Subject: 600 Area Perched Groundwater Extraction Pilot Test Interim Status Report – Project Year 11

Enclosed is the *600 Area Perched Groundwater Extraction Pilot Test Interim Status Report for Project Year 11*, submitted in accordance with the 600 Area Perched Groundwater Extraction Pilot Test Interim Status Report – Project Year 5, approved by NMED August April 17, 2018. Requirements of the NMED-approved *600 Area Perched Groundwater Extraction Pilot Test Work Plan* (November 13, 2012) and subsequent correspondence are included in the report. A statistical analysis has been included in the Year 11 report in order to support groundwater and soil vapor data evaluations. This submittal includes an Executive Summary as Enclosure 1, a paper copy of the report as Enclosure 2, and a CD-ROM with the report as a PDF and Excel Statistical Trend Input Files as Enclosure 3.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

If you have any questions or comments concerning this submittal, please contact Antonette Doherty of my staff at 575-202-5406.

Executive Summary

The Interim Status Report for 600 Area Perched Groundwater Extraction Pilot Test (PGEPT) Project Year 11 summarizes the results of perched groundwater (PGW) extraction at the White Sands Test Facility (WSTF) 600 Area Closure (Closure). National Aeronautics and Space Administration (NASA) has extracted PGW for 11 years, originally in accordance with the *600 Area Perched Groundwater Extraction Pilot Test Work Plan*, submitted by NASA on November 13, 2012. Subsequent directives by NMED have required continued monitoring and extraction of the PGW. The objective of the pilot test is to extract PGW on the top of bedrock at the bedrock-alluvium interface using groundwater monitoring well 600-G-138 and determine the impact of groundwater extraction on the concentrations of hazardous constituents in the groundwater and soil vapor beneath the Closure. Quarterly PGW and soil vapor sampling was continued throughout Project Year 11 to monitor the impact of extraction.

Between April 2013 (when extraction was initiated) and March 2024, NASA has extracted 20,909 gallons of contaminated PGW from monitoring well 600-G-138. For Project Year 11, 1,782 gallons of extracted PGW was transported to, and treated by, the Mid-plume Interception and Treatment System. Field data and chemical analytical results obtained indicate that contaminated PGW prevails on top of the andesite bedrock at well 600-G-138 and the source of soil vapor contaminants remains. Analytical data from PGW well 600-G-138 indicate that the concentrations of volatile organic compounds (VOCs) continue to decline at a similar rate to declining concentrations in contaminated groundwater from upgradient locations in the 200 Area. Groundwater extraction over the 11-year duration of the PGEPT has not significantly reduced the 3-foot (ft) thickness of PGW at well 600-G-138 over an extended period. Analytical data from soil vapor monitoring at adjacent multiport soil vapor monitoring well (MSVM) 600-SGW-5 indicate that concentrations of VOCs in the soil vapor have continued to decline slightly throughout the 11 year duration of the pilot test.

Chemical analytical data show that the concentrations of nitrate/nitrite and chloride in PGW exhibit slightly declining trends over the PGEPT. The gradual declining trend in chloride and nitrate/nitrite concentrations may indicate a lessening in the impact of infiltration following the removal of standing water from the adjacent 600 Area Wastewater Lagoons by July 2017. Concentrations of trichloroethene (TCE) in PGW have declined from 110 µg/L in November 2013 to 35 µg/L in January 2024 or approximately 70 percent over the 11-year duration of the PGEPT. Chloroform concentrations in PGW measured during the PGEPT contrast the other VOCs and exhibit a statistically inconsistent trend.

Declining concentrations of several of the PGW contaminants of concern (COCs) is inferred to have had a delayed effect on reducing the concentrations of COCs in soil vapor measured at MSVM well 600-SGW-5 located adjacent to monitoring well 600-G-138. Well 600-SGW-5 also shows a consistent relationship of increasing soil vapor concentrations with depth and proximity to the local groundwater source during individual sampling events. During performance of the PGEPT, concentrations of TCE, the primary VOC in soil vapor, have trended downward in the monitoring zones at 7.5 and 102.5 ft, with no statistically significant trends for 52.5 and 137.5 ft below ground surface (bgs). In general, soil vapor chemical analytical data from samples collected at 600-SGW-5 have declined in concentration over the duration of the PGEPT.

NASA concludes that although PGW extraction at well 600-G-138 has not significantly reduced the volume of groundwater migrating through the well, it provides a significant contribution to the removal of contaminant mass from the 600 Area PGW. Based on the potential use for data from this project for PGW evaluation, NASA recommends that PGW extraction and monitoring at well 600-G-138 and soil vapor monitoring at well 600-SGW-5 be continued and summarized in the PGEPT Year 12 report.

Executive Summary

The Interim Status Report for 600 Area Perched Groundwater Extraction Pilot Test (PGEPT) Project Year 11 summarizes the results of perched groundwater (PGW) extraction at the White Sands Test Facility (WSTF) 600 Area Closure (Closure). National Aeronautics and Space Administration (NASA) has extracted PGW for 11 years, originally in accordance with the *600 Area Perched Groundwater Extraction Pilot Test Work Plan*, submitted by NASA on November 13, 2012. Subsequent directives by NMED have required continued monitoring and extraction of the PGW. The objective of the pilot test is to extract PGW on the top of bedrock at the bedrock-alluvium interface using groundwater monitoring well 600-G-138 and determine the impact of groundwater extraction on the concentrations of hazardous constituents in the groundwater and soil vapor beneath the Closure. Quarterly PGW and soil vapor sampling was continued throughout Project Year 11 to monitor the impact of extraction.

Between April 2013 (when extraction was initiated) and March 2024, NASA has extracted 20,909 gallons of contaminated PGW from monitoring well 600-G-138. For Project Year 11, 1,782 gallons of extracted PGW were transported to and treated by the Mid-plume Interception and Treatment System. Field data and chemical analytical results obtained indicate that contaminated PGW prevails on top of the andesite bedrock at well 600-G-138 and the source of soil vapor contaminants remains. Analytical data from PGW well 600-G-138 indicate that the concentrations of volatile organic compounds (VOCs) continue to decline at a similar rate to declining concentrations in contaminated groundwater from upgradient locations in the 200 Area. Groundwater extraction over the 11-year duration of the PGEPT has not significantly reduced the 3-foot (ft) thickness of PGW at well 600-G-138 over an extended period. Analytical data from soil vapor monitoring at adjacent multiport soil vapor monitoring well (MSVM) 600-SGW-5 indicate that concentrations of VOCs in the soil vapor have continued to decline slightly throughout the 11-year duration of the pilot test.

Chemical analytical data show that the concentrations of nitrate/nitrite and chloride in PGW exhibit slightly declining trends over the PGEPT. The gradual declining trend in chloride and nitrate/nitrite concentrations may indicate a lessening in the impact of infiltration following the removal of standing water from the adjacent 600 Area Wastewater Lagoons by July 2017. Concentrations of trichloroethene (TCE) in PGW have declined from 110 µg/L in November 2013 to 35 µg/L in January 2024 or approximately 70 percent over the 11-year duration of the PGEPT. Chloroform concentrations in PGW measured during the PGEPT contrast the other VOCs and exhibit a statistically inconsistent trend.

Declining concentrations of several of the PGW contaminants of concern (COCs) is inferred to have had a delayed effect on reducing the concentrations of COCs in soil vapor measured at MSVM well 600-SGW-5 located adjacent to monitoring well 600-G-138. Well 600-SGW-5 also shows a consistent relationship of increasing soil vapor concentrations with depth and proximity to the local groundwater source during individual sampling events. During performance of the PGEPT, concentrations of TCE, the primary VOC in soil vapor, have trended downward in the monitoring zones at 7.5 and 102.5 ft, with no statistically significant trends for 52.5 and 137.5 ft below ground surface (bgs). In general, soil vapor chemical analytical data from samples collected at 600-SGW-5 have declined in concentration over the duration of the PGEPT.

