS)/ QQ77004-002 | 4-Chloroaniline | 96.01 | 10 - 95 | 10 - 95 | percent | J/None | C | |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP20B-00-010 (SD)/ QF10017-001MD | Acenaphthylene | 106.4 | 50 - 105 | 10 - 105 | percent | J/None | M | |
| CDL-TP20B-00-010 (SD)/ QF10017-001MD | Hexachlorocyclopentadiene | 15.22 | 20 - 134 | 10 - 134 | percent | J/UJ | M | |
| CDL-TP20B-00-010 (MS)/ QF10017-001MS | Anthracene | 106.4 | 55 - 105 | 10 - 105 | percent | J/None | M | |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| A | Serial dilution |
| C | LCS Recovery |
| D | MS RPD |
| D3 | Field Duplicate RPD |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| TR | Trace Level Detect |
| V1 | ICV |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by CAPE FEAR ANALYTICAL, LLC, WILMINGTON, NC and were reported under sample delivery group (SDG) 7781_HDOX. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- Field Duplicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 9 results (17.65%) out of the 51 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| E1613 | The laboratory noted that MS/MSD recoveries and RPDs were outside control limits. |

November 15, 2017

Reviewed by Mark Lund, Project Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 28, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method E1613, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 12013664 (BS)/ 12013664 | Octachlorodibenzo -p-dioxin | 100.0 | 101 - 151 | 10 - 151 | percent | J/UJ | C | |
| 12013664 (BS)/ 12013664 | 2,3,7,8-Tetrachlorodibenz ofuran | 93.50 | 95 - 126 | 10 - 126 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-RB1-02 | EB | 2,3,7,8-Tetrachlorodibenzofuran | 10.8 | 7.16 U | 7.16 UJ | - | pg/l | C |
| CDL-RB1-02 | EB | Octachlorodibenzo-p-dioxin | 108 | 71.6 U | 71.6 UJ | - | pg/l | C |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method E1613, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP20B-00-010 (MS)/ 12013675 | Octachlorodibenzo-p-dioxin | 4830 | 93 - 162 | 10 - 162 | percent | J/None | M | Spike amount Insignificant |
| CDL-TP20B-00-010 (SD)/ 12013675 | Octachlorodibenzo-p-dioxin | 7.850 | 93 - 162 | 10 - 162 | percent | J/UJ | M | Spike amount Insignificant |
| CDL-TP20B-00-010 (MS)/ 12013675 | 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin | 239.0 | 93 - 144 | 10 - 144 | percent | J/None | M | |
| CDL-TP20B-00-010 (SD)/ 12013676 | 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin | 57.80 | 93 - 144 | 10 - 144 | percent | J/UJ | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP20B-00-010 | N | 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin | 4.89 | 46.6 | 46.6 J | + | pg/g | M/D |
| CDL-TP20B-01-010 | FD | 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin | 4.84 | 59.5 | 59.5 J | + | pg/g | M/D |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method E1613, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 12013676 (SD)/ 12013676 | Octachlorodibenzo-p-dioxin | 122.5 | < 20 | < 20 | rpd | J/None | D | |
| 12013676 (SD)/ 12013676 | 2,3,7,8-Tetrachlorodibenzofuran | 22.50 | < 20 | < 20 | rpd | J/None | D | |
| 12013676 (SD)/ 12013676 | 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin | 57.47 | < 20 | < 20 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS RPD for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP20B-00-010 | N | 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin | 4.89 | 46.6 | 46.6 J | + | pg/g | M/D |
| CDL-TP20B-00-010 | N | 2,3,7,8-Tetrachlorodibenzofuran | 0.978 | 2.30 | 2.30 J | | pg/g | D |
| CDL-TP20B-00-010 | N | Octachlorodibenzo-p-dioxin | 9.78 | 2960 | 2960 J | | pg/g | D |
| CDL-TP20B-01-010 | FD | 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin | 4.84 | 59.5 | 59.5 J | + | pg/g | M/D |
| CDL-TP20B-01-010 | FD | 2,3,7,8-Tetrachlorodibenzofuran | 0.968 | 2.50 | 2.50 J | | pg/g | D |
| CDL-TP20B-01-010 | FD | Octachlorodibenzo-p-dioxin | 9.68 | 3750 | 3750 J | | pg/g | D |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Table of All Qualified Results**

| CDL-TP20B-01-010 | FD | Octachlorodibenzo-p-dioxin | 9.68 | 3750 | 3750 J | | pg/g | D |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| D | MS RPD |
| M | MS Recovery |
| TR | Trace Level Detect |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) QG23025. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- Field Duplicate RPD
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 162 results (6.74%) out of the 2402 results (sample and field QC samples) reported are qualified based on review and 2 results (0.08%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | The laboratory noted that MS/MSD recoveries were outside control limits. Additionally, samples were diluted due to sample matrix. |
| SW7470A | No additional comments; see Checklist for detail. |
| SW7471B | No additional comments; see Checklist for detail. |
| SW8260B | The laboratory noted that surrogate/CCV/internal standards were outside control limits. |
| SW8270D | The laboratory noted that ICV/LCS/MS/MSD recoveries were outside control limits. |

Reviewed by Mark Lund, Project Scientist, Synectics,
Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ80806-001 (LB)/ QQ80806-001 | Aluminum | 23.00 | < 6.7 | < 50 | mg/kg | U/None | L | |
| QQ80806-001 (LB)/ QQ80806-001 | Copper | 0.3700 | < 0.19 | < 0.5 | mg/kg | U/None | L | |
| QQ80806-001 (LB)/ QQ80806-001 | Potassium | 22.00 | < 19 | < 250 | mg/kg | U/None | L | |
| QQ80806-001 (LB)/ QQ80806-001 | Calcium | 34.00 | < 24 | < 250 | mg/kg | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Trip Blank**

