

Greetings from...

*Moon
Base*

HUMANITY'S FIRST LUNAR OUTPOST

NASA is leading global teams of innovators across international partners, industry, and academia to build the Moon Base where Artemis astronauts will live, work, and establish an enduring human presence near the lunar South Pole. The Moon Base will be built in phases - each mission will build on the last, increasing capabilities over time. By starting with near-term technology demonstrations, robotic missions, and early experiments, NASA and its partners can test systems, learn quickly, and steadily work towards a long-term human presence on the Moon.