NASA concludes that although PGW extraction at well 600-G-138 has not significantly reduced the volume of groundwater migrating through the well, it provides a significant contribution to the removal of contaminant mass from the 600 Area PGW. Based on the potential use for data from this project for PGW evaluation, NASA recommends that PGW extraction and monitoring at well 600-G-138 and soil vapor monitoring at well 600-SGW-5 be continued and summarized in the PGEPT Year 12 report.

1.0 Introduction

The National Aeronautics and Space Administration (NASA) Johnson Space Center White Sands Test Facility (WSTF) is located in Doña Ana County, 18 miles northeast of Las Cruces, New Mexico and 65 miles north of El Paso, Texas. Figure 1.1 provides a WSTF location map.

WSTF's primary activities in support of the space program are:

1. Development, qualification, refurbishment, and testing of spacecraft propulsion systems, subsystems, and ground support equipment.

2. Investigation of flight hardware anomalies.

3. Testing of materials and components.

4. Performance of hazard and failure analyses.

Hazardous wastes are generated during the testing and evaluation processes at WSTF. Following the completion of construction of WSTF in 1964, many wastes were historically managed in surface impoundments within the WSTF industrial area which contributed to groundwater contamination. There are five closed hazardous waste management units (HWMUs) at WSTF, including the 600 Area impoundments. The 600 Area HWMU was closed by NASA in August 1989 and was managed under the WSTF Post-closure Care Permit between the time of closure and November 2009, when management of the HWMUs was incorporated into WSTF's Hazardous Waste Permit (Permit; NMED, 2009). Figure 1.2 provides an aerial photograph of the Closure (600 Area Closure) with pertinent features identified including the local well network.

1.1 Background

1.1.1 600 Area Closure Investigations and Perched Groundwater Identification (2009 – 2013)

NASA performed a comprehensive investigation to the depth of the vadose zone at the 600 Area Closure in late 2009 and early 2010. During the investigation, perched groundwater (PGW) was unexpectedly identified on the top of the poorly fractured to non-fractured (competent) andesite bedrock surface near the north and east corners of the Closure (Figure 1.2) in two of eight soil borings installed. Grab samples of the PGW indicated trichloroethene (TCE) concentrations in excess of groundwater cleanup levels. Nitrate/nitrite and chloride were also detected in the grab samples, indicating that the nearby 600 Area Wastewater Lagoons could potentially be contributing to the PGW at this location. Specific information was provided in the *NASA White Sands Test Facility (WSTF) 600 Area Closure Investigation Report Provided in Response to a NMED Notice of Disapproval* submitted to the New Mexico Environment Department (NMED) on March 30, 2011 (NASA, 2011a). NMED approved the report on June 9, 2011 (NMED, 2011a).

In accordance with NMED's approval of the 600 Area Closure Investigation Report, NASA submitted the *600 Area Closure Soil Vapor Extraction (SVE) Pilot Test Work Plan* on September 1, 2011. NMED approved the *600 Area Closure Soil Vapor Extraction Pilot Test Work Plan* with a modification on October 28, 2011 (NMED, 2011b). NASA performed a soil vapor extraction (SVE) pilot test at the Closure in March 2012. In the final NMED-approved report on the SVE pilot test (NASA, 2012a), NASA proposed the development of an abbreviated work plan for extraction of contaminated PGW beneath the Closure. NASA submitted the *600 Area Perched Groundwater Extraction Pilot Test Work Plan* (PGEPTWP) on November 13, 2012 (NASA, 2012b). NMED approved the work plan on January 16,

2013 (NMED, 2013a) and directed NASA to begin extraction by February 22, 2013. NASA was unable to obtain approval from the New Mexico Office of the State Engineer to utilize groundwater monitoring well 600-G-138 as a pollution recovery well in time to meet the NMED deadline. This required NASA to request an extension of time for implementation of the pilot test (NASA, 2013), in which NASA proposed to initiate extraction of PGW by April 19, 2013. NMED approved this extension request on March 1, 2013 (NMED, 2013b).

1.1.2 Perched Groundwater Extraction Pilot Testing and Reporting (2013 – Present)

NASA initiated extraction of PGW in accordance with the approved work plan on April 19, 2013 and provided the results of groundwater extraction and associated groundwater and soil vapor monitoring in the *600 Area Perched Groundwater Extraction Pilot Test Interim Status Report* (NASA, 2014). In that report, NASA concluded that the presence of contaminated PGW beneath the Closure continued to contribute to volatile organic compounds (VOCs) in the soil vapor above the PGW and potentially throughout the 600 Area. NASA recommended continued extraction and monitoring of 600 Area PGW and soil vapor monitoring. NMED approved the report on August 14, 2014 (NMED, 2014) and directed NASA to continue PGW extraction and submit another project report within 30 days of the end of the second project year of the project.

NASA continued the extraction of PGW from monitoring well 600-G-138 between April 2014 and March 2015 and presented the results of the second project year in the *600 Area Perched Groundwater Extraction Pilot Test Interim Status Report – Project Year 2* on April 16, 2015 (NASA, 2015a). NASA again concluded that the extraction of PGW had not reduced the thickness of the PGW unit beneath the closure and that the presence of contaminated PGW continued to contribute to the presence of VOCs in the soil vapor of the vadose zone. NMED approved NASA's report on July 15, 2015 with modifications (NMED, 2015). NMED directed NASA to provide nitrate/nitrite analytical data in subsequent status reports and to develop and submit a potentiometric map of the area. The required information was included in all subsequent interim status reports beginning with the *600 Area Perched Groundwater Extraction Pilot Test Interim Status Report – Project Year 3*, submitted to NMED on April 14, 2016 (NASA, 2016a) and approved on November 17, 2016 (NMED, 2016a).

On April 26, 2017, NASA submitted the *600 Area Perched Groundwater Extraction Pilot Test Interim Status Report – Project Year 4* (NASA, 2017a), in which NASA recommended discontinuing the extraction of PGW from monitoring well 600-G-138. NMED issued the *Approval with Modification Interim Status Report for 600 Area Perched Groundwater Extraction Pilot Test* on September 15, 2017 (NMED, 2017c). NMED disagreed with NASA's recommendation and directed NASA to revise the investigation report to continue PGW extraction at monitoring well 600-G-138. NASA submitted *600 Area Perched Groundwater Extraction Pilot Test Interim Status Report – Project Year 5* on May 3, 2018 (NASA, 2018a), which was approved by NMED on August 17, 2018 (NMED, 2018). The 600 Area Wastewater Lagoons standing water was removed by July 2017, and all sludge was removed by December 2018 (NASA, 2019c). NASA submitted the *600 Area Perched Groundwater Extraction Pilot Test Interim Status Report – Project Year 6* on April 30, 2019 (NASA, 2019a), which was approved by NMED on September 3, 2019 (NMED, 2019b). The Year 7 report was submitted on May 26, 2020 (NASA, 2020b) and approved by NMED on May 6, 2021 (NMED, 2021a). On April 29, 2021, NASA submitted the Year 8 report (NASA, 2021), which was approved on December 8, 2021 (NMED, 2021b). The Year 9 report was submitted on April 26, 2022 (NASA, 2022a) and was approved by NMED on January 6, 2023 (NMED, 2023a). Most recently, the Year 10 report was submitted on April 19, 2023 (NASA, 2023c) and was approved by NMED on March 7, 2024 (NMED, 2024).