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TB1-03 (TB)/ QG23025-005 | Acetone | 1.800 | < 1.6 | < 20 | ug/l | U/None | T | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Trip Blank for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DPS08-00-010 (SD)/ QG23025-014MD | Benzo(a)pyrene | 116.3 | 50 - 110 | 10 - 110 | percent | J/None | M | |

| CDL-DPS08-01-010 | FD | Hexachlorocyclopentadiene | 1100 | 890 U | 890 R | - | ug/kg | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QG23025-014MD (SD)/ QG23025-014MD | Hexachlorocyclopentadiene | 35.29 | < 30 | < 30 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW03-00-1120 (N)/ QG23025-010 | Terphenyl-d14 | 43.10 | 50 - 134 | 10 - 134 | percent | J/UJ | I | Diluted Out |
| CDL-DPW03-01-1120 (FD)/ QG23025-011 | Nitrobenzene-d5 | 139.3 | 44 - 120 | 10 - 120 | percent | J/None | I | Diluted Out |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| D | MS RPD |
| D3 | Field Duplicate RPD |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| S | Internal standard |
| T | Trip Blank |
| TR | Trace Level Detect |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) QG29026. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 54 results (9.33%) out of the 579 results (sample and field QC samples) reported are qualified based on review and 1 results (0.17%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | No additional comments; see Checklist for detail. |
| SW7470A | No additional comments; see Checklist for detail. |
| SW8260B | The laboratory indicated the following issues:<br><br>Sample 003 failed surrogate and internal recovery due to matrix interference. This was confirmed with a second run.<br><br>The method blank in batch 81567 had a detection of 2-hexanone at 5.2. All DoD samples were ND for 2-hexanone. |
| SW8270D | The laboratory noted that ICV/CCV/LCS recoveries were outside control limits. |

November 05, 2017

Reviewed by Mark Lund, Project Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

January 11, 2018

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DPS11-00-019 (SD)/ QG29026-001MD | Aluminum | 272.7 | 75 - 125 | 30 - 125 | percent | J/None | M | Spike amount Insignificant |
| CDL-DPS11-00-019 (SD)/ QG29026-001MD | Iron | 9.091 | 75 - 125 | 30 - 125 | percent | J/R | M | Spike amount Insignificant |
| CDL-DPS11-00-019 (SD)/ QG29026-001MD | Antimony | 38.18 | 75 - 125 | 30 - 125 | percent | J/UJ | M | |
| CDL-DPS11-00-019 (MS)/ QG29026-001MS | Aluminum | 333.3 | 75 - 125 | 30 - 125 | percent | J/None | M | Spike amount Insignificant |
| CDL-DPS11-00-019 (MS)/ QG29026-001MS | Antimony | 39.66 | 75 - 125 | 30 - 125 | percent | J/UJ | M | |
| CDL-DPS11-00-019 (MS)/ QG29026-001MS | Selenium | 74.14 | 75 - 125 | 30 - 125 | percent | J/UJ | M | |
| CDL-DPS11-00-019 (MS)/ QG29026-001MS | Arsenic | 74.86 | 75 - 125 | 30 - 125 | percent | J/UJ | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for SW6010C**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DPS11-00-019 | N | Antimony | 1.10 | 0.830 S U | 0.830 UJ | - | mg/kg | M |
| CDL-DPS11-00-019 | N | Arsenic | 0.800 | 2.60 | 2.60 J | - | mg/kg | M |
| CDL-DPS11-00-019 | N | Selenium | 1.10 | 0.880 U | 0.880 UJ | - | mg/kg | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ81566-001 (LB)/ QQ81566-001 | 2-Hexanone | 5.300 | < 3.8 | < 10 | ug/kg | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW07-1130 (SD)/ QG29026-004MD | Styrene | 56.00 | 65 - 135 | 20 - 135 | percent | J/UJ | M | |
| CDL-DPW07-1130 (MS)/ QG29026-004MS | Styrene | 60.00 | 65 - 135 | 20 - 135 | percent | J/UJ | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW07-1130 | N | Styrene | 0.500 | 0.800 S U | 0.800 UJ | - | ug/l | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TB1-03 (TB)/ QG29026-005 | Dibromofluoromethane | 79.63 | 80 - 119 | 10 - 119 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DPS07-00-002 (N)/ QG29026-003 | Toluene-d8 | 130.6 | 85 - 116 | 10 - 116 | percent | J/None | I | |
| CDL-DPS11-00-019 (N)/ QG29026-001 | Toluene-d8 | 116.0 | 85 - 116 | 10 - 116 | percent | J/None | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Surrogate for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DPS11-00-019 | N | Acetone | 18.0 | 42.0 | 42.0 J | + | ug/kg | I |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Trip Blank**

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TB1-03 (TB)/ QG29026-005 | Chloroform | 0.2100 | < 0.2 | < 0.5 | ug/l | U/None | T | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| QQ81322-002 (BS)/ QQ81322-002 | Caprolactam | 120.0 | 20 - 100 | 20 - 100 | percent | J/None | C | |
| QQ81322-002 (BS)/ QQ81322-002 | Acenaphthylene | 130.0 | 50 - 105 | 50 - 105 | percent | J/None | C | |
| QQ81322-002 (BS)/ QQ81322-002 | Hexachlorocyclopentadiene | 9.000 | 20 - 123 | 20 - 123 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for SW8270D**

Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| T | Trip Blank |
| TR | Trace Level Detect |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) QG25002. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- Field Duplicate RPD
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 45 results (3.89%) out of the 1158 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | No additional comments; see Checklist for detail. |
| SW7470A | No additional comments; see Checklist for detail. |
| SW8270D | The laboratory noted that ICV/LCS recoveries were outside control limits. |

November 09, 2017

Reviewed by Mark Lund, Project Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 22, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, Initial Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| ICV (IV) | n-Nitrosodiphenylamine | 121.0 | 80 - 120 | 80 - 120 | percent | J/None | V1 | |
| ICV (IV) | 4-Nitroaniline | 124.0 | 80 - 120 | 80 - 120 | percent | J/None | V1 | |
| ICV (IV) | Acenaphthylene | 132.0 | 80 - 120 | 80 - 120 | percent | J/None | V1 | |
| ICV (IV) | 2,4-Dimethylphenol | 139.0 | 80 - 120 | 80 - 120 | percent | J/None | V1 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by CAPE FEAR ANALYTICAL, LLC, WILMINGTON, NC and were reported under sample delivery group (SDG) 8017_HDOX . Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- LCS Recovery
- LCS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 2 results (5.88%) out of the 34 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

November 30, 2017

Reviewed by Mark Lund, Project Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 30, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method E1613, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 12014019 (BS)/ 12014019 | Octachlorodibenzo -p-dioxin | 100.5 | 101 - 151 | 10 - 151 | percent | J/UJ | C | |
| 12014019 (BS)/ 12014019 | 2,3,7,8-Tetrachlorodibenz ofuran | 94.50 | 95 - 126 | 10 - 126 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW04-00-1928 | N | 2,3,7,8-Tetrachlorodibenzofuran | 10.4 | 6.94 U | 6.94 UJ | - | pg/l | C |
| CDL-DPW04-00-1928 | N | Octachlorodibenzo-p-dioxin | 104 | 140 | 140 J | - | pg/l | C |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Table of All Qualified Results**