1.1.3 Perched Groundwater Investigation (2019 – Present)

In the years following initial identification of PGW unit in the vicinity of the 600 Area Closure, NMED indicated that additional investigation was warranted and required NASA to develop and submit a work plan by December 31, 2015 (NMED, 2015). NASA submitted the *Additional Work Plan Requirements to Evaluate Potential Source of 600 Area Contamination* on November 25, 2015 (NASA, 2015b) and the required *Abbreviated Investigation Work Plan (AIWP) for the 600 Area Perched Groundwater* to NMED on July 7, 2016 (NASA, 2016b). NMED disapproved the Work Plan on November 30, 2016 (NMED, 2016b). NASA submitted the *Response to Disapproval of Abbreviated Investigation Work Plan for 600 Area Perched Groundwater* on December 22, 2016 (NASA, 2016c). NMED approved the revised version of the work plan on March 31, 2017 (NMED, 2017a). The revised work plan included a geophysical seismic survey for the area surrounding the Closure and associated installation of PGW wells based on the results of the survey.

On August 7, 2019, NASA submitted the *Request to Remove Electrical Resistivity Component of the 600 Area Perched Groundwater Geophysical Survey based on Geophysical Subcontractor Input Received during the Procurement Process* (NASA, 2019b). NMED approved the work scope modification request on August 23, 2019 (NMED, 2019a). NASA submitted the *Synopsis of the Findings of the 600 Area Closure Geophysical Seismic Refraction Tomography and Reflection Surveys with Revised Soil Boring Locations* on December 19, 2019 (NASA, 2019d). NMED approved the submittal with modifications on December 22, 2020 (NMED, 2020). The objective of the seismic survey was to image the bedrock surface to assist in refining optimal soil boring locations to target any depressions in the bedrock surface that preferentially channelize the PGW. Attempts to define the elevation of the bedrock-alluvial interface using seismic refraction tomography (SRT) and reflection methods to the level of accuracy required to meet the objective were not successful. The inability of the seismic survey to predict the elevation of bedrock in an area with a considerable amount of available soil boring and well borehole bedrock tags indicated that extending the existing geophysical seismic survey would not be beneficial. On June 29, 2022, NASA submitted the 600 Area Perched Groundwater Investigation Report (IR; NASA, 2022b). NMED approved the IR with modifications on June 28, 2023 (NMED, 2023c).

The 600 Area PGW field investigation was conducted between October 2019 and May 2022 and in addition to the preliminary geophysical seismic survey of the bedrock surface included: the installation of soil borings, one of which was subsequently converted into a PGW unit monitoring well screened across the alluvial-andesite bedrock interface; a colloidal borescope flow vector evaluation; and the groundwater sampling of existing PGW wells. Six exploratory PGW soil borings (600-PGW-1 through 600-PGW-6) were initially installed at locations either where PGW had been previously identified or was inferred based on the results of the geophysical seismic survey. The bedrock elevations encountered at the six soil borings did not correlate well with the predicted bedrock elevations from the seismic survey (SRT and reflection) with discrepancies up to 50 feet (ft). The single location with acceptable correlation between the actual and predicted elevations of bedrock to the required level of resolution for the survey (ability to detect $\leq$ 5 ft channels) was soil boring 600-PGW-2 at the north corner of the 600 Area Closure. This was located adjacent to previously identified multiport soil vapor monitoring well (MSVM) well 600-SGW-8 where a ground truth bedrock elevation was available. Monitoring well 600A-001-GW was subsequently completed at this location (Figure 1.2).

A colloidal borescope flow vector evaluation was performed to evaluate the two available PGW wells (600-G-138 and 600A-001-GW) along with 12 other conventional monitoring wells within the adjacent fractured bedrock aquifer. Flow vectors generally conformed to the local pattern of groundwater bedrock aquifer and overlying PGW unit flow hypothesized for the 600 Area Closure. The flow directions suggested potential groundwater movement from the 200 Area along the strike of bedding plane solution channels southwest toward the 600 Area in the vicinity of Gardner Spring Arroyo (GSA). West of the

Hardscrabble Hill Fault (HHF), flow into the poorly fractured volcanic bedrock at the junction of the two lithologies juxtaposed along this fault is predominantly toward the west under the influence of the strong hydraulic gradient on the bedrock pediment. The exception to westward flow at the HHF is the tangential south-southwest flow at the alluvial-bedrock interface reflected by the flow vector in PGW well 600-G-138, which is consistent with a potential 200 Area/GSA source (NASA, 2022b).

Groundwater sampling was performed at the two available PGW locations (wells 600-G-138 and 600A-001-GW). Preliminary groundwater analytical results for PGW well 600A-001-GW were not compatible to the suite of contaminants and higher concentrations identified within previously installed PGW well 600-G-138. Although an insight to PGW geochemistry was improved through the installation of well 600A-001-GW, data acquired did not improve the conceptualization of the upgradient PGW source and downgradient PGW migration pathways. Direct flow between the two existing PGW wells was considered unlikely based on available data due to: the shallow bedrock high identified between the two at well 600-SGW-3 (Figure 1.2); the preliminary colloidal borescope flow direction at well 600-G-138 toward the southwest; and differences in the groundwater analytical results (NASA, 2022b).

Following NMED's approval of the 600 Area PGW IR (NMED, 2023c), NASA submitted the *600 Area Perched Groundwater Phase II Abbreviated Investigation Work Plan* (AIWP) on November 27, 2023 (NASA, 2023d). This report is currently in NMED review. The purpose of the Phase II AIWP is to continue characterizing the nature, source, and migration pathways of the PGW unit in the vicinity of the 600 Area Closure, which is hypothesized to be a channelized system based on information collected to date (NASA, 2022a). Phase II is divided into two separate components. Phase IIa comprises a comprehensive hydrogeological investigation of the existing PGW network based on the investigation of four conventional monitoring wells installed in the 600 Area that have encountered PGW. Phase IIb comprises the potential installation of additional soil borings and/or wells at locations deemed to have the best opportunity for PGW interception based on Phase IIa and conform to the requests of NMED (2023b).

1.2 Objective and Scope

The objective of the PGEPT is to extract contaminated PGW using existing monitoring well 600-G-138 and to evaluate the impact of groundwater extraction on concentrations of VOCs in the vadose zone near that groundwater monitoring well. To achieve this objective, NASA has collected and managed groundwater and soil vapor samples from 600-G-138 and adjacent MSVM well 600-SGW-5 (Figure 1.2), respectively. The scope of the pilot test is limited to extracting PGW from existing monitoring well 600-G-138, treating the extracted PGW at the Mid-plume Interception and Treatment System (MPITS) as indicated in the MPITS Interim Measure Work Plan (NASA, 2008) and Discharge Permit (DP)-1255 (NMED, 2023b), and evaluating PGW samples from well 600-G-138 and soil vapor samples from well 600-SGW-5.

1.3 Contaminants of Concern

The potential groundwater contaminants of concern (COCs) for this investigation were identified in the PGEPTWP and consist of TCE, tetrachloroethene (PCE), chloroform, N-Nitrosodimethylamine (NDMA), nitrate/nitrite, and chloride. TCE, PCE, chloroform, and NDMA were identified as COCs for this investigation because treatment standards for these constituents are stipulated in DP-1255 (NMED, 2023b), which provides the requirements for discharging groundwater treated by the MPITS, including groundwater extracted from 600-G-138. Nitrate/nitrite and chloride were identified as COCs because of their presence in grab samples collected from 600-G-138 during the initial 600 Area Investigation. The primary COC for soil vapor has been identified as TCE because concentrations of TCE in groundwater beneath the Closure exceed NMED regulatory cleanup levels (NASA, 2012b).