**Test Method: E1613 Extraction Method: SW3520C**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW04-00-1928 | N | 2,3,7,8-Tetrachlorodibenzofuran | 10.4 | 6.94 U | 6.94 UJ | - | pg/l | C |
| CDL-DPW04-00-1928 | N | Octachlorodibenzo-p-dioxin | 104 | 140 | 140 J | - | pg/l | C |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

| Reason Code Definitions | |
|---|---|
| Code | Definition |
| C | LCS Recovery |

| Flag Code and Definitions | |
|---|---|
| Flag | Definition |
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by CAPE FEAR ANALYTICAL, LLC, WILMINGTON, NC and were reported under sample delivery group (SDG) 8000_HDOX. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- LCS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 2 results (3.92%) out of the 51 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) RE09002. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 75 results (7.32%) out of the 1025 results (sample and field QC samples) reported are qualified based on review and 1 results (0.10%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Sample CDL-RB2-03-051116 was cancelled per client request.

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | It was noted on the EDD that there were Matrix Spike mismatches where the parent sample differed from the MS/SD analyses in regard to dilution |
| SW7470A | This checklist also covers samples analyzed by SW7471B |
| SW8260B | No additional comments; see Checklist for detail. |
| SW8270D | No additional comments; see Checklist for detail. |

Reviewed by James Parker, Senior Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 09, 2017

Reviewed by Leticia Sangalang, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, Total, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-RB1-03-051016 (EB)/ RE09002-005 | Barium | 0.002300 | < 0.0019 | < 0.025 | mg/l | U/None | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, Continuing Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| VSTD050RZ 5/13 19:56 (CV) | Tetrachloroethene (PCE) | 71.90 | 80 - 120 | 40 - 160 | percent | J/UJ | V2 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Continuing Calibration Verification for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP26B-00-010 | N | Tetrachloroethene (PCE) | 6.60 | 5.30 U | 5.30 Uj | - | ug/kg | V2 |
| CDL-TP27A-00-004 | N | Tetrachloroethene (PCE) | 5.40 | 4.30 U | 4.30 Uj | - | ug/kg | V2 |
| CDL-TP27A-01-004 | N | Tetrachloroethene (PCE) | 4.30 | 3.40 Q U | 3.40 UJ | - | ug/kg | I/V2 |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, Trip Blank**

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Continuing Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| SVMS 2072 5/19 08:54 (CV) | 4,6-Dinitro-2-methylphenol | 124.9 | 80 - 120 | 80 - 120 | percent | J/None | V2 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Continuing Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

**Quality Control Outliers for test method SW8270D, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-RB1-03-051016 (EB)/ RE09002-005 | 4-Chloro-3-methylphenol | 2.800 | < 0.26 | < 1 | ug/l | U/None | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Initial Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| SVMS 2007 (IV) | bis(2-Chloroethyl) ether (2-Chloroethyl ether) | 78.00 | 80 - 120 | 80 - 120 | percent | J/UJ | V1 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Initial Calibration Verification for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW12-00-2332 | N | bis(2-Chloroethyl) ether (2-Chloroethyl ether) | 1.00 | 0.400 U | 0.400 UJ | - | ug/l | V1 |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ12891-002 (BS)/ RQ12891-002 | 3,3'-Dichlorobenzidine | 14.00 | 20 - 110 | 20 - 110 | percent | J/UJ | C | |
| RQ12891-002 (BS)/ RQ12891-002 | n-Nitrosodiphenylamine | 49.00 | 50 - 110 | 50 - 110 | percent | J/UJ | C | |
| RQ12891-002 (BS)/ RQ12891-002 | Benzo(a)pyrene | 53.00 | 55 - 110 | 55 - 110 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW12-00-2332 | N | 3,3'-Dichlorobenzidine | 5.00 | 2.00 L U | 2.00 UJ | - | ug/l | C |
| CDL-DPW12-00-2332 | N | Benzo(a)pyrene | 0.200 | 0.160 L U | 0.160 UJ | - | ug/l | C |
| CDL-DPW12-00-2332 | N | n-Nitrosodiphenylamine | 1.00 | 0.920 L U | 0.920 UJ | - | ug/l | C |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW17-00-1928 (SD)/ RE09002-006MD | Pentachlorophenol | 115.9 | 40 - 115 | 10 - 115 | percent | J/None | M | |
| CDL-DPW17-00-1928 (MS)/ RE09002-006MS | Pentachlorophenol | 120.5 | 40 - 115 | 10 - 115 | percent | J/None | M | |
| CDL-DPW17-00-1928 (MS)/ RE09002-006MS | n-Nitrosodiphenylamine | 18.18 | 50 - 110 | 10 - 110 | percent | J/UJ | M | |
| CDL-DPW17-00-1928 (MS)/ RE09002-006MS | 3,3'-Dichlorobenzidine | 5.909 | 20 - 110 | 10 - 110 | percent | J/R | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |

| CDL-DPW17-00-1928 | N | 3,3'-Dichlorobenzidine | 5.00 | 2.00 S U | 2.00 R | - | ug/l | M |
| CDL-DPW17-00-1928 | N | n-Nitrosodiphenylamine | 1.00 | 0.920 S U | 0.920 UJ | - | ug/l | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP27A-00-004 (MS)/ RE09002-003MS | 2-Methylphenol (o-Cresol) | 110.0 | 40 - 105 | 10 - 105 | percent | J/None | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RE09002-006MD (SD)/ RE09002-006MD | n-Nitrosodiphenylamine | 105.9 | < 30 | < 30 | rpd | J/None | D | |
| RE09002-006MD (SD)/ RE09002-006MD | 3,3'-Dichlorobenzidine | 154.0 | < 30 | < 30 | rpd | J/None | D | |
| RE09002-006MD (SD)/ RE09002-006MD | 4-Chloroaniline | 32.43 | < 30 | < 30 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW17-00-1928 (SD)/ RE09002-006MD | Terphenyl-d14 | 28.33 | 50 - 134 | 10 - 134 | percent | J/UJ | I | |
| CDL-DPW17-00-1928 (MS)/ RE09002-006MS | Terphenyl-d14 | 49.86 | 50 - 134 | 10 - 134 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| A | Serial dilution |
| C | LCS Recovery |
| D | MS RPD |
| H1 | Test Hold Time |
| I | Surrogate recovery outside project limits. |
| M | MS Recovery |
| S | Internal standard |
| T | Trip Blank |
| TR | Trace Level Detect |
| V | Equipment Blank |
| V1 | ICV |
| V2 | CCV |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) RE06021. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 259 results (30.65%) out of the 845 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Reviewed by James Parker, Senior Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 14, 2017

Reviewed by Leticia Sangalang, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW7470A, Total, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ12756-001 (LB)/ RQ12756-001 | Mercury | 0.00007100 | < 2.8e-005 | < 0.0002 | mg/l | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, Trip Blank**

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TB1-03-050416 (TB)/ RE06021-007 | Toluene | 0.2700 | < 0.24 | < 1 | ug/l | U/None | T | |
| CDL-TB1-03-050416 (TB)/ RE06021-007 | Methylene chloride | 0.5000 | < 0.42 | < 1 | ug/l | U/None | T | |
| CDL-TB1-03-050416 (TB)/ RE06021-007 | Acetone | 6.000 | < 1.6 | < 20 | ug/l | U/None | T | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ12891-002 (BS)/ RQ12891-002 | 3,3'-Dichlorobenzidine | 14.00 | 20 - 110 | 20 - 110 | percent | J/UJ | C | |
| RQ12891-002 (BS)/ RQ12891-002 | n-Nitrosodiphenylamine | 49.00 | 50 - 110 | 50 - 110 | percent | J/UJ | C | |
| RQ12891-002 (BS)/ RQ12891-002 | Benzo(a)pyrene | 53.00 | 55 - 110 | 55 - 110 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

| CDL-DPW16-01-2130 | N | n-Nitrosodiphenylamine | 1.00 | 0.920 QL U | 0.920 UJ | - | ug/l | C/M/I |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW16-00-2130 (SD)/ RE06021-001MD | n-Nitrosodiphenylamine | 43.64 | 50 - 110 | 10 - 110 | percent | J/UJ | M | |
| CDL-DPW16-00-2130 (SD)/ RE06021-001MD | Benzo(a)pyrene | 54.55 | 55 - 110 | 10 - 110 | percent | J/UJ | M | |
| CDL-DPW16-00-2130 (MS)/ RE06021-001MS | n-Nitrosodiphenylamine | 47.83 | 50 - 110 | 10 - 110 | percent | J/UJ | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW16-00-2130 | N | Benzo(a)pyrene | 0.200 | 0.160 LS U | 0.160 UJ | - | ug/l | C/M |
| CDL-DPW16-00-2130 | N | n-Nitrosodiphenylamine | 1.00 | 0.920 LS U | 0.920 UJ | - | ug/l | C/M |

| CDL-DPW16-01-2130 | N | n-Nitrosodiphenylamine | 1.00 | 0.920 QL U | 0.920 UJ | - | ug/l | C/M/I |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DPW13-00-3544 (N)/ RE06021-003 | Terphenyl-d14 | 31.20 | 50 - 134 | 10 - 134 | percent | J/UJ | I | |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| T | Trip Blank |
| TR | Trace Level Detect |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

**Review Questions**

| Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry) | | | | |
|---|---|---|---|---|
| Review Questions | Yes | No | NA | Comment |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by CAPE FEAR ANALYTICAL, LLC, WILMINGTON, NC and were reported under sample delivery group (SDG) 9165_HDOX. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 5 results (4.20%) out of the 119 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

The laboratory noted that MS/MSD recoveries and RPDs were outside control limits.

| Analytical Method | Data Reviewer Comment |

| E1613 | No additional comments; see Checklist for detail. |

November 17, 2017

Reviewed by Mark Lund, Project Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 28, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method E1613, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 12016100 (LB)/ 12016100 | Octachlorodibenzo -p-dioxin | 4.730 | < 3.34 | < 10 | pg/g | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method E1613, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TP27A-00-004 (MS)/ 9165006 | Octachlorodibenzo-p-dioxin | -2960 | 93 - 162 | 10 - 162 | percent | J/UJ | M | Spike amount Insignificant |
| CDL-TP27A-00-004 (MS)/ 9165006 | 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin | 24.30 | 93 - 144 | 10 - 144 | percent | J/R | M | Spike amount Insignificant |
| CDL-TP27A-00-004 (MS)/ 9165006 | 1,2,3,4,6,7,8-Heptachlorodibenzofuran | 85.40 | 91 - 131 | 10 - 131 | percent | J/UJ | M | |
| CDL-TP27A-00-004 (SD)/ 9165007 | Octachlorodibenzo-p-dioxin | -1530 | 93 - 162 | 10 - 162 | percent | J/UJ | M | Spike amount Insignificant |
| CDL-TP27A-00-004 (SD)/ 9165007 | 1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin | 12.00 | 93 - 144 | 10 - 144 | percent | J/R | M | Spike amount Insignificant |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP27A-00-004 | N | 1,2,3,4,6,7,8-Heptachlorodibenzofuran | 4.69 | 45.4 | 45.4 J | - | pg/g | M |
| CDL-TP27A-01-004 | N | 1,2,3,4,6,7,8-Heptachlorodibenzofuran | 4.45 | 41.2 | 41.2 J | - | pg/g | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method E1613, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 9165007 (SD)/ 9165007 | Octachlorodibenzo -p-dioxin | 31.74 | < 20 | < 20 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS RPD for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP27A-00-004 | N | Octachlorodibenzo-p-dioxin | 9.37 | 12600 E | 12600 J | | pg/g | D |
| CDL-TP27A-01-004 | N | Octachlorodibenzo-p-dioxin | 8.91 | 8950 E | 8950 J | | pg/g | D |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Table of All Qualified Results**

**Test Method: E1613 Extraction Method: SW3540C**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-TP27A-00-004 | N | 1,2,3,4,6,7,8-Heptachlorodibenzofuran | 4.69 | 45.4 | 45.4 J | - | pg/g | M |
| CDL-TP27A-00-004 | N | Octachlorodibenzo-p-dioxin | 9.37 | 12600 E | 12600 J | | pg/g | D |
| CDL-TP27A-01-004 | N | 1,2,3,4,6,7,8-Heptachlorodibenzofuran | 4.45 | 41.2 | 41.2 J | - | pg/g | M |
| CDL-TP27A-01-004 | N | Octachlorodibenzo-p-dioxin | 8.91 | 8950 E | 8950 J | | pg/g | D |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| D | MS RPD |
| L | Lab Blank |
| M | MS Recovery |
| TR | Trace Level Detect |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) RH18018. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 139 results (18.31%) out of the 759 results (sample and field QC samples) reported are qualified based on review and 2 results (0.26%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Missing and broken amber bottles were noted in COC 63998 and were delivered in a separate cooler with COC 64008.