2.0 Scope of Activities

2.1 Perched Groundwater Extraction and Management

PGW is pumped from the well twice each WSTF working day. The pump is activated and operated until it breaks suction when the water level draws down to the pump intake depth, generally located at approximately 148 ft btoc, which is coincidental with the depth of the bedrock surface. On average, 12 to 15 gallons of PGW are removed each pumping day through two purging events, one in the morning and one in the afternoon. PGW recovery is not monitored on a regular basis, although well 600-G-138 is observed to recover fully between the morning purge event and the afternoon purge event, which are separated by approximately four to six hours. A field evaluation performed at well 600-G-138 in August 2022 indicated that PGW recovers at approximately 0.23 gallons per minute (gpm) over a period of 30 minutes.

NASA manages extracted groundwater in accordance with 40 Code of Federal Regulations (CFR) 262.17 and 20.4.1.300 New Mexico Administrative Code (NMAC) prior to transfer to the MPITS, where it is treated in accordance with the MPITS Interim Measure Work Plan (NASA, 2008) and discharged in accordance with DP-1255 (NMED, 2023b).

2.2 Groundwater Monitoring

Throughout the pilot test, groundwater samples have been collected quarterly from PGW monitoring well 600-G-138 (Figure 1.2) in accordance with the requirements of site-specific sampling procedures and the WSTF Groundwater Monitoring Plan (GMP) in effect at the time of each sampling (NASA, 2023e; NMED, 2023d). Prior to every PGW sample collection for Project Year 11 (4/19/2023, 7/21/2023, 10/18/2023, and 1/17/2023), the standing water in the well casing was evacuated and the non-dedicated purge pump was removed. The water level was allowed to recover before groundwater samples were collected with a decontaminated Teflon®[1] bailer. Groundwater indicator parameters (pH, temperature, conductivity, and turbidity) were measured and recorded in the appropriate field logbook. The PGW was then dispensed into laboratory-provided sample containers, which were appropriately labeled and placed in cold storage. Samples were shipped to NASA's contracted off-site analytical laboratories for analysis. Samples were analyzed quarterly for VOCs (by Environmental Protection Agency [EPA] Method 8260), chloride (by EPA Method 300.0), and nitrate/nitrite (by EPA Method 353.2) and annually for NDMA (by EPA Method 607; sampled 4/19/2023).

2.3 Soil Vapor Monitoring

For Project Year 11, Soil vapor well 600-SGW-5 was sampled quarterly (4/19/2023, 7/21/2023, 10/18/2023, and 1/17/2024) in conjunction with groundwater sampling performed at PGW monitoring well 600-G-138 as part of the PGEPT evaluation. The monitoring zones of soil vapor well 600-SGW-5 were sampled in accordance with WSTF-specific procedures for soil vapor sampling. The monitoring zones, sampling ports, and stainless-steel tubing were purged of entrained soil vapor with a non-dedicated surface vacuum pump to evacuate stagnant air from the soil vapor sampling implant and stainless-steel tubing connecting the implant to the surface sample collection fitting. Each MSVM well monitoring zone was purged for a minimum of five minutes per zone to evacuate at least three volumes of the ¼ inch tubing and soil vapor implant. Carbon dioxide, oxygen, and methane indicator parameters were monitored during the purging operation as these parameters are required to stabilize prior to sampling and recorded in the appropriate field logbook. Soil vapor samples were collected in 1-liter stainless-steel SUMMA

[1] Teflon® is a registered trademark of The Chemours Company FC, LLC.

canisters provided by the analytical laboratory. Samples were labeled and placed in controlled storage prior to shipment to the contracted off-site analytical laboratory. Samples were analyzed for VOCs by EPA Method TO-15.

2.4 WSTF Precipitation Monitoring

NASA currently monitors precipitation at WSTF via a rain gauge installed at the 700 Area closed landfill. As part of this PGW study, rain levels are evaluated with depth to PGW in well 600-G-138 to assess precipitation recharge effects on the PGW aquifer. Table 2.1 includes rain gauge results from 2013 through present (Project Year 1 through Project Year 11).

2.5 Statistical Evaluation

Both the well 600-G-138 groundwater and well 600-SGW-5 soil vapor COC data sets were used to perform ordinary least squares (OLS) regression or Mann-Kendall (M-K) trend tests using the most recent version of ProUCL software (5.2) to determine if there was a statistically significant trend in COC concentrations from Project Year 1 to the present (Project Year 11). OLS is a parametric test and used to determine if a linear temporal trend in the data exists. A best-fit straight line is determined from the data with a positive slope indicating an increasing trend, and a negative slope indicating a decreasing trend. The correlation coefficient, titled Pearson's *r*, describes the relation between the observed and calculated concentrations. The sign of *r* equates to the type of trend (positive for increasing and negative for decreasing), with the magnitude of *r* indicating the strength of the trend. The closer the absolute value of *r* is to 1, the stronger the trend (ITRC, 2013; EPA, 2009).

M-K trend tests are non-parametric, meaning that there are no assumptions regarding data distribution. Each sample is ordered by earliest to latest date, and then compared to every other sample in pairs for concentration change. The change is listed as a score, either -1, 0, or +1. The individual pair scores are summed to establish the M-K value (*S*), which will be negative, positive, or close to 0. The null hypothesis for the M-K trend test is no trend, meaning the concentrations randomly fluctuate around a constant population mean. In general, a positive *S* shows a potential increasing or upward trend, and a negative *S* shows a potential decreasing or downward trend (EPA, 2009; 2015; 2022). The level of confidence (expressed as a confidence coefficient) desired for the test is set prior to testing. The default confidence coefficient in ProUCL and accepted by NMED and EPA is 95 percent, or 0.95 with a significance level of 5 percent or 0.05. This means that there is an error rate of no more than 5 percent. The *p*-value represents the probability that the M-K test results are false when they are true (i.e., when the M-K shows a statistically significant trend when, there is no trend, but random fluctuations). If the *p*-value is less than or equal to 0.05 (the level of significance chosen), then the null hypothesis is rejected, meaning there is a statistically significant trend. The M-K *S*-value shows which trend (increasing for a positive *S* and decreasing for a negative *S*). If the *p*-value is greater than 0.05, then the null hypothesis is accepted, meaning there is not enough evidence of a trend at the significance level chosen (EPA, 2009). ProUCL, Version 5.2 software generates the graph, the statistical output, and the interpretation of the M-K test results.

3.0 Pilot Testing Results

3.1 Field Results

3.1.1 Perched Groundwater Extraction

The initial depth to groundwater (dtw) over the duration of pumping (Table 3.1) has ranged between a high of 144.80 ft below top of casing (btoc) on January 19, 2022 (3.18 ft thickness of PGW) and a low of

146.95 ft btoc on April 27, 2018 (1.03 ft thickness of PGW). Between April 2013 and March 2024, NASA has extracted an average of 158.4 gallons of contaminated PGW per month from 600-G-138 using a non-dedicated purge pump. Table 3.2 provides the PGW volume extracted each month between April 2013 and March 2024, listed by Project Year. During Project Year 11 between April 2023 and March 2024 a total of 1,782 gallons of PGW were extracted. PGW extraction was reduced to 78 gallons for July 2023 and 72 gallons for October 2023 (both well below the average) due to equipment replacement issues and reduced technician availability during reassignment to other ongoing field projects. The total amount of PGW extracted since April 2013 is 20,909 gallons.

3.1.2 Groundwater Monitoring

Indicator parameters monitored during groundwater sampling events are provided in Table 3.1. For the four Project Year 11 groundwater monitoring events in April 2023, July 2023, October 2023, and January 2024, NASA observed that initial depth to groundwater in the well casing was consistent at between 144.80 and 145.27 ft btoc, which is compatible with the depths reported during previous PGEPT monitoring years. With the depth to andesite below the closure identified as approximately148 ft btoc, a consistent thickness of approximately 3 ft of PGW is present on top of bedrock.