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | The lab narrated the following:<br><br>The ICSA verification standard associated with samples -006 and -007 contained zinc at 0.022 mg/L which was marginally greater than the LOQ of 0.020 mg/L. Since there are no interferences for zinc, the likely source of the trace zinc contamination was confined to the ICSA solution, which will be monitored.<br><br>Sodium was present greater than the limit of detection of 1.0 mg/L, but was less than half the limit of quantitation concentration of 2.5 mg/L in the CCBs analyzed on 09/01/2016 at 18:35 (1.5 mg/L) and 19:30 (1.5 mg/L). |
| SW7470A | No additional comments; see Checklist for detail. |
| SW8260B | The lab narrated the following:<br><br>The ICV associated with samples -001 through -005 recovered marginally high for DCDFM (123%). There were no detections in the samples. Also, the ICV associated with samples -006 and -007 recovered high for DCDFM (123%), the CCV also recovered high for TCFM (24%), but all samples<br>were ND.<br><br>The LCSD was not reported because of poor recoveries caused by the sample that was analyzed right before it. The CCV, LCS, and ending CCV all passed recovery. |
| SW8270D | The lab narrated the following:<br><br>Sample -004 failed low for the recovery of the surrogate Terphenyl-d14. The sample is re-extracted and reanalyzed within hold and surrogate still failed confirming matrix interference.<br><br>The LCS associated with sample -007 failed low for 3,3-Dichlorobenzidine. The sample is re-extracted outside the holding time. The LCS associated with the re-extracts still failed low for 3,3-Dichlorobenzidine and 3 additional analytes. No sample remained for a third extraction.<br><br>Sample -006 along with associated MS/MSD failed low for surrogate recovery. Insufficient sample was left to re-extract. |

Reviewed by Amy Bass, Data Review Chemist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Reviewed by Leticia Sangalang, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Total, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ21125-001 (LB)/ RQ21125-001 | Zinc | 0.003900 | < 0.0022 | < 0.02 | mg/l | U/None | L | |
| RQ21125-001 (LB)/ RQ21125-001 | Manganese | 0.007200 | < 0.00081 | < 0.015 | mg/l | U/None | L | |
| RQ21125-001 (LB)/ RQ21125-001 | Calcium | 0.1400 | < 0.13 | < 5 | mg/l | U/None | L | |
| RQ21125-001 (LB)/ RQ21125-001 | Magnesium | 0.3600 | < 0.26 | < 5 | mg/l | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DTW2-00-17116 (SD)/ RH18018-006MD | Chloroethane | 136.0 | 30 - 135 | 20 - 135 | percent | J/None | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, Trip Blank**

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-TB1-03-081716 (TB)/ RH18018-002 | Bromoform | 0.6100 | < 0.4 | < 1 | ug/l | U/None | T | |
| CDL-TB1-03-081716 (TB)/ RH18018-002 | 1,2-Dichloroethane | 2.900 | < 0.4 | < 1 | ug/l | U/None | T | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Initial Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| ICV 19-Jul-2016 21:03 (IV) | 2,4-Dinitrophenol | 75.00 | 80 - 120 | 80 - 120 | percent | J/UJ | V1 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Initial Calibration Verification for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DTW1-00-119128 | N | 2,4-Dinitrophenol | 5.00 | 3.20 U | 3.20 UJ | - | ug/l | V1 |
| CDL-DTW1-01-119128 | N | 2,4-Dinitrophenol | 5.00 | 3.20 Q U | 3.20 UJ | - | ug/l | I/V1 |

### Quality Control Outliers for test method SW8270D, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RH18018-001MD (SD)/ RH18018-001MD | 3-Nitroaniline | 102.7 | < 30 | < 30 | rpd | J/None | D | |

**Quality Control Outliers for test method SW8270D, MS RPD**

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DTW1-01-119128 (N)/ RH18018-004 | Terphenyl-d14 | 33.25 | 50 - 134 | 10 - 134 | percent | J/UJ | I | |
| CDL-DTW2-00-17116 (N)/ RH18018-006 | 2-Fluorobiphenyl | 42.24 | 44 - 119 | 10 - 119 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| D | MS RPD |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| T | Trip Blank |
| TR | Trace Level Detect |
| V1 | ICV |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by CAPE FEAR ANALYTICAL, LLC, WILMINGTON, NC and were reported under sample delivery group (SDG) 9711_HDOX. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

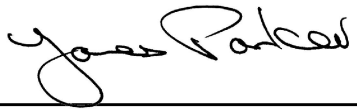
- Blank
- Blank - Negative
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 1 results (1.18%) out of the 85 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

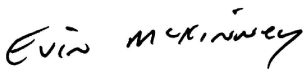
| Analytical Method | Data Reviewer Comment |
|---|---|
| E1613 | The laboratory noted that MS/MSD recoveries were outside control limits. |



November 20, 2017

Reviewed by James Parker, Senior Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.



November 28, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method E1613, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-DTW2-00-107116 (MS)/ 9711002 | Octachlorodibenzo -p-dioxin | 67.70 | 101 - 151 | 10 - 151 | percent | J/UJ | M | |
| CDL-DTW2-00-107116 (SD)/ 9711003 | Octachlorodibenzo -p-dioxin | 93.90 | 101 - 151 | 10 - 151 | percent | J/UJ | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-DTW2-00-107116 | N | Octachlorodibenzo-p-dioxin | 109 | 1470 | 1470 J | - | pg/l | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Table of All Qualified Results**

| Test Method: E1613 Extraction Method: SW3520C | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
| CDL-DTW2-00-107116 | N | Octachlorodibenzo-p-dioxin | 109 | 1470 | 1470 J | - | pg/l | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| M | MS Recovery |
| TR | Trace Level Detect |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) RE17027. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 11 results (0.99%) out of the 1111 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

It was noted that FedEx "Rec'd By" info missing on COC.

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | No additional comments; see Checklist for detail. |
| SW7470A | No additional comments; see Checklist for detail. |
| SW8260B | The lab narrated the MS/MSD recoveries in batch 13975 were outside acceptance criteria. All other QA/QC criteria for the batch were within acceptance criteria and method control limits. The MS/MSD recovery results are attributed to matrix interference. The associated sample results were reported and no corrective action was required. |
| SW8270D | The lab narrated the MS/MSD recoveries in batch 13648 were outside acceptance criteria. All other QA/QC criteria for the batch were within acceptance criteria and method control limits. The MS/MSD recovery results are attributed to matrix interference. The associated sample results were reported and no corrective action was required. |

Reviewed by Amy Bass, Data Review Chemist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

December 01, 2017

Reviewed by Leticia Sangalang, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW8260B, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-RB2-03-051316 (EB)/ RE17027-008 | Chloromethane | 0.2300 | < 0.19 | < 1 | ug/l | U/None | V | |
| CDL-RB2-03-051316 (EB)/ RE17027-008 | Acetone | 5.900 | < 1.6 | < 20 | ug/l | U/None | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Equipment Blank for SW8260B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| CDL-MW3-00-007026 | N | n-Nitrosodiphenylamine | 1.00 | 0.920 S U | 0.920 UJ | - | ug/l | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| D | MS RPD |
| M | MS Recovery |
| TR | Trace Level Detect |
| V | Equipment Blank |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by CAPE FEAR ANALYTICAL, LLC, WILMINGTON, NC and were reported under sample delivery group (SDG) 9224_HDOX. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 6 results (7.06%) out of the 85 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| E1613 | No additional comments; see Checklist for detail. |

November 18, 2017

Reviewed by Mark Lund, Project Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 28, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method E1613, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 12016133 (BS)/ 12016133 | 2,3,7,8-Tetrachlorodibenzofuran | 94.50 | 95 - 126 | 10 - 126 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-MW3-00-007026 | N | 2,3,7,8-Tetrachlorodibenzofuran | 11.0 | 7.34 U | 7.34 UJ | - | pg/l | C |

| CDL-MW4-01-009028 | N | 2,3,7,8-Tetrachlorodibenzofuran | 10.5 | 7.02 U | 7.02 UJ | - | pg/l | C |
| CDL-MW5-00-009028 | N | 2,3,7,8-Tetrachlorodibenzofuran | 10.6 | 7.04 U | 7.04 UJ | - | pg/l | C |
| CDL-RB2-03-051316 | EB | 2,3,7,8-Tetrachlorodibenzofuran | 10.6 | 7.07 U | 7.07 UJ | - | pg/l | C |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method E1613, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-MW3-00-007026 (SD)/ 9224006 | 2,3,7,8-Tetrachlorodibenzo-p-dioxin | 87.89 | 88 - 135 | 10 - 135 | percent | J/UJ | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for E1613**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|

| CDL-MW5-00-009028 | N | 2,3,7,8-Tetrachlorodibenzofuran | 10.6 | 7.04 U | 7.04 UJ | - | pg/l | C |
| CDL-RB2-03-051316 | EB | 2,3,7,8-Tetrachlorodibenzofuran | 10.6 | 7.07 U | 7.07 UJ | - | pg/l | C |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| M | MS Recovery |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) RK17021. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 278 results (21.53%) out of the 1291 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | The lab noted MS/MSD recoveries in batch 27186 were outside acceptance criteria. All other QC criteria for the batch was within acceptance criteria and method control limits. The MS/MSD recovery results are attributed to matrix interference. The associated sample results were reported and no corrective action was required. |
| SW7470A | No additional comments; see Checklist for detail. |
| SW8260B | No additional comments; see Checklist for detail. |
| SW8270D | The lab noted the following:<br><br>The LCS associated with all samples had several compounds recovery below acceptance criteria. The associated CCV had high recovery for Isophorone (21%), with no detections in the samples.<br><br>The MSD for -009 was not spiked.<br><br>Surrogate failures were present in samples -003, 004 and 012. All samples were re-extracted outside the holding time, the associated LCS passed recovery for all analytes. Samples -004 failed surrogate recovery confirming matrix interference. |

Reviewed by Gretchen Gotlieb, Data Review Chemist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

December 04, 2017

Reviewed by Leticia Sangalang, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Total, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8260B, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-MW6-00-023042-02 (SD)/ RK17021-009MD | 1,1,2-Trichloro-1,2,2-trifluoroethane | 76.00 | 78 - 150 | 20 - 150 | percent | J/UJ | M | |

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-MW2-00-029048-02 (N)/ RK17021-012 | Terphenyl-d14 | 44.81 | 50 - 134 | 10 - 134 | percent | J/UJ | I | |
| CDL-MW5-00-009028-02 (N)/ RK17021-004 | Terphenyl-d14 | 27.46 | 50 - 134 | 10 - 134 | percent | J/UJ | I | |
| CDL-RB1-02-111516 (EB)/ RK17021-003 | 2-Fluorobiphenyl | 38.32 | 44 - 119 | 10 - 119 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Table of All Qualified Results**

| Test Method: SW8270D | Extraction Method: SW3520C | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
| CDL-RB1-02-111516 | EB | Di-n-octyl phthalate | 5.00 | 4.00 QL U | 4.00 UJ | - | ug/l | C/I |
| CDL-RB1-02-111516 | EB | Hexachlorocyclopentadiene | 5.00 | 3.20 Q U | 3.20 UJ | - | ug/l | C/I |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| C | LCS Recovery |
| I | Surrogate recovery outside project limits. |
| M | MS Recovery |
| TR | Trace Level Detect |
| V | Equipment Blank |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by CAPE FEAR ANALYTICAL, LLC, WILMINGTON, NC and were reported under sample delivery group (SDG) 10102_HDOX. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 21 results (9.50%) out of the 221 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

The sample receipt checklist notes that samples 10102004,005, 008, 009 and 010 have 4% solids.

| Analytical Method | Data Reviewer Comment |

| E1613 | The laboratory noted that MS/MSD recovery and RPD were outside control limits. |

November 14, 2017

Reviewed by Mark Lund, Project Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

November 27, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method E1613, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 12017461 (BS)/ 12017461 | 2,3,7,8-Tetrachlorodibenzofuran | 82.00 | 95 - 126 | 10 - 126 | percent | J/UJ | C | |
| 12017461 (BS)/ 12017461 | 2,3,7,8-Tetrachlorodibenzo-p-dioxin | 85.50 | 88 - 135 | 10 - 135 | percent | J/UJ | C | |
| 12017462 (BD)/ 12017462 | 2,3,7,8-Tetrachlorodibenzo-p-dioxin | 84.00 | 88 - 135 | 10 - 135 | percent | J/UJ | C | |
| 12017462 (BD)/ 12017462 | 2,3,7,8-Tetrachlorodibenzofuran | 87.50 | 95 - 126 | 10 - 126 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method E1613, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 10102010 (SD)/ 10102010 | Octachlorodibenzo-p-dioxin | 161.0 | 10 - 151 | 10 - 151 | percent | J/None | M | |
| 10102010 (MS)/ 10102010 | Octachlorodibenzo-p-dioxin | 198.0 | 10 - 151 | 10 - 151 | percent | J/None | M | |
| CDL-MW6-00-023042-02 (MS)/ 10102009 | 2,3,7,8-Tetrachlorodibenzo-p-dioxin | 83.98 | 88 - 135 | 10 - 135 | percent | J/UJ | M | |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method E1613, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| 10102010 (SD)/ 10102010 | Octachlorodibenzo -p-dioxin | 20.47 | < 20 | < 20 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) SK09023. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