Figure 3.1 shows total rainfall in inches for each project year as well as depth to PGW for each sampling event at 600-G-138 for comparison. Local precipitation at WSTF for Project Year 8 (4.88 inches) and Project Year 11 (6.13 inches) was low (compared to Project Years 10 (13.47 inches) and 9 (14.11 inches; Table 2.1; Figure 3.1). However, as shown by depth to PGW in well 600-G-138, the observed variability in annual precipitation does not appear to significantly affect the measured thickness of the PGW. There is even a slight upward trend showing PGW increasing in well 600-G-138 over time but no corresponding increase in precipitation (Figure 3.1). For 2022, the largest amount of rainfall was recorded in the month of August (4.77 inches) accounting for approximately 36 percent of the total annual rainfall based on WSTF rain gauge data at the 700 Area Landfill (Table 2.1). The elevated rainfall did not result in any significant change in the initial PGW elevation for the October 2022 (145.27 ft btoc), or January 2023 (145.00 ft btoc) measurements.

3.1.3 Soil Vapor Monitoring

NASA performed PGEPTWP-required quarterly soil vapor monitoring at MSVM well 600-SGW-5 (Figure 1.2) in conjunction with groundwater sampling. During each sampling event, soil vapor was purged from each monitoring port (7.5, 52.5, 102.5, and 137.5 ft below ground surface [bgs]) using a landfill gas monitoring instrument. Purged vapor for the Project Year 11 sampling events ranged from 0.3 to 1.1 percent carbon dioxide, from 17.9 to 21.4 percent oxygen, and was 0.0 percent for methane throughout.

3.2 Project Year 11 Chemical Analytical Results

3.2.1 Groundwater Monitoring Chemical Analytical Data

Chemical analytical results for the groundwater COCs from samples collected during the groundwater sampling events at monitoring well 600-G-138 for all project years including Project Year 11 are summarized in Table 3.3. All chemical analytical data for groundwater samples through Project Year 11 are provided in Appendix A.

3.2.2 Soil Vapor Monitoring Chemical Analytical Data

Chemical analytical results from soil vapor samples collected during the quarterly vapor sampling events at MSVM well 600-SGW-5 for all project years including Project Year 11 are summarized in Table 3.4. The chemical analytical data from all 600-SGW-5 soil vapor samples associated with the PGEPT though Project Year 11 are provided in Appendix B.

3.2.3 Surface Water Chemical Analytical Data

In the July 15, 2015, *Approval with Modifications 600 Area Perched Groundwater Extraction Pilot Test Interim Status Report – Project Year 2*, NMED directed NASA to "…include the nitrate/nitrite water sample data from the lagoon" in future reports (NMED, 2015). NASA ceased wastewater discharge to the lagoons in July 2015 and collected the final set of water samples for waste characterization purposes in September 2015. No further chemical analytical data are available for the wastewater lagoons and NASA will no longer report on surface water chemical analytical data from the lagoons in future reports.

3.3 Statistical Trends

Appendix C contains statistical data output files and the OLS and M-K graphs performed as part of this evaluation. Enclosure 3 of this submittal includes the data input files in Excel spreadsheets.

3.3.1 Groundwater Trends

Due to normally distributed data and constant variance, OLS regression was performed for groundwater concentrations in well 600-G-138 for COCs chloroform and chloride. TCE and nitrate/nitrite were not distributed normally, so M-K trend tests were completed. PCE and NDMA were not detected frequently enough in groundwater at well 600-G-138 during the PGW pilot study to perform statistics, and therefore neither OLS regression nor M-K were performed for those COCs. Table 3.3 provides a summary of statistics for both groundwater and soil vapor.

All four COCs (TCE, chloride, nitrate/nitrite, and chloroform) tested displayed statistically significant decreasing or downward trends in COC concentrations. Chloride showed a strongly decreasing trend with a large negative *r*-value (-0.7748 and a *p*-value of 0.0000), while chloroform showed smaller magnitude decreasing trend (*r*-value of -0.5280 and a *p*-value of 0.0002). M-K trend results for nitrate/nitrite showed a statistically significant downward trend, with TCE showing a strongly decreasing trend (S-values of -250 and -723, respectively). M-K trend tests were also completed for chloride and chloroform for comparison purposes. The M-K trends agreed with OLS regression results (*S*-values of -516, and -332). This indicates that COC concentrations within the PGW are decreasing over time (Appendix C).

3.3.2 Soil Vapor Trends

OLS regression (for normally distributed data) or M-K trend tests (for non-normally distributed data) were performed for chloroform and TCE soil vapor concentrations within well 600-SGW-05. Since the regression line in OLS regression represents the population mean and M-K hypothesizes no trend (that concentrations will fluctuate around a constant population mean) it is important that the mean (or median) be determined by detections and not influenced by NDs (EPA, 2009). To ensure this, NASA did not perform OLS regression or M-K trend tests on data sets with greater than 50 percent NDs. Therefore, no OLS regression or M-K trend tests were completed for PCE at all depths (with percent NDs of 57, 62, 58, and 78). For use in OLS regression and M-K trend tests, NDs cannot be replaced using Kaplan-Meier or regression on order statistics (ROS) censoring methods. This is because both Kaplan-Meier and ROS assume a stable population, and a trend test may not have a stable population. Therefore, a form of simple

substitution or not using NDs are the only options for use in trend tests with NDs (EPA, 2009; ITRC, 2013). ProUCL guidance recommends replacing all NDs for use in trend tests with a single value lower than the lowest detection limit (DL). Multiple DLs cannot be input, or the trend test is invalid (it would be seeing trends in DLs instead of detected values; EPA, 2015; 2022). However, this method only works for NDs with low DLs. NDs with elevated DLs may be outliers from errors or dilution effects. It is recommended that high concentration outliers be deleted from the data set for use in M-K tests (Cameron, 2017). The OLS regression method is similar and is sensitive to outliers. Since it is important to have a regression that is representative of the data (and not NDs), outliers should be removed (EPA, 2009). A box plot without NDs of chloroform at 7.5 ft depth shows an outlier (Appendix C). This outlier (8.2 $\mu g/m^3$) was removed for chloroform at 7.5 ft. One outlier was present for chloroform at 102.5 ft depth (15 $\mu g/m^3$) as shown on the box plot below the box (Appendix C) and listed as an outlier in Rosner's outlier test. This point was removed for trend testing. For the 137.5 ft depth for chloroform, there was one large outlier (20,000 $\mu g/m^3$) which was removed. For TCE at 7.5 ft depth had two outlier concentrations (170 $\mu g/m^3$ and 150 $\mu g/m^3$). All NDs for trend testing were replaced with DLs less than any detections. Chloroform NDs at 7.5 ft and 137.5 ft were replaced with 0.31 $\mu g/m^3$. For TCE there was only one ND in all the data (at 137.5 ft bgs). This value was replaced with 0.3 $\mu g/m^3$, a value lower than the lowest detection (Enclosure 3, Excel input file).

A goodness-of-fit test was performed for soil vapor COCs chloroform and TCE (Appendix C). Both chloroform and TCE at depths of 52.5 ft and 102.5 ft, were normally distributed. Therefore, OLS regression was performed for those COCs/depths, along with TCE at 7.5 ft bgs. M-K trend tests were completed for chloroform and TCE at all depths. For chloroform in soil vapor at 137.5 ft bgs, there was insufficient statistical evidence of a significant trend in the M-K graph (S-value of 130 and *p*-value greater than 0.05 (0.0830); Appendix C). The null hypothesis was accepted, meaning that there was no trend. However, chloroform at both 7.5 ft, 52.5 ft, and 102.5 ft bgs resulted in statistically significant decreasing trends. For chloroform at 7.5 ft, the S-value was -177, a mild decreasing trend. At 52.5 ft, the *r*-value was -0.5833, showing a moderate decreasing trend. M-K results for that depth indicate a strong decreasing trend with a strongly negative *S*-value (-554) and a *p*-value of zero. For chloroform at 102.5 ft bgs, the OLS regression shows a decreasing trend as well (*r*-value of -0.6051, *S*-value of -442 and a *p*-value of zero [less than 0.05 shows a trend];Appendix C).