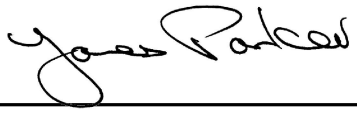
- Blank
- Blank - Negative
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 12 results (4.65%) out of the 258 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | No additional comments; see Checklist for detail. |
| SW7470A | The laboratory noted that the LLCCV was outside control limits with a high bias; however, all associated samples are non-detect. |
| SW8270D | The laboratory noted that the ICV was outside control limits with a high bias for 2,4-dimethyl phenol and hexachlorobutadiene; however, all associated samples are non-detect. |



January 26, 2018

Reviewed by James Parker, Senior Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

January 30, 2018

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Total, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| SQ56932-001 (LB)/ SQ56932-001 | Arsenic | 0.003100 | < 0.0025 | < 0.015 | mg/l | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Blank for SW6010C, Total**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-PWTOC06-00-309450 | N | Arsenic | 0.0150 | 0.00920 BJ | 0.0150 U | + | mg/l | L |

| CDL-PWTOC06-04-309450 | N | Arsenic | 0.0150 | 0.0130 BJ | 0.0150 U | + | mg/l | L |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW7470A, Total, Low Level Calibration Verification**

Compliance requirements for satisfactory low level calibration verification is established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| LLCCV (LV) | Mercury | 125.0 | 80 - 120 | 80 - 120 | percent | J/None | V6 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Initial Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| SVMS 3094 (IV) | bis(2-Chloroethoxy) methane | 120.1 | 80 - 120 | 80 - 120 | percent | J/None | V1 | |
| SVMS 3094 (IV) | 2,4-Dimethylphenol | 120.3 | 80 - 120 | 80 - 120 | percent | J/None | V1 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-PWTOC06-04-30945 (SD)/ SK09023-003MD | 4-Chloroaniline | 31.88 | < 30 | < 30 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-PWTOC06-04-30945 (SD)/ SK09023-003MD | Terphenyl-d14 | 48.36 | 50 - 134 | 10 - 134 | percent | J/UJ | I | |
| CDL-PWTOC06-04-30945 (MS)/ SK09023-003MS | Terphenyl-d14 | 45.52 | 50 - 134 | 10 - 134 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| D | MS RPD |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| TR | Trace Level Detect |
| V1 | ICV |
| V6 | Low Level Calibration Verification |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by Shealy Labs, Inc., West Columbia, SC and were reported under sample delivery group (SDG) RH24026. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

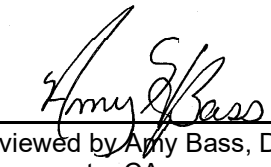
- Blank
- Blank - Negative
- Equipment Blank
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 884 results (31.04%) out of the 2848 results (sample and field QC samples) reported are qualified based on review and 3 results (0.11%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW6010C | The lab noted the following:<br><br>The ICSA verification standard associated with samples -003 thru -007, -009 thru -014 and -016 thru -019 contained zinc at 0.022 mg/L which was marginally greater than the LOQ of 0.020 mg/L. Since there are no interferences for zinc, the likely source of the trace zinc contamination was confined to the ICSA solution, which will be monitored.<br><br>Sodium was present greater than the limit of detection of 1.0 mg/L, but was less than half the limit of quantitation concentration of 2.5 mg/L in the CCBs analyzed on 09/01/2016 at 18:35 (1.5 mg/L) and 19:30 (1.5 mg/L). Sample results with concentrations greater than the linear range standard concentration were diluted and reanalyzed.<br><br>The LCS associated with sample -022 is below acceptance criteria for silver. No sample remained for reanalysis.<br><br>The MS/MSD recoveries in batch 21756 were outside acceptance criteria. |
| SW7470A | The lab noted MS/MSD recoveries in batch 20976 were outside acceptance criteria. |
| SW8260B | The lab noted ICV associated with all samples except for -014 and -015 recovered high for DCDFM (123%) but all samples were ND. The CCV associated with samples -003 through -013 recovered high for TCFM (24%), but all samples were ND. |
| SW8270D | The lab noted the following:<br><br>The LCS associated with samples -001, -002, -003 through -007 and -009 through -012 failed low for 3,3-Dichlorobenzidine. No sample remained for re-extraction of samples -001 and -004. All other samples are re-extracted and re-analyzed, the LCS still failed for 3,3-Dichlorobenzidine. No sample remained for a third extraction.<br><br>Samples -003 through -006, -010, -013 and -019 failed low for surrogate recovery due to severe matrix interference.<br><br>The LCS associated with samples -021, -022 and -023 failed low for 3,3-Dichlorobenzidine. No sample remained for the re-extraction of sample -021. Samples -014, -017, -018, -022 and -023 failed low for surrogate recovery. Samples are re-extracted. The re-extracted LCS fails low for several analytes, but passes for 3,3 DCB. Samples -014 and -018 passed surrogate recovery, samples -017, -022 and -023 failed surrogates confirming matrix intereference (sulfur). This was confirmed through re-extraction.<br><br>ICV associated with samples -001 and -002 had a recovery for 2,4-dinitophenol at 75% which is below DOD limits of 80-120%.<br><br>The MS/MSD recoveries in batches 20682, 20871 and 21267 were outside acceptance criteria. |



November 24, 2017

Reviewed by Amy Bass, Data Review Chemist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

December 05, 2017

Reviewed by Leticia Sangalang, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

**Quality Control Outliers for test method SW6010C, Dissolved, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ21756-001 (LB)/ RQ21756-001 | Sodium | 0.3500 | < 0.33 | < 5 | mg/l | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW6010C, Dissolved, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for SW6010C, Dissolved**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-PW18-00-002 | N | Silver | 0.0100 | 0.00500 LS U | 0.00500 UJ | - | mg/l | C |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, Dissolved, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for SW6010C, Dissolved**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-PW18-00-002 | N | Selenium | 0.0200 | 0.0170 S U | 0.0170 R | - | mg/l | M |
| CDL-PW18-01-002 | N | Selenium | 0.0200 | 0.0170 U | 0.0170 R | - | mg/l | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, Dissolved, Serial dilution**

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-PW18-00-002 | Potassium | 17.50 | < 10 | < 10 | %d | J/UJ | A | |
| CDL-PW18-00-002 | Sodium | 41.00 | < 10 | < 10 | %d | J/UJ | A | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Serial dilution for SW6010C, Dissolved**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-PW18-00-002 | N | Potassium | 50.0 | 380 S | 380 J | | mg/l | A |
| CDL-PW18-00-002 | N | Sodium | 250 | 7500 S | 7500 J | | mg/l | A |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, Total, Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ21125-001 (LB)/ RQ21125-001 | Zinc | 0.003900 | < 0.0022 | < 0.02 | mg/l | U/None | L | |
| RQ21125-001 (LB)/ RQ21125-001 | Manganese | 0.007200 | < 0.00081 | < 0.015 | mg/l | U/None | L | |
| RQ21125-001 (LB)/ RQ21125-001 | Calcium | 0.1400 | < 0.13 | < 5 | mg/l | U/None | L | |
| RQ21125-001 (LB)/ RQ21125-001 | Magnesium | 0.3600 | < 0.26 | < 5 | mg/l | U/None | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Blank for SW6010C, Total**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-RBPW2-02-082416 | EB | Magnesium | 5.00 | 0.370 BJ | 5.00 U | + | mg/l | L |
| CDL-RBPW3-02-082516 | EB | Calcium | 5.00 | 0.140 BJ | 5.00 U | + | mg/l | L |
| CDL-RBPW3-02-082516 | EB | Magnesium | 5.00 | 0.380 BJ | 5.00 U | + | mg/l | L |
| CDL-RBPW3-02-082516 | EB | Manganese | 0.0150 | 0.00530 BJ | 0.0150 U | + | mg/l | L |
| CDL-RBPW4-02-082616 | EB | Magnesium | 5.00 | 0.360 BJ | 5.00 U | + | mg/l | L |
| CDL-RBPW4-02-082616 | EB | Manganese | 0.0150 | 0.00340 BJ | 0.0150 U | + | mg/l | L |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW6010C, Total, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-RBPW2-02-082416 (EB)/ RH24026-007 | Magnesium | 0.3700 | < 0.26 | < 5 | mg/l | U/None | V | |

| CDL-RBPW4-02-082616 (EB)/ RH24026-012 | Magnesium | 0.3600 | < 0.26 | < 5 | mg/l | U/None | V | |
| CDL-RBPW4-02-082616 (EB)/ RH24026-012 | Sodium | 1.100 | < 0.33 | < 5 | mg/l | U/None | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-RBPW1-02-082216 (EB)/ RH24026-002 | Acetone | 2.900 | < 2 | < 20 | ug/l | U/None | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8260B, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RH24026-009MD (SD)/ RH24026-009MD | Acetone | 32.80 | < 30 | < 30 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Initial Calibration Verification**

Compliance requirements for satisfactory continuing calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data. Continuing calibration is performed to verify and evaluate instrument performance during sample analysis. Summary forms were evaluated against project acceptance criteria, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| ICV 19-Jul-2016 21:03 (IV) | 2,4-Dinitrophenol | 75.00 | 80 - 120 | 80 - 120 | percent | J/UJ | V1 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Initial Calibration Verification for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| CDL-PW12-00-002 | N | 2,4-Dinitrophenol | 5.00 | 3.20 Q U | 3.20 UJ | - | ug/l | I/V1 |
| CDL-RBPW1-02-082216 | EB | 2,4-Dinitrophenol | 5.00 | 3.20 U | 3.20 UJ | - | ug/l | V1 |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| RQ20682-002 (BS)/ RQ20682-002 | 3,3'-Dichlorobenzidine | 7.300 | 20 - 110 | 20 - 110 | percent | J/UJ | C | |
| RQ20871-002 (BS)/ RQ20871-002 | 3,3'-Dichlorobenzidine | 6.800 | 20 - 110 | 20 - 110 | percent | J/UJ | C | |
| RQ21267-002 (BS)/ RQ21267-002 | 3,3'-Dichlorobenzidine | 2.800 | 20 - 110 | 20 - 110 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| CDL-RBPW6-02-083016 (SD)/ RH24026-021MD | Benzo(a)pyrene | 50.00 | 55 - 110 | 10 - 110 | percent | J/UJ | M | |
| CDL-RBPW6-02-083016 (MS)/ RH24026-021MS | Hexachlorocyclopentadiene | 11.67 | 20 - 123 | 10 - 123 | percent | J/UJ | M | |
| CDL-RBPW6-02-083016 (MS)/ RH24026-021MS | Pentachlorophenol | 33.33 | 40 - 115 | 10 - 115 | percent | J/UJ | M | |
| CDL-RBPW6-02-083016 (MS)/ RH24026-021MS | Dibenz (a,h)anthracene | 35.42 | 40 - 125 | 10 - 125 | percent | J/UJ | M | |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| A | Serial dilution |
| C | LCS Recovery |
| D | MS RPD |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| TR | Trace Level Detect |
| V | Equipment Blank |
| V1 | ICV |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| R | The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making. |
| B | Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample. |
| UB | The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Project-Specific Uniform Federal Policy (UFP) Quality Assurance Project Plan (QAPP) for Project 15 – Construction Debris Landfill Feasibility Study Wallops Flight Facility (WFF) Chincoteague, Virginia, Sept 2015 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by CDM Smith, Inc., Boston, MA; analyses were performed by CAPE FEAR ANALYTICAL, LLC, WILMINGTON, NC and were reported under sample delivery group (SDG) 9696_HDOX. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

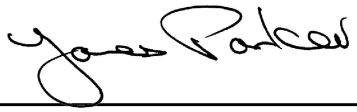
- Blank
- Blank - Negative
- Equipment Blank
- Field Duplicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 340 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the limit of detection and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

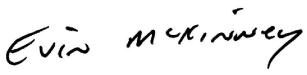
| Analytical Method | Data Reviewer Comment |
|---|---|
| E1613 | No additional comments; see Checklist for detail. |



November 17, 2017

Reviewed by James Parker, Senior Scientist, Synectics, Sacramento, CA

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.



November 28, 2017

Reviewed by Evin McKinney, Senior Scientist, Synectics, Sacramento, CA

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Qualified Results

No results associated with this sample delivery group required qualification.