As shown on the TCE soil vapor M-K plots (Appendix C), a statistically significant decreasing or downward trend was present at all depths (7.5 ft bgs with negative M-K test values [-279], and *p*-values less than 0.05 [0.0025] at 52.5 ft with *S*-value of -634 and *p*-value of 0.0000, and at 137.5 ft with an *S*-value of -278 and *p*-value of 0.0024). OLS regression results for TCE at 7.5 ft showed moderate decrease (-0.4077 with a *p*-value of 0.0060) and at 52.5 and 102.5 ft bgs showed strongly decreasing trends (*r*-values of, -0.7372 and -0.7052 and *p*-values of 0.0000;Appendix C).

4.0 Conclusions and Recommendations

4.1 Recent Developments

The 600 Area PGW field investigation conducted between October 2019 and May 2022 included the installation of PGW monitoring well 600A-001-GW screened across the alluvial-andesite bedrock interface (NASA, 2022b). Recent fieldwork for the sewage lagoons soil boring investigation performed in early February through March 22, 2023 has subsequently improved the potential to conceptualize the 600 Area PGW unit. During the installation of two deep soil borings to bedrock, both locations positively identified PGW on top of the andesite bedrock surface and were converted to PGW monitoring wells. Well 600A-003-GW was installed on the west side of the 600 Area Overflow Lagoons and well 600A-004-GW within the north cell of the 100 Area Lagoons (Figure 1.2). As a result, the 600 Area PGW unit appears to be available for study (pending final development activities) in four monitoring wells (600-G-

136, 600A-001-GW, 600A-003-GW, and 600A-004-GW). The channelized PGW unit and dispersed nature of PGW wells in the 600 Area is hypothesized to reflect preferential flow along depressions carved by erosion. NASA proposed additional strategies that may be utilized to further evaluate the 600 Area PGW unit in the *600 Area Perched Groundwater Phase II AIWP* on November 27, 2023 (NASA, 2023c). This report is currently in NMED review.

4.2 Conclusions

The cumulative total volume of PGW extracted and treated from WSTF well 600-G-138 over the 11 project years of the pilot study is 20,909 gallons (Table 3.2), with 1,782 gallons specifically extracted for Project Year 11. Field measurements of the PGW depth in monitoring well 600-G-138 (Table 3.1) over the 11-year project duration of the PGEPT show that groundwater extraction has not significantly reduced the average thickness of PGW on top of andesite bedrock at approximately 3 ft over the evaluation period. The adjacent 600 Area Wastewater Lagoons were drained by July 2017 (NASA, 2019c), and no longer contribute potential infiltration to the area. The annual rainfall at WSTF for 2023 was below average at 6.10 inches but did not significantly affect the thickness of the PGW even during the period of highest precipitation in August (1.36 inches) that accounted for approximately 22 percent of the total annual rainfall. In addition, the upward trend seen in the PGW within well 600-G-138 shows that the PGW unit is slightly increasing over time with no corresponding increase in precipitation (Figure 3.1).

Chemical analytical data presented in Section 3.2 and the M-K trends and OLS regressions show that the concentrations of TCE, chloride, nitrate/nitrite and chloroform in groundwater have been declining over the 11 project years of the PGEPT. Concentrations of nitrate/nitrite in PGW samples from 600-G-138 (Table 3.3) for Project Year 11 currently approximate the New Mexico maximum concentration limit of 10 mg/L. The nearby former 600 Area Wastewater Lagoons may have contributed to the existence and composition of PGW in the area. The declining trend in both chloride concentrations by approximately 30 percent and nitrate/nitrite concentrations by approximately 20 percent (Table 3.3) over the 11 PGEPT project years and the statistically significant decreasing trends shown by the OLS regression and M-K graphs indicate a lessening in the impact of infiltration from the 600 Area Wastewater Lagoons following their removal.

The TCE concentrations in PGW have shown declines of between 60 to 70 percent over the 11-year duration of the PGEPT (from approximately 100 to 110 µg/L in Project Year 1 to 30 to 40 µg/L in Project Year 11), and a statistically significant decreasing OLS regression and M-K trend. The lower the *p*-value, the more confidence in the result, and the TCE OLS regressions (and M-K trend test) had *p*-values at 0. Concentrations of TCE in the upgradient aquifer of the 200 Area theorized to be a source of the 600 Area PGW have also declined significantly in recent years. As calculated from concentrations listed in the 4th quarter 2022 PMR, significant reduction of TCE of approximately 86 percent between 1990 through 2023 has been observed within well 200-D-240, and approximately 74 percent between 2007 through 2023 at adjacent well 200-SG-1 (NASA, 2023a). Chloroform, chloride, and nitrate/nitrite concentrations in PGW measured during the PGEPT also show a decreasing trend over the 11 years of the PGEPT. PCE and NDMA have remained undetected in groundwater at well 600-G-138 throughout the project.

Continued PGW extraction at well 600-G-138 has not significantly affected the volume of groundwater migrating through the well. The reduction in the COC concentrations in groundwater samples is inferred to be the result of reduced infiltration of nitrates/nitrites following removal of the 600 Area Wastewater Lagoons, in conjunction with declining VOC concentrations associated with the migrating contaminated groundwater from upgradient locations in the 200 Area (NASA, 2023a). The extraction of PGW from well 600-G-138 is contributing to the removal of contaminant mass from the 600 Area local aquifer. Although the contaminant mass removed over the duration of the pilot test is relatively low compared to

other wells in the network, data obtained during this pilot test supported the development of NASA's November 1, 2018, *Targeted Mobile Remediation Process Pilot Test Work Plan* (NASA, 2018b).

Declining concentrations of the PGW COCs appear to have influenced a reduction of the concentrations of COC in soil vapor measured at adjacent MSVM well 600-SGW-5 (Table 3.4). The slightly declining concentration trends are shown in the Appendix C soil vapor M-K graphs, which provide graphical summaries of the detected concentrations of TCE and chloroform in soil vapor at well 600-SGW-5 over the duration of PGW extraction at well 600-G-138. For these two contaminants, well 600-SGW-5 also shows a relationship for increasing contaminant concentrations with depth during single sampling events as evidenced by the plots for individual sampling ports located at 7.5, 52.5, 102.5, and 137.5 ft bgs. This trend would be anticipated due to the confirmed presence of contaminated shallow PGW at this location. Over the 11 project years of the PGEPT, concentrations of TCE, the primary VOC in soil vapor, trend slightly downward in the monitoring zones at 7.5, 52.5, 102.5, and 137.5 ft bgs (Table 3.4). Concentrations of chloroform are relatively stable in the four soil vapor monitoring zones of MSVM well 600-SGW-5. In general, soil vapor chemical analytical data from samples collected at 600-SGW-5 has statistically significantly declined over time for TCE in shallow and intermediate zones and for chloroform in intermediate zones (Appendix C). PCE has generally remained at trace concentrations or is undetected in soil vapor at well 600-SGW-5.

NASA concludes that the presence of contaminated PGW with declining concentrations of the COCs beneath the Closure continues to contribute to overlying soil vapor in the vadose zone. The reduction in concentrations within the upgradient 200 Area that is hypothesized to source the 600 Area PGW appears to have had an impact on COC concentrations in soil vapor. Declining concentrations of the PGW COCs may have a potentially delayed effect on reducing the concentrations of COCs in soil vapor.

4.3 Recommendations

To continue remediating groundwater and providing data for the larger scale investigation of 600 Area PGW (NASA, 2016b), NASA recommends that the extraction of contaminated PGW from monitoring well 600-G-138 be continued for Project Year 12 in accordance with the 600 Area PGEPTWP (NASA, 2012b). Groundwater and soil vapor samples will continue to be collected quarterly from PGW monitoring well 600-G-138 and MSVM well 600-SGW-5, respectively. NASA is also evaluating the possibility of incorporating the extraction of PGW at well 600-G-138 into the ongoing Targeted Monitoring Remediation Process (TMRP) project as presented in the *TMRP Phase 2 Pilot Test Work Plan* (NASA, 2023b) and may request to adjust or discontinue the PGW extraction strategy accordingly for monitoring well 600-G-138 in future project years. Methods for additional investigation of the PGW is subject to the NMED review of the *600 Area Perched Groundwater Phase II AIWP* submitted on November 27, 2023 (NASA, 2023d).

Note: Two values in the results column indicates that a field duplicate sample was collected, analyzed, and presented as the second result.

J – Indicates the result is an estimated value less than the quantitation limit, but greater than or equal to the detection limit.

NA – Indicates that the analyte was not monitored for the event. NDMA samples are collected annually in accordance with the approved GMP (NASA, 2023e; NMED, 2023d).

< – Indicates that the analyte was not detected above the detection limit.

+ – Indicates that samples were not collected for the specified analysis during this event. The 11/13/13 sampling event was performed in order to obtain results for VOCs that could be used in conjunction with soil vapor analytical results from sampling performed the same day. Additional results for NDMA, NO2/NO3, and chloride were not required for this comparison, so additional samples were not collected.

Groundwater cleanup levels: TCE 4.9 µg/L; PCE 5 µg/L; Chloroform 2.2 µg/L; NDMA 0.0011 µg/L; and Nitrite/Nitrate 10 mg/L (from the GMP; NASA, 2023e; NMED, 2023d); and chloride 250 mg/L (WQCC MCL).

Bold indicates exceedance of groundwater regulatory limit.

Notes:
Two values in the results column indicates that a field duplicate sample was collected, analyzed, and presented as the second result.
A – Indicates that the result of an analyte for a laboratory control sample (LCS), initial calibration verification (ICV) or continuing calibration verification (CCV) was outside standard limits.
D – Indicates that the reported result is from a dilution.
FB – Indicates that the analyte was detected in the field blank.
J – Indicates that the result is an estimated value less than the quantitation limit, but greater than or equal to the detection limit.
RB – The analyte was detected in the method blank.
[1] – The result provided is from replacement samples collected on May 20, 2015.
* – Indicates that the analyte was reported as non-detect with an elevated detection limit and dilution factor.
< – Indicates result is non-detect at reported detection limit.
[1] Residential VISL for soil vapor used. The values are listed as noncancer / cancer.
Bold indicates exceedance of current residential RBC in Table 2b (NASA, 2023a).

Appendix A
Chemical Analytical Results for Groundwater Sampling at Monitoring Well 600-G-138

Data Qualifier	Summary Text
*	User defined qualifier. See quality assurance narrative.
A	The result of an analyte for a laboratory control sample (LCS), initial calibration verification (ICV) or continuing calibration verification (CCV) was outside standard limits.
AD	Relative percent difference for analyst (laboratory) duplicates was outside standard limits.
D	The reported result is from a dilution.
EB	The analyte was detected in the equipment blank.
FB	The analyte was detected in the field blank.
G	The result is an estimated value greater than the upper calibration limit.
i	The result, quantitation limit, and/or detection limit may have been affected by matrix interference.
J	The result is an estimated value less than the quantitation limit, but greater than or equal to the detection limit.
NA	The value/result was either not analyzed for or not applicable.
ND	The analyte was not detected above the detection limit.
Q	The result for a blind control sample was outside standard limits.
QD	The relative percent difference for a field duplicate was outside standard limits.
R	The result is rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
RB	The analyte was detected in the method blank.
S	The result was determined by the method of standard addition.
SP	The matrix spike recovery and/or the relative percent difference for matrix spike duplicates was outside standard limits.
T	The sample was analyzed outside the specified holding time or temperature.
TB	The analyte was detected in the trip blank.
TIC	The analyte was tentatively identified by a GC/MS library search and the amount reported is an estimated value.

Rosner's Outlier Test for Chloride

Mean	**207.9**
Standard Deviation	**39.5**
Number of data	**44**
Number of suspected outliers	**1**

#	Mean	sd	Potential outlier	Obs. Number	Test value	Critical value (5%)	Critical value (1%)
1	207.9	39.05	292	3	2.155	3.08	3.43

For 5% Significance Level, there is no Potential Outlier

For 1% Significance Level, there is no Potential Outlier

Rosner's Outlier Test for Chloroform

Mean	**0.605**
Standard Deviation	**0.17**
Number of data	**45**
Number of suspected outliers	**1**

#	Mean	sd	Potential outlier	Obs. Number	Test value	Critical value (5%)	Critical value (1%)
1	0.605	0.168	1.2	23	3.541	3.09	3.44

For 5% Significance Level, there is 1 Potential Outlier

Potential outliers is: 1.2

For 1% Significance Level, there is 1 Potential Outlier

Potential outliers is: 1.2

Rosner's Outlier Test for NO2NO3

Mean	**11.08**
Standard Deviation	**1.475**
Number of data	**44**
Number of suspected outliers	**1**

#	Mean	sd	Potential outlier	Obs. Number	Test value	Critical value (5%)	Critical value (1%)
1	11.08	1.458	5.32	40	3.952	3.08	3.43

For 5% Significance Level, there is 1 Potential Outlier

Potential outliers is: 5.32

For 1% Significance Level, there is 1 Potential Outlier

Potential outliers is: 5.32

Rosner's Outlier Test for TCE

Mean	**58.51**
Standard Deviation	**23.84**
Number of data	**45**
Number of suspected outliers	**1**

#	Mean	sd	Potential outlier	Obs. Number	Test value	Critical value (5%)	Critical value (1%)
1	58.51	23.57	110	4	2.184	3.09	3.44

For 5% Significance Level, there is no Potential Outlier

For 1% Significance Level, there is no Potential Outlier

79	
80	**Dixon's Outlier Test for Y11Chloride**
81	
82	Number of Observations = 4
83	10% critical value: 0.679
84	5% critical value: 0.765
85	1% critical value: 0.889
86	
87	**1. Observation Value 204 is a Potential Outlier (Upper Tail)**
88	
89	Test Statistic: 0.382
90	
91	For 10% significance level, 204 is not an outlier.
92	For 5% significance level, 204 is not an outlier.
93	For 1% significance level, 204 is not an outlier.
94	
95	**2. Observation Value 170 is a Potential Outlier (Lower Tail)**
96	
97	Test Statistic: 0.029
98	
99	For 10% significance level, 170 is not an outlier.
100	For 5% significance level, 170 is not an outlier.
101	For 1% significance level, 170 is not an outlier.
102	
103	
104	**Dixon's Outlier Test for Y11Chloroform**
105	
106	Number of Observations = 4
107	10% critical value: 0.679
108	5% critical value: 0.765
109	1% critical value: 0.889
110	
111	**1. Observation Value 0.57 is a Potential Outlier (Upper Tai**
112	
113	Test Statistic: 0.000
114	
115	For 10% significance level, 0.57 is not an outlier.
116	For 5% significance level, 0.57 is not an outlier.
117	For 1% significance level, 0.57 is not an outlier.
118	
119	**2. Observation Value 0.51 is a Potential Outlier (Lower Tail)**
120	
121	Test Statistic: 0.000
122	
123	For 10% significance level, 0.51 is not an outlier.
124	For 5% significance level, 0.51 is not an outlier.
125	For 1% significance level, 0.51 is not an outlier.
126	
127	
128	**Dixon's Outlier Test for Y11NO2NO3**
129	
130	Number of Observations = 4
131	10% critical value: 0.679
132	5% critical value: 0.765
133	1% critical value: 0.889
134	
135	**1. Observation Value 12.3 is a Potential Outlier (Upper Tai**
136	
137	Test Statistic: 0.211
138	
139	For 10% significance level, 12.3 is not an outlier.
140	For 5% significance level, 12.3 is not an outlier.
141	For 1% significance level, 12.3 is not an outlier.
142	
143	**2. Observation Value 10.4 is a Potential Outlier (Lower Tail)**
144	
145	Test Statistic: 0.316
146	
147	For 10% significance level, 10.4 is not an outlier.
148	For 5% significance level, 10.4 is not an outlier.
149	For 1% significance level, 10.4 is not an outlier.

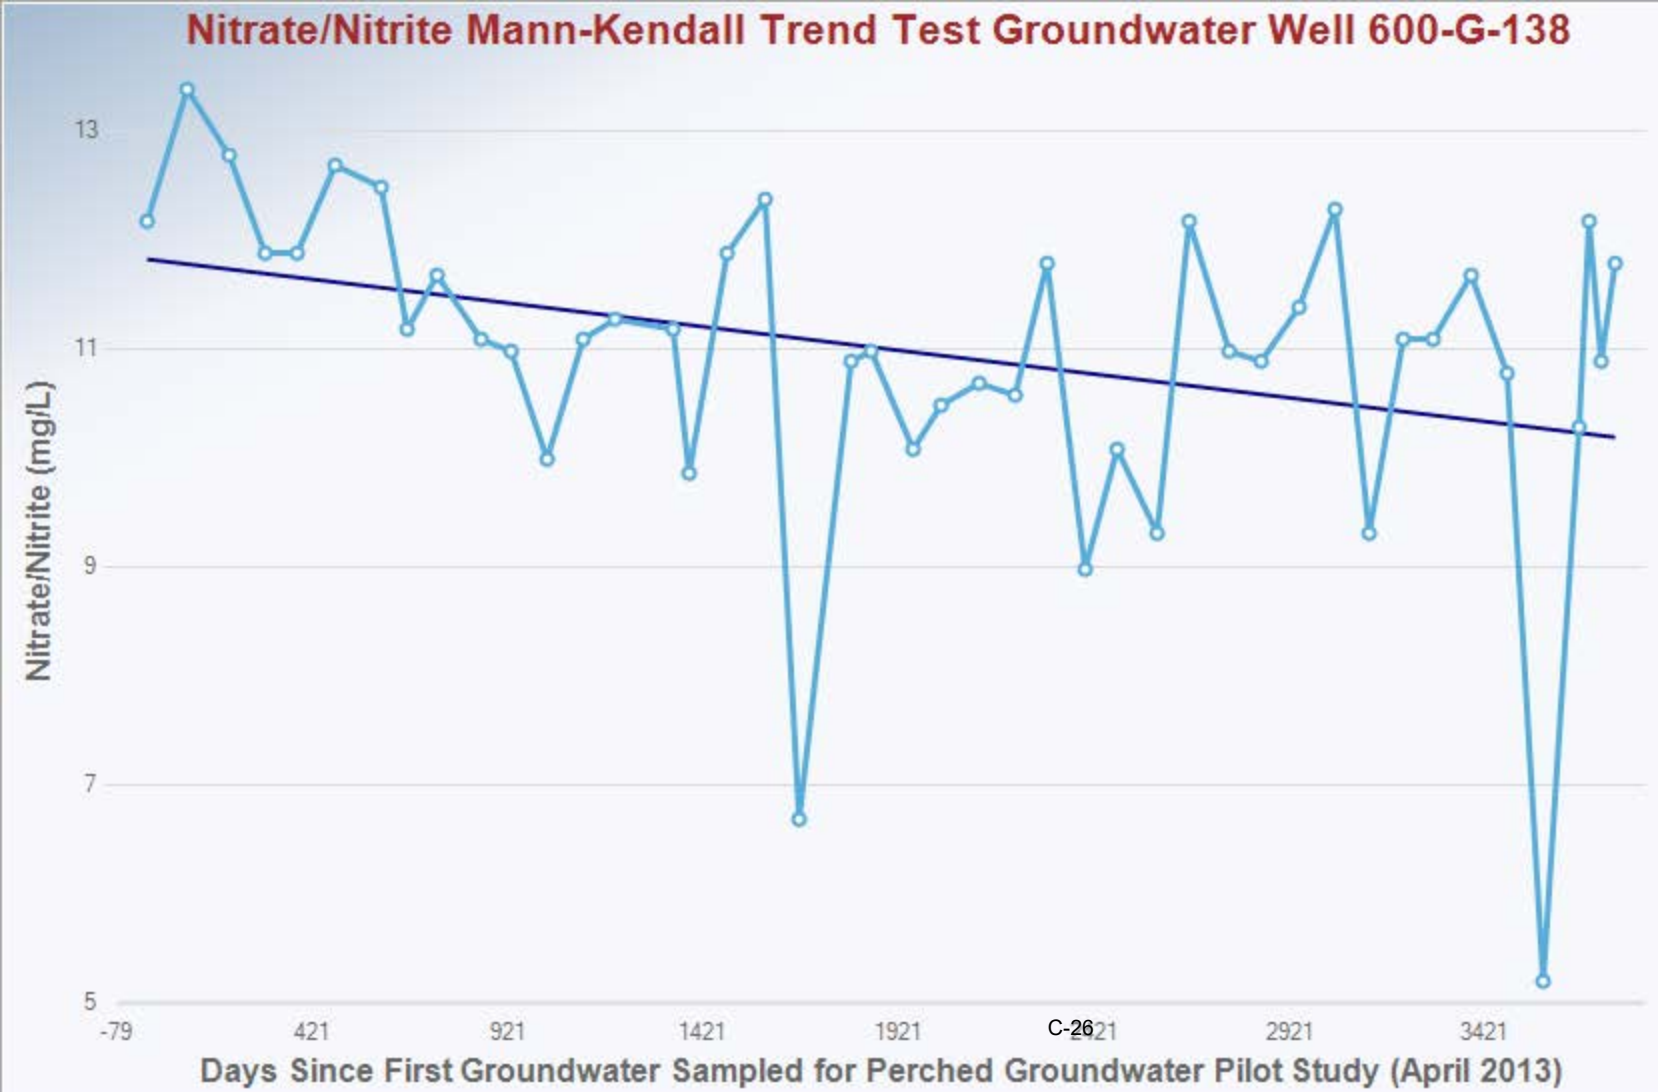
Nitrate/Nitrite Mann-Kendall Trend Test Groundwater Well 600-G-138



Mann-Kendall Trend Analysis

n	44
Confidence Coefficient	0.9500
Level of Significance	0.0500
Standard Deviation of S	98.7893
Standardized Value of S	-2.5205
M-K Test Value (S)	-250
Appx. Critical Value (0.05)	-1.6449
Approximate p-value	0.0059

OLS Regression Line (Blue)

OLS Regression Slope	-0.0004
OLS Regression Intercept	11.9439

Statistically significant evidence of a decreasing trend at the specified level of significance.

Mann-Kendall Trend Analysis

n	44
Confidence Coefficient	0.9500
Level of Significance	0.0500
Standard Deviation of S	97.9898
Standardized Value of S	-2.8268
M-K Test Value (S)	-278
Appx. Critical Value (0.05)	-1.6449
Approximate p-value	0.0024

OLS Regression Line (Blue)

OLS Regression Slope	-1.1132
OLS Regression Intercept	13,472.2672

Statistically significant evidence of a decreasing trend at the specified level of significance.
